PREFACE.

WHILST we find books of reference in most departmen[illegible] Science and Literature [illegible] connection with European countries, daily becoming cheap[illegible]r and more abundant, those [illegible]stigate or seek for information regarding the resources of British India, or any of [illegible]tific and economic subjects connected with Eastern countries, still meet with much [illegible]y and hindrance, to the necessity of consulting numerous authors whose [illegible] are scarce or co[illegible]d as some inquirers are without the pecuniary means of [illegible]ring all the rec[illegible] and journ[illegible], or find it impossible to procure them at any [illegible]st, whilst other[illegible] or opportunity for such extensive research, it is evident [illegible]at progress in the[illegible] of knowledge would be greatly facilitated, by collecting nd condensing this widely dispersed information, thereby enabling future inquirers to gain ome acquaintance with the results of the investigations made by the many diligent and aborious individuals, who have devoted a great portion of their time to collecting in- [illegible]rmation over the vast area of Southern Asia.

My avocatio[illegible]mployed in India, more particularly in the past seven years, ave rendered nec[illegible]ne a collection of books of reference relating to India and the ast, somewhat m[illegible]ous and varied in character than private individuals generally ossess; whilst r[illegible]nent as Secretary to the Madras Central Committees for the reat Exhibition[illegible]he Madras Exhibition of 1855, the Universal Exhibition held Paris in 1855, and the Madras Exhibition of 1857, combined with my duties (since 851), as the Officer in charge of the Government Central Museum, have brought un- er my notice a rare variety of Eastern products and subjects of interest; and thinking [illegible]ore quitting the countries in which I have dwelt for nearly a quarter of [illegible]ury, I might with advantage leave to my successors in a portable form, the [illegible] on the p[illegible] of the East that have come under my notice, combined

with an abstract of the useful information respecting them contained in my books, I h been led to show the results in the present shape.

A work of this aim and character might doubtless fully occupy the life-tim of several men of varied attainments; and this *Cyclopædia of India and of Eastern and Southern Asia*, may therefore be regarded only as a first attempt towards the kind of boo the want of which has been long and generally felt. But although fully conscious o its incompleteness in many respects, yet, I trust it may still be received with all imper fections and omissions as a useful and opportune addition to Asiatic Literatur; at least by those who recognise the justness of the saying of Emmerson, that "the thing "done avails, and not what is said about it: and that an original sentence, or a step for "ward, is worth more than all the censures"* which may be made by such as are disposed to find fault, or who would demand in a work of this kind, a degree of perfection unattainable on a first trial.

The book is merely a novelty in form, the matter it contains being as old as our first possessions in India: it is simply a compilation of the facts and scientific knowledge, which authors and inquirers have been amassing and communicating since the to one another and the public. But, "in our time, the higher walks of literature have been so long and so often trodden, that whatever any individual may undertake, it is scarcely possible to keep out of the footsteps of some of his precursors"†; and this Cyclopædia, I may therefore avow to be but an endeavour to make generally available, in a condensed form the information acquired by those who have in any way investigated the natural or manufactured products of Southern Asia, or have at any time made its arts or natural history subjects of inquiry. Some of those whose writings I have made use of, have long since gone to their account, but many a labourer yet alive may find the result of his labour embodied here; and I have done this freely, because even those from whose writings I have most largely drawn, will acknowledge that the quaint old lines of Chaucer‡ still apply with full force; viz. that,

"Out of the old fields, as men sayeth,
Cometh all this new corn fro' yeare to yeare:
So out of old books, in good faith,
Cometh all this new Science that men lere."

Indeed, I have rather sought to collect and condense accurate and well ascertained facts, than to present novelties; for originality is but too often unconscious or undetected

* English Traits, p. 5. † Salad for the Social, page 317. ‡ Ibid. page 321.

years ago remarked, that all pretensions to it are ridiculous ; and a has told us, that 'there is nothing new under the sun.' But if there new in this work, I hope it may yet be found to contain much which unknown before ; and which want of books, leisure, or opportunity, may have arred them from learning.

The Cyclopædia is not intended to comprise the whole science of Botany, nor that of Medicine, or Zoology ; nor to instruct in all the matters useful in Commerce or the Arts ; but, whether examined for information or amusement, the botanist, the medical practitioner, the naturalist, and the merchant, may perhaps each find something in t, which, from his engagements, he did not know before, or though once knowing e may have again forgotten. In both cases, the work may prove useful, since old houghts are often like old clothes ; put away for a time, they become apparently ew by brushing up. It would have been better perhaps, had a work of this kind een undertaken years ago, or even now were it made the joint effort of several persons : ndeed, to render it in any way complete, would call for the resources at the command of Government rather than of individuals ; but we cannot have every thing at the time we ish, nor in the way we wish, and it is better to have some one undertake it and do it he best way he c *now*, than to postpone it to some further indefinite period.

With a view therefore of laying a foundation as a starting point for future inquirers now make the commencement of a work, towards which I hope to receive from ny quarters aid and support as I proceed : being thereby enabled either to produce future arged and improved editions of the work myself,—placing it, as I hope, within the each of all,—or seeing that task taken up hereafter, by younger men, with more time nd opportunity than are now before me. A dinner of fragments is often said to be he best dinner ; and in the same way, there are few minds but might furnish some nstruction and entertainment, from their scraps, or odds and ends of knowledge. Those ho cannot weave a uniform web, may at least produce a piece of patchwork* ; and ny items of information sent to me will be very acceptable.

There is another difficulty which inquirers in this country have had to meet and ruggle with ; I allude to the many languages and dialects in use in India and Eastern

* Guesses at Truth.

Asia, and consequently the variety of scientific, national, or even local names, by wh same thing is known. The only means of overcoming this difficulty was to frame a co ous Index of contents; for Pope has well said that

> "Index Learning turns no student pale,
> Yet holds the eel of Science by the tail."

This Indexing will add to the bulk of the book, but greatly also to its value a work of reference; and will be carefully completed.

CYCLOPÆDIA OF INDIA AND EASTERN ASIA,

Commercial, Industrial, and Scientific,

PRODUCTS OF THE

MINERAL, VEGETABLE AND ANIMAL KINGDOMS, USEFUL ARTS AND MANUFACTURES.

(1) ABACA BRAVA, the wild abaca, the name given by the natives of the Philippine Islands, to a variety of the Manilla Hemp, Musa textilis, called Agotai by the Bicoles.—*Royle, Fib. Plants. p.* 65.

(2) ABACA, MOUNTAIN, a variety of the Manilla Hemp Plant, Musa textilis, the fibres of which only serve for making ropes, called *Agotag* and *Amoquid* in the Bicol language.—*Royle, Fib. Plants., p.* 65.

(3) ABEER OR RANDA, a grateful perfumed powder, rubbed on the face or body, or sprinkled on clothes to scent them: one kind is composed of rice flour, or the powdered bark of the mango tree or deodar, camphor and aniseed. A superior kind is prepared from powdered sandalwood or wood aloes, Curcuma zerumbet (Kuchoor), or Curcuma zedoaria (ambi huldee), rose flowers, camphor, and civet cat perfume, pounded, sifted and mixed.—*Herklots.*

(4) ABELMOSCHUS ESCULENTUS.

Esculent Okra, ENG.	Benda, TEL.
Vendah, MAL.	Bhendie, DUK.
Vendee, TAM.	Ramturay or Dhenroos, BENG.

An annual herbaceous plant; generally cultivated in gardens in India. Abelmoschus esculentus, Wight and Arnott, (H. esculentus, L.) according to Roxburgh, is a distinct species from the *Abelmoschus longifolius*, Wall. (Hibiscus, Roxb.) and a native of tropical America. It is possible they may be one and the same plant, as they are considered by Wight and Arnott. Dr. Roxburgh says that he never found this plant wild, and that it is much cultivated throughout India. The other sort (A. esculentus) is a native of the West Indies. Dr. Roxburgh's admirable description of this plant is as follows:—"This is one of the best, if not the best, of the esculent herbs of India; the plant is easily raised from seed, and produces abundance of fruit, the only part which is eaten. The whole plant, particularly the capsules, is replete with much mild mucilage, which I consider as highly nourishing as well as mucilaginous, and might no doubt be employed to advantage in all diseases requiring emollients and demulcents. Some tender branches placed in water for examination soon rendered it gelatinous, almost as much so as if the branches of *Pedalium murex* had been standing in it. Dr. Cullen observes that coughing is often caused by acrid vapour rising from the lungs, irritating the glottis and its neighbourhood; that by besmearing these parts with demulcent matter, we often lessen the irritation and frequency of coughing. A mild, palatable, culinary preparation of the very young capsules of this plant, would, I think, stand as fair a chance to answer this intention as any thing I know, and at the same time prove a nourishing part of the diet." "The stigmas are replete with a very beautiful deep purple juice, which they communicate to paper, and which is tolerably durable. "*H. esculentus*, the West India *Okra*, possesses virtues nearly similar, though I believe inferior; this I have also cultivated for many years in the Botanic Garden, and it differs from this very conspicuously, both in the shape of the leaves and capsules."—*Roxb. Fl. Ind.* iii. p. 210. Without exactly admitting the correctness of Dr. Cullen's views as to the cause of the irritation of the glottis, experience amply shews the value of the practice recommended by that able physician; below will be found a formula for the preparation of a *demulcent lozenge*, which has been devised in the hope of meeting the object Roxburgh points out. O'Shaughnessy recommends this lozenge strongly as a very pleasant nutritive and soothing preparation.—*O'Shaughnessy page* 215-217. This plant though indigenous to the West Indies, has long been naturalized in India. It produces the well-known vegetable, the Bendikai, which is so much esteemed for imparting a mucilaginous thickening to soups. The young

pods are gathered green and pickled like capers. The seeds may be boiled like barley, and the mucilage which they contain is both emollient and demulcent. Its leaves are used for poultices. The plant yields a long silky fibre, strong and pliant, and well suited for the manufacture of ropes, string, gunny-bags and paper. The fibres are exported to a slight extent from this country, as hemp, to which they bear a considerable resemblance. A bundle of them tested by Dr. Roxburgh bore a weight of 79 lbs. when dry, and 95 lbs. when wet. In the Juries' Reports of the Madras Exhibition it is stated that there is a great consumption of them in the Madras Presidency, chiefly for rope and gunny-bags. In the year 1853-54 there was exported 6,112 cwt., valued at 27,113 Rs. Samples of these fibres were exhibited from a number of districts, but nearly all of them were discolored and their strength much impaired from steeping. They retain their gloss even when very brown and rotten.—*Roxb. Royle. Jury Rep. Mad. Exhib, &c. quoted in Useful Plants.* The lozenge above alluded to, is made of arrow root one ounce, white sugar one pound, abelmoschus mucilage concentrated to one-third, and strained, as much as required to form a mass, to be divided into lozenges and dried. These make a good demulcent in irritating coughs.—*Beng. Phar. p.* 434.

(5) ABELMOSCHUS FICULNEUS, Vendee Fibre, promises to yield a useful fibre for gunny bags and paper. The bark contains a large proportion of white reticulated fibre similar to that obtained from the Mulberry. It grows abundantly on the black cotton soils of India. At the Madras Exhibition of 1855, Mr. Jaffrey exhibited a very good clean sample of this fibre, of great length, but not very strong.—*Madras Exhibition Juries' Reports.*

(6) ABELMOSCHUS MOSCHATUS (*Moench.*) Nat. Ord. MALVACEÆ: MONADELPHIA POLYANDRA. *Sex. Syst.*

Musk-Mallow, ENG.	Kalee-kustoorie, DUK.
Caat-kustoorie, MAL.	Mooshk-dana, HIND.
Vettilei-kustoorie, TAM.	

An annual herbaceous plant, a native of the East Indies and of South America, and its seeds, the *Hubb-ool-mushk*, are to be found in all the bazaars, being in much esteem for their cordial, stomachic and antispasmodic virtues. Reduced to powder, the Arabs use them as an adjunct to coffee to which they impart an aroma. The seeds are brown, kidney shaped, the size of hemp seed, slightly compressed, striated with parallel streaks. In smell and taste, these seeds resemble a mixture of musk and amber, and on burning, a similar odour is evolved. This plant abounds in mucilage, and is said to be used in Upper India to clarify sugar. The seeds are also used as a substitute for animal musk in scenting powders and pomatums. The bruised seeds have been given with the best effe in counteracting bites of venomous reptiles, being applied both internally and externally. In the West Indies they are reduced to powder, steeped in rum, and in this state are considered most efficacious in snake bites. A strong fibre is also produced from this plant. Dr. Roxburgh cut the stems while in flower and immediately steeped them in water. According to his experiments, on the relative strength of Indian fibres, these broke at an average weight of 107 lbs. both when dry and wet.—*O'Shaughnessy; Madras Exhibition Juries' Reports: Useful Plants.*

(7) ABELMOSCHUS TETRAPHYLLA. At the Madras Exhibition of 1857, Mr. Jaffrey exhibited an excellent, white and strong fibre, obtained from this plant: flowers large, yellow, with a dark centre, abundant in Girgaum woods, Bombay. Wight in his Icones, 951, figures the A. angulosus.

(8) ABKARRY. Revenue derived in India from duties levied on the manufacture and sale of inebriating liquors, as toddy, pachwai, and arrack; also on intoxicating drugs, whether in substance, infusion or extract, as opium, bhang, churrus: also on certain licensed distilleries, and on shops licensed to sell by retail.—*Wilson.*

(9) ABROMA AUGUSTA, (*Linn.*) Nat. Ord. BYTTNERIACEÆ. MONADELPHIA DECANDRIA. *Sex: Syst:* Oolut-kumbul, BENG. Abroma Augusta, the Woollut Comal or Ullut Comal of Bengal, is a plant of the family of Byttneriaceæ and called by Dr. Roxburgh, Perennial Indian hemp or flax. It grows as a native of various parts of India, and as far east as the Philippines, and might be profitably cultivated as a cordage material, as the bark abounds in white fibre. It is a small tree or shrub with soft velvetty branches and drooping purple flowers, and grows so rapidly as to yield annually, two, three, or even four profitable cuttings, fit for peeling. On this account, and on account of the beauty, strength, and fineness of its fibres, it is deserving of more than common attention. The produce is said to be three times greater and one tenth stronger than that of Sunn. It is a perennial plant, but can be cultivated as an annual. If maceration be employed, its continuance must be guided by the heat of the weather. The plant succeeds well in all parts of India. Dr. Roxburgh called especial attention to it, inasmuch as it was more easy of cultivation than Sunn (Crotalaria juncea). To prepare the fibre, the bark is steeped in water for about a week, beyond which they require no further cleaning, and in this state, without any subsequent preparation they are not liable to become weakened through exposure to wet. A cord made from these fibres bore a weight of 74 lbs. while that of Sunn only 68 lbs.—*Royle. Riddell. Cyclopedia of Natural History. Useful Plants.*

(10) ABRUS PRECATORIUS (*Linn.*) Nat. Ord. LEGUMINOSÆ. MONADELPHIA ENNEANDRIA. *Sex. Syst.*

Wild Liquorice, ENG.	Ghoorieghenza, TEL.
Koonee, MAL.	Guncha, HIND.
Coondamunnie, TAM.	Sweta, Koonch, BENG.

A native of India, and thence spread into Africa and America. Of this creeper there are several varieties, with seeds, scarlet, black, and white. Those of a bright scarlet colour, with a jet black spot at the top, are used by the jewellers and druggists as weights, also for beads and rosaries, whence the specific name. From their extreme hardness and pretty appearance, people prize them for necklaces and other ornaments. They are said to be innocuous if swallowed whole, but dangerous in a powdered state. On the latter point, however, there must be some mistake, as they form an article of food in Egypt, though considered hard and indigestible. They are occasionally employed in external applications in ophthalmia. They are reduced to a fine powder by the goldsmiths, who use them in this state to increase adhesion in the more delicate parts of manufactured ornaments. In Hindoostan they are known as the Retti weights. The roots abound in sugar and are employed as a substitute for liquorice, for which they are a perfect substitute, in every respect. The leaves have a similar taste, and, mixed with honey, are applied externally in swellings of the body. Horsfield says that in Java the root is considered demulcent, and the mucilage is there combined with some bitter, while Lunan states that in Jamaica the leaves are used instead of tea. It is a popular belief that they almost "uniformly weigh exactly one grain, troy;" but they vary from one to two grains. The Burmese use them within a fraction for two grain weights. One hundred and twenty, by one mode of reckoning, and one hundred and twenty-eight by another, make one tickal, which weighs, according to Captain Low, 253·75 grains troy.—*Riddell. Useful Plants. Mason. O'Shaughnessy.* Wight in his Icones, 33, figures A. fruticulosus.

(11) ABUTILON. A genus of plants belonging to the natural order *Malvaceæ*. The genus contains about eighty species; three of which A. tomentosum: A. polyandrum and A. indicum, yield a fibrous material. That of the two last is known as *Toothee*, the fibre being long and silky, resembling hemp.

(12) ABUTILON INDICUM.

Country Mallow, ENG.	Nugoo-benda, TEL.
Payrin-toothee, MAL.	Petaree, BENG.
Perin-toottie, TAM.	

A small plant 2-3 feet, common in most parts of India, and cultivated in Burmah. It yields a rather strong fibre fit for the manufacture of ropes. The leaves contain a great deal of mucilage, and on that account are used in the same manner, in India and Burmah, as the marsh mallows in Europe. A decoction of them is used by European and Native practitioners as an emollient fomentation, and an infusion of the root is given as a cooling drink in fevers, Wight remarks that there is no character of any importance to separate this species from the A. asiaticum.—*Useful Plants. Mason.*

(13) ABUTILON POLYANDRUM.

Grows on the Neilgherries and Nundidroog; yields a long silky fibre, resembling hemp, fit for the manufacture of ropes, samples of which, as well as of that of the A. tomentosum, were submitted by Mr. Jaffrey to the Madras Exhibition, though those of the latter were not considered of a superior quality.—*Jur. Rep. Mad. Ex. Useful Plants.*

(14) ABUTILON TOMENTOSUM, or Toothee; some small indifferent specimens of fibre from this, were exhibited from two or three districts at the Madras Exhibition of 1855.—*Madras Exhibition Juries' Reports.* Wight also figures 68, A: crispum.

(15) ABWAB. Heads or subjects of taxation: miscellaneous cesses, imposts and charges.—*Wilson.*

(16) ACACIA. A very extensive genus of trees, inhabiting the tropical parts both of the Old and New Worlds, and over all Australia. There are nearly 300 species.—*Eng. Cyc.*

(17) ACACIA AMARA. Woonja marum. வேம்பு. *Mimoseæ*, Roxb. c. 122. A tolerably large tree, but of rather low stature, the wood dark coloured and hard. Dr. Wight had not an opportunity of properly examining it.—*Wight.*

(18) ACACIA ARABICA (*Willd.*) Nat. Ord. LEGUMINOSÆ. POLYGAMIA MONŒCIA. *Sex. Syst.*

Kurroo-vaylum, MAL.	Kalee-kekur, DUK.
Karoo-velum, TAM.	Babul, BENG: HIND:
Nulla-tooma, TEL.	

The tree is found in every district of India, and is worthy of cultivation on account of its gum, timber, and its seeds, a favourite food of sheep, &c. It is of rapid growth, and requires no water, flourishing in dry arid plains, and especially in black cotton soil, where other trees are rarely met with. Like several others of the same genus, it yields abundance of transparent gum, which is used in India as a substitute for the real gum Arabic, the latter being the produce of the A. vera. The gum is procured by making incisions in the bark, and the sap running out, hardens in lumps of different sizes and figures. The bark itself is used medicinally as a tonic and astringent; in decoction it is employed as a wash for ulcers; and finely powdered and mixed with gingely oil, externally, in cancerous affections. Mixed with the seeds of Sesamum orientale, after the oil has been expressed, it is an article of food with natives. A decoction of the bark makes a good substitute for soap, and is used in dyeing various shades of brown. According to Dr. Buchanan, moreover, it is employed in Mysore in the process of distilling rum. The leaves burnt and mixed with cocoanut-oil are applied externally in cases of itch. The

bark is extensively employed in tanning, and, under proper management, makes a good leather, imparting a reddish tinge. In native hands the leather is often porous, brittle and ill coloured. It is a very hard, tough wood and is extensively used, but can seldom be obtained of large size, and is generally very crooked. It is used for plough shares, naves of wheels, knees and ribs of country ships &c., and generally for all purposes, for which a bent hard wood is required. It makes excellent tent pegs. Although in great demand for ships, it does not last above 16 years, when so applied. It is common in the Dekhan and Pegu, thrives equally well in black or red soil, growing rapidly and requiring no water; the flowers are yellow and the tree on the whole ornamental. Another species of Acacia is mentioned by Dr. Riddell as found in the Dekhan, called *Ramkanta*, which grows tall and erect with a cypress like appearance, and differs in form and the colour of its legumes from the Arabica: it is extremely ornamental, but the natives have an objection to the tree from some superstitious motive, an ill omen being attached to it; the wood is hard, and used for cart-wheels, ploughs, &c.—*Riddell. Reports of Juries, M. E. Useful Plants. Mason. Rohde.*

(19) ACACIA CATECHU *(Willd.)* Nat. Ord. LEGUMINOSÆ. POLYGAMIA MONÆCIA, *Sex. Syst.*

Wodalay or Wothalay, TAM. | Kheir, HIND.
Podeelmaun, TEL. | Khaira, BENG.

This tree grows in Malabar and various parts of India, Burmah, Tenasserim &c., but more frequently in the Dekhan and the Carnatic. It is a small tree, and, though considered less hard and durable than other Acacias, it furnishes nevertheless, large and plentiful timber. It is found in great quantities in the forests of the Prome and Tharawaddy districts, as well as on the Shan side above Tounghoo, and is described by McClelland as affording a red wood, adapted to cabinet making. The substance, formerly known as Terra Japonica, was generally supposed to be yielded by this tree. It is now better understood as one of the kinds of catechu prepared in India—the word being derived from *cate* a tree, and *chu* juice. It is extracted from the unripe pods and old high-coloured wood, and the mode of preparation in some of the Northern parts of India is minutely described by Dr. Royle. The chips of the inner wood are put into an earthen pot over the fire; they are then boiled, and the clean liquor is strained off; when of sufficient consistence, they are poured into clay moulds. This is usually of a pale red colour, and in quadrangular pieces. Ainslie states that it is used in Berar in the process of dyeing chintz and other cloths. It is occasionally mixed with plaster to increase its adhesion, and is, also, in conjunction with certain oils, applied to beams to preserve them against the white ants. The most celebrated catechu is that obtained from Pegu, and this brings £4 or 5 a ton more than other astringent extracts. Catechu contains a greater proportion of tannin than other astringent substances, and it has been found that 1 lb. of this is equal to 7 or 8 lbs. of oak bark for tanning purposes. The manufactured article is brought down in considerable quantities from Berar and Nepaul, and thence to Calcutta, from whence it is exported to Europe. Other kinds of catechu are prepared in India, the commonest of which is that from the nut of the Areca palm. It is much used as a medicinal astringent substance, and forms a good leather of a red or orange colour.—*McClelland. Riddell. Useful Plants. Juries' Reports M. E.*

(20) ACACIA CONCINNA *(Willd.)* Nat. Ord. LEGUMINOSÆ. POLYGAMIA MONÆCIA, *Sex. Syst.*

Chikai, TEL. Reeta, BENG.

A climbing shrub growing in Bengal and Assam. A considerable trade is carried on in some parts of India in the pods of this shrub, which resemble the soap-nut in taste, and are used like it, for washing the head. They are also employed by the Hindoos for marking the forehead. The leaves are acid, and are used in cookery instead of tamarinds.—*Roxb. Nimmo, &c. quoted in Useful Plants.*

(21) ACACIA DEALBATA, a handsome tree, from fifteen to thirty feet high, most abundant in Port Philip and Twofold Bay, forming luxuriant groves on the banks of streams, between the parallels of latitude 34 and 30 degrees. Its bark contains a greater per centage of tannin than any other, and pays to ship to England.—*Simmonds.*

(22) ACACIA ELATA. Seet, BURMESE.

Plentiful in the Pegu, Tounghoo and Prome districts; timber straight, lengthy, and of large girth; wood red, adapted to cabinet making.—*McClelland.*

(23) ACACIA FARNESIANA *(Willd.)* Nat. Ord. LEGUMINOSÆ. POLYGAMIA MONÆCIA, *Sex. Syst.*

Gooya-babula, BENG. | Vaday-vullie-marum, TAM.
Kustoori, TEL. |

This is a large shrub or small tree armed with thorns, growing in Bengal, Assam, and the Peninsula of India. It exudes a considerable quantity of useful gum. Roxburgh says it is a native of every part of India. The wood is very hard and tough, and is much used for ship-knees, tent-pegs and similar work. The flowers, distilled, yield a delicious perfume.—*W. & A. Roxb. &c. quoted in Useful Plants.*

(24) ACACIA FERRUGINEA *(Willd.)* Nat. Ord. LEGUMINOSÆ. POLYGAMIA MONÆCIA, *Sex. Syst.*

Vulvaylum, TAM. Woanee, TEL.

A tree, 20-25 feet, armed with conical stipulary spines growing on the Coromandel coast, Courtallum and N. Circars. The bark steeped in jaggery water is distilled as an intoxicating liquor. It is very astringent. A decoction of the same, in conjunction with ginger and other ingredients, is frequently employed as an astringent wash for

the teeth *Ainslie. Lindl. &c. quoted in Useful Plants.*—Wight, also, figures, 1157, A, latronum.

(25) ACACIA LEUCOPHLÆA *(Willd.)* Nat. Ord. LEGUMINOSÆ. POLYGAMIA MONÆCIA, *Sex. Syst.*

Kekur, HIND. | Tella-tooma, TEL.
Velvaylum, TAM. |

Produces a good dark coloured wood, but generally small. The specific name is given from the pale yellowish colour of the bark, which is used in Madras as one of the ingredients in distilling arrack. This Acacia is easily distinguished by its panicled globular inflorescence and stipulary thorns. It grows in the Dekhan and in the woods and hills of the Coromandel Coast. A fibre is also prepared from the bark by maceration, after four or five days beating. It is used for large fishing nets and coarse kinds of cordage, being tough and strong. *Rep. M. E. Useful Plants. Wight. Rohde.*

(26) ACACIA MYRIOPHYLLA *(Grah.)*

A small tree, growing to the height of 12 feet, in Silhet. With the bark of this tree the mountaineers make an intoxicating liquor, which they drink, as we do beer.—*Useful Plants.*

(27) ACACIA ODORATISSIMA *(Willd.)*

Karinthakara, MAL. | Curroovaynghay, TAM.
Shinduga, TEL. |

A tree in height from 30-40 feet, growing in Malabar, Coromandel, and the Tenasserim Provinces. It furnishes a strong, hard, and heavy wood of rapid growth, attaining considerable size, about 1 foot square beams, and well suited for naves and felloes of wheels. The tree is abundant, and grows in almost any soil.. The grain is ornamental but rather open. Its timber is well suited for certain purposes of the house carpenter and for cartwrights and coach builders; it attains a considerable size and is of rapid growth, and its value for the general purposes of carpentery is not sufficiently known. The wood is said to turn nearly black in the course of time. *Mason. Juries' Reports. Jaffrey.*

(28) ACACIA ROBUSTA, the large Australian or Cape Acacia, is now growing freely on the Neilgherry Hills. At the Madras Exhibition of 1857, Mr. McIvor exhibited specimens of bast, from this tree, strong, very tough and durable, also pliable when wetted. In January 1856, Mr. McIvor first commenced employing this bast but it has since then been constantly made use of, for all the purposes to which Russian bast is put in gardens in Europe. This bast could be procured cheaply and in large quantities, as the trees when cut down throw up numerous young shoots, to the height of from six to twelve feet in one year. The bark of the tree is also a powerful tanning material.—*Madras Exhibition of* 1857.

(29). ACACIA RUGATA. SOAP ACACIA. The dry pods of this species of acacia are sold in the bazars of the Tenasserim Provinces, and are used as a substitute for soap in cleansing the hair. Turmeric and the leaves of the Soap Acacia afford a beautiful green dye.—*Mason.*

(30) ACACIA SASSA. *Syn.* A. gummifera. Mimosa gummif. οποχαλπασον: *Talleh* of the Arabs of the desert. A native of Africa near Mogadore, also of the Island of Bourbon; the trunk is very large and lofty, and affords the gum opocalpasum, the Abyssinian myrrh of Bruce. Dr. O'Shaughnessy states that it also produces the Bussorah gum of commerce, which may be substituted in medicine for Gum Tragacanth. —*O'Shaughnessy page* 301.

(31.) ACACIA SENEGAL. *Syn.* Mimosa Senegalensis. Trunk 15 to 20 feet in height; this affords the Senegal gum of commerce; it does not differ essentially from that of A: vera. —*O'Shaughnessy p.* 301.

(32) ACACIA SERISSA.

Dirisana, TEL. Seet, BURMESE.

Found throughout the Tenasserim provinces and India: timber large and plentiful, particularly in the Tounghoo district,—wood red, adapted to cabinet making and ship building. Mason describes it as a large tree, and its wood as "dark coloured, and very hard." It yields a large quantity of a clear gum, known in Southern India as the "dirasana" gum which closely resembles that from the Vachelia farnesiana.—*McClelland. Jaffrey. Madras Exh: Jur: Reports.*

(33) ACACIA SPECIOSA OR FLEXUOSA.

Velvaynghay, TAM. | Sirisha, BENG.
Dirisana, TEL. |

Grows in Travancore, and Coromandel. It is a tree of rapid growth and attaining a large size, with flowers white, very fragrant; supposed to be identical with the *A. sirissa,* which is extensively planted along the Ganges canal. Its large head affords a good shade. The timber is very durable, hard and close-grained, and is employed in making furniture, in ship building &c. It is of a light colour, and well adapted for frames for pictures and similar work. This tree yields a considerable quantity of gum, which is valuable for many ordinary purposes. It is something like gum Arabic. *Juries' Reports, M. E. Useful Plants. Wight.*

(34) ACACIA STIPULATA. *(D. C.)*

Amlooki, BENG.

The unarmed Acacia, flowers of a pink colour: grows in Travancore, Courtallum, Bengal, and Tenasserim Provinces. This is one of the largest trees of the genus Acacia. The timber is close-grained and strong. It is a native of the mountains north of Bengal, but is to be met with in most parts of the Peninsula. Under the Burmese name of "Seet," it furnishes a large heavy timber, and is found throughout the forests from Rangoon to Tounghoo,—wood red, adapted to cabinet making, furniture and other purposes.—*McClelland. Useful Plants.*

(35) ACACIA SUNDRA.

Carangally, TAM. | Sundra, TEL.

A very hard, heavy and durable wood, used

for posts and rice pestles. The tree is rather large and abundant, but the wood is not generally to be obtained in the market in planks of any size, although Mr. Rohde mentions he has obtained planks one foot broad. At Guntoor, Mr. Rohde states that posts, 5 feet long, are procurable, at 12 Rs. per 100; these are well suited for fencing, though the non-elastic nature of the wood is unfavorable to the holding of nails driven into it. The natives regard it as the most durable wood for posts in house building. A one inch bar sustained a weight of 500lbs. A resin similar to that yielded by the A. catechu is procured from this tree; in fact the two species are very nearly alike: the uncertainty of the prickles absent or present, even on the same tree, is a distinguishing characteristic of this one. Its bark has been tried but found of no value for tanning purposes.—*Juries' Reports. Useful Plants. Rhode, Wight.*

(36) ACACIA VERA. *Syn.* A. nilotica. Mimosa nilotica. Αχανθος αιγυπτιχη. This tree affords two products, one natural, the other artificial, namely the acacia juice and gum arabic. The Acacia juice, (Akakia of Dioscorides and Eastern writers), is a solid, heavy, shining, brittle, dark coloured substance, inodorous, insipid at first, flavour astringent, powder brown, soluble in water which it colours red. Dioscorides, and before him Hippocrates, have described and highly lauded the properties of this juice. It is obtained by pounding the unripe fruit, and expressing the juice; this is thickened before the sun, and then placed in bladders in which drying gradually takes place. The little bladders of akakia found in Europe contain about 5 or 6 ounces each; it is sold in the bazars of Bengal in thin, very black cakes, about the size of a rupee—*O'Shaughnessy pp* 299,300.

Gum Arabic. Vern Kapitha, *Sans.* Kavit goond. *Duk.* Sumug Arabee, *Arab.* Gum is consumed in immense quantities by dyers and glaziers, and enters into a great number of pharmaceutical preparations. Its nutritive qualities admit of no rational doubt, although M. Majendie denies that it can support life, chiefly because it contains no nitrogen; its composition being carbon 13, hydrogen 12, oxygen 12 equivalents. The natives of the countries along the banks of the Niger, the Moors of the interior of Africa, the Negro gum collectors of the forests of the Gambia, as well as some tribes of Bedouins, subsist almost exclusively on this principle. Gum exudes spontaneously, or its afflux is promoted by incisions in the bark. The *Acacia vera* is the only tree of the African desert, and its leaves yield the camel the sole forage it can meet in those arid regions.—*O'Sh. page* 300.

(37) ACALPHYA BETULINA. Nat. Ord. EUPHORBIACEÆ. MONÆCIA MONADELPHIA. *Sex. Syst.* Chunnie marum, TAM.

Wood to be obtained about 18 inches in diameter; hard and heavy; not of much value to carpenters.—*Wight.*

(38) ACALYPHA INDICA (*Linn.*) *Sex*: *Syst*:

Kooppamaynie, MAL. Cupameni, TAM. TEL. Kooppie, DUK. | Mookto-joori, Shwet Busunda, Moorkanta, BENG.

A small annual, common every where in the Peninsula and Bengal. This plant, is easily distinguished by the singular cup-shaped involucre which surrounds the flowers. The root bruised in hot water is employed as a cathartic, and the leaves as a laxative, in decoction; mixed with common salt the latter are applied externally in scabies. The powder of the dry leaves is given to children, in worm cases: as is also a decoction of them, with the addition of a little garlic. The juice of the same part of the plant, together with that of the tender shoots, is occasionally mixed with a small portion of margosa oil, and rubbed on the tongues of infants for the purpose of sickening them, and clearing their stomachs of viscid phlegm. The Hakeems prescribe it in consumption.—*Useful Plants. Honigberger, O'Shaughnessy, page* 562. Wight also figures A. mappa.

(39) ACANTHUS ILLICIFOLIUS. HOLLY LEAVED ACANTHUS. Every muddy bank in the Tenasserim Provinces is relieved by crowds of a handsome blue flowered plant with leaves like a holly, and hence called the holly-leaved Acanthus. The Burmans say its roots are a cure for the bites of poisonous snakes.—*Mason.*

(40) ACARUS FARINÆ, or meal mite, occurs, though rarely, in flour, and is never present unless when damaged: Any flour, therefore, containing this insect, is in a state unfit for consumption. It is believed to be of more frequent occurrence in the flour of the leguminosæ than of the gramina—*Hassall.*

(41) ACER CAUDATUM (Wallich), the LONG-POINTED MAPLE. It is a native of the highest regions of Nepaul, of Sirmoor, Kumaon, and Srinaghur.—*Eng. Cyc.*

(42) ACER CULTRATUM (Wallich), the CURVE-KEYED MAPLE, is a large tree, native of the regions towards the Himalayas, in Kumaon and Srinaghur.—*Eng. Cyc.*

(43) ACER LÆVIGATUM (Wallich), the POLISHED MAPLE. Leaves oblong, taper-pointed, slightly serrated, shining, green beneath. Flowers white. It is found in the woods of the higher mountains of Nepaul, and also in the Alps of Sirmoor, where it acquires a trunk thirty or forty feet high and from three to four feet thick. Its growth is slow; its timber is said by Dr. Wallich to be used by the inhabitants of Nepaul for rafters, beams, and similar building purposes.—*Eng. Cyc.*

(44) ACER OBLONGUM, OVAL-LEAFED MAPLE: an ever-green tree, of rapid growth, native of the northern parts of India, growing both in Nepaul and Kumaon. It is probably confined to the hot valleys of those regions, for it has been

found incapable of supporting the climate of England.—*Eng. Cyc.*

(45) ACER STERCULIACEUM (Wallich), the SHADY MAPLE, is a large tree, with a trunk often three feet in diameter; found in Nepaul. —*Eng. Cyc.*

(46) ACER VILLOSUM (Wallich), the SHAGGY MAPLE, is a very large tree, found on the Himalaya Mountains, approaching the limits of perpetual snow, in Sirmoor and Kumaon.—*Eng. Cyc.*

(47) ACETIC ACID, PYROLIGNEOUS ACID.
Acidum Aceticum. LAT.

A well-known acid, obtained by the fermentation of saccharine matter, and the distillation of wood. It is employed in the preparation of the acetate of lead, in many of the pharmaceutical compounds, and also as an antiseptic. Acetic acid is important in a manufacturing point of view from its being the sour principle of vinegar. This acid occurs ready formed in some plants, and is produced during the spontaneous fermentation of many vegetable and animal juices. All liquids containing alcohol are capable of passing into the state of vinegar; and hence the manufacturers find it convenient to employ those liquors, such as wine, beer, toddy, &c., in which the vinous fermentation is complete. When these liquids are exposed to the atmosphere, at a certain temperature, a new chemical change is induced, whereby oxygen is absorbed, and the alcohol gradually passes into acetic acid.—*Tomlinson: Faulkner.* Dr. O'Shaughnessy discovered that much pyroligneous acid passes over along with other gases, in preparing the charcoal for the Bengapore powder works. In Germany a strong acetic acid is obtained cheaply and rapidly by causing a mixture of one part of spirit, four water, and about 1000th part of honey or yeast to filter into a cask containing wood shavings, and provided with holes to secure a free circulation of air. A very large surface being thus exposed the alcohol is rapidly converted into acetic acid. The fluid drops from the cask into the receiver and should be repassed over the shavings four times. The action is most effective when the temperature ranges from 75° to 100°. This is a process well calculated to succeed in India. Teak shavings well boiled in water and subsequently steeped in good vinegar should be employed. The casks should be provided with a perforated tray at top to receive the mixture, the perforations being about the size of a quill, and furnished with cotton wicks to moderate the flow of the liquid. The tray should also have four air-holes an inch in diameter, with glass tubes to permit of the circulation of air.—*Beng. Phar. p.* 233.

(48) ACHIMENES. GESNERACEÆ.

Very ornamental flowering plants, of easy culture; the scaly tuberous roots, by which they are propagated, must be carefully preserved during the dry weather, by occasionally moistening the earth in which they are kept, and after the commencement of the rains, the imbricated buds, which they produce under ground, may be divided and planted out.—*Riddell.*

(49) ACHRAS SAPOTA.
Seemy Eloopie Marum, TAM.

A valuable fruit tree, the fruit of which is known as the Sapodilla plum; wood hard and close grained. The seeds are aperient and diuretic; in over doses they are dangerous. The bark is said to be a good substitute for Cinchona. The *Tamil* name of this tree is liable to be confounded with Mimusops and Bassia. It is a native of South America; and, in India, only grown as a fruit tree. It has been introduced into the Dekhan from Goa. The fruit is generally brought to Bombay for sale in December, from Goa.—*Jaffrey, Riddell.*

(50) ACHYRANTHES ASPERA, *(Linn.)* Nat. Ord. AMARANTACEÆ. PENTANDRIA MONOGYNIA. *Sex: Syst:*

Nahi-ooroovie, TAM.	Agarch, DUK.
Cadelari MAL.	Lal-chirchiri, HIND.
Outeraynie, TEL.	Upanga, BENG.

A herb, about 3 feet high. Very common in Travancore, Coromandel and Bengal. In some parts of India, the natives use the root as a tooth brush. The seeds are given in hydrophobia, and in cases of snake-bites, as well as in ophthalmia, and cutaneous diseases. The flowering spikes, rubbed with a little sugar are made into pills, and also given internally, in hydrophobia. The leaves taken fresh and rubbed to a pulp are considered a good remedy applied externally to the stings of scorpions. The ashes of the burnt plant mixed with conjee is a native remedy in dropsical cases. The *A. fruticosa* is also given in cases of dropsy. Mr. Jaffrey mentions that, A. aspera, although seldom eaten alone, is in general use in what is called by the natives "calavay-keeray," mixed greens.—*Useful plants. Honigberger. Jaffrey.*

(51) ACHYRANTHES LANATA. (Ainslie, vol. ii. p. 393.) *Vern.* Khul ka jur, *Duk.* Astma bayda, *Sans.* Apanga, *Beng. Syn.* Illecebrum lanatum, Roxb. ii. 504. The root is deemed to be demulcent, and is prescribed in strangury. It is quite common in Colombo, and called Pot kudapala.—*O'Shaughnessy page* 354.—Wight in his Icones, figures. A alternifolia, 732: aspera, 1777: bidentata, 1779: brachiata, 1776: diandra, 722: ferruginea, 721: fruticosa, 1778: lanata, 723: lappacea, 731: Monsoniana, 725: muricata, 732: orbiculata, 1783: prostrata, 733: rubrofusca, 1778: scandens, 724: sericea, 726: triandra, 727.

(52) ACIDS. Tezab, HIND: PERS. Acidum. LAT.

Acids are distinguished by the following general properties:—1. Their taste is for the most part sour; and the stronger kinds are acrid and corrosive. 2. They generally combine with water in every proportion, with a condensation of volume and evolution of heat. 3. With a few exceptions they are volatilized or decomposed at a moderate heat. 4. They usually change the purple colours of vegetables to a bright red. 5.

They unite in definite proportions with the alkalies, earths, and metallic oxides, and form the important class of compounds, called Salts. Acids form a very numerous and important class of bodies in chemistry and in many of those arts and manufactures in which chemical processes are concerned. Perhaps the most important acid, in a manufacturing point of view, is the SULPHURIC, NITRIC, HYDROCHLORIC, ACETIC, CARBONIC, TARTARIC, CITRIC, OXALIC, ARSENIOUS, and other acids are also important objects of commerce. Some acids are gaseous, others fluid, and others solid. Some cannot exist, except in combination with water or with a base, such as acetic: others, as anhydrous sulphuric acid, exist without either. Most of the acids are colourless, but chromic is red: Some are inodorous, as sulphuric; others pungent as hydrochloric: Some are comparatively fixed, as the phosphoric; others can be converted into vapour at a moderate heat, as sulphuric; others are volatile at all temperatures, as the hydrochloric.—*Tomlinson. Faulkner.*

(53) ACKER WOOD, a fancy wood of a cinnamon colour.—*Faulkner.*

(54) ACONITUM, a genus of plants belonging to the natural order *Ranunculaceæ*. From very early times it has borne the same name, and has been known for the dangerous properties of many of its species. They are all hardy herbaceous plants, many of them of great beauty; and are so easily cultivated, that one of them, *A. Napellus*, is found in every cottager's garden in England. The English call them Wolf's Bane. Poisonous properties are probably found in all the species of the genus. *A. cammarum*, *A. lycoctonum*, and *A. anthora* are certainly dangerous. None of them, however, not *A. Napellus* itself, can be compared for fatal energy with the dreadful "Bikh" or "Bish" of Nepaul, the *Aconitum ferox*, which seems to possess the concentrated powers of all the European species.—*Eng. Cyc.*

(55) ACONITUM FEROX *(Wall.)* Nat. Ord. RANUNCULACEÆ. TRIGYNIA POLYANDRIA. *Sex: Syst:* (*Vern.* Bish. Meetha Teetia. Metha zuher. Ati Singeca Bish, Bishnak) Off. The *root*. Mahoor. HIND. A native of the Himalayan mountains, Sirmoor, Kumaon, and Nipal, and one of the most celebrated articles in Indian medicine and toxicology. The plant was first identified and described by Dr Wallich in his Plantæ Asiaticæ Rariores. This plant is found at high elevations sometimes at 10,000 feet above the sea, and Dr. Wight asserts, that wherever within the tropics we meet herbaceous forms of Ranunculaceæ, we may feel assured of having attained an elevation sufficient to place us beyond the influence of jungle fever. The root of this species of Aconite is highly poisonous, equally fatal taken internally or applied to wounds, but the effects of the aconite are witnessed in a concentrated state when the extract is introduced into a wound. Mr. Pereira, in some experiments made some years ago, found that one grain of the spirituous extract introduced into the peritoneal sac of a rabbit killed it in 9½ minutes. A preparation of the root is much used in all the hilly districts in Northern India to poison arrows for the destruction of wild beasts. We seldom however obtain the root sufficiently fresh in the plains to produce such effects as would explain its alleged utility for this purpose. It has been used on several occasions to poison wells and tanks, and doubtless might be made a formidable means of defence against the invasion of the territories in which it abounds. The Goorkhas say that they could so infect all the waters with the dreadful root that no enemy could advance into their mountain fastnesses. The tigers are destroyed by the poisoned arrows being shot from bows fixed near the tracks leading to their watering places. A tiger shot from a bow in Assam was found dead at only sixty yards from the spot, so soon did the poison take effect. The roots of the Assam variety of Aconitum ferox, are sold in small wicker baskets, small, black, and very fibrous. Those of the Nipal variety are about the length of the thumb, tapering to a point, black and wrinkled; fracture white, in best specimens, resinous and transparent. The natives of India think that its effluvia will even poison the air where the plant grows. In medicine the Bish is chiefly employed by the natives in the treatment of leprosy, fever, cholera, and rheumatism. In the Taleef-i-Shireef it is directed never to be given alone, but, mixed with several other drugs: it is recommended in a variety of diseases, as cholera, intermittent fevers, tooth-ache, snake-bites, and especially in rheumatism, as an external application. In Europe the wolf's bane or monk's hood (A. Napellus) has long been deemed efficient in many painful and spasmodic affections. The extract has been generally employed, commencing with half of a grain repeated thrice daily, and gradually increased until a tingling sensation of the affected part is produced. From three to five grains daily have thus been taken not only with impunity, but with the effect of checking or even removing many forms of nervous disease.—*O'Shaughnessy page* 166. *Useful Plants. Honigberger.* ACONITINA or bikya is a formidable poison, 1-10th of a grain killed a goat in one of Dr. O'Shaughnessy's experiments in 12 minutes. The animal evinced severe distress and died in convulsions. The pupils were widely dilated. It is not given internally, but is used as an ointment, one grain being mixed with a drachm of lard. It is an invaluable local application in many forms of neuralgia, especially in tic douloureux. It almost immediately occasions a tingling sensation in the part, then numbness, and relief of the pain.—*Ben. Phar. page* 265. An Extract of Aconite, was prepared from the

A. ferox by Dr. O'Shaughnessy. One-tenth to quarter of a grain was to be given in pills, with crumbs of bread, thrice daily, in chronic rheumatism, neuralgia, and tic-doloreux. It is, however, a dangerous internal remedy, and not so manageable as the tincture. Externally one drachm of the extract is used in an ointment with an ounce of lard as an application in tic doloreux, sciatica, &c. This was intended to be a substitute for the London and Edinburgh extracts, which are preparations from the expressed juice of the leaves of the aconitum napellus.—*Beng. Phar. page* 286.

(56) ACONITUM HETEROPHYLLUM. Nat. Ord. RANUNCULACEÆ. TRIGYNIA POLYANDRIA. *Sex: Syst:* Atees, HIND.

The root of this species of Aconite, which is known by the name of Atees in northern India, has long been celebrated in Indian Materia Medica as a tonic and aphrodisiac medicine. The plant was first described and identified by Dr. Wallich (see Plant: Asiat: Rariores), and has received additional notice from Prof. Royle. It occurs in abundance on the lofty mountains of Choor Shalma and Kedarnath, and varies greatly in the size and form of its leaves, from which circumstance it derives its specific name. The root is composed of two oblong tubera, of light ash colour externally, white internally, and of pure bitter taste. Under the name of *atees*, however, and very like the true root, there is commonly sold in the bazars of Bengal an insipid and totally inert substance, which O'Shaughnessy believes to be the dried tubera of the Soota mooli, or *Asparagus sarmentosus*. The true bitter atees is devoid of any astringency, yields to water 18 per cent, to alcohol 32. In any trial of this medicine prescriptions should invariably give the vernacular name, to prevent confusion with the formidable aconite of the preceding article. Honigberger mentions that the roots of Acon. heterophyllum, as found in the Himalayahs, besides being considered by the Hakeems to be tonic and aphrodisiac, are given also in pectoral affections, coughs, &c.—*Useful Plants. Honigberger. O'Shaughnessy p.* 166-8.

(57) ACORNS.

Glands; FR.	Glandes; LAT.
Eicheln, Eckern; GER.	Schedudii; RUS.
Ghiande; IT.	Bellotas; SP.

Acorns are the seed or fruit of the oak. Their taste is astringent and bitter. In England they are but rarely used, except for feeding hogs and poultry. Several species of oak are indigenous in the Tenasserim Provinces, and on the hills of India.—*Mason. Faulkner.*

(58) ACORUS CALAMUS *(Linn.)* Nat. Ord. ACORACEÆ. HEXANDRIA MONOGYNIA. *Sex: Syst:* Sweet flag. Ακορον Diosc.

Sweet-flag, ENG.	Vyamboo, or Vashampoo or Wussumboo, MAL.
Vassamboo, TAM.	Shwet-buch, BENG.
Vudya, TEL.	Buch, DUK.

Acorus Calamus, Sweet flag, a native of Ampoyna, Ceylon, Nipal, Khassia Hills, Malabar, Bourbon, and Burmah, grows in damp marshy places. It yields the calamus aromaticus of the shops. When dry it occurs in the shops in longitudinal pieces, wrinkled and marked with projecting points. The whole plant is aromatic, but the root alone preserves the flavour in drying. Taste rather bitter, but stimulant and spicy. It is a favorite medicine among the Hindoos as a stimulant in flatulency and similar states. An aromatic bitter principle exists in the rhizomes of this plant; for which reason they are regarded as useful additions to tonic and purgative medicines, being much given to children in cases of dyspepsia, especially when attended with looseness of bowels. Beneficially employed also in chronic catarrh and asthmatic complaints. The leaves of the American species of Acorus are said to be noxious to insects and are never eaten by cattle. They are used for tanning leather, and perfuming various substances. Pereira has remarked that the rhizomes might be easily substituted for more expensive spices or aromatics. In Constantinople they are made into a confection, which is considered a good stomachic, and is eaten freely during the prevalence of epidemic disease; they are supposed moreover to be an antidote for several poisons. The leaves contain an essential oil to which they owe their fragrance, and which in England is used by the perfumers mixed with the farina of the rhizomes in the manufacture of hair powders. As a tonic in intermittent fevers, the rhizome has been successfully given when bark has failed. It is of a pale brown colour, with whitish scars on the lower side; in taste it is pungent, and slightly bitter. Rheede states that on the Malabar Coast, a bath made of the infusion of the root is considered an efficacious remedy for epilepsy in children. The sweet cane, or sweet flag, is cultivated by the Burmese to a small extent for its medicinal properties.—*O'Shaughnessy. Useful Plants. Mason.*

(59) ACORUS VERUS differs much from A. calamus, and has been attributed erroneously to the Gentiana Chirayta. The *Calamus aromaticus* of the ancients is referred by Royle to the *Andropogon Calamus aromaticus.—O'Shaughnessy, p.* 626.

(60) ACTEA SPICATA, Baneberry. A native of the Caucasus and Siberia. Roots astringent; the whole plant acrid and poisonous.

(61) ACTEA ACUMINATA, (Wall.) is found on the Choor and Acharanda mountains.—*O'Shaughnessy, page* 170.

(62) ADAMANTINE SPAR. This mineral is now more commonly denominated *Corundum* or *Corund* by mineralogists, the name given to it in India, from which country it was first brought to Europe. The first specimens of it were sent by Dr. Anderson, of Madras, to Mr. Berry, a lapidary in Edinburgh, as the substance used in India to polish masses of crystal and all other precio

stones, except the diamond. It was examined by Dr. Black, who ascertained its peculiar nature, and from its great hardness he called it Adamantine Spar. With the exception of the diamond, it is the hardest substance known. It contains about 90 per cent. of alumine, a little iron, and a little silica, is usually of a pale grey or greenish colour, but is also found of various tints of red and brown. It is usually met with in rough ill-defined crystals, in granite, and sometimes in primary limestone, and is found in China, many parts of India, and occasionally in different parts of Europe. *See* CORUNDUM. *Emery*, the well-known substance used in the cutting and polishing of glass, in polishing steel, making razor-straps, and similar purposes in the arts, is a granular variety of Corundum, usually very much mixed with iron ore. It is chiefly imported from the Isle of Naxos, in the Grecian Archipelago, but is also found in Saxony. Small portions, mere mineral specimens, have been found in Southern India. The *Sapphire* is a remarkable instance how the mysterious chemistry of nature in the mineral kingdom produces from the same elements substances the most different in external form; this beautiful precious stone yielded by the analysis of Chenevix 94 per cent. of alumine; and Tennant found in emery, when freed from its admixture of iron, 92 per cent. of the same earth. The sapphire is, after the diamond, the most valuable of gems; it is usually dark blue, but also occasionally colourless, and the precious stones called by lapidaries *Oriental Ruby*, *Oriental Topaz*, *Oriental Amethyst*, and *Oriental Emerald*, are red, yellow, violet, and green Sapphires, distinguishable from the other gems of the same name which have not the prefix Oriental, by their greatly superior hardness and greater specific gravity. Sapphires are found in gravel and sand in the island of Ceylon and in Pegu, but they have never been seen in a matrix. They are also occasionally found in gravel in different parts of Europe, and they have been met with of a clear blue colour and crystallised, in the lava of Neider Mendig, near Andernach on the Rhine.—*Eng. Cyc.*

(63) ADANSONIA DIGITATA: BAOBAB; Monkey bread: Ethiopian sour gourd; Lalo plant. Papara Poolia Marm. TAM. Excepting, perhaps, the Locust tree, it is the largest known tree, with the trunk of an immense size close to the ground, sometimes as much as thirty feet, but fast tapering and of little height in proportion. It is a native of the Western Coast of Africa, about Senegal and Sierra Leone, but it has long been naturalized in India, and from its many uses, is deserving of a place among the more useful plants of this country. The tree lives to a great age, whence it has been called "arbre de mille ans"; and Humboldt speaks of it as "the oldest organic monument of our planet." The foliage is sometimes abundant and the whole forms a nearly hemispherical mass of verdure from 140 to 150 feet in diameter, and sixty or seventy feet high. The pulp of the fruit is slightly acid and agreeable, and by the people of Africa is frequently eaten, while the juice expressed from it, mixed with sugar, constitutes a drink which is valued as a specific in putrid and pestilential fevers. The trunk of the tree is subject to a particular disease, owing to the attacks of a species of fungus which vegetates in the woody part, and which, without changing its colour or appearance, destroys life and renders the part so attacked as soft as the pith of trees in general. Such trunks are hollowed by the Africans into chambers, and within them are suspended the dead bodies of malefactors. There they become mummies, perfectly dry and well preserved, and are known by the name of Guiriots. The fruit contains several black seeds; in taste somewhat acid, but making a cooling and refreshing drink, especially in fevers. In Cairo, the pulp dried and powdered is administered medicinally in dysentery and diarrhœa. In Senegal, by the negroes the fruit is considered a preservative against the epidemic fevers of the country. The bruised leaves in a dry state form a substance called "lalo," which the Africans mix with their food and imagine to be useful in checking profuse perspiration. In Gaudaloupe the planters use the bark and leaves as a febrifuge. The oldest description of these trees is that of Aloysius Cadamosto, a Venetian, who, in 1454, found one growing at the mouth of the Senegal river, whose trunk in circumference was 112 feet. Adanson himself saw them of 29 feet in diameter and 70 feet in height, and remarks that other travellers had found trunks of 32 feet diameter. If the age of these trees can be correctly estimated by the annular rings visible on a horizontal section of the trunk, the antiquity assigned to trees of the above diameters must be, according to the calculations of Adanson and Perottet, upwards of 5,000 years. As a timber tree, it is useless, the wood being soft and spongy. Dr. Hooker says, "the tree is emollient and mucilaginous in all its parts." Among other uses in Africa, the leaves are made into fomentations and poultices for rheumatic affections of the limbs and irritable inflammatory ulcers. Its leaves are used for leaven; its bark furnishes indestructable cordage, and a coarse thread used for cloth and ropes. Ropes made from the bark are said to be very strong, and there is in Bengal a saying, "as secure as an elephant bound with a Baobab rope. On the sea coast the fishermen use the fruit as floats for their nets.—*Useful Plants. Riddell. Eng. Cyc.*

(64) ADDA, the Arabic name of a small species of lizard (*Scincus officinalis*) celebrated by the Eastern physicians on account of its pretended efficacy in the cure of elephantiasis, leprosy, and other cutaneous diseases, to which the Arabs and

inhabitants of Egypt are peculiarly subject; and of which they are as afraid as of the plague itself.—*Eng. Cyc.*

(65) ADENANTHERA PAVONINA.

Ani Gundemunie, MARM:	Ywaigyee, BURM.
Munjadi, TAM.	Manjatie, MAL.
Manseni kotta, TEL.	Ranjuna, HIND.
Rukta-chundun, BENG.	

This is a considerably large, handsome tree, called in England Red Sandal Wood, and to be met with in most of the forests of India. In Burmah it is not very plentiful, being widely dispersed, but found in sufficient quantity in the Rangoon, Pegu and Tounghoo districts. It is called *Rukta chundun* in the bazars of Upper India, a name which Dr. Royle observes is also given to the wood of *Pterocarpus santalinus*. The wood hard, and durable; red, yielding a dye and adapted to cabinet making. The seeds, are of a shining scarlet colour, with a circular streak in their centre, and used as weights by jewellers, and as ornaments in the form of beads, bracelets &c. Books represent these as usually weighing four grains, and they are in common use by the Burmese, as equivalent to that weight. The seeds, however, have to be selected for the purpose; many of them not weighing more than two or three grains each. A cement is made by beating them up with borax and water. The pulp of the seeds mixed with honey, is applied externally to hasten suppuration in boils and abscesses. The natives in Travancore have an idea that taken internally they are poisonous, especially when in a powdered state.—*McClelland; Mason; Useful Plants: Juries Reports, Madras Exhibition.*

(66) ADEPS MYRISTICÆ, a concrete oil obtained from nutmegs, by expression: sometimes erroneously called oil of Mace.—*Simmonds.*

(67) ADHATODA VASICA (*Nees.*)

Adatodey, TAM.	Bakus, BENG.
Adasara, TEL.	Uroos or Utarosha, SANS.
Malabar Nut, ENG.	Justicia Adatoda, Linn.

A shrub 8-10 feet: common in the Peninsula of India, Nepaul. All parts of the plant are bitterish and slightly aromatic, and supposed to be antispasmodic; and are given in cases of asthma and intermittent fever. The wood is soft, and much esteemed for making charcoal for gunpowder. *O'Sh. p.* 483. The leaves given in conjunction with those of the Solanum trilobatum (Todoovallay, TAM.) and S. Jacquini (Cundunghatrie, TAM.) are employed by the Vytians internally in decoction as anthelmintic.—*Ainsl. Roxb. &c. quoted in Useful Plants.* Wight also figures, A. Neilgherrica; and A. Wynaudensis.

(68) ADONIS. *Ranunculaceæ.* A flowering plant which derives its name from the blood red colour of most of the species, the plants thrive in the Dekhan, in any good soil, may be raised by seed, or by dividing the root, and sown or planted after the monsoon.—*Riddell.*

(69) ÆCEOLADES AMPULLACEA, SYN. SACCOLABIUM RUBRUM, AERIDES AMPULLACEUM, red saccolabium, with rosy flowers, is very handsome and quite abundant, in the Tenasserim Provinces. Lindley says it can scarcely be distinguished from *S. ampullaceum* of Wallich's catalogue. Wight gives a figure, 1683, of *Æ.* tenera.—*Wight. Mason.*

(70) ÆGICERAS FRAGRANS. A large shrub in the Tenasserim Provinces; when in bloom it is covered with small white flowers, which seem to have great attractions for the fire-flies. In moving up the streams near the sea-board on a dark night, these trees are often seen illumined with myriads of waving brightening wings, and making them look in the deep gloom, like superb candelabra hung with living lamps.—*Mason.*

(71) ÆGLE MARMALOS.

Vilva-marum, TAM.	Bel, BENG.
Coovalum, MAL.	Tanghul, MALAY.
Maradoo, TEL.	Ouk-sheet, BURM.

The Bel Fruit, or Bengal Quince, or Smaller Wood-Apple. A large thorny tree, with ternate leaves, native of all parts of the East Indies, which flowers during the hot season, and its large spheroidal fruit ripens after the rains. It is delicious to the taste and very fragrant. It has lately been brought into repute, when fresh and in conserve, as a remedy in dysentery: it had long been used in diarrhœa, and its aperient and detersive qualities and its efficacy in removing habitual costiveness, have been proved by constant experience. The mucus of the seeds is for some purposes a very good cement. The leaves abound in a volatile, fragrant, bitter, exciting oil. From the flowers of the Bengal quince a fragrant liquid is distilled in Ceylon, known as MARMALA WATER, which is much used as a perfume for sprinkling by the Natives. The fruit is smooth, resembling an orange, with a yellow hard rind, which is astringent and used in dyeing yellow. The roots, bark and leaves are reckoned refrigerant in Malabar. The bark of the former especially is given in compound decoctions in intermittent fevers, and the latter made into poultices in ophthalmia. When dried before it is ripe, the fruit is used in decoction in diarrhœa and dysentery; and when ripe and mixed with juice of tamarinds, forms an agreeable drink. The wood is light-coloured, variegated with veins, but said to be of no great value, which seems unlikely to be correct. *Ægle marmalos and Feronia elephanta*, the former the large, and the latter the small wood-apple, are found about towns and villages throughout the Prome district, and also about Tounghoo, more especially on the Shan side of the river, where they may be had in great quantity from the end of February to the month of July. Lest their resemblance to the fruit of *Nux-vomica* might give rise to accidents, the strong aromatic smell of the wood-apples, like that of all other fruit of the orange family, to which they belong, is the best test by which they may be distinguished from the *Nux-vomica* fruit, which is devoid of aroma.—*McClelland. Useful Plants. Mason, Riddell, Waring, Wight.*

and in Great Britain *German Tinder*. It is found in all the Indian bazars.—*Mason. Faulkner.*

(86) AGARICUS is the generic name by which all the species of mushrooms properly so called are collectively known. In France, in Italy, and especially in Russia, a useful aliment is afforded by a great variety of species which, although very common in Britain, it would be extremely dangerous to eat; and, on the other hand, even the dangerous *A. muscarius* is a species of food in Kamtschatka. The following characters will serve to distinguish such Agarics as are poisonous or suspicious:—1. Such as have a cap very thin in proportion to the gills. 2. Such as have the stalk growing from one side of the cap. 3. Those in which the gills are all of equal length. 4. Such as have a milky juice. 5. Such as deliquesce, that is, run speedily into a dark watery liquid. 6. And lastly, every one that has the collar that surrounds the stalk filamentous, or resembling a spider's web.—*Eng. Cyc.*

(87) AGATE, one of the inferior gems, and classed amongst the Earthy Minerals by Phillips, is found in great variety and abundance in many parts of India. Some of the agates and other silicious minerals in the amygdaloid rocks on the banks of the Seena river, between Sholapoor and Ahmednuggur, are of great size and in profusion, but the most beautiful are brought from Cambay. When agates are cut open, they display a singular variety of forms, in some cases resembling animals and plants, in others, zigzag lines, like the plan of a modern fortification from which this variety gets the name of *Fortification agate.* These lines are the edges of successive layers or deposits of the mineral, during the process of its formation. As the internal surfaces are capable of receiving a high degree of polish, Agates are much valued as ornamental stones, and are also manufactured into cups, rings, seals, handles for knives and forks, sword hilts, beads, smelling bottles, snuff boxes, &c. The "Burnishers" of the Book-binder and other mechanics, are made of agates. Agate is one of the numerous forms in which silica is arranged, and contains 98 per cent. of that mineral. Agate and other varieties of silicious stones are known in commerce, as Cambay stones, Godavery pebbles;—1. *Carnelian*, from carnis flesh, is one of the most common of these minerals, those of a flesh colour being most frequent; there are however various shades of red and yellow, but the deep clear red is the rarest and most valuable. Japan furnishes the chief supply of carnelians, but the best varieties are from Cambay, and exported from Bombay. Many antique gems are in carnelian, and the stone is much used for seals and beads. 2. *Calcedony*, from Chalcedon in Bithynia, opposite Constantinople, is a gem of a uniform milky white, or pale yellow colour: it often has a wavy structure; is found abundantly all through the great trap formation of the Dekhan, sometimes in large masses, and cups and vessels are formed from it.

(88) AGATHÆA SPATULATA. *Compositæ.* A flowering plant cultivated by Europeans in India, named from "Agathos" excellent, on account of its beautiful blue flowers. They are grown in light rich soil, and require only ordinary attention in watering.—*Riddell.*

(89) AGATHIS. The generic name given by botanists to the trees, known in common language by the name of Dammar and Kawrie Pines. These plants belong to the natural order *Coniferæ*, from all other species of which they are known, firstly, by their broad, lance-shaped, leathery leaves, the veins in which are numerous and nearly parallel, diverging a little at the base, and converging at the apex; and, secondly, by their seeds having a wing on one side instead of proceeding from the end.

(90) AGATHIS AUSTRALIS. *Coniferæ.*—The New Zealand pine, lately introduced from the Cape into the Horticultural Society's Garden Bombay: the Kawrie Pine grows, native, in New Zealand, in the forests of which it attains a considerable height, with a straight clean stem, which from its lightness and toughness, has been found well calculated for the masts of ships. It is distinguished from the Dammar Pine by its narrower and more acute leaves, and by its more rapid mode of growth.—*Eng. Cyc.*

(91) AGATHIS LORANTHIFOLIA The *Dammar Pine* or the *Pinus Dammara* of Linnæus, is a large tree found on the very summits of the mountains of Amboyna, Ternate, and in many of the Molucca Islands. When young it has something of the aspect of a young cedar, the wood of which it is said to resemble. In several of the European countries, it is occasionally cultivated in the hot-houses of curious persons; but is of little value except for its resin, which, when pure, is white, clear, and brittle as glass, but in time becomes amber-coloured. Its timber is represented to be light and of inferior quality, wholly unfit for any situation exposed to wet, but answering tolerably well for in-door purposes. Griffith mentions *Agathis loranthiflora*, as a member of the Tenasserim Flora, and Mr. Mason has seen the young plants of the tree to which he must refer. The leaf is precisely that of the dammer pine, but the tree is not known to yield any dammar. The wood is white, rather light, and bears considerable resemblance to some kinds of pine. It is used by native carpenters for various purposes, and the Burmese have a superstition that the beams of balances of their scales ought to be formed of this wood. They call it *theet-men*, the tree-governor.—*Mason. Riddell. Eng. Cyc.*

(92) AGATHOTES CHIRAYTA.

Chirayit Gentian, Eng.	Chiraeta, Duk. Hind. and Beng.
Sheelassetto, Tel.	Chirataka, Sans.
Kiriyatha, Mal.	
Shayraet, Tam.	

Syn. Gentiana Chirayta, Flem. As. Res. xi. p.

167, Roxb. Fl. Ind. ii. p. 71. Wall. Pl. Rar. 3 p. 33. t. 252. Nepal and the North of India, Morung Hills. This is perhaps one of the most esteemed of Indian medicinal plants. It is gathered when the flowers begin to decay, and is dried for use. All parts are extremely bitter, and are identical in composition with the common gentian, containing, according to Battley, malic acid, bitter extractive, resinous matter, gum, and salts, (*Royle*, p. 277). It is highly esteemed as a tonic and febrifuge all over India. The cold infusion is the form best suited for its use.—*O'Shaughnessy page* 459. Its bitter properties are in high estimation with European practitioners in India, who use it instead of gentian, for which it is a perfect substitute. The root is the bitterest part of the plant, and this bitter principle is easily imparted to water or alcohol. According to Mr. Battley's analysis of its chemical properties, "it contains a free acid, a bitter resinous extractive, with much gum, and chlorates, with sulphates, of potass and lime. No alkaloid has been detected in it; what is therefore sold as a sulphate of chiraytine is well known to be only the disulphate of quinia." It is best recommended in preparation as an infusion or watery extract, or a tincture, but not in decoction; even an infusion made with warm water is apt to produce headache. To form a cold infusion, a pint of water should not stand more than twenty minutes on half an ounce of the bruised plant. The following remarks are extracted from a modern writer on the subject of this useful medicine:—"Chirayta possesses the general properties of bitter tonics, but has at the same time some peculiar to itself, which fit it well for certain forms and complications of disease. Unlike most other tonics, it does not constipate the bowels, but tends to produce a regular action of the alimentary canal, even in those subject to habitual constipation. During its use the bile becomes more abundant and healthy in character. The tendency to excess of acidity in the stomach, with disengagement of flatus, is much restrained by its use. These qualities fit it in a most peculiar degree for the kind of indigestion which occurs in gouty persons. It may, when necessary, be associated with alkaline preparations or with acids; the latter are generally preferable. The same remark applies to its employment in the treatment of scrofula. As a remedy against the languor and debility which affect many persons in summer and autumn, nothing is equal to the cold infusion of this plant. It may be taken twice or even more frequently daily, for a considerable time; then discontinued, and afterwards resumed. Children take it more readily than most other bitters. It is found to be a very efficacious remedy in India against intermittents, particularly when associated with Guilandina Bonduc or Caranga nuts. The debility which is apt to end in dropsy is often speedily removed by infusion of Chirayta, to which is added the tincture formed of it with orange-peel and cardamoms. Its efficacy in worm-cases has procured for it the name of worm-seed plant. The extract is given with great benefit in some forms of diarrhæa and dysentery, particularly if combined with ipecacuan, the emetic tendency of which it very markedly controls."—In Dr. Fleming's Notes on 'Indian Medicinal Plants,' as quoted by Wallich, it is stated, "the dried herb is to be met with in every bazar of Hindustan, being a medicine in the highest repute with both the Hindu and European practitioners. It possesses all the stomachic, tonic, febrifuge, and antarthritic virtues which are ascribed to the Gentiana lutea, and in a greater degree than they are generally found in that root in the state in which it comes to us from Europe. It may therefore on every occasion be advantageously substituted for it. The efficacy of the Chirayta when combined with the Caranga nut in curing intermittents has been already mentioned. For restoring the tone and activity of the moving fibre in general debility, and in that kind of cachexy which is liable to terminate in dropsy, the Chirayta will be found one of the most useful and effectual remedies which we can employ. The parts of the plant that are used in medicine are the dried stalks with pieces of root adhering to them. A decoction of these, or which is better, an infusion of them in hot water, is the form usually administered." *Don in Lon. and Edin. Phil. Mag. Wallich Plantæ As. Rarior. &c. quoted in Useful Plants. See "Chiretta."*

(93) AGATI GRANDIFLORA.

Agathee, TAM.	Agati, MAL.
Agathi or Anisay, or Agisi or Avisi, TEL.	Buka, BENG. SANS.

This tree is commonly met with in gardens throughout the Peninsula, and easily recognized by its large bright scarlet flowers. The wood is soft and of no use, but the bark is a powerful bitter tonic; the leaves are aperient: and Rheede says, an infusion of them is given on the Malabar Coast in cases of catarrh, and are said to be aperient: the *legumes* are from twelve to eighteen inches long. There are several species of Agati, with a variety of variegated and red flowers; and the leaves and flowers of the white variety, known in Tamil as Agati-keera Poo, are used in soups, curries, and as greens; the pods are sometimes eaten, though seldom. This tree is much cultivated in Betel gardens, for shade, and as a trellis for the support and shelter of the Piper Betel. The legumes of the agati are a favorite vegetable with the natives of Burmah also, and the trees may be seen in perhaps every town and village in the Tenasserim Provinces.—*Jaffrey. Riddell. Mason. Useful Plants. O'Sh.*

(94) AGAVE AMERICANA.

American Aloe, ENG.	Rakus, HIND.
Anai Kuttalay, TAM.	

The common American Aloe, although not

indigenous, is now common in every part of India. It is a native of America within the tropics from the plains to elevations of 10,000 feet, and is now naturalized in the South of Europe. It is much valued as a hedge plant, but its chief importance arises from the excellent fibres which it yields. Not only are the latter procured from the leaves, but a ligneous fibre is contained in the root, familiarly known as the Pita thread. This is much used in the Madras Presidency. It is manufactured at a very slight expense, the usual mode of preparation being usually to cut the leaves and throw them into ponds for three or more days, when they are taken out, macerated, and scraped with a bluntish instrument; But the best thread is obtained by crushing the leaves, when fresh, and scraping them. *See Fibres.* It has been found that the leaf fibres are liable to rot owing to a milky viscid juice contained in them. This defect has however been considerably obviated by very hard crushing, or pressure between heavy cylinders which, by getting rid of all the moisture, renders them more pliable for weaving and other purposes. In Calcutta the fibres being submitted to experiments were found equal to the best Russian hemp. They are much used for lashing bales of calico. As log-lines for ships they are found to be very durable and far superior to ropes of hemp. In several experiments that have been made, especially by Drs. Royle and Wight, Aloe fibre rope has been found to be more powerful than either coir, country hemp, or jute. A bundle of the Agave fibre bore 270 lbs., that of Russian hemp only 160 lbs. Dr. Wight found some cord of it bore 362 lbs. In Tinnevelly it sells from 20 to 40 Rupees the candy of 500 lbs.; and at Madras 7 Rs. a maund. In 1853-54 were exported from the Western Coast, 3,65 cwt. valued at 21,506 Rupees. There is no doubt that the Aloe fibres deserve more particular notice as they are admirably suited for cordage, mats, ropes, &c., and might be advantageously used in the manufacture of paper. *See Aloe Fibre.* In Madras the plant is called the Petha-Kalabantha. In Mexico they prepare a fermented liquor from the stem by incision, called Pulque, and from this they distil an ardent spirit. In that country too the dried flowering stems are used as an impenetrable thatch. An extract of the leaves is used to make a lather, like soap, and the leaves, split longitudinally, are employed to sharpen razors on, serving the purpose of a strop, owing to the particles of silica they contain. Lastly, Lindley states that the roots are diuretic and antisyphylitic, and are brought to Europe mixed with Sarsaparilla.—*Penny Cyc. Royle's fibrous plants. Jury Rep. M. E. quoted in U. Plants.*

(95) AGAVE CANTALA. Roxb. Bakkul, also, *Cantala*: also *bans Keora* HIND. *Bamboo pandanus.* Dr. Royle considers the A. vivipera to be closely allied to this species, which he discribes as common in the Bengal Presidency, and growing freely in Malwa, yielding fibres from twenty to thirty inches in length, and on testing their strength Captain Thompson found them quite equal to the best Russian hemp.—*Royle p.* 8.

(96) AGAVE DIACANTHA. "Moogai." This plant is a native of Mexico, and yields fibres. It might be advantageously introduced into India.—*Royle p.* 44.

(97) AGAVE VIRIDIS. A specimen of fibre said to be from the *Agave viridis* was exhibited by the Cuddapah Local Committee at the Madras Exhibition of 1855. It was of fair quality, but it was probably the produce of the A. vivipira.—*Juries' Reports.*

(98) AGAVE VIVIPARA *(Linn.)*

Bastard Aloe, ENG. | Peetha kalabuntha, TEL.
Kathalay, TAM.

This is the most common species in the North-West Provinces. A good fibre, which is long in the staple, is procured from the leaves. The latter are allowed to rot in water for twenty days, are then beat on a plank and again thoroughly washed. A strong and useful cordage is made from them, as well as mats, ropes, &c. In South Arcot, these fibres sell at 30 Rupees the candy. In the Madras Exhibition of 1855, a good specimen of fibre from this plant was contributed by Dr. Kirkpatrick. It was long in the staple, clean and strong, and had been prepared without rotting, by the simple process of beating, scraping and washing. The manufacture of this, and of rope have been introduced as an employment for the Lunatics in the Asylum at Bangalore. The rope finds a ready sale in the bazar, and pays all the expenses of the manufacture, besides providing a few comforts for the industrious inmates.—*Useful Plants. Royle p.* 43; 44; 45. *Juries' Reports.*

(99) AGAVE YUCCAEFOLIA. A plant naturalised in India, capable of yielding fibres.—*Royle p.* 43.

(100) AGERATUM CERULIUM AND A. MEXICANUM, are flowering plants, well worth cultivating for their pretty flowers; propagated from seed and cuttings; will bloom throughout the year, if sheltered from the hot winds; must not be too much shaded; if cultivated in pots, use a sandy soil.—*Jaffrey. Riddell.*

(101) AGLAIA ODORATA. AURANTIACEÆ. —A flowering shrub with ternate and pinnate leaves, and very small yellow flowers in axillary racemes. It produces flowers of an agreeble perfume greatly admired by the Chinese.—*Riddell. Fortune.*

(102) AGLAIA SPECTABILIS. A large tree, met with along the banks of rivers in the Pegu and Tounghoo districts. It affords a light serviceable timber, somewhat stronger than the American Pine, and capable of being wrought with little labour. Wood, red-colored, strong and adapted for house-building.—*McClelland.*

(103) AGRIMONY, AGRIMONIA COMPOSITA (Royle), procurable in Indian bazars but said to be a product of Persia, probably from the Shiraz mountains. Is possibly the "Ghafez" of the Hakeems.—*Honigberger.*

(104) AGRIMONIA EUPATORIA. A native of all parts of Europe. It contains tannic and gallic acid, and a very small quantity of fragrant essential oil, the flavour of which resembles that of tea, for which agrimony is much used as a substitute by the poorer classes in Europe. Agrimonia Nipalensis is very closely allied to this.—*O'Shaughnessy page* 325.

(105) AGYNEIA COCCINEA. The roots of this curious flowered plant are used medicinally by the Karens.—*Mason.* Wight gives a figure, 1893, of A. bacciformis.

(106) AHVI MARAM, Tamul; or "steam-wood," from its emitting steam when the root is cut; is a Malabar tree, growing to about ten inches in diameter, and fifteen feet long: it is of little value, and not very durable; but at times it is used for inferior purposes in the frames of native vessels, in repairs, &c.—*Edye, Malabar and Canara.*

(107) AILANTHUS EXCELSA, XANTHOXYLACEÆ.

Peroo-marum, Tam. | Peru-marum, Mal. | Peddamanie. Tel.

This large tree resembles the ash in its general appearance and attains a large size. By one account the wood is said to be hard, close grained and heavy, fit for gun-stocks. In Bombay it is said to be much used in cabinet-making, but the correctness of this information may be doubted. What has been seen of it shows the wood light and white: it is used for making sword handles, and sheaths for spears also for catamarans. The wood is not durable. The tree flowers in January and February. It is common in the Northern Circars and about Baroach and Baroda.—*Riddell. Juries Reports. Useful plants. Jaffrey. Wight.* Wight gives, 1604, a figure of A. malabarica.

(108) AILANTHUS MALABARICA, *(DC.)*

Peroomarum, Mal. | Peru marum, Tam.

Travancore. Malabar. A large tree similar to the above with very few points of difference in its botanical character. It is common in Travancore, and has rather an ornamental appearance from its dark shining pinnate leaves. The bark has a pleasant and slightly bitter taste, and is given in cases of dyspepsia, and moreover considered a tonic and febrifuge. It yields a fragrant resinous juice known as *Mutlee-pal*, which was first noticed by Buchanan, who found the tree in the Annamullay forests. This reduced to powder mixed with milk and strained is given in small doses in dysentery, and reputed to be an excellent remedy, owing chiefly to the balsamic properties of the resin. The bark triturated with mango and mixed with rice is reckoned useful in cases of ophthalmia. Wight states that "the bark is rough, and very thick, studded with bright garnet looking grains apparently of a resinous nature, nor do they dissolve either in spirit or water.—*Ainslie. Wight. &c. quoted in Useful Plants.*

(109) AIR BLADDER. This is called also the Air Bag, Swim, or Sound. It is a peculiar organ with which the great majority of fishes are provided, and by which they are enabled to adapt the specific gravity of their bodies to the various pressures of the superincumbent water at different depths. It is composed of a lengthened sac, sometimes simple, as in the common perch, sometimes divided into two or more compartments, by a lateral or transverse ligature, as in the trout and salmon, and, at other times furnished with appendices, more or less numerous according to the particular species. In all cases, it is composed of a thick internal coat of a fibrous texture, and of a very thin external coat; the whole being enveloped in the general covering of the intestines. Although it does not appear that the air-bladder is connected with the function of respiration in fishes, it occupies the position, and has the same relations, as the lungs in reptiles. It is in fact, the homologue of these organs. Fishermen are well acquainted with the nature and functions of the air-bladder. They are accustomed to perforate this vessel with a fine needle in cod and other species which require to be brought fresh to market, sometimes from a very great distance. By this operation, the confined air is allowed to escape, and the fish constrained to remain quiet at the bottom of their well-boats, where they live for a very considerable period. The Cod-sounds, brought into Britain in great quantities from Newfoundland, are the salted air-bladders of these fishes. They are also largely imported into England from the East Coast of Scotland. The Iceland fishermen, as well as those of America, prepare isinglass of a very excellent quality from cod-sounds, though they are not acquainted with the method of clarifying it, which the Russians practise in preparing isinglass from the sound of the sturgeon.—*Engl. Cyc. p.* 103. Russian Isinglass is prepared from the sounds of the Sturgeon, *Accipenser sturio*, found in the Caspian and Black Seas and their tributary rivers. In America, from the *Labrus squeteague*, the intestines of the cod, *Morrhua vulgaris*: and in Calcutta, from the sounds of the Polynemus Sela, the *Sulea* of Bengal. *O'Shaughnessy, p.* 685. The sounds of two Madras fish, the *Korwa*, and *Kattali*, Tam., are so employed.

(110) AJMOOD.—Petroselinum Sativum, Parsley.

(111) AJWAIN SEED—*Ptychotis Ajwain.*

Amoos, Arab. | Ajwain, Hind.
Invance, Beng. | Nankhoah, Pers.
Azma, Guz.

The small fruit or seed possesses an aromatic

smell and rather warm pungent taste. The plant is known everywhere in India, and P. Sylvestris, Royle, is the Arab ajwain called by the Persians Nan-khoah, largely used as a carminative and in flatulent colic, and, Honigberger states, in stoppage of urine. It is propagated by seed and grown in square beds; in the Dekhan, the seed is sown in September and October, and sold at five pice the seer, the plant is grown by the Native gardeners for the seed only, which is used in curries.—*Faulkner, Honigberger, Riddell.* Care must be taken not to confound, under the native names, the seeds of the Ptychotis Ajwain with those of the poisonous khorasanee Ajwain, which are the seeds of the Hyoscianus or Henbane. The Ptychotis Ajwain seeds are very small, stalked, conical, pointed, streaked with yellow stripes, and stalks of the seeds of a bright yellow. Henbane seed, is grey, not ribbed or streaked, shape obscurely triangular, and flattened, surface rough and dotted. Other seeds, especially of umbelliferous plants, are sold under both these names.—*O'Shaughnessy.*

(112) AJUGA DEALSINGHI (perhaps A: reptans; A. fruticosa, or A. chamæpytes) from the lower ranges of the Himalayas where it is given in quartain ague. *-Honigberger.*

(113) AJUGA DECUMBENS, Don. Hills of Cashmere, where, from its manifold virtues, it is called jan-i-adm, i. e. the life of man. Given in tormina and inflammation of the gums.—*Honigberger.*

(114) ALABASTER. There are two kinds of white stone to which antiquaries and artists give this name: the one is a carbonate of lime: the other, a sulphate or gypsum. The compact crystalline masses deposited from water holding carbonate of lime in solution, called by mineralogists stalagmite, are often composed of layers having different degrees of translucency. The finest alabasters are from near Volterra in Tuscany. The true Alabaster however is a variety of gypsum or sulphate of lime, and is much employed in the arts for ornamental purposes, as in making vases, small statues &c. It is not known to occur in India, all the so called *Alabaster* images, ornaments &c. of Burmah, being fabricated from stalagmitic carbonate or the granular carbonate of lime. Alabaster is found near Derby, but it is inferior to the beautiful alabaster of Italy, which is semi-transparent when first raised from the quarry: but is subsequently rendered more opaque by being entirely surrounded and covered with cold water which is gradually raised to the boiling point. Alabaster occurs in the tertiary strata of Mont-martre near Paris and in the Tyrolese, Swiss and Italian Alps. It is remarkable for its softness, purity of colour, fragile character, and liability to crack. Once soiled, its purity can never be restored. Articles of delicate workmanship in this material are therefore preserved under glass.—*Mason. Tomlinson.*

(115) ALANGIUM DECAPETALUM.

Alingie-marum, Tam.	Anisarooly Mara, Can.
Angolam, Mal.	Bagh-ankia. Beng.
Akola, Hind.	

A small tree with whitish flowers; the petals vary on the same tree from six or eight to ten. The fruit is astringent, but eaten by the Natives. The wood is said by Roxburgh to be "beautiful," and Wight found it to sustain a weight of 310 lbs. but it wants size; he had never seen a ten inch plank. The roots are aromatic. It grows common in Guzerat, and in rocky places in Malabar, also in Assam. *-Jaffrey. Juries' Reports M. E. Wight. Useful Plants.*

(116) ALANGIUM HEXAPETALUM (*Lam.*)

Woodooga, Tel.	Akola, Hind.

Grows at Allahabad and in Malabar and Burmah. Roots are aromatic and said by the Malays to possess purgative properties. Fruit edible, but not pleasant to the taste. Wood is considered valuable.— *Useful Plants.*

(117) ALAUDINÆ, a sub-family of birds belonging to the order *Passerinæ*, and the family *Conirostres*, is thus characterised by Mr. Swainson: Bill cylindrical; nostrils concealed; wings very long; no spurious quill; the first, second, and third quills longest, and nearly equal: the rest considerably graduated; tips of the lesser quills emarginate; tail forked; head crested. (Sw.) Various species of larks are found in all parts of the globe, and are everywhere distinguished by their vigilance and their singing. They are peculiarly birds of the fields, meadows, and other open places. The conformation of their feet, except in a few instances, such as the woodlark, does not adapt them to perch upon trees. They accordingly always build on the ground, making in general a rather slight though neat nest, and laying about five eggs, usually of a grayish white, with specks of a brown colour. In Europe, they frequently rear two broods of young during the summer. —*Eng. Cyc. p.* 105.

(118) ALBATROSS (*Diomedea*), a genus of web-footed birds, comprising several species - the Albatross of China (*D. fuliginosa*, Latham); the Yellow and Black-beaked Albatross (*D. chlororynchos*, Latham); and the common Albatross (*D. exulans*, Linnæus). The common Albatross is the species which is most frequently met with in the seas of Southern Africa. It is the largest sea-bird known.— *Eng. Cyc. p.* 106.

(119) ALBUMEN OR ALBUMINE, from the Latin *Albumen*, the white of an Egg, is an organic nutritive principle, the chief ingredient in the white of eggs and in the fluid portion of the blood. It also occurs in the sap or juices of many vegetables, in the seeds of the cereal grasses, in many fruits, and barks of trees. The most characteristic property of albumen, connected with commercial purposes, is that of solidifying or co-agulating when exposed to a moderate heat, and this is taken advantage of in all countries to employ both the animal and vegetable product in

the clarification of syrups and other liquids. Albumen, in the form of fluid white of egg, is an effective antidote in poisoning with corrosive sublimate. Lime, baryta and strontia, form insoluble compounds with albumen, which harden on drying, and a lute formed by mixing slacked lime with white of egg and spread on strips of paper or linen, is useful in making tight the joints of chemical apparatus.—*Tomlinson.*

(120) ALCOHOL.

Esprit de Vin, Fr. Weingeist, Ger. | Spirito ardente, Spirito di vino, Aquarzente, It. Arrack, Vern.

Alcohol is the spirituous portion of fermented liquors, sometimes called *ardent* spirit. By carefully distilling fermented liquors, the alcohol, mixed with a portion of water, can be separated; forming a product, the properties of which differ according to the substances from which it is derived. Thus the fermented and distilled juice of the grape yields *brandy*; that of the sugar cane, *rum*; the wort of barley, which is generally malted for the purpose, yields *whiskey* and *spirits of wine*, and rice, produces *arrack*. Alcohol is a limpid colourless liquid, of an agreeable odour and strong pungent taste. It is extremely inflammable, burning with a pale, bluish flame, the heat of which is intense, and has no smoky deposit, which makes its use invaluable for the spirit lamp of the chemist. Alcohol has never been frozen, hence it is of great use in measuring low degrees of temperature. In the arts it is used as a solvent where water fails, hence its value in varnish making as it dissolves resins. It freely dissolves the essential oils and camphor, hence its use in chemistry and pharmacy. It also dissolves, sugar, soap, and oxalic, tartaric, gallic, benzoic, and other acids. It is extensively employed in the preparation of ether. Used internally, it is an agreeable stimulant in its various forms in fermented drinks, but its abuse is the cause of much want, suffering and disease. The quantity of alcohol in wine, beer, &c. is very variable. According to professor Brande, port and sherry and some other drying wines contain from 19 to 25 per cent of alcohol: the lighter wines of France and Germany about 12 per cent. Strong ale contains about 10 per cent: and ordinary spirits, as brandy, gin, and whiskey, 40 to 50 per cent, or occasionally more. —*Tomlinson. Faulkner.*

(121) ALE. The bitter ales of Messrs. Allsop and Co. and Messrs. Bass and Co. are manufactured at Burton-upon-Trent, and have for many years, been most extensively imported into India. Burton brewers have long been celebrated for their beer, and their success is generally supposed to be dependent on the quality of the well water used: but it is more probably that the fame has been acquired by the use of the best materials and employing great care in the process. On analysis, the water is found to contain a large quantity of sulphate of lime, a good deal of the sulphates of potash and magnesia, and a considerable amount of carbonate of lime: the lime and magnesia in the state of carbonate, being held in solution by carbonic acid, the excess of which is so great as to redden litmus paper. The Burton well water, therefore, is a *hard* water, and might be regarded as but ill-adapted for the purpose of brewing, but the boiling expels the excess of carbonic acid in the water, which kept the carbonates of lime and magnesia in solution: and these salts are precipitated. Again, the alkaline phosphates present in malt have the power of decomposing and precipitating sulphate of lime, phosphate of lime and a soluble alkaline sulphate being formed, and the greater part of the phosphate of lime so formed is redissolved in the acid formed during fermentation. The water, from being at first hard, thus becomes comparatively soft, and in this state is well suited for the extraction of the active properties of the malt and hops used in the manufacture of bitter beer. The water used is remarkable from its complete freedom from organic matter. The Burton ales speedily become bright and clear, never require finings to be employed; and are fit for use almost as soon as brewed. This is no doubt owing to the depurating power of lime, to the presence of which in the Burton water and its precipitation during the boiling, the transparency and brightness of the beer are attributable. An analysis shows the following results as the contents of an imperial gallon:—

	Messrs. Allsop & Sons, Brewed.		Messrs. Bass and Co. Brewed.	
	March 1851.	24th March 1851	For Home consumption 3rd March 1852.	For Home consumption 25th Nov. 1851.
	Grains.	Grains.	Grains.	Grains.
Sugar,	200	320	390	420
Gum,	2,080	2,110	3,930	2,660
Bitter Extract,	810	750	760	800
Total Solid,	3,090	3,180	5,080	3,880
Alcohol of spe: gr: 794	3,540	3,820	3,983	3,744
Water,	63,370	63,000	60,937	62,376
Per centage of Alcohol	70,000	70,000	70,000	70,000

The above general analysis shews that the bitter beers of Messrs. Allsop and Sons, and of Messrs. Bass and Co., contain only a moderate amount of alcohol, and an unusually large quantity of bitter extract, consisting of the extract of hops. The specific gravity of the beers brewed by Messrs. Allsop and Sons and Bass and Co. of various ages, was found to vary: the former from 1007 to 1020, and the latter 1008 to 1024; as a rule the solid contents and extractive matter of beer is greatest in the newest and strongest beers, and these are, to a considerable extent, indicated by the specific gravity. Dr. Hassal reports, that, after the most scrutinizing examination, microscopical, chemical and physiological, the examiners failed to detect any other ingredients than the products of malt and hops, and

the constituents of pure spring water. From the pure and wholesome nature of the ingredients employed, the moderate proportion of alcohol present, and the very considerable quantity of aromatic anodyne bitter, derived from hops, contained in these beers, they tend to preserve the tone and vigour of the stomach, and conduce to the restoration of the health of that organ when in a state of weakness or debility. These bitter beers differ from all other preparations of malt, in containing a smaller amount of extractive matter, thus being less viscid and saccharine, and consequently more easy of digestion; they resemble, indeed, from their lightness, a wine of malt rather than any ordinary fermented infusion, and they are strongly recommended by the Medical profession. The various firms, Messrs. Byass and Co.; Friend and Co.; E. and J. Hibbert; White and Price; Child and Co.; Wallis and Co.; Findlater, Mackie and Co.; Bovill, Kinahan; Halston, Crimp and Ward, under whose names beers appear in the market in India are merely agents for Messrs. Allsop and Bass. In the year 1853, there was exported from Great Britain, to Aden, British India, China, and Hongkong, 103,130 barrels of beer and ale, the declared value of which was £205,481, and in the four years 1852-53 to 1855-56 inclusive, Madras imported it to the value of Rupees 16,26,009. —*Hassal, page* 448. *Trade Statement. Commercial Reports.*

(122) ALEURITES TRILOBA (*Forst.*) Nat. Ord. EUPHORBIACEÆ.

Belgaum or Country Walnut, ENG.	Akrot, PERS. and HIND. MAL. and BENG.

This is a large and rather handsome tree, almost all parts of which are covered with a farinaceous substance. A useful, fine, clear, lamp oil is expressed with very little difficulty from the kernels of the nut, which yield more than 50 per cent. This tree has been introduced into India from the Society Islands; it grows to a large size; the fruit is roundish, two celled, each containing a nut resembling in flavor the filbert; the natives say the fruit when fresh is unwholesome and requires to be kept for one year before it may be eaten. But they are fond of it, it being very palatable, and something like the English Walnut. In the Sandwich Islands they are employed for candles. A number of them strung upon a stick will burn for hours, giving a clear and steady light. They are considered aphrodisiac in the Moluccas. A gummy substance exudes from the seeds, which the natives of Tahiti are fond of chewing. One great advantage attending the manufacture of oil from this nut is that it can be separated with much less labour and simpler machinery than the cocoanut oil, which requires great pressure to separate it from the kernel. The tree grows most readily from seed, and might be extensively cultivated: the quality of the wood is unknown. The cake after expression of the oil is a good food for cattle and useful as manure. According to Simmonds, "31½ gallons of the nut yield 10 gallons of oil, which bears a good price in the home market." About 10,000 gallons are yearly produced in the Sandwich Islands. In Ceylon it is manufactured, and there known as the kekuna oil. It is supposed to be a good substitute for rape oil.—*Lindley. Simmonds, Comm: prod. Jury Rep. M. E. &c. quoted in Useful Plants. Jaffrey, Riddell.* A. laceiferum is figured, 1915, by Wight

(123) ALEXANDERS. Smyrnum olusatrum and perfoliatum belong to the natural order, Umbelliferæ. The blanched stalks of this perennial herb are used in soups and salads; raised from seed, sown in drills, when the seedlings have attained a few perfect leaves, they require to be thinned out to the distance of 12 or 15 inches apart, they will bear transplanting, and are blanched by the leaf stalks being tied together and earthed up like celery.—*Eng. Cyc. Riddell.*

(124) ALGÆ. This tribe of plants comprehends the sea-weeds, lavers and fresh-water submersed species of similar habits. Many of these are edible, and are largely employed to burn into kelp, and as manure for grass lands. Laminaria saccharina, or the sugar sea-belt, is said to be eaten by the Icelanders, and is considered a great delicacy in Japan. Carrageen moss, *Chondrus Crispus*, is used in Ireland, as an article of food, and is sold in London as a substitute for Iceland moss. Another genus of the same order is *gelidium*, one of the species of which is said to be the substance collected by the swallows, to construct the edible nests of Java. Several other species of *gelidium* are made use of as food, in the East, being added to dishes to render the hot and biting condiments less pungent.—*Eng. Cyc.* Sea-weed is an article imported from abroad into China by junks, as well as collected on the Chinese coast; the foreign sort is principally the *leung fan tsoi*, from which agar-agar is made, but no particulars can be ascertained regarding the trade. In China, this sea-weed is eaten after merely cleaning and stewing it in fat or oil.—*Morrison.* Almost all the plants of this order yield soda and iodine on incineration. Until very recently they were collected in large quantities, and burned for the sake of the soda yielded by the ashes; after separating the alkali, iodine was obtained from the mother liquors. Although the trade in *kelp* (the local name in Britain for sea-weed soda) has been nearly annihilated by the plan for making soda from common salt, still sea-weed ashes constitute the sole source from which iodine is manufactured. The green *Conferva* which floats on the salt-water lake near Calcutta readily yields iodine. It should be dried, burned, the ashes packed in crucibles and heated to brighted redness. The residue treated with water, on evaporation yields a saline mass of muriate and sulphate of soda, chloride of potassium, and iodide of potassium and sodium. Mr. Royle informs us

that the natives of the districts at the base of the Himalayas use in the treatment of goitre a dried leaf "brought from a great distance," and which they call *gillur ke putta*, or goitre leaf. It much resembled fragments of a common fucus.—*O'Shaughnessy, page* 671.

(125) ALGAROBA BEANS. *Ceratonia Siliqua*, or *Prosopis pallida*. The seed pods or bean of the Carob tree, a tree common in the Levant or south of Europe. The pods contain a large proportion of sweet fecula, are used as food, and frequently by singers, being considered to improve the voice. During the peninsular war, the cavalry horses were fed principally on these beans, of which about 40,000 quintals are annually exported from Crete.—*Simmonds.*

(126) ALHAGI MAURORUM.

Camel's thorn. Syn.	Shuturkhar, Ooshuturkhar,
Hedysarum alhagi,	Juwansa, Hind.

A native of the deserts of Egypt, Syria, Mesopotamia, Persia, and India; very common about the Jumna, especially near Delhi; used for making tatties in upper India. Although it is certain that it is to this tree that the manna of the desert is to be referred, it is known that many others produce a similar exudation. This substance occurs in small, round, unequal grains, the size of coriander seed, of a yellowish white colour, caking together and forming an opaque mass, in which are found portions of the thorns and fruits of the plant; this manna is inodorous, its flavour is sweetly saccharine, followed by slight acridity. The turunjabin is never found in the shops of Europe, but in many parts of the East it is used as a substitute for sugar. Tournefort states that it is common on the Alhagis in the environs of Tauris in Persia; at Bosorah the manna is collected on a small thorny bush, also common in Khorasan, and called *el hadsje*. The turunjabin is in every respect like the manna of the sacred writings. The turunjabin is chiefly gathered in the neighbourhood of Tauris, where the plant grows abundantly. It is a natural exudation from the leaves and branches of the plant, which first appears in the form of a small drop as of honey, which increases to the size of a coriander seed. It is principally employed in Persia and is known as Persian manna, and employed as food for cattle. Two other species, A. camelorum, and A. nipalensis also yield a manna. A. Maurorum is said to grow also, in Delhi, the Mahratta Country and Sinde. The turunjabin is gathered by merely shaking the branches. At first it resembles drops of honey, but soon thickens into solid grains. At the hot season when almost all the smaller plants die, this puts forth its leaves and flowers. Camels and other cattle are very fond of the plant.—*Eng. Cyc. Useful Plants.* A good analysis of turunjabin is still a desideratum. As a medicine its effects correspond to those of the *ash manna.—O'Shaughnessy, page* 295.

(127) ALHAGI NIPALENSIS, Nipal Alhagi, (Don Pr. Fl. Nipal, p. 247,) is stated to afford manna. Mr. Royle however considers this species identical with the Alhagi Maurorum, and states on strong grounds that no manna is secreted by either in India, Arabia, or Egypt. Persia and Bokhara seem its proper districts, and hence the turunjabin is imported into India. In Calcutta it is difficult to procure it of good quality: when pure it sells in Bengal for 10 rupees the seer.

(128) ALIVERIE. Garden cress, *Haleem*, seeds of Lepidum sativum, used in medicine.—*O'Shaughnessy.*

(129) ALKALIES.—*Guz. Hind.* Khar. Are characterised by their peculiar hot, bitter, and caustic taste; by their changing the colours of the vegetable blues to green, and yellows to brown: and by their neutralising acids, and forming with them the various class of compounds, termed Salts. Alkalies are of extensive use in various chemical arts; as in the manufacture of glass and soap.—*Faulkner. Tomlinson.*

(130) ALKANET, DYERS BUGLOSS. *Anchusa Tinctoria.*

Ossetong, Dut.	Anchusa, It.
Orcanette, Fr.	Arcaneta, Sp.
Orkanet, Ger.	

A native of the Peloponnesus, the island of Cyprus and the deserts about Alexandria; but is cultivated in England, Spain and the south of France. The root yields a fine red colour to oils, wax, all unctuous substances, and to spirits of wine. Its chief uses are for colouring lip salves, ointments, staining wood and dyeing cotton, but it is also used for coloring many of the beverages sold under the name of Port-wine and the corks used for the bottles in which this fluid is sold. —*Tomlinson. Faulkner.*

(131) ALLAMANDA CATHARTICA (*Linn.*) Nat. Ord. Apocynaceæ. Aruli, *Mal.* Cayenne, Guiana, and coasts of Brazil, Calcutta. The leaves a valuable cathartic, used especially in painter's colic. In too large doses violently emetic and drastic. —*O'Shaughnessy page* 448. This showy climbing milky plant was introduced into India from Guiana in 1803. It has become quite naturalized, and is one of the handsomest ornaments of our gardens. If allowed to climb up large trees, the effect is very striking and beautiful, owing to the clusters of bright yellow flowers it is covered with. The whole plant abounds in milky juice. Its large yellow flowers blossom in succession throughout the year. It thrives best when allowed to ramble unrestrainedly.—*Lindley. Don. &c. quoted in Useful Plants. Riddell. Jaffrey.*

(132) ALLIGATOR, a name originally given by the British Colonists of the Southern States of the North American Union, to a large species of reptile closely resembling the Crocodile of Egypt, but which modern researches have shown to possess characters generically differing from those of that animal. The word is supposed to be a corruption of an old Indian name. According

to its modern acceptation among zoologists, the name is no longer confined to the species most commonly found in Carolina, Louisiana, and the other Southern States of the Union; but it is applied generically to all the other American species which agree with it in its most prominent and influential characters, and which have been called Caymans, Jacarés, &c. by the Spaniards, Portuguese, and Indians of South America. The characters which are proper to the Alligators, and by which they are distinguished from the crocodiles of the Old World, are by no means of such importance with respect to the influence they may be reasonably supposed to have upon the habits and economy of these animals as to warrant the formation of these reptiles into a distinct and separate genus. Their manners and habits are precisely those of the true crocodiles, and if they differ in certain minor details of structure, this difference should be considered not as a generic character, but as purely specific.—*Eng. Cyc. page* 120.

(133) ALLI is described by Edye in his Malabar and Canara list, as the Malayala name of a rather scarce tree which grows to about twenty feet high, and from twelve to fifteen inches in diameter. It produces he says a sort of fig, which the natives use medicinally.—*Edye, Mal. and Can.*

(134) ALLIUM, a very extensive genus of bulbous Monocotyledonous plants, belonging to the natural order *Liliaceæ*. The species are all remarkable for having, in a greater or less degree, the odour of garlic, and for the agreeable stimulating effects that accompany it. For this reason some of them have been objects of cultivation from the highest antiquity.—*Eng. Cyc. page* 126.

(135) ALLIUM ASCALONICUM, the Shallot, a native of Asia Minor, is in many respects similar to the chive, from which it is known by its larger leaves, its smaller and more deeply-coloured flowers, and by its stamens having alternately three points on the filaments.—*Eng. Cyc. page* 126. The Shallot, HIND: Pecaz, is cultivated in a light rich soil and propagated by dividing the clustered roots; it should be sown in beds at the commencement of the rains, and will give a crop during the cold weather.—*Riddell.*

(136) ALLIUM CEPA, the common Onion, HIND: Pecaz is too well known to require description. It is not certain of what country it is a native, but it has from time immemorial been cultivated in Egypt. Its varieties are not very numerous, considering that it is almost exclusively increased by seed.—*Eng. Cyc. page* 126.

(137) ALLIUM FISTULOSUM. Salad or Welsh Onion. This onion has little or no bulb, used in soups and salads, may be closely imitated by purchasing a few onions monthly from the bazar, and planting in any good soil. By this means young onions can always be had for the table.—*Jaffrey.* The Welsh Onion, is a native of Siberia, and is supposed to have gained its English name from having been imported originally from Germany, with the name Walsch, or foreign, attached to it.—*Eng. Cyc. page* 126.

(138) ALLIUM OPHIOSCORODON, Rocambole, or Spanish shallot, is very slightly different from garlic, being chiefly distinguished by its larger size in all the parts, and by the upper part of its stem being generally twisted spirally just before flowering.—*Eng. Cyc. p.* 126.

(139) ALLIUM PORRUM, the Leek, has, like many other cultivated plants, disappeared in a wild state, so that its origin is unknown.—*Eng. Cyc. page* 127.

(140) ALLIUM SATIVUM, Garlic, Luhsen, HIND: has been found wild in Sicily, and some parts of Province.—*Eng. Cyc. page* 126. Garlic seed oil is called, వెల్లగడ్డ నూనె Tellagedda nuna. TEL: வெள்ளைப்பூண்டுஎண்ணெய், Wulla poondoo yennai. TAM:

(141) ALLIUM SCHŒNOPRASUM, the Chive, is a little tufted plant, with slender, cylindrical, taper-pointed, dark-green leaves.—*Eng. Cyc. page* 126.

(142) ALLOY. Chemistry has made us acquainted with almost forty-three metals, of which not more than twelve are of great and extensive use in the industrial arts. These are iron, copper, lead, tin, silver, gold, mercury, zinc platinum, arsenic, antimony, and bismuth; in this limited list platinum is always employed in a pure state; iron, copper, lead, tin, silver, gold, and zinc, are also employed in certain cases, in a pure state, but in all those applications where hardness is a desirable quality, two or more metals are combined, so as to form an alloy, and the number of alloys may be increased to an almost unlimited extent. Hitherto not more than two or three hundred have however been made, and even of this number not more than about sixty have been studied with care. The alloy known as Type metal is composed of 1 part of antimony and 3 or 4 or 6 of lead, and a larger amount of lead produces an alloy adapted to the sheathing of ships. *Gun* metal is an alloy of 9 parts of copper and 1 of tin, and forms a tough red metal used for brass ordinance, one-sixth of tin produces the maximum degree of hardness, and one-fourth, the highly elastic sonorous *bell metal: Speculum* metal is two parts copper and one of tin. An alloy compo[illegible] of 8 parts of bismuth, 5 of lead, and 3 of [illegible]n, forms the *fusible metal*, which fuses in [illegible] water and even in a temperature of 198° [illegible] 200°. —*Tomlinson.* In the Travancore State, the workmen have been very successful in their fabrication of alloys, but the ingredients they use are not known.—*Juries' Reports M. E.*

(143) ALLSPICE; Allspice, Pimento, or Bayberry tree, *Eugenia Pimenta*, is a handsome tree,

often 30 feet high, a native of South America and the West India Islands, but is said to have been also introduced into the southern parts of India. The berries are the valuable part of the tree, and should be picked when they reach their full growth, before they begin to ripen. The leaves and bark participate in the warm aromatic properties for which the berries are celebrated, and are useful as a spice in cookery and as a stimulant in medicine. The fragrant odour of the berries being thought to resemble that of a mixture of cinnamon, cloves and nutmeg, has obtained for them the name of Allspice. A single tree has been known to yield 150 lbs. of the raw fruit or 100 lbs. of the dried spice. Mr. Mason mentions that on the sides of some of the highest mountains in the province of Tavoy, he repeatedly met with a tree, but never saw it either in fruit or flower, which the Burmese call "wild clove tree." The young branches and the leaves of this taste very strongly of all-spice, and he considers it a Eugenia, possibly E. pimenta. All-spice is rarely adulterated, owing, possibly to its low price.—*Eng. Cyc. Hassall. Mason.*

(144) ALMANDINE, or Precious Garnet, is that variety commonly employed in jewellery.

(145) ALMOND OIL.

Badam-ka-tel, HIND.	Ingudi-tailam, SANS.
Roughan-i-Badam, PERS.	Vadamcotty-yennay, TAM.

This is expressed from sweet and bitter almonds. It is inodorous, insipid, of a pale straw colour, limpid, and lighter than water. Sweet almond oil is used in medicine, and the bitter chiefly in confectionary. There are about 80 tuns of this oil annually imported into Britain, the price being about 1s. per lb. It is principally the produce of the Arzo tree, forests of which grow to the south of the Empire of Morocco, which produce an exceedingly hard species of Almond. Its fruit consists of two Almonds, rough and bitter, and in manufacturing the oil, they are well rubbed or shaken in a coarse bag, to separate a bitter powder which covers the epidermis; they are then pounded to a paste in marble mortars, and the paste subjected to a press. The Almond is supposed to contain 46 p. c. of oil, but from 5½ lbs. only 1lb. 6 oz. can be extracted by the cold process; and above 2 lbs. if heated iron plates be used. *Simmonds.* The oil of Almonds is the basis of the great part of the liniments, plasters, and ointments of the European pharmacists.—*O'Shaughnessy.*

(146) ALOE FIBRE; PITA FIBRE or PITA, is the commercial name given in Southern India to the fibres of the American Aloe, or *Agave Americana*, of the *A. vivipera* or bastard aloe, and to the fibres of Fourcroya gigantea. The A. viridis also is said to yield a fair fibre, and one is also obtained from the A. diacantha, the Moogai of Mexico; those of the Adam's needles, the Yucca gloriosa, or common leaved, and Y. Aloefolia, or Aloe-leaved Yucca, and Dr. Hunter also mentions the Y. angustifolia; Y. tenacissima; Y. filimentosa and Y. regia as species yielding fibres, to all of which perhaps the same commercial term is applicable. Two species of Agave, the *A. Americana*, and *A. vivipera*, have become so naturalised in many countries, but especially in the south of Spain, in Africa and India, into the last of which countries they have been introduced by the Portuguese from America, as to seem almost indigenous. They are not yet sufficiently abundant in Southern India to be employed to a very great extent for the production of fibre, but as they take root and grow readily, there is nothing to hinder their very extensive application, and it may be useful to many to repeat short descriptions of them here. *A. Americana*, or great American Aloe, has a short cylindrical woody stem, terminated by fleshy, spiny, bluish green leaves from two to six feet long, flowers once, on a tall flower stem, 20 to 40 feet. The species of Agave are not only ornamental as plants and useful as hedges, but are important for their products. The roots as well as the leaves contain ligneous fibres, "Nita" thread, useful for various purposes. The leaves are sometimes eight feet long, one foot broad, and five inches deep, and abound in fibres of great length, and these being tough and durable, they are separated for the purposes of making rope, the separation being effected by crushing or bruising, steeping in water, and afterwards beating. In applying them for the manufactures of fibres, it is very essential to have the sap removed as early as possible after the leaves are cut, and with this view a grooved cylinder press is found very effectual, while frequent beating removes a thick viscid milky juice, which, if allowed to remain after cleaning, imparts a stiffness to the fibre. The Aloe fibre is now a growing export from Southern India,—3,658 cwts in one year having been exported from the Western Coast valued at Rs. 21,506, and it is probable that the product of all the plants above named were included under that term. The exports from all the provinces of the Madras Presidency of hemp, and aloes' hemp, during the four years 1852-53 to 1855-56 have been as follows:

		Cwt.	Rs.
1852,-53	Hemp, ...	7,772	31,013
	Do. Aloes, ...	2,682	27,095
1853-54	Hemp, ...	6,112	27,113
	Do. Aloes, ...	3,658	21,506
1854-55	Hemp, ...	9,263	37,770
	Do. Aloes, ...	236	2,243
Total	Hemp, ...	23,147	95,896
Do.	Aloes' Hemp.....	6,576	50,844

The exports being chiefly to the United Kingdom, Bombay, Cutch, Guzerat, Sinde, Bengal and Indian French Ports. Aloe fibre was for several years employed in the Arsenal at Madras, as a substitute for English hemp, but its liability to rot, led to its discontinuance, and the case with which it

is cut prevented its employment as a tow for packing shot. It is possible that such unsuccess was owing to a want of acquaintance with the proper mode of preparing it, for in Mexico a highly prized thread is manufactured from the leaf fibre : and made into the ropes used in their mines and nets and rigging of ships. The famous hammocks of Panama are made of Agave fibre, and the nations of all the countries in which it is grown, use it largely.—*Hunter. Commercial Products.*

KATHALAI is the Tamul term applied to the Agave vivipera, the manufacture of fibres from which has been successfully accomplished in the Bangalore jail. The name of "silk-grass" also is applied to these fibres, as well as to those of the A. yuccæfolia. The fibres of the A. vivipera are said to equal in strength the best hemp. The A. cantala of Roxburgh is supposed to differ little from the A. Americana and its fibres could be equally turned to use. (*Syn.* Pita. Pita Kalabuntha. Cantala. Bans-keora.) As the economic uses to which all the parts of a plant can be put, are of much importance to the success of all agricultural operations, we may mention that, *Fourcroya gigantea* (Ventenat), known as the Sheemay Kathalay, is not an Aloe, although its fibre is usually so denominated. The fibrous plants here described are not natives of India, but have mostly been introduced from America. They are capable of enduring a great variety of climates, and are all rapidly extending over India, but they are not yet sufficiently abundant, the Fourcroya gigantea, especially, to yield the fibre in large quantities. F. gigantea produces a fibre five or six feet long, somewhat finer than that of the Agave fibres, but possessing similar properties. The F. gigantea is less abundant than the Agave, but is as easily propagated, and its leaves attain a length of ten feet.

YUCCA GLORIOSA, Adam's Needle, is not abundant in Southern India, but it grows readily, and might be easily propagated to a great extent. It yields a strong, white, fine, but rather stiff fibre, suited for the manufacture of cordage. It very soon becomes discolored by steeping, but is less liable to rot than some other fibres of this kind.

YUCCA ALOEFOLIA, produces a white, pliant and strong fibre, resembling that of the Agave in some respects, but is apt to be discolored by steeping, which he Agave is not.--*Royle. Riddell. Balfour's Exports and Imports. M. E. Juries' Reports.* Dr. Hunter has proved that the so called Aloe Plants yielding fibres are of great value, for a bundle bore 160 lbs when a similar one of Petersburgh hemp broke with the same weight. The fibre is two feet long, white and of fine quality, and readily takes colours. It was made from the A. perfoliata, *Kalabuntha*, which Dr. Royle supposes to be the same as his A. Indica.—*Simmonds. Useful Plants. Juries' Reports M. E. Mason. Faulkner.*

PULQUE. The saccharine and mucilaginous sap of the A. Americana may be made to flow by incisions in the stem : it readily ferments, and in Mexico, yields on distillation an agreeable ardent spirit, called, vino mercal. The incisions are made just before the flower scape is ready to burst. The dried flowering stems of A. Americana also afford an almost impenetrable thatch ; the fresh green leaves are cut up and given to cattle, and the centre of the flowering stem, split longitudinally, is by no means a bad substitute for a European razor strop, owing to minute particles of silica forming one of its constituents. The two products most deserving attention however are the extract which forms a lather like soap, and the fibre, known in Southern India as the pita. The Mexicans also make their paper of the fibres of Agave leaves laid in layers.

(147) ALOE INDICA (*Royle.*) Nat. Ord. LILIACEÆ.

Indian-Aloe, ENG.	Kunwar, DUK.
Kadenaka or Catevala, MAL.	Gheegowar. HIND.
Kuttalay, TAM.	Ghrito-komaree, BENG.
Kalabunda, TEL.	

It is the A. perfoliata of Willdenow. *Useful Plants.* It is a species with reddish flowers, common in dry situations in the North-west of India, probably the source of some of the common aloes (*musabhir*) of the bazars. It produces Cape aloes, and the coarse variety called the fœtid, *caballine*, or horse aloes.—*O'Shaughnessy, page* 665. This Aloe is chiefly planted to form hedgerows, and makes an excellent fence. It flowers in the rains, and the stem grows to the height of ten or twelve feet. The leaves make a good common cordage, or rope, used for mats, &c.--*Riddell.*

(148) ALOE LITORALIS, (*Kœnig.*) Nat. Ord. LILIACEÆ.

Sea-side, or small Aloe, ENG	Chini kala-bunda, TEL.
Sirrooghoo Kuttalay, TAM.	Chota-kunwar, DUK.
	Koomaree, BENG.

This species is commonly found growing near the sea-coast, and is readily distinguishable by the reddish colour of its leaves. It grows plentifully at Cape Comorin and the neighbourhood. A good kind of Aloes is procurable from it. The Natives attach much value to the juice of the leaves of this species, which they apply externally in cases of ophthalmia, and especially in what are commonly termed country sore-eyes. The mode of administering it is to wash the pulp of the leaves in cold water and mix it up with a little burnt alum. In this state it is applied to the eyes, being previously wrapped in a piece of muslin cloth. An ink is prepared by the Mahomedans from the juice of the pulp.—*Ainslie .&c. quoted in Useful Plants.*

(149) ALOE SOCOTORINA. Socotorine aloe. A native of the island of Socotra, leaves minutely serrated ; flowers scarlet at the base, pale in the middle, green at the point. Yields Socotorine aloes, also the true *hepatic* and *Mocha* aloes.—*O'Shaughnessy, page* 664.

(150) ALOE SPICATA. A native of the interior of the Cape of Good Hope, leaves distantly toothed, with a few white spots, the flowers filled with purplish honey,—*O'Shaughnessy, page* 665. The A. spicata is common in the Peninsula of India. It is a good hedge plant; and the leaves yield a useful fibre.—*Useful plants.*

(151) ALOE VULGARIS *(Lam.)* Nat. Ord. LILIACEÆ.

Common or Hedge Aloe, ENG. | Kuttalay, TAM.

The *Aloe vulgaris*, common aloe, *Syn.* A. Barbadensis, A. perfoliata, is a native of the East Indies, and now cultivated in many tropical and hot countries. The leaves are armed with spines, and are a little mottled; flowers yellow. This species yields the *Barbadoes aloes* of commerce, by some called *Hepatic* aloes.—*O'Shaughnessy, page* 664. The above plant, common in the Peninsula, is said properly to be a native of Greece, or as some say of the Cape Colony, but has long been naturalized in both Indies.—*Useful plants.*

(152) ALOES.

Mucibar, ARAB.	Catasha, MALAYALUM.
Comarika, CYNG.	Sibber, PERS.
Musumbir, DUK.	Carriaboolum, TAM.
Alia, HIND.	Mussumbrum, TEL.
Uloo-watan, MALAY.	

The drug called Aloes is the bitter, resinous, inspissated juice of the leaves of various species of an arborescent plant of the lily family, growing principally in tropical and sub-tropical regions, and having a wide extent of range, being produced in the Eastern Archipelago, the East and West Indies, Arabia, and the Cape of Good Hope. The drug is imported into England under the names of Socotorine; East Indian or Hepatic; Barbadoes; Cape and Caballine Aloes; and the various species of plants producing it, are the Aloe spicata, vulgaris, socotorina, Indica, rubescens, arabica, linguæ-formis and Commelina. The average imports into England was about 8,539 tons in 1841 and 1842, but it has lately much increased, and the greater portion is sent from the Cape. Aloes differs considerably in appearance and properties generally, according to the mode of preparation. The best kind is obtained by making transverse incisions through the leaves, and allowing the juice to drop out. This is evaporated to dryness by a gentle heat. Dipping the leaves in hot water facilitates the flow of the juice.—*O'Shaughnessy*, 665. The usual way, however, of extracting the substance is by making a transverse incision in the leaves or cutting them off at the base and scraping off the juice as it flows, if done in the former way, and allowing it to run in a vessel placed for the purpose, if in the latter. Pressure is made occasionally to assist the flow, but by this means large quantities of the mucilage are forced out and mix with the proper bitter juice which is proportionately deteriorated; for it must be recollected that the aloe contains a great deal of mucilaginous matter abundant towards the centre of the thick fleshy leaves. The Aloes after being received into a vessel are exposed to the sun or other heat by which means they become inspissated. The true *Socotorine Aloes* is the produce of A. Socotrina, which grows abundantly in the island of Socotra, in the Indian Ocean, growing spontaneously on the mountain limestone, from 500 to 3000 feet above the sea. It is sold at 13*d.* to 2*s.* a pound, and with that from Melinda on the Zanzibar coast and Macula on the Arabian shore, is exported to Bombay, furnishing the greater part of that sold in Europe as Socotorine Aloes. It is sent to England in packages of 150 to 200 lbs. wrapt in skins of the Gazelle, but sometimes in casks holding half a ton or more. It has a pleasant aroma, is somewhat transparent and of a garnet or yellowish red colour. It brought, in Liverpool, from 30*s.* to £6 the cwt. in 1853; according to Mr. Mason, A. Socotorina, grows in the gardens in the Tenasserim provinces. East Indian or Hepatic Aloes, so called from its liver colour, is believed to be the produce of A. arabica or perfoliata, which grows in Yemen, and is imported into Bombay, for re-export to Europe. Its colour is more dull than the other kinds, and it has a less pleasant aroma. A. Indica produces an inferior sort of the drug, in Guzerat, Salem and Trichinopoly, selling at the place of manufacture at from 2*d.* to 3*d.* a pound. *Barbadoes Aloes* is the produce of A. vulgaris, and is often passed off for the Hepatic. It is darker in hue than the East Indian sort, being darkish brown, or black, and the taste is more nauseous and intensely bitter. It is imported into England in calabashes or large gourd shells containing from 60 to 70 lbs. Socotorine and Hepatic Aloes, are imported into Bombay from the Island of Socotra and the Arabian Gulf. The greater portion of the former kind is re-exported in small barrels to England, and occasionally to Calcutta. In *Socotrine aloes* the colour is reddish brown. Its surface shining, structure transparent, fracture shelly, taste very bitter. The powder is of bright yellow colour; when burnt it evolves a very fragrant odour. The *true hepatic* aloes, also re-exported from Bombay, and probably the produce also of the Socotorine aloe, differs from this kind in being opaque and olive-colored.—*O'Shaughnessy. Caballine or Horse* aloes is the name given to the coarsest kind of Barbadoes aloes, and is only used in veterinary practice: it is obtained from Spain and Senegal. The *fœtid* or *caballine aloes* is now no longer found in commerce.—*O'Shaughnessy page* 665. *Cape aloes*: is the produce chiefly of A. spicata and A. Commelina, which grow wild in great abundance in the interior of the Cape Colony, and is exported in chests and skins: the produce of A. spicata, is of a yellowish colour and of a heavy disagreeable odour. *Ainslie. Lindl. Penny Cycl. &c. quoted in Useful Plants.*

Cape aloes is deep brown, shining, of greenish tint and resinous fracture, edges transparent and ruby coloured, powder greenish-yellow, odour strong. *Barbadoes aloes* is what is commonly termed *hepatic*. It is exported in gourds, ranges in colour from dark brown or black to red or liver colour, fracture dull or glossy, odour disagreeable, and increased by breathing upon the surface, powder dull olive yellow. Of late years the importation into England of the true Socotorine Aloes has considerably decreased. What is now shipped to Europe is sent usually round by Bombay, but Simmonds says, "Socotorine Aloes, although long considered the best kind, is now below Barbadoes Aloes in commercial value." *Kurachee Aloes* are intermediate in properties between the Socotorine and Dekhan kind.—*Ben. Phar.* 192. As a drug, Aloes is reckoned extremely valuable, and its medical properties are very numerous. Although aperient, unlike other cathartics, the effect is not increased if given in large doses beyond a certain point. To persons predisposed to apoplexy it is more beneficial than most other purgatives. The compound decoction is a valuable emmenagogue, particularly when combined with preparations of iron. The best mode of covering the unpleasant taste of Aloes when given liquid is in the compound tincture of lavender. Although Aloes are produced by most of the varieties of the above plants, Dr. O'Shaughnessy remarks that the quality of the product is apparently more dependent on soil, climate, and preparation, than on any specific difference in the plant. In the four years 1852-53 to 1855-56, Madras exported 515 cwt. valued at Rs. 4037: and imported last year to the value of Rs. 2686. In the year 1853, Britain imported to the extent of 33,333 lbs. of aloes from British India, and re-exported 157,506 lbs. to the various countries of Europe.—*Commercial Products.*

(153) ALOEXYLON AGALLOCHUM is a tree belonging to the natural order Leguminosae, which yields a scented wood, used by the Chinese in medicine and perfumery. *Aloexylon Agallochum*, Eagle or aloes wood, is a native of Cochin China. The wood is rather hard, in fragments of about one cubit in length, obtuse, furrowed, heavy, marbled ashy and brown, shining, brittle, very resinous; odour weak but agreeable, increased on friction, and very strong on burning the wood; flavour agreeable, balsamic and slightly bitter, and irritating to the throat. No analysis is on record of this substance; it is only known as a curiosity in Europe, but in the East it is deemed an invaluable tonic and stimulant remedy, a delicious perfume, and becoming offering for religious ceremonies. See AQUILARIA AGALLOCHA, (*Aquilarineæ*); also EXCŒCARIA AGALLOCHA, (*Euphorbiaceæ*.) Aspalathum wood is also supposed to proceed from this or the Aquilaria in a state of decomposition, but of this nothing is known with certainty. The Rhodes wood (Convolvulaceæ) has also been called "Aspalath."—*O'Shaughnessy, page* 314.

(154) ALONSOA GRANDIFLORA. SCROPHULARIACEÆ.—An ornamental plant called the "maskflower," the colour of which is scarlet, it is easily cultivated in rich mould and multiplied by cuttings or seed.—*Riddell.*

(155) ALPINIA, a genus of plants belonging to the natural order *Zingiberaceæ*. The species have thick tuberous horizontal roots. The stems are numerous and perennial, with lanceolate leaves, having a slit ligulate sheath. The flowers are in panicles, or loose racemes or spikes. The tube of the corolla is short, the inner limb 1-lipped. The filament of the stamens linear. The fruit is capsular and 3-celled with winged seeds. —*Eng. Cyc.* Wight in Icones figures *A. Allughas*, 2026; calcarata, 2028; nutans, 2027; Rheedii, 2026.

(156) ALPINIA ANGUSTIFOLIUM is a sharp-leaved species, and a native of marshy ground, in Madagascar. It is cultivated in the Mauritius. It has a deep blood-red calyx, and the outer segment of the corolla is red. The whole plant is aromatic, and the fruit constitutes the *Cardamomum majus* of the older writers.—*Eng. Cyc.*

(157) ALPINIA AROMATICA is a native of the valleys on the eastern frontiers of Bengal. The fruit has similar qualities to those of the true cardamoms, for which they are often sold to the druggists of India.—*Eng. Cyc.*

(158) ALPINIA CARDAMOMUM has a root-stock creeping under the surface of the soil like that of the ginger, but it is smaller. The stems rise obliquely to the height of from two to four feet. The leaves are alternate. Flowers in spikes, seated in lanceolate acute villous scarious ash-coloured bracts. The tube of the corolla slender. The anther double, with a large three-lobed convex crest. The fruit a capsule containing roundish angular dotted brown seeds. This plant is a native of the mountainous parts of Java and Sumatra, and is commonly cultivated in the gardens of India. The seeds are aromatic, and are used by the Malays instead of the true Cardamoms, which are the produce of the *Elettaria Cardamomum*. [ELETTARIA.] Sir J. E. Smith states that this plant is the *Amomum verum* of the older botanists.—*Eng. Cyc.* A. Cardamomum furnishes the best known sort of the clustered cardamoms. About 192 candies are grown annually in Travancore and 100 candies in Malabar. This product is in great request throughout India, fetching as high as £30 the candy of 500 lbs.—*Simmonds.*

(159) ALPINIA GALANGA (*Swz.*) Nat. Ord. ZINGIBERACEÆ.

Greater Galangal, ENG.	Koolinjan, DUK.
Pere-aretei, TAM.	Koolunjun, BENG.
Doomba-stacum, TEL.	Chitta-ratta, MAL.

Vern. Koolinjan, *Hind.* A native of Sumatra,

cultivated in the Indian archipelago; tubers slightly aromatic and bitter, the root-stock more so, pungent, acrid, and aromatic. They constitute the true galanga roots of the druggists, and are used for the same purposes as ginger.—*O'Shaughnessy, page* 652. Grows in the South Concan, Travancore and Chittagong. *A. Galanga* is a native of Sumatra, and is cultivated in the Indian Archipelago. Its roots are pungent, acrid, and aromatic, and are often substituted for ginger. They are sold by druggists under the name of *Galanga major.—Eng. Cyc.* The tuberous roots are the larger galangal of the shops and are used as a substitute far ginger: its taste is peppery and aromatic. They are given in infusion in fevers, rheumatism and catarrhal affections. In Cochin-China they are employed when fresh for seasoning fish, as well as for other economical purposes. Simmonds says the galangal root is much used in China, and is one of the articles of commerce, realizing in London 12 to 16 shillings per cwt. in bond. It has an aromatic pungent taste; the outside is of a reddish-brown; internally it is reddish-white. An inferior sort of galangal is got from A. Allughas, (*Roscoe*) the root of which is considerably aromatic. 1286 cwt. of galangal root, valued at 2,880 dollars were exported from Canton in 1850.—*Simmonds. Useful Plants.*

(160) ALPINIA RACEMOSA; Its root-stocks has the same aromatic and pungent properties as ginger.—*Simmonds.*

(161) ALSTONIA SCHOLARIS (*R. Br.*) N. Ord. APOCYNACEÆ.

Pala, MAL.	Eer-ellay palay, TAM.
Chatinn, BENG.	

Grows in Travancore, Coromandel and Assam. A handsome looking tree. Wood white and close-grained, but rather coarse. It is bitter-tasted and the bark is a powerful tonic, and much used by the natives in bowel complaints. The whole plant abounds in milky juice. In Assam, where the tree grows to a large size, and where it is called Loteeana, the wood is much prized for beams, and light work, such as boxes, trunks, scabbards, &c. The full grown tree is likewise found in the Travancore forests.—*Nimmo. Roxb. &c. quoted in Useful Plants.* Wight figures also A. venenata, 436.

(162) ALSTROMERIA. *Amaryllidaceæ:* tuberous-rooted flowering plants, mostly from South America, with every variety of colour: they may easily be cultivated in a mixture of sand and loam during and after the rains.—*Riddell.*

(163) ALTAMGHA, Turkish, literally red stamp. A grant under the seal of the former princes of Hindustan recognised by the British as conferring a title to rent free land in perpetuity, hereditary and transferable.—*Wilson.*

(164) ALTERNANTHERA SESSILIS. *Poonanghn Cunney-keeray,* Tam. This, in many parts of the country, is a common annual weed, greatly prized by the natives, who attribute to it very high qualities, considering the leaves food for kings. It sells at a high price, and the wonder is, from such being the case, that the gardeners do not attempt its extensive cultivation: used as greens.—*Jaffrey.* A. campestris 717, and A. sessilis, 727, are figured in Wight's Icones.

(165) ALTHÆA OFFICINALIS.—Hollyhock. *Vern.* Gool Khirree. *Off.* The root. This is a native of Europe and of Cashmere, and is used precisely as the marsh mallow. Besides gum, the root contains a large proportion of a crystalline acid, called the *aspartic,* combined with ammonia—the asparagin of Robiquet. This principle is prepared by slicing the roots and macerating the slices in cold water, filtering and evaporating the liquor.—*O'Shaughnessy, p.* 214.

(166) ALTHÆA ROSEA. One of the mallow family, grows wild in China and all over India, and is known to yield fibres. It is used medicinally, as in England. It is the parent of the many beautiful varieties of hollyhock, and yields a blue colouring matter, equal to Indigo. —*Royle. Eng. Cyc.*

(167) ALUM.

Shebb, ARAB.	Alumen, LAT.
Chinakarum, CYNG.	Zajbeluir, PERS
Aluin, DAN.	Pedrahume, PORT.
Putkarie, DUK.	Kwassze, RUS.
Alum, FR.	Puttaki, SANS.
Alaun, GER.	Allumbre, SP.
Phutkee, GUZ.	Paddicarum, TAM.
Phutkre, HIND.	Paddicara, TEL.
Allume, IT.	*Faulkner.*

Alum, is a common natural production, of which the salajit of Behar and Nipal is an example.—*O'Shaughnessy*; but the salajit of Nipal is a mixture of sulphuret of aluminium, sulphate of alumina and sulphate of iron; its composition is very uncertain.—*Beng. Phar. p.* 366. Alum is found in a reddish slate clay, or soft clay-slate in the valley of the Tenasserim, about forty miles below Matah at the forks; this, with an indurated sand from a neighbouring locality that also contains it, is the only alum that has been yet met with in the Provinces.—Alum is exported from China, in considerable quantities to India and the Archipelago. Great quantities are employed by the Chinese in purifying the water which they use for culinary purposes: they also use it in sizing paper for foreign printing. *Morrison's Foreign Commerce with China.* It will be seen from the above that it occurs naturally, but the Alum of commerce is not a natural product, being manufactured from Alum shale, alum rock, bituminous shale, and slate clay; and though an earthy salt is found native in small quantities, it has long been produced artificially. It is brittle, inodorous, has a sweetish astringent taste, and crystallises generally in transparent octahedrons. It is of great use in the arts, especially for preparing mordants in dyeing and calico printing. It is also used in

preparing and preserving skins: in candle making, for hardening and whitening the tallow; in paper-hanging it is mixed with the paste; and it is also used in medicine as an astringent and for collyria. In India it is used in dyeing the purple and deep red colours; by the tanners in preparing a soft white leather, and by the goldsmiths for brightening gold. The great importation of alum is from China, but it is obtained, according to Ainslie, in Jeypore and Travancore. It is largely imported into Bombay from China, but a superior kind is brought from Cutch, and it is found in the Tenasserim valley, about 40 miles below Matah in a reddish slate clay. In the process of manufacture, the shales are roasted, and after being reduced to powder the alum is obtained by washing. During the four years 1852-53 to 1855-56, inclusive, Madras imported 4859 cwt. valued at Rs. 26,103, chiefly from Penang, Singapore, Malacca and Bombay.—*Commercial Products.*

(168) ALUMINA, is an earth of common occurrence in the mineral kingdom, in a state of silicate; as in felspar and its associate minerals and in the various modifications of clay thence derived. Native alumina exists in the sapphire, the oriental ruby and topaz: corundum, adamantine spar and emery consist chiefly of alumina with a small portion of oxide of iron and silica. Alumina has a strong affinity for various organic compounds, and its use in dyeing and calico printing depends on its attraction for different colouring principles, and for ligneous fibre. If ammonia be added to a solution of alum in an infusion of cochineal or madder, the aluminous earth falls in combination with the red colouring matter and the liquor is left colourless. Colours thus prepared are called *Lakes.—Tomlinson.*

(169) ALYSSUM SAXATILE. *Cruciferæ*—These species of herbaceous plants are best adapted for borders. They are cultivated by seed in a common soil. Their flowers are all of a yellow colour.—*Riddell.*

(170) ALYXIA STELLATA, Malay Archipelago, Society and Friendly Islands. Bark contains benzoic acid, and is possessed of properties analogous to those of canella and winter's bark; now used in Germany in chronic diarrhœa and nervous disorders.—*Lindley. O'Shaughnessy, page* 448.

(171) AMARANTACEÆ, Amaranths, a natural order of Apetalous plants, many species of which are pot-herbs, and their seeds collected as grain crops. Dr. Wight gives figures of the following genera: Amarantus fasciatus, 717; frumentaceus, [illegible] *inamœnus*, 715; lanceolatus, 716; oleraceus, [illegible], 1371-2; polygamus, 713-4; polygonoides, 712; ?—719; polystachyus, 713; spinosus, 513; tenuifolius, 718; tristis (?), 514 and 713. As garden ornaments, some of them as A. tricolor, caudatus or "Love lies bleeding," Hypochondriacus or "Prince's Feather," are flowering plants. This last flower is found wild in the South of England. Many of the species are very common, and of a great variety of colours. A. tricolor is remarkable for its variegated leaves, the centre of which is red and pale yellow; propagated by seed only.

(172) AMARANTUS ANARDHANA. Its seeds are gathered and used as food.—*Honigberger.*

(173) AMARANTUS ASPERA.

Agareh ke jur, Duk. | Apamarga, Sans.
Lal chirchiri, Hind.

An infusion of the root is given as a mild astringent in bowel complaints. The flowering spike made into pills with a little sugar is a popular preventive medicine in Behar for persons bitten by rabid dogs. The root is used by the natives as a tooth-brush, the whole plant when macerated yields a considerable quantity of potash. —*O'Shaughnessy, page* 529.

(174) AMARANTUS ATROPURPUREUS.

Banspata lall auteeya, Ben. | Shegapoo Thundoo-keeray, Tam.

Is probably a variety of A. oleraceus, an annual with beautiful red foliage and diminutive flowers. It gives a good spinach though seldom used by Europeans.—*Jaffrey. O'Shaughnessy.*

(175) AMARANTUS CAMPESTRIS (*Wild.*)

Sirroo-keeray, Tam. | Tseeri-koora, Tel.

Is a small annual, with anthers of an orange-colour; flowering in May and June, and growing in Bengal, and Travancore. The root is considered a demulcent and given in decoction in cases of strangury. The leaf of this plant is among the potherbs of the Hindoos, and the leaves are eaten by the poorer classes.—*Ainslie. &c. quoted in Useful Plants.* Jaffrey mentions that campestris and (polygonoides ?) are prevalent weeds; commonly cultivated by the native gardeners for spinach—during the hot months: require to be used when 3 or 4 inches high; of rapid growth; should be sown every third or fourth week.—*Jaffrey.*

(176) AMARANTUS FRUMENTACEUS (called *kiery*) Poongh-keeray, *Tam:* grows in the Hills between Mysore and Coimbatore, seeds ground into flour. In the Calcutta Botanic Garden 40 square yards, sown in June, yielded 21lbs. of clean seed in September; the plant also grows from October to February, inclusive.—*O'Shaughnessy, page* 529. This plant is extensively cultivated in the Coimbatore district, chiefly for the flour of its seeds, which is a great article of diet among the natives.—*Useful Plants.* Under the name of Poongh-keeray, *Tam*: it is also cultivated by the hill people for the seeds, which are ground into flour, and form one of their principal articles of diet. The leaves are of a reddish brown color, and the plant averages in height from 4 to 6 feet.—*Jaffrey.*

(177) AMARANTUS GANGETICUS, is the *lall sag* of the Bengalees.—*O'Shaughnessy,*

page 528. The leaves of this plant are eaten as a spinach: it is generally sown broad-cast, and procurable all the year round.—*Riddell.*

(178) AMARANTUS LANCEOLATUS. *Vern.* Bans-pata nuteeya, bamboo-leaved amaranth, the leaves and tender tops are eaten by natives in their curries and used as emollient poultices.—*O'Shaughnessy, page* 528.

(179) AMARANTUS OLERACEUS. *Koollay Thundoo-keeray,* Tam: superior to A. campestris in every respect as a spinach; commonly cultivated in the gardens of Europeans, there are 3 or 4 varieties; one with red leaves, another with white stems, which are peeled and eaten as asparagus: A. giganteus, variety, is about 4 to 8 feet high, with a thick succulent stem, and is eaten as a substitute for asparagus.

(180) AMARANTUS POLYGAMUS.

Chumli sag, HIND. | Chumpa Nutceya, (var. *lal*), BENG.
Moollay-keeray, TAM.

This vegetable is commonly used during the hot weather. There are three or four varieties, with various colored leaves. It is one of the best of the Indian spinaches; it is raised from seed during the hot months; and requires to be sown thick and eaten when young. The lower class of natives are seldom able to purchase this vegetable, it being too costly; is generally used when 2 feet high under the Tamil name of Thundoo-keeray: leaves, stems, and roots are eaten at that age.—*Jaffrey.*

(181) AMARANTUS POLYGONOIDES.

Checloo nuteeya, BENG. | Chirakura, TEL.

Very small, and a common garden weed, used as a pot-herb, and deemed so wholesome that convalescents are ordered it in preference to all the other kinds.—*O'Shaughnessy, page* 528.

(182) AMARANTUS SPINOSUS. *Vern.* Kanta nuteeya, Mooloo keeray, *Tam.* thorny amaranth. Sharp spines in the axils of the leaves; a very troublesome weed during the rainy and cold seasons. Nearly all the species may be used as emollients for enemata, cataplasms, diluents, drinks, &c.—*O'Shaughnessy, page* 529. Jaffrey mentions this as an annual, troublesome weed; abundant; thorny; the small leaves have a dark spot in the centre; it makes tolerable spinach, though troublesome to gather. In Tenasserim, also, it grows spontaneously as a common weed, and in some parts of that province, the natives use it for a pot-herb.—*Mason.*

(183) AMARANTUS TENUIFOLIUS. *Vern.* Jeel chumli, *Beng.* Cultivated grounds near Calcutta. Stem none; a spreading plant close to the ground.—*O'Shaughnessy, page* 528. Jaffrey mentions A. tenuifolius under the name of *Katoo Sirroo-keeray,* Tam., as a weed with clusters of green flowers, proceeding from the axils of the leaves, stem much branched; found every where.

(184) AMARANTUS TRISTIS.

Kuppei-keeray, TAM. | Quoi-tota-kura, TEL.

Annual, and cultivated; held in great esteem by the natives. It may be cut down several times without destroying the plants, which are much used for food.

(185) AMARANTUS VIRIDIS, (*Linn.*) leaves are used as emollient poultices, *Amarantus viridis, lividus* (Gobura nuteeya, *Beng.*), and *A. oleraceus* (Sada nuteeya) are cultivated for culinary purposes; the tops of the young stems and branches of the last were formerly brought to table in India as a substitute for asparagus.—*O'Shaughnessy, page* 528.

(186) AMARYLLIS BELLADONA--EQUESTRIS—-MEXICAN—CAPE—-AMERICAN—-ASIATICA. Flowering plants which blossom during the rainy and cold season, and form a great ornament when judiciously planted amongst other border flowers. The colours are of every variety —red, white, pink, &c. The large flowering sorts are greedily devoured by birds and insects, and require much care to prevent their being destroyed. Propagated as all other kinds of bulbous roots.—*Riddell.*

(187) AMARYLLIS FRITTILARIA, or SNAKES' HEAD LILY.—From Amarysso, resplendent. The wild flower hangs pendulous, and is chequered with pale dark purple; specific name from Frittillas, a dice board. Most of the species are natives of China, the Cape of Good Hope, and America: they have, however, become quite acclimated in India, and are found almost in every flower-garden under the names of Mexican, Barbadoes, Turk's cap, Tiger lily, Parrot, &c.—The bulb, in one year, will produce from three to a dozen fresh plants. When grown in pots, a small hole should be left in the bottom, and the pots of sufficient size to admit the expansion freely of the bulbs, which, after the decay of the old flowering stalk, may be separated and transplanted: if in borders, they will blossom during the rains and cold weather, and even during the hot season.—*Riddell.*

(188) AMAZON STONE. A crystallised variety of felspar, of a beautiful apple-green colour. It is met with in the Ural Mountains and South America.

(189) AMBAREE. Poolchay fibre. Syn: *Ambaree* also *Taag.* also Pat in Western India:

Pallungoo, *Madras.*
Pooley Numajee, *Coimbatore.*
Gongkura, *Teloogoo.*
Masta Paut, *Bengalese.*
Ambayapata, *in Purneya, Chandana.*
Sunnee, *Scharunpore.*
Wilaitee (or foreign) Sunn, *Mudra.*
Kudrum, *in Behar.*
Dekanee Brown hemp, also Hemp, *Bombay.*

—*Royle, p.* 253, 254 *and* 257.

This fibre is obtained from the Hibiscus cannabinus, very generally cultivated all over India, and a very good quality of its fibre is exported from the Western Coast. The fibre of this plant, like that of Jute is sometimes called "Paut," also, in Bombay, Dekhanee hemp, to distinguish it from taag or Concanee hemp: also Indian "hemp." It is one of the "brown hemps" of Bombay, and is often confounded with the fibre of "Sunn," though the two plants

greatly differ, the sunn, crotalarca juncea, being known in Bombay as Taag. The length of the fibres of carefully cultivated Ambaree is from five to six feet: they are of a paler brown than ordinary Brown Hemp, harsher in feel and stick more together; but they are divisible into fine fibrils; possessed of considerable strength: well calculated for rope making, as also for coarse fabrics. Though esteemed by some of the natives of Western India, the hemp of the H. cannabinus, is not, either in strength or durability, so good as the true hemp, or as the Sunn or Brown Hemp of the crotalaria juncea. Its price in the Home market is probably the same as that of the Jute. Hibiscus cannabinus is an erect growing plant, of the height of about four feet. It is slightly prickled over the stem. The leaves have an acid taste, and are much used as a pot herb. There is a dark purplish coloured species, the leaves of which are used for a similar purpose; they are both grown all the year round, and sold in the Dekhan at five seers for one pice. —*Riddell.* The following is the strength of this fibre as tested by several scientific men.

Experiments of	Ambaree, Hibiscus cannabinus, broke with	Sunn, Crotalaria juncea, broke with
	lbs.	lbs.
Dr. Roxburgh,...	110 to 115	130—160
Dr. Royle, ...	150	190
Dr. Wight, ...	290	404

The exports of this fibre are included under the general term, hemp, and cannot therefore be distinguished from that of Sunn hemp.—*Royle, p.* 253 *to* 259.

(190) AMBER.

Umber, TAM. | Inkitreeyoon, ARAB.
Kahruba, DUK. HIND. and PERS. | Ambar, MALAY.

Is a transparent, brittle, light, hard substance; sometimes nearly colourless, but commonly yellow, or even deep brown. When bruised, it exhales a slight aromatic odour. It is susceptible of a good polish, and when rubbed becomes electrical. It is used in varnishes, as well as for ornamental purposes, such as the manufacture of rosaries, necklaces, mouth-pieces, armlets, &c. Amber is procurable in the bazars of all eastern nations. It is chiefly obtained on all extended lines of sea-coast, has been brought from Europe, America, Africa and the islands south of Asia. It is found after storms, when it is either picked up on the beach or sought after by men who walk up to their necks in the

from Grossdirscheim to Pillau. It has al found in Poland, Saxony, Siberia and Gre also, at Cramer in Norfolk and on the Yo coast, and is occasionally found in sand a formations. Ainslie mentions that it h found in the Dekhan, of a fine quality, b scarce; also occasionally in Travancore, a copal is often sold in the bazars as Amb is found on several islands of the Indian pelago and in small quantities on the c China and Tunking. Its value in countries, where it is used for ornaments, cense and in medicine, has latterly dim having been superseded by cheaper an odoriferous substances. A considerable po the Amber in the markets of the East is l from Eastern Africa, but a substance kn false Amber, possibly fossil copal, is in into China, from India, and sold in Ca prices, almost as great as those which the article bears. A gum scorched with produce a yellowish brown color, is oc ally sold in India as Amber. Accord the recent researches of Göppert, ambe indurated resin, derived from various t the family of the coniferæ, which resin i in a like condition in all zones, beca usual original depositories, viz. beds of coal, have been formed almost every whe der similar circumstances. The Amber in the North of Ava, are described by Dr field as ocurring in a lignite formation, a fossil copal of the Vencully cliffs near T drum is associated with lignite. Tran pieces of a lively yellowish brown colour best, and when embedding insects, the p China is much enhanced. Opaque an pieces are almost valueless.—*Mason. Fa Tomlinson. Eng. Cyc.*

(191) AMBERGRIS.

Anbar, ARABIC. | Anbar, MALAY.
Mussumbra, CYNG. | Shahboi, PERS.
Umber, HIND & DUK. | Min-Umber. TAM.

Has no connexion with amber, or ambar, being a concretion from the int of the spermaceti whale, Physeter m phalus, and is generally supposed to morbid product analogous to biliary and not to be found in the healthy a 362 ounces have been taken from the bo small whale. It is obtained in warm cli floating on the sea, and thrown on the Ambergris of good quality is solid, opaqu bright gray colour; which is darkest ext and intermixed with yellow or reddish stri little black spots within; gives off an ag flavor when heated, or rubbed, or handle when cold it has but little taste or smell

apparently smooth and homogenous. Ambergris is brought from the Arabian Gulf, Zanzibar, Madagascar, Surinam, Java, Japan, but most of it is picked up after storms on the shores of the numerous islands of the Indian and Pacific Oceans. It is used as a perfume and stimulating aromatic. —*Tomlinson. Faulkner.*

(192) AMBER, LIQUID. The Liquid-amber of commerce is a product of three species of plants belonging to the natural order of Balsamifluae of Blüme, which has been altered to Balsamaceæ by Dr. Lindley. The name of this substance is derived from *Liquidum*, fluid, and *Ambar* the Arabic name of Amber. The three species all form fine trees, and occur in the Levant, Mexico, North America, Java and Tenasserim. Liquid-ambar altingea is a superb forest tree, occurs on the mountains of Java, at elevations of 2000 or 3000 feet above the level of the sea, also on the coast of the Tenasserim provinces, where it is indigenous, and in some places quite abundant, (Malay, Rasamalay; Burmese, Nan-tu-yoke.) Indeed a considerable stream in the province of Mergui derives its name from this tree, in consequence of its growing so thick on its banks. The bark of L. altingia has a hot and bitterish taste, and yields a fragrant balsam or liquid storax, although there is no proof that the liquid storax known in Europe is obtained from it, and it does not grow near the localities where liquid storax has so long been obtained. L. styraciflua a large, fine tree, is the species found in Mexico, and the United States, in the latter of which it is called sweet gum, and the fragrant liquid exudes, though not very copiously, from incisions in the stem. This is called Liquid-ambar, Oil of Ambar, and Copalm Balsam, and in this form has a pleasant balsamic odour and an aromatic bitter taste. This becoming dry, forms what is called soft or white Liquid-ambar, which resembles very thick turpentine, [illegible] a feebler odour than the liquid balsam, and contains less volatile oil, but more benzoic acid. L. orientalis is a native of Cyprus and parts of the East Indies. Dr. Pococke, as quoted by Dr. Lindley, states that it is called Xylon Effendi (the Wood of our Lord), in Cyprus, where it produces an excellent white turpentine, especially by incisions in the bark. It is also said to be produced on the island of Cabross, at the upper end of the Red Sea, near Cadess, which is three days' journey from Suez. The product of the L. Altingia is said to be mixed with the substance obtained by boiling the branches of Styrax officinale, or acting upon them with oil, spirit or naphtha. The subject is interesting as connected with ancient commerce, inasmuch as old writers mention a liquid with the solid storax, the mia-saileh and Mia yahseh of the Arabs. In all its states Liquid-amber is used to mix with Balsam of Peru. L. cerasifolia of Wallich (Sedgwickia cerasifolia of Griffiths) grows in Assam, but it is not known if it yields any balsam.—*Eng. Cyc. Mason.*

(193) AMBOOSIE, DRIED MANGOES.

Amurya, Guz. | Amboosie; kucherian, Hind.

Is the flesh or pulp of green mangoes, cut into oblong pieces, salted and dried in the sun, when it assumes a brownish colour. It is used as an ingredient in curries by the natives of India, to which it imparts an agreeable acid taste. Goa Amboosie is most prized on the west of India, but is made everywhere. —*Faulkner.*

(194) AMBOYNA WOOD, LINGOA WOOD. A fragrant wood of various colours, used in cabinet work in England. Localities, Ceram, and Amboyna. At the Great Exhibition of 1851, it was sent from Singapore.—*Faulkner. Lond. Ex. Juries' Reports.*

(195) AMETHYST.

Amethyste, Fr. | Amethystus, Lat.
Amethyst, Ger. | Ametisto, Port.
Amatista, It. | Ametisto, Sp.—*Faulkner.*

Amethyst. This name has been applied to two precious stones of essentially different natures. The *Oriental Amethyst* is a rare variety of *Adamantine Spar* or *Corundum*. The *Occidental*, or *Common Amethyst*, is a variety of quartz or rock crystal, which is met with in many parts of the world, as India, Siberia, Sweden, Germany, Spain, &c. It occurs in various forms, as massive, in rounded pieces, and crystallised.—*Engl. Cyc. page* 142. Common Amethysts of great magnitude, in regular crystals, are obtained near Hyderabad in the Dekhan. The amethyst is principally distinguished from common quartz by its colour, which is occasionally of every shade of violet, or rather purplish-violet, and this in the perfect amethyst is pretty equal throughout the crystal: very commonly the summits only of the crystal are amethystine, the lower part being nearly colourless, or tinged with green. By long-continued heat the colour is destroyed and the crystals become white and opalescent.—*Eng. Cyc. page* 143.

(196) AMHERSTIA NOBILIS. This is the finest [illegible]s tree in Chin India. It is of low stature with slender pendulous branches clustered under its tufted summit of lively green, and draperied with large pea blossom shaped flowers of brilliant red and yellow, which hang down from its graceful arches in tassels more than a yard long. It was discovered by Dr. Wallich on the Salwen near Trockla, and named by him after Lady Amherst the Noble Amherstia. It has been introduced into England where every tree is said to be worth fifty pounds. When one flowers, it produces quite a sensation from the Thames to the Tweed. A botanical correspondent in the North of England writes: "I dont hear whether the Amherstia which flowered near London last year is going to do so again this, but doubtless it will, and we shall soon hear of it."

" Ho, Trockla! thy tide
Hath a beautiful bride,
The child of an iris-wreathed shower;
With vails flowing down
From her emerald crown,
Whose fringes unfold
In scarlet and gold,
A glorious sight,
Ever graceful and bright—
The queen of proud Ava's wild bower.

There sweet-blossomed trees
Are wooing the breeze
O'er highland, and dingle, and glade,
But though they allure
With their fragrance so pure,
The Amherstia is fairest,
The noblest, the rarest;
Nor all the rich flowers
Of Albion's bowers
Can vie with its purpling shade." *Mason.*

In Calcutta, it was considered rather difficult to manage, but Fortune mentions that it was succeeding admirably under the treatment of Mr. Scott, the head gardener.—*Mason p.* 360.

(197) AMIANTHUS, MOUNTAIN FLAX.—A mineral in silky filaments, which, when mixed with oil, may be woven into a fire-proof cloth. It is sometimes used as a lamp-wick. Localities, Scotland, St. Neverne in Cornwall, Corsica, and the United States of America.—*Faulkner.*

(198) AMMANIA VESICATORIA, (BLISTERING AMMANIA.) *Vern.* Dadmaree, Bunmurich, BENG. An annual found in wet land during the rains, 6 to 36 inches high, has a strong smell like muriatic acid; leaves exceedingly acrid, employed by the natives as blisters in rheumatism; and Ainslie states that the fresh leaves bruised and applied to the part intended to be blistered perform their office in half an hour, and most effectually. Dr. O'Shaughnessy made trial of this article in eight instances; blisters were not produced in less than 12 hours in any, and in three individuals not for 24 hours. The bruised leaves had been removed from all after half an hour. The pain occasioned was absolutely agonizing until the blister rose. He says he should not be justified in recommending these leaves for further trial, they cause more pain than cantharides, and are far inferior to the plumbago (lal chitra) in celerity and certainty of action. Wight also gives figures of A. pentandra and A. rotundifolia.—*O'Shaughnessy, page* 331.

(199) AMMONIA is formed during the putrefactive fermentation of organic substances which contain nitrogen; also by heating animal matters such as bones, hoofs, horns &c. in iron cylinders; but the great supply is obtained from the gas-works of Europe, the ammoniacal liquor which comes over with the tar, during the destructive distillation of coal, being converted by various processes into sulphate, hydrochlorate, or carbonate of Ammonia. Common smelling salts are the sesqui-carbonate of Ammonia.—*Tomlin-*

(200) AMMONIA LIQUID, SPIRITS OF HARTSHORN, VOLATILE ALKALI, is a limpid, colourless fluid, exceedingly volatile, has a pungent smell, and a caustic taste; and is one of the most useful stimulants in the *Materia Medica.*

(201) AMMONIA, HYDROCHLORATE OF,

Sal Ammoniac, ENG. | Sohaga and Noshadur, PERS.
Navacharum. TAM. | DUK. AND SANS.
Urmeena, ARAB.

This valuable salt is the nowshadur of the bazars, where it is found in a sufficiently pure state for its more important uses, but it can be purified by a simple method of refining. Muriate of Ammonia is a volcanic product, but is also the result of the decomposition of many animal matters; the dung of camels when roasted with common salt, yields it in sufficient quantities to be the chief source of the salt in India and Egypt. Indeed, it was first obtained in Egypt near the temple of Jupiter Ammon, whence its name, by sublimation from the soot of camels dung. It is now manufactured largely in Europe, by combining hydrochloric acid, either directly, or indirectly, with ammonia obtained from the decomposition of animal matter. In France, by the distillation of bones, in iron retorts, but in Britain, from the ammoniacal salts contained in the liquor resulting from the distillation of coal in the gas works. Sulphuric acid is added, and the sulphate of ammonia thus produced, is decomposed by muriate of soda. Muriate of ammonia is sold in the bazars of India in thick fibrous semi-translucent cakes, devoid of smell, of bitter acrid taste. It sublimes when heated, dissolves in its own weight of boiling, or three times its weight of cold water. The hot water solution yields a copious deposit of fine feathery crystals. During its solution in water, the temperature falls several degrees, and this property is accordingly turned to account where ice is not procurable as a mode of cooling various beverages, or to aid the condensation of vapours in pharmaceutical experiments. This salt is very little prescribed internally: a lotion composed of one part of muriate of ammonia, dissolved in 24 parts of rectified spirit, and the same quantity of distilled vinegar, is much used as an external application to bruised parts and indolent tumours.—*Beng. Phar. p.* 259. It is used by tinmen to clean the surface of their metals and to facilitate the soldering of iron and copper and prevent the oxydation of the copper. It is also sometimes employed by dyers, to brighten their colours. It is employed, in solution as a repellant in cases of inflammation and tumours: it is exhibited as a diuretic by the Tamul practitioners in ascites and anasarca, and is also supposed by them to be a useful remedy in certain female obstructions, and uterine morbid enlargements. Sal Ammoniac, mixed with common salt, forms a powerful refrigerating mixture; when dissolved

merce, used for dissolving gold, instead of nitro-hydrochloric acid. It is also used in small quantities in steam boilers, to prevent the formation of calcareous deposits.—*Ainslie. Tomlinson.*

(202) AMMONITES, as the Ammonites were evidently principal agents for keeping within bounds the mollusks, &c. the crustaceans, and perhaps fishes of the periods prior to the Chalk formation, and belonging to the latter epoch, we should expect to find them widely distributed. Accordingly, they occur in Europe, Asia, and America, in strata apparently of the same date. In some instances, the genera and even the species are identical. Dr. Gerard found in the Himalaya mountains, at an elevation of 16,000 feet, *Ammonites Walcottii* and *Ammonites communis*, fossils that are found in the Lias of Lyme Regis. M. Ménard met with one in the Maritime Alps at an elevation of 1500 toises. Their numbers must have been great. M. Dufresne informed Lamarck that the road from Auxerre to Avalon in Burgundy was absolutely paved with them. The individual agency too of some of these carnivorous instruments for preserving the balance of marine animal power must have been of no small importance. Lamarck says that he has seen Ammonites of two feet (French) in diameter. Mr. James Sowerby and Dr. Mantell record ammonites in the chalk with a diameter of three feet and Dr. Buckland states that Sir T Harvey and Mr. Keith measured Ammonites in the Chalk near Margate which exceeded four feet in diameter; and this in cases where the diameter could have been in a very small degree enlarged by pressure. Ammonites occur in great abundance in the supra-cretaceous strata between Trichinopoly and Pondicherry.—*Engl. Cyc. page* 149.

(203) AMMONIACUM, from *Dorema ammoniacum.* (Don *Linn. Trans.* xvi. 601.) *Vern.* Oshak, *Pers.* This plant grows in Persia, plains of Yerde Kaust, and Kumisha in the province of Irak, and near the town of Jezud Khast, in very dry plains, and gravelly soil exposed to the sun. (*Lindley.*) The stem and fruits yield abundance of Ammoniacum resin.—*O'Shaughnessy, page* 364. This gum resin is imported into Bombay from the Persian Gulf, and re-exported to different countries.—*Faulkner.* It is obtained by incisions in the plant, and occurs in two forms,—first, in voluminous masses of yellowish colour, enclosing white almond-like tears, the whole being of plastic consistence, and very impure; secondly, in tears of irregular form, white or yellowish, opaque, rather solid, agglutinated or distinct, compact, brittle, of glassy fracture, and free from impurities. Its odour is faint and peculiar, taste sweetish and then bitter. It is partially soluble in water, ether, alcohol, alkaline solutions and acetic acid. Its *medical effects*, are similar to, but less powerful than, asafœtida: It is principally employed as an expectorant in the chronic catarrhs and asthmas of old persons. It is also applied externally as a warm and stimulating plaster.—*O'Shaughnessy, page* 365.

(204) AMOMUM, a genus of plants of the natural order Zingiberaceæ.

(205) AMOMUM ANGUSTIFOLIUM. Roxb. Fl. Ind. i. 39. A native of Madagascar, cultivated in the Mauritius; the fruit is the *greater cardamoms* of the old writers.—*O'Shaughnessy, page* 650.

(206) AMOMUM AROMATICUM. Roxb. Fl. Ind. i. p. 45. *Vern.* Morung elachi, *Hind.* —*O'Shaughnessy page* 650. This is a native of Chittagong and the valleys of the Eastern frontiers of Bengal; the fruit has similar properties to those of the true cardamoms, for which they are often sold to the druggists of India.

(207) AMOMUM CARDAMOMUM. Roxb. Fl. Ind. i. p. 37. *Vern.* Elachi, *Beng.* Java, Sumatra, and mountainous parts of India.—*O'Shaughnessy, page* 655. This seems the round and clustered cardamom of the shops. It is a garden plant in India: the seeds are aromatic, and are used by the Malays instead of the true cardamoms, *Elettaria cardamomum.*

(208) AMOMUM DEALBATUM, is *the Burra elachi* of Sylhet.—*O'Shaughnessy, page* 650.

(209) AMOMUM GRANA PARADISI. Paradise grains, Malaguetta pepper. A native of the coast of Guinea near Sierra Leone. *O'Shaughnessy, page* 650. The *A. grandiflorum* of the same locality yields seeds of very different and camphor-like flavour.—*O'Shaughnessy, page* 650. The cardamoms of commerce are the capsules, which are gathered as the seeds ripen, are dried in the sun, and are then fit for sale. The smaller capsules or lesser cardamoms are the most valuable.

(210) AMOMUM MAXIMUM, according to Pereira, yields the *great winged* cardamoms, referredby Lindley to *Elettaria.*—*O'Shaughnessy, page* 650.

(211) AMOMUM NUTAR. Under this name Dr. Riddell describes a flowering plant throwing out long branches with drooping panicles of wax-like flowers, a native of some of the Eastern Islands, which has never been known to give seed. The only flower approaching near it in beauty, is one of the parasites blossoming in May at Mahabuleshwar.—*Riddell.*

(212) AMOORA (AGLAIA) ROHITUKA. Nat. Ord. MELIACEÆ.—Andersonia Rohituka, *Roxb.* Sphœrosacme R.,

Chemmarum, MAL.	Tikhta-raj, BENG.
Hurin-hura, or Khana, HIND.	Khayau-kayoe, BURM.

From the seeds, where the trees grow plentifully, the natives extract an oil which they use for many economical purposes. *Roxb.* This tree is scarce, but found in the Tounghoo Forests. Wood, white colored, adapted to every

purpose of house-building. It grows also in Travancore and Bengal.—*McClelland. Useful Plants.*

(213) AMORPHOPHALLUS CAMPANULATUS *(Blume.)* Nat. Ord. ARACEÆ.

Telinga Potatoe, ENG.	Karoonay-kalungoo, TAM.
Karuna, MAL.	Ol, HIND.
Muncha kunda, TEL.	

The roots of this plant are very nutritious, on which account they are much cultivated for the purpose of diet. They are planted in May, and will yield from 1 to 250 maunds per beegah, selling at the rate of a rupee a maund. The roots are also used for pickling. They are acrid when raw, and are employed medicinally in boils and ophthalmia. Wight says, that "when in flower the fetor it exhales is most overpowering, and so perfectly resembles that of carrion as to induce flies to cover the club of the spadix with their eggs." A very rich soil, repeatedly ploughed, suits it best. The small tuberosities found in the large roots are employed for sets, and planted in the manner of potatoes. In twelve months they are reckoned fit to be taken up for use; the larger roots will then weigh from 4–8 or more pounds, and keep well if preserved dry. The Natives of India employ them for food in the manner of the common yam, and they are very generally raised by the Burmese and Karens. It is much cultivated in Madras.—*Jaffrey. Mason, Useful Plants.* Wight also figures A. margaritifer, A. sylvaticus, and A. bulbifer.

(214) AMPHIDESMA, a genus of marine bivalve shells, which are found in the sand on the sea-coast of tropical climates. The shells are oval or rounded, sometimes rather twisted and slightly gaping behind. They have two hinge teeth in each valve, and often distinct compressed lateral ones. The elastic cartilage is placed in a small triangular cavity just behind the hinge teeth. The cartilage has opaline reflections, and the cartilages of some large shells, as the mother-of-pearl shells, are sold by the jewellers under the name of Peacock-stone, or Black Opals. They are not so much used now as formerly, but they are still much sought after on the continent, especially in Portugal.—*Eng. Cyc. page* 185.

(215) AMPHIDONAX KARKA (*Lindl.*) Nat. Ord. GRAMINACEÆ. Arundo karka. *Retz. Roxb. fl. Ind.* i. 348. Dárma, *Beng.* grows in Bengal and the Peninsula of India. The common Durma mats at Calcutta are made of the stalks of this reed split open. In Sinde the culms are made into chairs and the flower stalks are beaten to form fibres which are there called Moonyah. These are used for strings and ropes, &c. &c.—*Royle. Roxb. &c. quoted in Useful Plants.*

(216) AMPHILOBIUM MUTISII. *Bignoniaceæ*—A pretty climber with purple flowers, well adapted for trellis work, in India.—*Riddell.*

(217) AMPULLARIA, a genus of fresh-water spiral univalve shells, which are found in the rivers and ponds of India, Africa, and South America. They are of a globular or rather depressed form, are covered with a thick olive or black periostraca, and often banded. Their mouth is ovate, with the lips complete all round, and often slightly thickened or reflexed. —*Engl. Cyc. page* 188.

(218) AMYGDALEÆ (Drupaceæ of Lindley), a sub-order of the natural order Rosaceæ. The leaves and other parts of the plant yield hydrocyanic acid, owing to which the species are all more or less poisonous: but other parts free from this acid, or possessing it in very minute quantity, as the succulent fruit and the kernel, are valuable articles of food, on which account they are much cultivated. The peach, nectarine, plum, cherry, almond, apricot, prune, damson, and bullace are produced by different species of this order, and many of them are considerable articles of import into India. The bark of *Amygdaleæ* yields a gum, which has similar properties to gum Arabic; and an astringent substance which gives some of the species so much efficiency in fevers, that their bark has been compared in utility to Peruvian bark.

(219) AMYGDALUS, a genus of plants, the type of the sub-order *Amygdaleæ*, comprehending the almond, and the peach and nectarine, besides a few bushes, the chief interest of which arises from their gay appearance.—*Engl. Cyc: p.* 188.

(220) AMYGDALUS COMMUNIS, common almond.

Faulkner.

Var. A. sweet, *Var.* B. bitter. A native of the Himalayas, the Mauritius, Taurus, Caucasus, and Hindoo Kosh; cultivated in Europe, abundant in Cashmere. Of this plant, there are two varieties of fruit, the sweet and the bitter almonds of commerce. The sweet almond contains 24 per cent of albumen and 54 per cent of fixed oil, the latter forming the principal product of the tree. It is colourless, very slightly yellow with difficulty congealed, taste sweet, smell light, agreeable and resembling that of the seeds. In all its properties and uses, it is nearly identical with olive oil: and forms the basis of the greater part of the liniments and ointments of the European Pharmacopœias. *Var.* B. *The bitter almond.*—(Kurwa Badam, *Beng.*) The fruit is smaller than that of the preceding variety: in every other respect the structure and appearance of the trees and fruits seem to correspond. The taste, composition, and properties are however totally different. This leads almost irresistibly to the conclusion that there must ex-

ist specific anatomical differences between the trees. It has indeed been asserted, but on very inadequate grounds, that the sweet and bitter fruits have been gathered from the same tree. Others state that culture will change the bitter to the sweet, as it has changed the sour crab to the delicious apple, and the bitter, half poisonous wild potatoe to its present state. On this point Lindley observes, that the sweet and bitter almond are only varieties of each other, chiefly differing in the quantity of prussic acid their seeds contain. No opinion is to be treated with more respect than that of Lindley on all botanical matters, but Dr. O'Shaughnessy expresses his belief that no prussic acid has yet been traced in the sweet almond. The sweet and bitter kind are imported into the northern parts of India from Ghoorbund, and into the southern parts from the Persian gulf. When the bitter almond deprived of its epidermis is subjected to cold pressure, it affords a large quantity of thick fixed oil, identical with that procured from the sweet almond. When the oil cake thus obtained is reduced to powder and distilled with water, a volatile oil passes over, of golden yellow colour, of strong odour of prussic acid, extremely poisonous, and depositing crystals on exposure to the air. This oil contains a large quantity of hydrocyanic acid; the oil combines with alkalies forming soaps and a *benzoate* of the base; acted upon by nitric acid it is also oxydized, and the same acid produced. It is very soluble in alcohol and sulphuric ether.—*O'Shaughnessy, pages* 319-20.

(221) AMYGDALUS PERSICA (Peach tree.) Shuft Aloo, *Pers*: This tree was introduced into Europe from Persia, where the fruit is very fine, and called Kulloo and Kardee-aroo, and Khookh, *Arab.* It is also found of fine quality in Mysore and China, and cultivated with success in Bengal and the Dekhan. The three varieties of this fruit met with in the Dekhan are a large round white sort, of a delicious flavor; the flat China; and a small thin-skinned description, more resembling an apricot in appearance, and much harder than the others. The peach is easily cultivated by seed or layers. A seedling will throw out blossom in the second year, and be ten or twelve feet in height: it requires to be carefully pruned, wintered, and watered. No branches should be allowed to grow on the stem closer than three feet from the ground; all spurious and misplaced shoots should be rubbed off before gaining strength to exhaust unnecessarily the juices of the tree; and all distorted leaves, the work of insects, of parasitic plants, mildew, &c. should be picked off and destroyed. The kernels of the peach should be carefully removed from the shell, and in no ways injured, required for planting: they should be sown small beds at the commencement of the rains, but eighteen inches apart, and as soon as the s are fit for removal, a good sized ball of earth must be taken up with the roots, to prevent the root fibres from receiving injury. All the buds around the stem had better be rubbed off by the hand, as far as requisite, and a proper shape be given to the tree, by cutting out all the superfluous spurs and their branches. The time for opening the roots of the peach is after the close of the rains: then remove the earth with care, so as not to injure the roots, for the space of three feet round the stem; pull off all the leaves, and cease to water the tree until the blossom buds appear; then cover up the roots with good loam mixed with old rotten manure; water freely every third or fourth day, until the fruit begins to ripen, when you must be guided by circumstances. It is necessary sometimes to thin the fruit, and also to put the peaches in bags, as they begin to ripen, otherwise the birds destroy them. In the Dekhan, peaches first come in about February, and with care may be continued until the rains commence, after which the excess of moisture received by the leaves and roots causes the fruit to swell and burst.—*Riddell.* The flowers are purgative, but also narcotic. Dr. Christison relates the case of a gentleman who was poisoned by taking them in salad as an aperient. The leaves and kernels on distillation yield abundance of prussic acid. The fermented fruit gives an excellent brandy, chiefly manufactured in the United States of America. The bark gives a large quantity of gum during the hot season.—*O'Shaughnessy, page* 222.

(222) AMYRIDACEÆ, *Amyrids*, a natural order of plants, consisting of tropical trees or shrubs, the leaves, bark, and fruit of which abound in fragrant resin. The species are natives of tropical India, Africa, and America. This order is remarkable for yielding various fragrant resins as Myrrh, Frankincense, and other products. The Frankincense of India is the produce of a species of Boswellia. Olibanum is yielded by *Boswellia serrata.* Myrrh is obtained on the Abyssinian coast from the *Balsamodendron myrrha. B. Opobalsamum* yields the Balm of Mecca. Bdellium is produced in Africa by *B. Africanum.* American Elemi comes from *Icica Icicariba.* Resin of Courina from *I. ambrosica,* The gum Elemi of commerce is said to be yielded by several species of *Amyris.* (Lindley, *Vegetable kingdom.*)—*Engl. Cyc. p,* 189.

(223) AMYRIS COMMIPHORA. This tree grows in India: its wood and resinous juice have a strong balsamic smell: its gum is called *Meisakshi,* Tel. and Hind. and *Mysashee,* Tam. —*Riddell.*

(224) AMYRIS HEPTAPHYLLA. *Amyridaceæ.* Karn-phul, HIND.—A shrub with alternate pinnate leaves, and small yellow flowers; the leaves when bruised have the smell of anise. —*Riddell.* Between the Pegu and Tounghoo districts the leaves of this tree, both dry and in a green state, are a favorite spice to the inhabi-

tants of that part of the country, where it grows plentifully.—*McClelland.*

(225) ANABAS, (from ἀναβαίνω, to ascend), *Tellee*, also *Pannei-eri*, TAM. *Palmyra Climber*, the name given by Cuvier to a genus of Acanthopterygious osseous fishes, remarkable for the power possessed by the species of living for some time out of water, and making their way on land. This power depends on a structure characteristic of the family of which it is the type, part of the pharangeals being labyrinthiform; that is to say, divided into a number of irregular lamellæ, more or less numerous, forming cavities and little cells capable of retaining a certain quantity of water. This apparatus is so protected that, when the animals are out of their native element, the evaporation of the contained water takes place very slowly, and the gills are kept moist, by means of which remarkable provision the fishes of this family are enabled to leave the rivers and marshes where they usually reside, and to travel over land for considerable distances, creeping among the herbage or along the ground. Although this fact has been but recently known to modern naturalists, the ancients appear to have been well acquainted with it, and Theophrastus has recorded the existence in India of certain little fishes which leave the rivers for a time, and again return to them: he doubtless alludes to the *Anabas* and its allies. —*Engl. Cyc. p.* 189. The genus *Anabas*, of which there is but one species, the Anabas scandens (*Perca scandens* of Daldorf, *Anthias testudineus* of Bloch), is distinguished by a well-marked character, the borders of its opercle, subopercle, and interopercle being denticulated, whilst the preopercle is not so, nor even distinctly marginated. The head is round and broad, the muzzle is very short and obtuse, the eye placed very near its extremity. The mouth is small, and large scales cover the head. The body is oblong, compressed centrally and behind. The lateral line is interrupted at its posterior third, recommencing a little lower. The tail is somewhat rounded. The whole body is covered with large scales. There is a single dorsal and an anal fin, nearly equal in height, and in both the spinous rays prevail.—*Engl. Cyc. p.* 189. In colour it appears to vary, being brown or bluish-black or dark green, paler beneath and having violet fins. In form the individuals are constant and reach the length of 6 inches.—*Engl. Cyc. page* 189. This fish inhabits all parts of India and the Indian Archipelago, living in marshes and in the back-waters, and feeding on aquatic insects, and Dr. Cantor, observed it at Chusan. Respecting its habits there has been much discussion. In 1797 a Danish gentleman, M. Daldorf, communicated an account of its habits to the Linnæan Society of London, in which he stated that he had observed it in the act of ascending palm-trees near marshes, and had taken it at a height of no less than 5 feet above the surface of the water, effecting its movements of ascent by means of its fins and tail and the spines of its opercles, in a similar manner to that by which it progressed along the ground. Another Danish observer, M. John, published a similar statement, adding that it is called in Tranquebar by a name which signifies palmira Tree-Climber. Other European naturalists, who have equally observed it in its native countries, such as Reinwardt, Leschenault, Hamilton and Buchanan, whilst they record its habit of creeping on the ground and living a long time out of water, deny or omit all mention of its power to ascend trees but we have frequently seen it climbing up rough surfaces.—*Engl. Cyc. page* 189.

(226) ANACARDIACEÆ, ANACARDS, or Cashew Tribe—are woody plants, abounding in an acrid resin: the juice is often used as a varnish, for which it is well adapted in consequence of its turning hard and black when dry. The extreme acridity of its fumes, however, which are apt to produce severe inflammation in many constitutions, render it dangerous to use: the Rhus or Sumac, the Pistacias Mango and Anacardium are genera of this order.—*Eng. Cyc.*

(227) ANACARDIUM OCCIDENTALE (*Linn.*)

Cashew-nut tree, ENG.	Parunkimavah, MAL.
Cola-Mavah, TAM.	The-ho-thayet, BURM.
Higilee Badam, Cajoo, HIND.	Jidi memidi, TEL.

This tree, indigenous to the West Indies, grows all over India, Burmah and the Tenasserim provinces, where, though scarce in the forests of Pegu, it is largely cultivated about Phoungyee houses and in groves near towns. It sometimes grows to a large size, and its wood is dark in colour, but not deemed of value in carpentry; it makes the best charcoal for iron smiths. It is very ornamental when in leaf, bearing sweet-smelling flowers, succeeded by a pea-shaped fruit of a yellow and red colour. The nut hangs at the end of the fruit outside; and is of a kidney shape. The fruit is very acrid and astringent. The pericarp of the nut produces a black acrid oil, which, owing to its caustic properties, is often applied to floors or wooden rafters of houses to prevent the attacks of white ants. It requires however to be used cautiously. This oil is called Cardole, also Cashew Apple oil, and is a powerfully vesicating agent. A valuable substringent gum is obtained from the trunk of the tree, useful as a good varnish, and ma[illegible] substitute for gum Arabic. It sho[illegible]aking a fair lected while the sap is rising. It i[illegible]uld be col- useful where the depredations of i[illegible]ctus particularly to be guarded against, and is use[illegible]insects require by the bookbinders, who wash t[illegible] and in S. America solution of it, in order to keep [illegible]eir books with a ants. The kernels, when roast[illegible]t thaway moths and [illegible]d, are edible and

wholesome, and are used for imparting a flavour to Madeira Wine. Ground up and mixed with cocoa they make a good chocolate. The juice which flows from an incision in the body of the tree will stain linen so that it cannot be washed out. The caustic oil of the coats of the nut is applied to warts, corns, ulcers, &c., but it is said that the vapour of the oil when roasting will produce violent swelling and inflammation. Martius says, "The sympathetic effect of the nut borne about the person upon chronic inflammations of the eyes, especially when of a scrofulous nature, is remarkable." The bark of the tree is given internally in infusion in syphilitic swellings of the joints. Lastly, an edible oil, equal if not superior to olive or almond oil, is procured from the nuts, and the fresh juice of the flower-stalks is used in lemonade. Wine and vinegar are also made of it by fermentation. The seeds or nuts form an article of commerce, and are said to yield a spirit by distillation, superior to rum or arrack and described as a powerful diuretic. The astringent juice of the fruit is highly recommended as a remedy in dropsical habits.—*Lindley. Pereira. Ainsl. &c. &c. quoted in Useful Plants. Riddell. McClelland. M. E. Jur. Rep. Jaffrey.*

(228) ANAGALLIS ARVENSIS, or pimpernel, is common in Europe and in India during the cold season; is an acrid drastic cathartic once much prescribed in insanity, epilepsy and dropsy. Wight in his Icones 1205 gives figures also, of A. cœrulia; A latifolia.

(229) ANAGALLIS INDICA. *Primulaceæ.*—A flowering plant, a native of Nepal, colour blue, of easy culture and propagated by cuttings, in any common soil.—*Riddell.*

(230) ANAMIRTA COCCULUS. (*W. & A.*) N. O. MENISPERMACEÆ. *Syn. A. paniculata, Colebrooke. Menispermum Cocculus L.—M. heteroclitum. Roxb.*

Kaka-collie, TAM.	Kakmari, HIND.
Kaki-chempoo, TEL.	Polla, or Kakandaka-conu. veh, MAL.

The seeds are called Kakmari ke beenj in the bazars. This is a strong climbing shrub, with the bark corky, ash-coloured, and deeply cracked into fissures; leaves roundish, acute, very slightly cordate, sometimes truncate at the base, hard, leathery, shining, smooth, with five digitate ribs, six inches long and as many broad: stalks shorter than the leaves, tumid at both ends; flowers in lateral compound racemes. Drupes two or three, globose, cotyledons distinct, linear, oblong, very membranous.—(*Lindley's Flora Medica. p.* 41) It is a native of Malabar, Travancore, the Circar mountains, and the Eastern Islands, is cultivated in the Botanical Garden of Calcutta and according to Dr. Helfer is indigenous in the Tenasserim Provinces. The seeds of this species are well known in commerce under the name of Cocculus indicus, or "*Coques du Levant*;" they are roundish, kidney-shaped, enclosed in a blackish brown, dry and wrinkled perisperm, within which the fruit is white, bivalvic and unilocular; the kernel is oily. They are devoid of smell, of extremely bitter taste, and poisonous in moderate doses. These properties are due to the presence of a peculiar principle named *Picrotoxic acid.* This acid is prepared by making a watery extract by acetate of lead; filter, evaporate to dryness in a water bath, dissolve in spirit, filter a second time, and continue evaporating and redissolving until the extract is perfectly soluble in alcohol and water. It now consists of picrotoxic acid and colouring matter. The latter may be separated by the careful addition of a small portion of water; the colouring matter is removed, and the picrotoxic acid remains. The seeds are poisonous to all animals, and even to vegetables. The general effects produced on the former are nausea, vomiting, tetanic convulsions, and insensibility; ten or twelve grains of the picrotoxic acid are sufficient to destroy a dog. Marcet proved by experiments that a solution prepared with an extract made with the seeds have killed a bean plant in twenty-four hours. Cocculus indicus is largely employed in Australia in destroying the parasitic animals which attack the skins of sheep. It is also used for stupifying fish; mixed with crumbs of bread and thrown into ponds, the fish which eat the crumbs become intoxicated, float on the surface, and are easily taken. It is well known that fish thus caught are exceedingly dangerous. It has been said that the seeds are often added to beer, which they render more intoxicating, but the truth of this accusation, has not been confirmed. The only use of the Cocculus indicus in medicine is as an external application, as a powder or ointment, to destroy vermin in the hair, and in the treatment of some cutaneous diseases. A considerable quantity of "Cocculus indicus" seeds is exported from Malabar and Travancore, and shipped for the London market, where the prices vary from 18 to 24 shillings per cwt. The exports from Travancore alone for 1854-55, were upwards of 75 candies. The imports for the English market are about 240 tons annually.—*O'Shaughnessy. Mason. Ainsl. Simmonds. Lindley. &c. &c. quoted in Useful Plants.*

(231) ANANAS SATIVUS (*Schult.*) Nat. Ord. BROMELIACEÆ. HEXANDRIA MONOGYNIA. Sex. Syst.

Pine-apple, ENG.	Ananas, DUK.
Pooreethee, MAL.	Ananas, TEL.
Anasie, TAM.	

The Pine Apple grows profusely in the Malay Peninsula, the Moluccas, the Philippine Islands and China, and it seems to have been introduced into India by the Portuguese, but it is now domesticated, indeed in parts almost wild. The delicious flavour of the fruit is well known. The plant succeeds well in the open air as far North as 30°, while in the southern parts of the Peninsula of India they form hedges, and will grow with little care and in almost any soil. The flav-

our of the fruit is of course greatly heightened by cultivation, being somewhat acrid in its wild state. The plants are remarkable for their power of existing in the air without contact with the earth, and in South America they may be seen in abundance hanging up in the gardens and dwelling-houses, in which situations they will flower profusely, perfuming the air with their delicious fragrance. The most important use of the Pine-Apple plant undoubtedly consists in the fine white fibres yielded by the leaves. These have been formed into the most delicate fabrics, as well as fishing lines, ropes, &c. Unlike other fibres they are not injured by immersion in water—a property much increased by tanning, which method is constantly used by the natives. In Malacca and Singapore a trade is carried on with China in these fibres, which are there used in the manufacture of linen-stuffs. As a substitute for flax they are perhaps the most valuable of Indian fibres. Dr. Royle states, "that a patent was taken out for the manufacture of thread from the Pine-Apple fibre, because, when bleached, it could be manufactured the same way as flax. The process of bleaching by destroying the adhesion between the bundles of fibres renders it much finer, and hence enables it to be extended between the rolls in the process of spinning." The Juries Reports in the Madras Exhibition of 1855 mentions its fibre as being fine, white and strong, of considerable length, very silky and susceptible of being split into the finest threads: very fine specimens of this were exhibited by the Madras School of Arts as tow, hackled flax, and refuse for making string. Also as thread, string, and line: clean specimens of the fibre were contributed from Cocanada, South Arcot, Tanjore, Bolarum, and Tranquebar. According to experiments by Dr. Royle, pine-apple fibre prepared at Madras bore 260 lbs., and some from Singapore 350 lbs. A rope of the same broke at 57 cwt. In other experiments a 12-thread rope of plantain fibre broke at 864 lbs., and a similar rope of Pine-Apple fibre at 924 lbs. *Royle. Ainslie. quoted in Useful Plants. Jury Rep. Mad. Ex.*

(232) ANANAS STRIATIFOLIA. RIBBON-LEAVED PINE APPLE. This is a very ornamental variety of the pine apple that has been introduced from Malacca, into the Tenasserim Provinces.—*Mason.*

(233) ANATHERUM, a genus of grasses, belonging to the group of which species yield fragrant volatile oil. *A. muricatum* now Andropogon, is the *Vetian* of the French and the *Khuskhus* of the Hindoos. Its fragrant roots are employed in making tatties, covers for palanquins, &c. It is administered medicinally, and has stimulating and diaphoretic qualities. *A nardus* is also, on account of the volatile oil it contains, called Ginger-Grass, or Koobel.—*Eng. Cyc. p.* 193.

(234) ANATIDÆ (*Leach*), the Duck kind, a group formed by Dr. Leach to include his genera formed by the great genus *Anas* of Linnæus [Ducks.]—*Eng. Cyc. p.* 193.

(235) ANCESTROLOBUS CARNEA (Zoungali, Burm.) and A. MALLIS. (Yinbya, Burm.)

These two timber trees, are plentiful in the Pegu and Tounghoo forests. The timber grows very tall, but seldom exceeds three feet in girth. Wood, dark-brown.—*McClelland.*

(236) ANCHOR.

Lungur, ARAB.	Lungur, PERS & HIND.
Ancre, FR.	Ancora, IT.
Anker, GER.	Ancla, SP.
Loolee, GUZ.	*Faulkner.*

A well known heavy hooked iron instrument, for fixing a vessel in a road-stead or harbour.—*Faulkner.* The Anchors for the larger sailing vessels are wholly imported into India. The *sheet, anchor, bower, spare, stream, kedge and grapnel,* are names given to anchors of various forms and sizes. The patent anchors of Mr. Stuard have one arm; as also have some of those of Lieutenant Rodgers, who has patented two single armed compound anchors, and a third which has two arms. His improvements are perhaps the greatest that have been made.—*Tomlinson.*

(237) ANCHOVY (*Engraulus*, Cuvier),

Anchois, FR.	Acciughe, IT.	*Faulkner.*

A genus of Abdominal Malacopterygious Fishes, separated by Baron Cuvier from the *Clupeæ*, or Herrings of Linnæus. The genus, as at present constituted, consists of six or seven species, all of diminutive size, and, with the exception of the common Anchovy (*E. encrasicholus*), and a nearly allied species distinguished from it by M. Cuvier (*E. meletta*), are all inhabitants of the tropical seas of India and America. Whether these latter wholly agree with the European species in the savour and other qualities of the flesh, for which it is so highly esteemed, is a doubtful question; at all events the fishing of the native species for export, has never been attempted in America or India. The common Anchovy of commerce is a small fish, not much longer than the middle finger, of a bluish-brown colour on the back, and silvery-white on the belly. It abounds in the Mediterranean along the shores of Spain, Italy, and Greece; in the Atlantic, it is found along the coasts of Portugal and France, and occasionally has been taken off the shores of England and Holland, as well as in the Baltic. Considerable fisheries of Anchovies are established along the coasts of Provence and Catalonia; but the most productive of all is off Gorgona, a small island west of Leghorn. If, when the barrels are open, the fish are found to be small and firm, round-backed, with a silvery-white skin and red flesh, and a plump compact form, they are probably the true anchovy; if, on the contrary, they taper very much towards the tail, or are of a dark brown colour without, and have flabby pale-coloured flesh, they will probably turn out to be the Sardine (*E. meletta*), another Mediterranean species frequently mixed with real anchovies, or

even sold separately as the genuine fish. The true Anchovy, Engraulis encrasicholus of Fleming (Lycostomus) grow from four to seven inches in length. The true Anchovy when bottled has the head and intestines removed; but the scales and fins, with the exception of the pectorals are allowed to remain. The fish is of small size, silvery, and rather flat, and the flesh of a salmon colour, but increases to a deep beautiful pink colour, when it is twelve months old. Anchovies are imported into England in barrels in brine made with rock-salt, and bottled in England; but of 28 samples of bottled Anchovies examined by Dr Hassall, in 1852, nearly all were found adulterated, with Dutch fish, Sicilian fish, Bole Armenian and Venetian red, not a third part consisting of true Gorgona Anchovies. The commercial value of "French fish," possibly an *Engraulis*, is about one-half that of the Gorgona Anchovy; that of the "Sicilian fish," is at least one-third less than the Gorgona Anchovy; and the "Dutch fish," also possibly an *Engraulis*, is likewise of very inferior value, and greatly inferior as an article of diet: sprats and sardines are also sold as real Gorgona Anchovies, but the sardine is a white fish.—*Hassall. Eng. Cyc.* The species of Engraulis at Madras are three in number; the Netteli or Teran Goonie, *E. albus*, is caught in the great nets, in immense numbers and by Europeans, highly esteemed for the breakfast table; and one about 6 inches long is very delicate eating. The Tamil names of the others are *Pota Nelteli* and *Maper Netteli*. (See ENGRAULIS.) *Jerdon.* The *gna-ping-nai-say*, of the Burmese coast and Tenasserim provinces, is considered by Dr. Morton to be the *E. Meletta*, or common sardine; but Mr. Mason, has no doubt it is an Engraulis.—*Faulkner. Mason.*

(238) ANCHOVY PASTE. Dr. Hassall's recent analysis of this substance showed the entire samples to be highly and even vividly colored with very large quantities of bole Armenian, and adulterated also with flour.—*Hassall.*

(239) ANCHOVIES, ESSENCE OF. No condiment is more generally known and esteemed than anchovy sauce. It was in use among the Romans, and was one of the kinds of sauce called Garum, which appears to have formed an indispensable article of seasoning in their most expensive and luxurious dishes. Dr. Hassall found the whole of the samples analyzed by him, to be adulterated with the ferruginous oxide, bole Armenian.—*Hassall. Eng. Cyc.*

(240) ANCHUSA TINCTORIA, Alkanet. A native of Europe, the root extensively used in dyeing. For this root those of the *Onosma echioides*, and *O. tinctoria* have been substituted. The *Onosma emodi* (Wall.) of the Himalayas is closely allied to this, and is called *Maha runga* from the intensity of its colour. The alkanet of Constantinople is produced by a different order of plants altogether, being the root of the Alcanna vera, (Natural order, *Salicariæ*.) *Fee.* —*O'Shaughnessy, page* 498. Its *red* principle Alkanet, or Orcanet, occurs in masses of brown colour, resinous fracture, melting at a low heat, soluble in alcohol, ether, and the fatty oils, which assume a red colour, remaining still transparent; less soluble in water, forming blue compounds with potash, soda, baryta, and with lime, decomposed by hot sulphuric acid, changed into oxalic acid by the nitric acid. The alcoholic solutions treated by several metallic re-agents afford some beautiful lakes. Orcanet is only employed in pharmacy as a colouring matter for ointments and pomatums. Its chief use is as a dye stuff, and for colouring sugared sweetmeats for confectioners.—*O'Shaughnessy, page* 496. The Anchusa plants are annuals and perennials, easily cultivated, and for ornamental purposes, may be planted in open borders; their colours are deep blue, and in some cases varied with red and white. —*Riddell.*

(241) ANDROGRAPHIS. Wight, in his ICONES, gives figures of the following species, viz. A. Ceylanica, 1560; echioides, 467; lobelioides, 1557; Neesiana, 1561; paniculata, 518; serpyllifolia 517; viscosula, 1559; Wightiana, 1558. We notice the following.

(242) ANDROGRAPHIS PANICULATA (*Wall.*) ACANTHACEÆ. *Syn.* Justicia paniculata, *Roxb. Fl. Ind.* i. p. 118.

Kala megh, BENG	Kiriatha, MAL.
Kalupnath, or Muha tita (great bitter), HIND.	Creat, DUK.
Kiriat, TAM.	Nella, TEL.

It is the Cara-caniram of Rheede, and in some parts of India it is known as the Vella-Vaymboo. A native of dry ground under the shade of trees; flowers in the wet and cold seasons. Celebrated as a stomachic bitter, and used in cholera and dysentery. It is the basis of the celebrated "*Drogue amere*," a compound of mastic, frankincense, resin, myrrh, aloes, and creat root, steeped in brandy for a month, and the tincture strained and bottled.—*O'Shaughnessy, page* 482. It is an annual plant, and according to Ainslie, it was originally brought from the Isle of France. It is cultivated in Tinnevelly and other districts; and is now found wild in Bengal and probably in the Peninsula. It is one of the plants from which the Chiretta of the bazars is obtained. See CHIRETTA.—*Ben. Phar.* 210.

(243) ANDROPOGON CALAMUS AROMATICUS is supposed by Dr. Royle to be the calamus aromaticus of the ancients; yields a volatile oil, erroneously termed oil of spikenard; the true spikenard of the ancients is supposed to have been obtained from the Nardostachys Jatamansi, a plant of the Valerian family. Dr. Royle regards this andropogon as the plant which yields the oil of Nemaur, known in Southern India as the Roosa Grass oil, which differs but little either in appearance or quality from the Lemon grass oil, is used for the same purposes and forms a good

substitute for the more expensive cajaput oil.—*O'Shaughnessy. Royle. Jur. Rep. M. E.*

(244) ANDROPOGON CITRATUM (*DC.*) Nat. Ord. GRAMINACEÆ.

Lemon-grass, or Sweet-rush, ENG.	Ghunda-bela, HIND.
Camachie-pilloo, TAM.	Sireku MAL.
Kamachie-kussoo, TEL.	Gnudho-bena, BENG.
	Sa ba-len, BURM.

A. schœnanthus, *Linn.*—Cymbopogon schœnanthus.—*Spreng.* This lemon-grass is a native of Arabia, but is cultivated in India, in the West Indies, Ceylon, Burmah, Tenasserim, and the Moluccas. The active principle of the leaves seems to reside in the essential oil which they contain, and which is obtained by distillation. This is known in commerce as "Lemon grass oil," and forms an important article of export from Ceylon, amounting in value to nearly £7,000 annually. It may be seen covering all the Kandian Hills, and so long as it is young, it is the best possible pasture for cattle. This species of grass is very hard, and grows to the height of seven feet or even higher, and has a strong but extremely pleasant acid taste. It derives its name, from having, when crushed, an odour like that of the lemon, so strong, that after a time it becomes quite heavy and sickening although grateful and refreshing at first. It is cultivated all over the Tenasserim provinces; a decoction of the leaves is deemed by the people efficacious in cholic. The leaves are used in India as a kind of Tea, and are deemed tonic and slightly stimulant. It is now cultivated very generally throughout the West Indies, in the gardens of the planters, as an elegant and powerful aromatic, and was doubtless introduced from the East. An infusion of the fragrant leaves, which are bitter and aromatic, is given to children as an excellent stomachic. It is also diaphoretic. Mixed with butter-milk the leaves are used in cases of ringworm; and the white centre of the succulent leaf-culms is used to impart a flavour to curries. The oil is of a light straw colour, but becomes red if kept long. It is much used in perfumery, as the oil of Verbena.—*Roxb. Lindley. Ainsl. Simmonds. &c. Mason. Useful Plants.*

(245) ANDROPOGON DIGITALIS, is mentioned by Simmonds, as Kus-kus grass, the oil of which, from Ulwar in Rajpootanah, was shown in the Exhibition of 1851.

(246) ANDROPOGON ESCULENTUM. Mr. Mason mentions that several species of andropogon, as the genus is described by Roxburgh, are among the most abundant of the grasses of Burmah, and one of these Dr. McClelland describes under the name of *Andropogun esculentum*, or Lemon grass, (Tsablain, Burmese) cultivated in small quantity in every village throughout the country, and to be had in all the bazars. It is a valuable article, and in a dry state might be found profitable for export. Mr. Jaffrey mentions that A. esculentum, (*A. Narthum-pilloo*, Tamil) is used in Madras to perfume water, which the people drink, and that a proportionate quantity imparts a pleasant flavour to tea.—*McClelland. Jaffrey. Mason.*

(247) ANDROPOGON IWARANCHUSA (*Roxb.*)

Iwaran-kusha, BENG.

Andropogon Iwaranchusa, this Roosa oil, has long been supposed to be the celebrated grass oil of Nemaur, but Dr. Royle, does not recognise the correctness of this opinion and refers the Nemaur oil to the A. Calamus Aromaticus, It is probable, however, that the several species furnish oils of similar characters. A. Iwaranchusa is a native of the low hills at the base of the Himalayas, and is also found at Asseergurh and in Malwah, generally. The roots of this fragrant grass are used by the Natives in northern India in intermittent fevers. In habit and taste it is similar to the A. citratum. The oil of A. Iwaranchusa is used as a stimulant internally and externally, much in the same manner as oil of cajeput.—*O'Shaughnessy.*

(248) ANDROPOGON MARITIMA? (Martini?) is mentioned by Simmonds as having been shown at the Great Exhibition of 1851, under the name of Newar oil and prepared at Agra from this species, but it is probably the following plant.—*Simmonds.*

(249) ANDROPOGON MARTINI (*Roxb.*)

Koobell, HIND.	Roussa-grass, ENG.

A fragrant oil is extracted from this species of grass known as the Grass Oil of Nemaur. It is also known as the ginger-grass oil. It is valuable as a rubefacient, and is employed as a substitute for Cajeput oil. The grass has a strong aromatic taste, scenting the milk of those animals which feed on it. It is considered by Dr. Royle to be the Sweet Cane of Scripture. It is frequently applied externally in rheumatic affections, being obtained by distillation. The scent is very fragrant and aromatic, and the colour is a pale straw. Much used in perfumery, and medicinally as a stimulant and diaphoretic. It has the power in a most remarkable degree of preventing the hair of the head from falling off after acute diseases, such as fever, or after confinement or prolonged nursing. It even restores it after it has fallen off. But it must be strong and pure, and not that usually sold by perfumers.—*Lindley. Royle. Pereira. &c. quoted in Useful Plants.*

(250) ANDROPOGON (ANATHERUM) MURICATUM.

Cuscus-grass ENG.	Khus-kus, BENG.
Vette-vayr, TAM.	Bena-useer, HIND.
Cooroo-vayroo, or Kussa-voo, TEL.	Pan-yen, BURM.

The Anatherum (Andropogon) Muricatum, a scented grass, grows naturally all over India, and the roots of which are much employed by the European residents, as well as by the Natives, for the manufacture of fans and thinly worked into bamboo frames, as screens, which, when damped with water, are employed for the purpose

of cooling the heated atmosphere in dwelling-houses during the hot winds. These are known as the Khuskhus tatties. An Atr or perfumed oil from this grass was shown at the Exhibition of 1851. In Burmah, the Karens, as well as the Burmese, cultivate little bunches for its fragrant roots. An infusion of the root is used medicinally as a gentle stimulant, and a grateful drink in feverish cases. The roots reduced to powder are given in bilious affections, and mixed with milk and applied externally, as cooling applications to the skin when irritated. They are fragrant, and aromatic to the taste, and contain a volatile oil, which is imported into England for perfumery. An ointment prepared with the oil has been employed in removing pediculi from the hair. A weak infusion is frequently given in cases of gout and rheumatism.—*Ainsl. Roxb. Pereira. &c. quoted in Useful Plants. Jur. Rep. Madras Exhibition. Mason.*

(251) ANEMONE, WIND-FLOWER; a genus of plants belonging to the natural order Ranunculaciæ, and consists of lowly herbs, usually perennials, with white or purple, or scarlet or even yellow blossoms, and which are succeeded by a cluster of grains, each terminated by a long, silky, feathery tail. On this account they are cultivated as ornamental flowering plants, but the Anemones possess, in common with others of the order, an acrid property. In cultivating them, in India, Dr. Riddell remarks that they require a strong rich loamy soil, at least a foot and a half in depth, and well mixed with old decayed vegetable manure, so that it may retain a moderate share of moisture. If not grown in beds, they must be in pots of a large size, and this will no doubt be found the best method of culture, enabling advantage to be taken of situation or such other circumstances as may be desirable. The plants should occasionally have the earth loosened around the roots, and the stems earthed up, taking care that the crowns of the tubers are never exposed, otherwise they will be seriously injured; they should be grown or kept only in such spots as may benefit by the morning and evening sun. In the selection of roots, choose those of a moderate size and form, without any hollow in the centre: when fresh, the roots are exceedingly brittle.—*Riddell. Eng. Cyc.*—*Anemone pulsatilla*, and *nemorosa* are described by Fee, Lindley, and others, as exceedingly acrid and corrosive. *Anemone cernua*, according to Siebold, is in high repute among the Chinese as a tonic bitter, under the name of Hak-too-woo.—*O'Shaughnessy, page* 160.

(252) ANETHUM GRAVEOLENS. Dill water is a commonly used carminative for the relief of flatulence, flatulent colic, and the hiccough of infants; and may be advantageously combined with a few grains of Magnesia or aromatic confection. In Pegu, Dill is occasionally seen, and the seeds are constantly for sale in the bazars. This plant is the *aneethon* of Dioscorides; and of Matthew's gospel, rendered in the received version *anise*. The Burmese do not distinguish it from carraway.—*Mason*. The Hakeems of Northern India believe the use of Dill seed promotes the secretion of milk, and they are given in flatulency.—*Honigberger. Useful Plants.*

(253) ANETHUM PANMORI. *Syn. Fœniculum Panmorium.*

Sonf. Panmuhori, HIND.

A native of various parts of India. Root white, nearly fusiform, and almost simple. Used in India as an aromatic in food and in medicine.—*O'Shaughnessy, page* 360.

(254) ANETHUM SOWA (*Roxb.*) Nat. Ord. APIACEÆ.

Sowa Dill, or Bishop weed, ENG.	Soya, HIND.
Satha-kooppa, TAM.	Sowa, Shuta-pooshda, HIND.
Saddapa, TEL.	Shatha-kooppa, TEL.
Shubit, ARAB.	Soolpha, BENG.
	A graveolens, WALL.

This plant grows in Bengal and is cultivated in the Peninsula, Burmah &c. Fruit aromatic and carminative and used by the natives in their curries and for medicinal purposes, especially to relieve flatulence and colic. The best form for adults is probably that of a few drops of the essential oil on sugar, or dissolved in spirit. By distillation the fruits of this and the next species yield a pale yellow volatile oil, sp. gr. 881, soluble in alcohol, ether, and in 144 parts of water.—*O'Shaughnessy, page* 366. Bruised and boiled in water and mixed with the roots, the seeds are applied externally in rheumatic and other swellings of the joints. The leaves applied warm and moistened with a little oil are said to hasten suppuration.—*Useful Plants.*

(255) ANGELICA ARCHANGELICA, *A. officinalis*, North of Europe in watery places. Root large, fleshy, branched, resinous, abounds in essential oil. The root is fragant, pungent, bitterish sweet at first, leaving a glowing sensation in the mouth, and exciting salivation. A good aromatic tonic; candied with sugar it is used in Europe in chronic colds, and as a diaphoretic; insects destroy it very speedily.—*O'Shaughnessy, page* 361. As a flowering plant in India, it requires to be raised annually from seed, should be sown in a well prepared bed and thinned, when 2 inches high, to 1 foot or 18 inches apart.

(256) ANGELONE GRANDIFLORA.—Commonly called Indian Larkspur, a flowering plant, very useful for flower borders; easily propagated by cuttings, growing in almost any situation, and constantly in flower; color blue.—*Riddell.*

(257) ANGELY, OR ANGILICA, according to Edye, the Malayalam and Tamil name of a tree which grows to two and a half and three feet in diameter, and from fifty to sixty feet high. It is described by Edye, as used for large canoes and snake-boats, and, if kept oiled, is very dura-

ble. Also, as used for planks, for native vessels, in consequence of its being very tough, and well fitted to hold the yarns where the planks are sewed together, which is the case with all the flat bottomed boats on the coast, where there is a surf on the beach, as at Madras, for the massula boat; at Mangalore and Calicut, for the manchee boats, &c.; and many of the pattamahs are fastened by paddings of coir on the joints of the planks &c.—*Edye, Malabar and Canara.*

(258) ANGUSTURA, CUSPARIAN BARK. A valuable tonic obtained from the stem and branches of the *Galipea Cusparia*. It breaks with a short and resinous fracture, is covered with an ash-coloured epidermis, is internally smooth, and of a dull brownish-yellow colour. Its odour is rather nauseous and fishy, and has a strong bitter flavour, accompanied by a peculiar and somewhat aromatic pungency. The plant is found in the warmer parts of South America, especially in the neighbourhood of Angostura in Columbia.—*Faulkner. O'Shaughnessy.*

(259) ANIME, GUM. This gum-resin is of a pale brownish colour, and is met with in commerce partly in translucent and somewhat unctuous grains or tears, and partly in large brittle masses. The commercial article is doubtless the product of three trees, the American Gum Anime or Courbaril Locust tree, the "Hymenœa Courbaril," also the Vateria indica or Gum Copal tree, and the V. Roxburghii, which yields almost a precisely similar resin. For ordinary purposes, these may be used indifferently; but Gum Anime is distinguished from copal (*Hind.* Chandroos), to which it has a great resemblance, in being readily soluble in alchol, and softening in the mouth. Mr. Mason mentions that the Courbaril locust tree has been introduced from South America into the Tenasserim Provinces and is easily propagated; the Vateria indica is a native of the Peninsula of India, and V. Roxburghii of the Tenasserim Provinces. Gum Anime is extensively used in the composition of varnishes, but in countries where it occurs indigenously, for flambeaux and tapers. It is a product when the tree is in a sickly state. It is yellowish, transparent, hard and friable; occurs in irregular fragments with brilliant and smooth fracture: it softens in the mouth and the true Anime is more soluble in alcohol than copal to which it has a great resemblance.—*Mason. O'Shaughnessy. Faulkner.*

(260) ANISEED.

Aneeson, ARAB.	Mungfi, Adis-manis, JAV.
Kadis-manis, BALI.	Anisum, LAT.
Anys, DUT.	Jeera-manis, MALAY.
Sonf, DUK.	Razyean-i-roomie, PERS.
Graines d'Anis, FR.	Anis, PORT.
Anis, GER.	Sataphuspha, SANS.
Anisu, GUZ.	Sumbu, TAM.
Anise, HIND.	Sumpu, TEL
Anise, IT.	Tsa-moun-tsa-bah, BURM.

Aniseed, the seeds of an umbeliferous plant, Pimpinella anisum, grows in China, Europe, Egypt, Persia and India. It is usually sown in a light soil after the rains, and allowed to remain where sown, thinning out the weaker plants. It is an aromatic, sweetish warm tasted seed: is an article of the *materia medica*, and is also used by confectioners and by the native physicians. It has the same virtues as carraway seed. The kinds met with in Bombay are the English and Persian.—*Faulkner. Riddell. Mason. Eng. Cyc.*

(261) ANISE, STAR. FLOWERED ANISEED.

Badian khutai, ARAB.	Skimmi, JAPAN.
Pa-co hu-huei-hiam, CHIN.	Badian-i-khotai, PERS.
Anas phool, DUK.	Anasepoo, TAM.
Badian, HIND.	

Star Anise: Badian-i-khutai or Chinese Anise, is the fruit of the *Illicium anisatum*, a small tree which grows in China, Japan and the Philiphines, and the name of *Star* is applied to them from the manner in which they grow, the pods being in small clusters joined together at one end, and diverging in five rays. They are prized for the volatile oil obtained from them, and for their aromatic taste. The barks have a more aromatic flavor than the seeds, but they are not so sweet. In China, their most common use is to season sweet dishes: In Japan they are placed on the tombs of friends and presented as offerings in the temples. They are chiefly exported direct to India, England, and the north of Europe, at the average value of 8½ dollars per picul. In 1850, 695 piculs were exported from Canton, valued at 8,200 Spanish dollars. In India they are much used in seasoning curries and flavouring native dishes, and large quantities are used in Europe in the preparation of liqueurs. 3,000 piculs of Anise are exported annually from Cambodia, and, in 1848, 81 piculs of oil of Aniseed, valued at 11,900 dollars, were exported from Canton.—*Morrison. Simmonds. Faulkner. O'Shaughnessy.* In preparing a spirit of Anise, the Star Anise, may be used instead of common Anise—*Beng. Phar. p.* 412.

(262) ANISOCHILUS CARNOSUM (*Wall.*) Nat. Ord. LAMIACEÆ DIDYNAMIA GYMNOSPERMIA. *Ser. Syst.*

Thick-leaved Lavender, ENG.	Litakee.pungerie, DUK.
Karpoorawullie, TAM.	Kautoo-kunka, MAL.
Kurroowehloo, TEL.	

A small plant, growing in the clefts of rocks among mountains in the Northern Circars, Malabar and Mysore. The fresh juice squeezed from the leaves of this plant and mixed with sugar and gingely oil, is used as a cooling liniment for the head. Leaves and stems are given in infusion to children in coughs and colds. The plant also yields a volatile oil.—*Ainsl. Rheede. &c. quoted in Useful Plants.* Wight also figures A. albidum, A. dysophylloides, A purpureum, A. suffruticosum.

(263) ANISOMELES MALABARICA. (Malabar Cat Mint.)

Pemayrutie, TAM.	Bootan kooshum, SANS.
Moga beerakoo, TEL.	

Syn. Ajuga fruticosa, *Roxb. Fl. Ind.* iii. p. 1.

Nepeta malabarica, *Ainslie*, vol. ii. p. 294, grows in the East Indies, the Isle of France, and is very common in Travancore. Ague patients are made to inhale the vapour arising from an infusion of this plant; this causes copious sweating. The leaves are bitter, astringent, and somewhat aromatic; they are given in infusion in the latter stages of dysentery, and in intermitting fevers to the quantity of an ounce and a half twice daily (*Ainslie.*) The juice expressed from the slightly warmed leaves is prescribed for children in fever, from dentition. The entire plant is deemed emmenagogue in the West Indies.—*O'Shaughnessy, page* 482. Wight gives also a figure of A. ovata.

(264) ANNELIDA (Cuvier), an extensive division or class of animals, established by modern naturalists partly at the expense of Linnæus's heterogeneous class of Worms (Vermes). It was Baron Cuvier who, in 1802, first proposed to distinguish the Annelida as a class, chiefly on account of their blood being of a red colour, as in the leech, and circulating by means of a double system of complicated blood-vessels. The name is derived from the Latin word annulus, a ring, because the animals arranged under this division always have their bodies formed of a great number of small rings, as in the earth-worm. Their external covering, or skin, is soft and pliable; and their bodies, having no bony skeleton, are soft and in general more or less of a cylindrical form. The *Annelida* are for the most part oviparous, but the leeches and earth-worms deposit what are termed capsules, or membranous cocoons, containing many embryo young. There is little variety in their mode of life. Some live in fresh and others in salt water; and others, like the Hair-worm (Gordius), are amphibious. Some species construct tubes in the interior of stones, or in shells, which they perforate, or in madrepores. Some species again form calcareous cases, or cement around them various foreign substances, particularly sand. The sedentary species are timid, and when taken from their retreats can neither escape nor defend themselves. The *Errantia*, on the other hand, are frequently very nimble, and can defend themselves well by means of their bristles. The principal family of this order is the *Hirudinidæ*, which comprehends not only the leeches properly so called, which live by sucking the blood of various animals, but also includes many other worms which derive their nourishment in a totally different way, and present corresponding differences in organisation. The affinities between the leeches and some of the setiferous Annelidans, as various species of *Nereis*, *Lumbricus*, *Planaria*, *&c.* are so close that they hardly admit of being arranged in separate orders, and others of the Leech tribe may even be confounded with some species of *Lerneæ* or *Epizoa*. The ancients appear to have only known the most common species of Leeches. Aristotle makes no mention of them, and they do not appear to have been used in medicine in the time of Hippocrates. Pliny describes them very clearly under the name of *Hirudines* and *Sanguisugæ*, and distinguishes two species. The Sea Leech is distinctly mentioned by Belon, Rondelet, and by all the writers on natural history since the revival of letters. More recently, Linnæus increased our knowledge of the number of species, of which he describes eight in the 12th edition of the 'Systema Naturæ.' Muller afterwards discovered five or six others, so that Gmelin, in his edition of the 'Systema Naturæ,' enumerated fourteen species. Since then, Shaw, Leach, Dutrochet, Savigny, Milne-Edwards, and others, have found many more, and the introduction of new zoological methods, has caused a necessity for arranging these various species in different genera. The True Leeches are all destitute of branchiæ or special organs of respiration; and this function has been supposed to be effected by means of the skin generally, but M. Milne-Edwards has recently stated (as was before observed by Cuvier) that "there exists in these Annelidæ a series of small membranous sacs, each of which communicates externally by a minute orifice situated on the ventral aspect of the body: these sacs derive from the numerous vessels which ramify upon their parietes a considerable quantity of blood; water penetrates into the organs, and seems to subserve a true respiratory purpose." But though the species of the family *Hirudinidæ* are not provided with distinct branchiæ, these organs are found in the genus which is generally associated with the True Leeches. In *Sanguisuga*, Sav., *Jatrobdella*, Blain., the anterior sucker has its upper lip divided into several segments. Its aperture is transverse, and it contains three jaws, each of which is armed on its edge with two ranges of very fine teeth, which enable these leeches to penetrate through the skin without making any dangerous wound. This genus contains the true Medicinal Leeches, eight species of which have been enumerated: the most common is the *Sanguisuga medicinalis*, *Hirudo medicinalis*, Linn: which is a native of all the stagnant fresh waters.—*Eng. Cyc. page* 212. *See* LEECH.

(265) ANOLA, HIND. Fruits of Emblica officinalis, roundish, blackish, grey, very wrinkled, obscurely six-sided; nut three-celled, each shell with two shining seeds.—*O'Shaughnessy.*

(266) ANOMATHECA CRUENTA. *Iridaceæ.*—A pretty flowering plant, showy when planted in a bed by itself, producing abundance of blossom of red and lilac colours, cultivated easily from seed.—*Riddell.*

(267) ANONACEÆ, ANONADS, the CUSTARD-APPLE-TRIBE, a natural order of plants consisting of tropical or subtropical trees and bushes, that usually abound in a powerful aromatic secretion, which renders the flowers of some

highly fragrant, the leaves of others a grateful perfume, and the dried fruits of many so highly aromatic as to vie with the spices of commerce; among these last is the Ethiopian Pepper of the shops, which is yielded by the fruit of *Uvaria aromatica*. Of others of this order, the fruit is succulent and abounds in a delicate juice, which renders it a pleasant article of food. Under the name of Sour-sop, Sweet sop, and Custard-Apple, many kinds are cultivated in the East and West Indies and South America. Finally, the bark of some separates readily into fibres which make excellent cordage: a large tree, called in Brazil Pindaiba, and by botanists *Xylopia sericea*, is advantageously employed for this purpose.—*Eng. Cyc. page* 214.

(268) ANONA CHERIMOLIA.—A succulent fruit of a dark purple colour containing a soft sweet mucilage, and is much esteemed by the Peruvians.—*Riddell.*

(269) ANONA MURICATA. Sour Sop. This fruit, resembling the custard apple, is sometimes cultivated by Europeans in the Tenasserim provinces.—*Mason.* This fruit tree grows also in India but it is a native of the West Indies. It grows to about the same size as the Bullock's Heart. The fruit is of a greenish colour when ripe, and has a rough thorny appearance: the flavour is very peculiar, differing from the other species of the Anonaceæ: the scent resembles that of black currants; the seeds are similar to those of the custard-apple. The fruit ripens in March; and in the West Indies is considered very cooling in fevers. It bears only once a year. The wood is inferior.—*Riddell. M. E. Juries' Reports.*

(270) ANONA RETICULATA. Bullock's Heart.

Ram-Phul, Hind. | Nona, Malay.
Rama Seta marum, Tam. |

This fruit tree grows to a large size. The fruit is so called from its fancied resemblance to the heart of the animal. The colour is a dark brownish red. When ripe, it is a soft, sweetish, pulpy fruit, but has not the fine flavor of the custard apple. It is ripe from November to June, but not much esteemed by Europeans.—*Riddell.* It is found in native gardens in India and Burmah.—*Mason. M. E. Juries' Reports. Crawford, Dict.*

(271) ANONA SQUAMOSA (*Linn.*) Nat. Ord. Anonaceæ.

Custard apple, Eng. | Ata, Beng.
Attha marum, Mal. | Ame-sa, Burm.
Seeta phul, Duk. | Sri-kaya, Malay.

This species, as well as the A. reticulata, (Sweet-sop, or Bullock's-heart,) and the A. muricata, (Sour-sop,) has long been naturalized in the East Indies. The fruit is delicious to the taste, and on occasions of famine, has literally proved the staff of life to the natives. This fruit was cultivated in the Burmese time to a great extent, and with much success, on the slopes of the hills about Prome on both sides of the river. Since our occupation of the country, the plantations have fallen into neglect, and although supplies of the fruit are still furnished, yet these are so to a much more limited extent, and as the plants now receive no care, the fruit will soon become scarce. This and similar sub-acid fruits form a considerable article of food to the Burmese, to whom they serve as a substitute for flesh-meat, being eaten with rice as an ordinary article of their daily provisions.—*McClelland.* It is very generally cultivated all over India, and grows wild in many parts of the Dekhan. The tree when cultivated and pruned, during the hot season, produces fruit afterwards of double the usual size. Dr. Royle says that the leaves of this plant have a heavy disagreeable odour, and the seeds contain a highly acrid principle fatal to insects, on which account the natives of India use them powdered and mixed with the flour of gram (Cicer arietinum) for washing the hair." A few leaves and some seeds put into a bed infested with bugs dispel these pests immediately.—*Royle. Gibson. &c. quoted in Useful Plants. McClelland. Riddell. Crawford.*

(272) ANT.

Cheonti, Hind | Irmboo, Tam. | Chima, Tel.

The Ants (*Formica*), are well known insects, which have attracted attention from the earliest ages, on account of the singular economy and extraordinary industry, manifested by the different species. Dr. Jerdon has given the following catalogue of the species found in Southern India, which he arranges according to St. Fargeau, who, in the 1st volume on the Hymenopteres in the Suites a Buffon divides the ants into four tribes, viz:—1st Tribe, Les Myrmicites, females with a sting. 1st segment of abdomen of 2 knots. This includes the following genera. 1st Cryptocerus. 2d Atta. 3d Ocodoma, differing from Atta in its larger head, and the presence of spines. 4th Eciton. 5th Myrmica.—2d Tribe, Les Ponerites, females with sting. 1st segment of abdomen of one knot only. It includes the genera Odontomachus and Ponera.—3d Tribe, Les Formicites, females without a sting. 1st segment of the abdomen of one knot only, and it contains the genera *Polyergus* and *Formica*.—Many of our Indian Ants cannot be well referred to any of these genera, but as it is probable that some new genera have been formed by recent writers, Dr. Jerdon in general contents himself with referring most of his species to one or other of those here characterized, and the following are his own remarks. "Following the arrangement of St. Fargeau, we have first the tribe of *Myrmicides* and the first genus mentioned by him, Cryptocerus, being American exclusively, we come to the genus *Atta* of Latreille, from which St. Fargeau has separated *Ocodoma*, the chief distinction being the spines which exist either on the head or thorax of the latter, which moroevet is said to have the head of variable size, whilst in Atta it is said to be usually not of a large size.

We have in India species belonging apparently to both groups which I shall now endeavour to describe.

(273) "TRIBE, MYRMICIDES. Gen. *Atta*. I possess 6 species of Ants, all of small size, which appear to belong to this genus, having a sting, two knots in the first segment of the abdomen, antennæ not concealed in a cleft, thorax without spines, and short palpi.

(274) "*Atta minuta*, new species. *Worker* barely 1-12th of an inch long, head oblong, eyes minute, advanced; thorax narrow; abdominal pedicles long, narrow, the first much more raised than the 2d; antennæ gradually thickening, of a rufous colour, with the abdomen somewhat darker or fuscous. Female about ⅓d of an inch long, similar in form to the Worker, abdomen larger proportionally, and head smaller. This minute species makes a temporary nest in various situations, in an empty box, between the back of a book and its leaves, even among the loose pages of a book, in an empty shell, &c. &c. Nothing is used in its construction, a shelter from the light merely being sought for. It is perhaps not very numerous in individuals, one wingless female is generally found in the nest. It is very common in the Carnatic and most of India, but I have not seen it in Malabar. It appears to prefer dead animal matter to saccharine or vegetable products.

(275) "*Atta destructor*, new species. *Worker* about 1-10th of an inch long, head oblong, not so long in proportion as in the last; eyes small, more medial than in the last, antennæ short; thorax narrow, slightly grooved, abdominal pedicles long, narrow, first higher than the second, abdomen oval; colour rufous, abdomen glossy brown. I have not seen the female. They live in holes in the ground, or in walls, &c., and are very numerous in individuals. They prefer animal to vegetable substances, destroying dead insects, bird skins, &c. &c., but also feed greedily on sugar. They are common in all parts of India, and often prove very troublesome and destructive to the naturalist.

(276) "*Atta domicola*, new species. *Worker* about 1-6th of an inch long, head oblong; eyes moderate size, medial; antennæ rather long, jaws strongly 4 toothed, thorax very slightly notched, abdominal pedicles narrow, first much raised, second slightly so, abdomen ovate, legs longish, head, thorax, and legs, deep red brown, abdomen blackish. This species of Ant does not seem to be common. I have only hitherto procured it at Nellore in a hole in a house, and I only saw one kind of individual.

(277) "*Atta rufa*, new species. *Worker* 1-8th to 1-6th of an inch long, head short, oblong; eyes rather small, medial; antennæ rather short, with the two last joints much enlarged; jaws linear oblong, strongly toothed; thorax slightly grooved, first abdominal pedicle lengthened, narrow in front, wide behind and much raised, second broader, not so high—of an uniform glossy rufous colour, with the end of the abdomen somewhat darker. *Warrior* variable, about ¼th inch long, head large, very square, slightly notched behind, smooth; eyes advanced, lateral; jaws oblong, quite entire, blunt; antennæ short, otherwise as in the ordinary Worker. Female about 7-24th of an inch long, head small, diamond shaped, eyes very large, 3 large ocelli on the top of the head, antennæ *not* geniculate, short; all the joints nearly equal; thorax thick in front, depressed behind, abdomen long; oval wings reach beyond abdomen. This Ant is the only one of the true *Atta* that has two kinds of neuter individuals, and in its form and general habits it approaches much to the next genus, Ocodoma; but as it wants the spines on the thorax I have referred it to Atta. It is very common in Malabar, but is also found in the Carnatic: it is found in holes under ground, about gravel walks, mud walls, and often appears in houses, coming through a hole or crevice in the floor, or wall. From a colony of them, every now and then, vast numbers of the winged females (and males) issue forth just before sunset attended as far as the window by swarms of the neuters of both kinds. Its favorite food is dead insects and other matter, but it also carries off seeds like the Ocodoma, chaff, &c. &c. It stings very severely, leaving a burning pain that lasts for several minutes.

(278) "*Atta dissimilis*, new species. About 1-10th of an inch long, head oblong, rounded; eyes moderate, antennæ suddenly thickening at the last joint, thorax very slightly grooved, abdominal pedicles narrow above, both equally raised, first rather more conic than the second; abdomen long oval, colour blackish throughout. I have only found this Ant in small numbers on trees in Malabar.

(279) "*Atta floricola*, new species. *Worker* not 1-17th inch long; head oblong square; eyes small, advanced; jaws linear, pointed, antennæ very short, last joint suddenly enlarged; thorax very slightly grooved, abdominal pedicles about equal, narrow, raised, abdomen long oval; thorax and legs dark rufous, head and abdomen glossy dark brown. I have obtained this very small Ant, of which I have only seen one kind of individual, in small numbers on flowers and leaves at Tellicherry, and it appears to feed solely on vegetable secretions.

(280) "*Gen. Ocodoma*. We now come to a set of Ants extremely numerous over all India, and comprising several species very nearly alike and probably confounded together by those who have not examined them thoroughly. Almost all the species that I have seen have two kinds of neuters, one of them of very large size compared with the ordinary Workers, and which are usually called Warriors. Some points in the history of the economy of these Ants have caused much interest

among naturalists at home with regard to the food of these little creatures. The chief distinction of *Ocodoma* from *Atta* consists in the former having some small spines on the thorax.

(281) "*Ocodoma malabarica*, new species. *Worker* $\frac{1}{8}$th of an inch long, head oval, eyes moderate, jaws rounded, triangular, pointed, and finely serrated; antennæ long and slender; thorax doubly notched and with some small tubercles especially two in the usual situation of the thoracic spines; first abdominal pedicle small and *conic*, second large, rounded; head, thorax and legs, rufous, abdomen blackish; legs long. *Warrior* $\frac{1}{4}$th of an inch long; head enormous, rugose, striated, deeply notched behind; eyes minute, advanced, lateral; jaws triangular bluntly toothed, and with an appendage at their base; thorax very rough, tubercled, with two minute rudimentary spines; first abdominal pedicle small, narrow, barely raised; second large, broad, raised, rounded; antennæ short; antennæ, legs, and abdominal pedicles rufous, the rest of the body blackish. This species of Ant appears to form a link between the two Genera *Atta* and *Ocodoma*, as shown by the rudimentary state of the thoracic spines. I have found it chiefly about houses, it runs rapidly, lives both on insects and other animal matter, and on sugar, bread, &c. At first sight I mistook it for a small species of Formica, mentioned hereafter, Formica vagans.

(282) "*Ocodoma providens*. (*Sykes*)? *Worker* about $\frac{1}{7}$th of an inch long; head somewhat *orate*, *bulging* slightly at the sides, and narrowed behind, notched posteriorly and with two points, rough and granulous; eyes moderate, central, thorax slightly grooved with two small spines on its posterior angles; first abdominal pedicle pointed, second longer, broader and rounded; *Warrior* with jaws pointed and finely toothed; thorax very rough; length $\frac{1}{4}$ inch, head large, otherwise similar. I am by no means certain if this be Colonel Sykes' species or not, and, indeed, without actual comparison, it would be very difficult to decide, so similar are the general features of these small Ants, of which I possess four very closely allied species from Southern India, and have only collected these from two or three localities, so that many other allied species may still exist. The habits and manners of all are very similar. They live under ground, making, for their size, a large series of excavations. Their common food I suspect to be animal matter, dead insects, &c. &c., which at all events they take readily, but they also carry off large quantities of seeds of various kinds, especially small grass seeds, and more especially garden seeds, as every gardener knows to his cost. They will take off cabbage, celery, radish, carrot and tomato seeds, but are particularly partial to the light lettuce seeds, and in some gardens, unless the pots in which they are sown be suspended, or otherwise protected, the whole of the seeds sown will be removed in one night. I have also had many packets of seeds (especially lettuce) in my room completely emptied before I was aware that the Ants had discovered them. I do not know, however, if they eat them or feed their larvæ on them, though for what other purpose they carry them off I could not divine. I have often observed them bring the seeds outside their holes, as recorded by Colonel Sykes, and this I think generally at the close of the rainy season, but in some cases I had reason to believe that it was merely the husks, of which I have seen quite heaps, and that the Ants did not take them back to their nests. If any of the forementioned seeds be sown out at once in a bed, most likely in the morning the surface of the whole spot will be found covered over with little ridges, the works of these creatures, and the few seeds that perhaps remain, dug all round, and being carried off sometimes above ground, at other times under ground. Their galleries and subterranean passages are often very extensive, and it is no easy matter to dig down to their nest to see what becomes of the seeds. I have not procured the male or female of this species.

(283) "*Ocodoma diffusa*, new species. *Worker* about $\frac{1}{8}$th of an inch long; head somewhat oval, nearly smooth, with a few scattered granules, slightly emarginate behind; eyes moderate size; thorax deeply grooved, with two small spines posteriorly: first abdominal pedicle very pointed, conic; second rounded of equal height: head, thorax and legs rufous; abdomen brown. *Warrior* $\frac{1}{4}$th inch long, jaw strongly toothed, head large, much striated, deeply notched behind; thorax more deeply grooved and tubercled; otherwise as in the Worker. This species appears to be spread over most of India, and has similar habits to the last.

(284) "*Ocodoma diversa*, new species. *Worker* about 7-48th of an inch long, head oblong, nearly smooth, emarginate behind; eyes small; jaws triangular, toothed; thorax but slightly grooved and with two longish spines posteriorly; first abdominal pedicle broadly conic, second rounded; head, thorax and legs dark marroon, abdomen blackish. *Warrior* nearly $\frac{1}{2}$ inch long, head very large, nearly smoothed, slightly striated; jaws lancet-shaped entire; eyes small, somewhat advanced, antennæ short, otherwise as in the Worker. I procured this Ant in the Wynaad where it is not uncommon. The difference between the worker and the Warrior is greater than in any other Indian species.

(285) "*Ocodoma affinis*, new species. *Worker* $\frac{1}{8}$th of an inch long; head nearly square, almost smooth, with only a few striæ; eyes nearly medial, smallish; jaws triangular, with two strong teeth at the external angle of the jaw, and two smaller at the internal angle; thorax very slightly grooved, with two curved spines posteriorly, first abdominal pedicle very narrow, long, conic pos-

teriorly, not much raised; second rounded, of equal height, broader; head, legs and thorax rufous; abdomen dusky. *Warrior* nearly 7-16th of an inch long; head and jaws striated, eyes very minute, head notched anteriorly; antennæ inverted in a deep groove; metathorax elevated; no palpi apparently. This Ant is very common in Malabar; is nearly allied to, but differs from, *Ocodoma diversa* in the toothed jaws of the Warrior, &c. &c.

(286) " *Ocodoma minor*, new species. *Worker*, length about 5-48th of an inch, entirely rufous, head oblong, smooth; eyes small; jaws long, somewhat triangular, toothed, last tooth prolonged; thorax slightly grooved, with two small spines in its posterior extremity; abdominal pedicles slightly raised, first long, conic; second rounded; both narrow above. Female 5-8th of an inch long, head nearly square, slightly notched behind, three ocelli on top of head; eyes large medial, head striated with a hollow for the base of the antennæ; jaws triangular, bluntly toothed at the two angles; antennæ short; thorax much raised anteriorly, and with two small posterior spines; abdomen long, oval, large. I, on one occasion, only, found a single individual presumed to be the female, which had lost her wings, under a stone in a garden at Tellicherry, surrounded by numerous workers, who were busy tending her, and removing some eggs or larvæ. It is the only female I have seen of this genus, and is well characterized by its large eyes, and ocelli.

(287) " *Ocodoma quadrispinosa*, new species. *Worker* nearly 1-8th of an inch long, head smooth; eyes small; thorax with two small spines anteriorly, and two large curved spines posteriorly; first abdominal pedicle long, raised, rounded behind; second also rounded, blunter, of equal height; head, legs, and thorax dark rufous; abdomen blackish brown. I have not seen the Warrior (if any) of this race, which I found during the monsoon forming a small temporary mud abode round the head of flowers abundant in Malabar. It appeared to be feeding on the vegetable secretions surrounding the seeds. Of these seven species of Ocodoma the first and last are very distinct from all the others, the first by having only rudimentary spines, and the last by having four spines instead of two. *Ocodoma minor* is readily distinguished by its smaller size; and the other four are most readily distinguished *inter se*, by the jaws of the Warriors, which in No. 10 is entire; in 11, with two teeth at each angle; in 9, with moderately strong teeth throughout its extent; and in 8, with the jaw very finely toothed.

(288)" *Gen. Eciton*. The characters of this genus are thus given by St. Fargeau. " Antennæ entirely " free, head elongated, and the thorax without " spines; maxillary palpi long, of 6 joints; jaws " linear; wings unknown." I have got four species of Ant which perhaps may be ranged under this genus, of which only one species is described, and that from South America, but it is more than probable that they will form a new genus, to which however I will not attempt to impose a name. My species have a long slender body, oblong head, large eyes, short antennæ, inserted very near the mouth, linear or oblong jaws, and sting very severely.

(289) " *Eciton ? rufonigrum*, new species. *Worker*, length about 11-24th of an inch; head square; attennæ short, first joint thickened; very long palpi, eyes large, lateral, posterior; jaws somewhat linear, oblong, with two strong teeth at the external angle, and bluntly toothed in the rest of its extent; thorax slightly grooved; abdominal pedicles very little elevated, first very long; abdomen long, ovoid; thorax, legs, abdominal pedicles and antennæ rufous, head and abdomen black. This Ant is very common in the Carnatic, less so in Malabar. It makes its nests in holes of trees, old palings, bamboo rafters and such like; it does not care for sweets, is never seen on flowers, but devours dead animal matter. I have not seen the female. It stings very severely.

(290) " *Eciton nigrum*, new species. *Worker*, length 9-24th of an inch, head long, eyes large, medial; antennæ short, the first joint not being so long as the head; jaws somewhat square, bluntly toothed; thorax low, barely grooved; both abdominal pedicles long, rounded, low; abdomen long, oval; sting very large. Colour uniform black. Female, length 11-24th of an inch, differs from the Worker only in having wings. This Ant like the last is rare in Malabar, but tolerably common in parts of the Carnatic; it has the same habits as the last, living in holes of trees, &c., and feeds in the same manner. On cutting open a dead branch on which they had formed their nest, many winged females, and larvæ and pupæ were found in different states of development.

(291) " *Eciton rufipes*, new species. *Worker*, length 11-48th of an inch; head oblong; eyes very large, slightly advanced; thorax considerably grooved, abdominal pedicles long, low; abdomen long, ovated, black, with rufous legs. I have only found this species on one occasion under a stone in the Salem district, and know not if it has the dendrophilous habits of the two last.

(292) " *Eciton minutum*, new species. *Worker*, about 1-6th of an inch long, black throughout, very slender; legs rather thick; palpi much exposed. I regret that I have not at present a specimen of this little Ant to describe from more fully. Its general structure however is exceedingly similar to that of its congeners, from which its small size sufficiently distinguished it. I have found it both in the Carnatic and in Malabar, almost always on trees, but do not know if it has its nest in holes of the wood or otherwise. Though

scarce in individuals, it is by no means rare, and I hope to be able to describe it more fully hereafter.

(293) "*Gen. Myrmica.* Gen: Char: Antennæ sufficiently exposed; head triangular, without spines; maxillary, palpi long, of six joints; jaws triangular; three cubital cells in the upper wings, the third incomplete, &c. Such are the characters assigned to this genus by modern authors. Whether the following species all belong to it or not I cannot decide, but judging from their differences I imagine that they form at least three groups. In the first group I shall place two or three nearly allied species, one of which has already been described by Col. Sykes as a *Myrmica*, so that this may be considered the typical group. Of this I have what I imagine to be three species, but all very closely allied to each other.

(294) "*Myrmica diffusa*, new species. *Worker*, rather more than 1-9th inch long; head wider than thorax, oblong, triangular, striated; antennæ rather short, basal joint barely longer than the head, inserted near the mouth; eyes large; thorax notched, with two small spines on the posterior angles, curving backwards; first abdominal pedicle longish, somewhat heart shaped, excavated, second obovate; both very slightly raised: abdomen triangular; head and body rufous; abdomen dark glossy brown. Female—head not wider than the thorax, which is not spined; length 5-12th of an inch; wings not so long as abdomen. Male—head very small, eyes large; antennæ with the first joint not elongated; no spines on thorax, which is much raised; wings reach beyond abdomen; length 1-7th of an inch. This is a well known and widely diffused species, being found throughout India. It makes its nest in holes in branches of trees, runs with its abdomen turned upwards almost over its head, especially when excited, and feeds on honey and other vegetable secretions. Occasionally they appear to form their nest among the roots of moss, orchideæ, and various epiphytic plants; at least this is the case in Malabar: and I cannot detect any marked difference of species, although it is possible that the two races may be distinct. It is very pugnacious, and bites very severely, not appearing to use its sting much.

(295) *Myrmica rufa. Worker*, length 9-48th of an inch, head shorter, proportionally, and eyes larger; thoracic spines longer, straighter; 1st abdominal pedicle longer and less raised than in the last; entirely of a rufous colour. This is a very closely allied species, and is found in the same localities as the last. Had I found it in a different tract of country, I would have perhaps considered it as a climatal variety, but its large size, and the few points enumerated above lead me to view it as distinct. Its habits are similar.

(296) "*Myrmica Kirbyii. Sykes?* I regret that I have mislaid my copy of the Entomological Transactions in which this Ant and several others were described, but the similarity of the nest and its general description led me to conclude that the species procured by me is identical with Colonel Sykes' one. Is very closely allied to the two last, has its thorax larger, rough, and much ridged; its thoracic spines larger; first abdominal pedicle somewhat diamond shaped; second, heart shaped; the abdomen strongly ridged longitudinally; head, thorax and legs dark marroon; abdomen dark brown. Length 7-48th of an inch. I have found this species chiefly in the elevated forests of the Wynaad. I cannot say that I have met it below the ghauts. It forms a considerable nest of some papyraceous materials, usually of an oval form, and placed round a small branch which supports it. It is very numerous in individuals, countless swarms issuing from it on being disturbed and boldly attacking the assailant both with teeth and sting. It feeds on honey of flowers and other vegetable secretions.

(297) "*Myrmica fodiens* new species. *Worker*, length 1-12th of an inch; head rounded, triangular striated; eyes large, posterior; jaws somewhat linear, four toothed; thorax raised in front, depressed posteriorly with two small spines on each side in front, and two tubercles above these, and two large nearly horizontal spines at the posterior extremity of thorax; first abdominal pedicle long, narrow, raised behind; second raised, rounded; abdomen somewhat triangular; head thorax, legs and abdominal pedicles marroon colour, abdomen shining brown. *Female*, head rather smaller proportionally, finely striated; eyes larger, three ocelli; jaws blunt without teeth; antennæ scarcely longer than the head; thoracic spines less developed; abdomen larger. This is one of the most common and abundant Ants in Malabar, I do not remember to have seen it in the Carnatic. It seldom enters houses, but otherwise appears to take the place of *Formica indefessa*, which is not found in Malabar. It feeds chiefly on honey and other vegetable secretions, but also will take dead animal matter. It also occasionally feeds on the secretions of the..... ... and is also found in the train of caterpillars feeding on leaves. It makes large excavations under ground, generally having the entrance round the trunk of a tree, and it forms considerable heaps of fine earth round the mouth of the nest. It runs, unlike the last species, with its abdomen turned downwards under the abdominal pedicles. It appears to form the type of a very distinct group from the last.

(298) "*Myrmica? tarda*, new species. *Worker*, length 1-6th of an inch; head somewhat triangular, square behind, of same width as thorax; eyes rather small, quite lateral, somewhat posterior; antennæ short, thick, inserted near the mouth; thorax short, square, ending in two spines on each side; it and the head rough and shagreen-

ed; abdominal pedicles much raised, long, narrow; abdomen triangular, also shagreened; head, thorax, legs, abdominal pedicles, brick red; abdomen dusky, dark blue. This is a very curious looking Ant. It lives in holes in the ground in small societies, and feeds on vegetable secretions. It moves very slowly. It is found both in the Carnatic and Malabar.

(299) *Myrmica? cæca*, new species. Ocodoma? *Worker*, length 1-5th of an inch; head somewhat oval, rather small; no eyes; antennæ short, thick, inserted near the mouth; an oblique groove on each side of forehead for the laying of the antennæ; jaws triangular, hooked at the tip, and finely serrated; thorax narrow, of uniform width, granulose, with an elevation posteriorly ending in two small spines; abdominal pedicles raised, rounded, pointed backwards, the first the highest; abdomen long, oval; head, thorax, and legs reddish brown; abdomen glossy brown. I found this curious Ant only once, under a stone in the Wynaad.

(300) "*2nd Tribe. Ponerites.* The single species of Ant which I place under this head appears to correspond pretty well with the characters of the genus which have already been given.

(301) "*Odontomachus rufus*, new species. *Worker*, length 1-4th of an inch; head bulging at the sides, narrowed in front; eyes of moderate size: anterior antennæ rather long, slender; jaws closely approaching at their base, long, linear, with three strong pointed teeth at the end; thorax narrow; abdominal pedicle raised, pointed and conic; abdomen long, oval; head, thorax and legs rufous; abdomen, dark brown. I obtained this Ant under stones in a jungle in the Salem district, and know nothing of its habits. I have since obtained one individual also in the Wynaad, which may be the warrior of this species—if the society consist of different individuals. It is 11-24th of an inch long, and appears only to differ, besides its larger size, in having the eyes smaller, and more advanced, the teeth of the jaw blunt, and the thorax finely striated.

(302) "*Harpegnathos, New Genus.* Gen: Char: Jaws scythe-shaped, pointed, and finely serrated; head oblong, notched behind; eyes very large situated at the anterior extremity of the head; antennæ rising between the eyes; abdominal pedicle slightly raised. I cannot class this remarkable Ant as an Odontomachus, and have therefore been compelled to institute a new genus for its reception; some of the characters given may not be generic, but till other species are discovered it is difficult to say which are, and which are not, of generic value.

(303) "*Harpegnathos saltator*, new species. *Worker*, 1-6th of an inch long; head long, granuled; jaws with a strong tooth near the base pointing downwards and inwards, and thence gradually tapering to the tip, and finely serrated; thorax barely grooved; abdominal pedicle small, low, ovate; abdomen very long; sting large; head and abdomen blackish brown, thorax and legs rufous.—Length 3-4th of an inch. I have not seen this remarkable Ant in the Carnatic. I first saw it at Tellicherry, and subsequently in other parts of Malabar. It is also found in the Mysore country, as I learn from Mr. Hamilton, a most talented and industrious Amateur Entomologist. I have given it the name of *saltator* from its power of making most surprising jumps which it does when alarmed or disturbed. It is very pugnacious, and bites, and stings very severely. It makes its nest under ground, generally about the roots of some plant. Its society does not consist of many individuals. It appears to feed on insects, which it often seizes alive.

(304) "*Gen. Ponera, Lat.* Its generic characters have been given above.

(305) "*Ponera sculpta. Worker*, length from 5-17th of an inch to nearly ½ an inch; head oblong, pointed in front and rounded behind; jaws large, triangular, armed with alternately a large and a small tooth; eyes very large, nearly medial; antennæ inserted on a line just in front of the eyes, rather long; thorax nearly uniform in width and height; abdominal pedicle raised, pointing forwards, with two small spines; abdomen long, cylindric; legs long; the whole body curiously sculptured, being channeled and grooved in different directions, longitudinally, circularly, obliquely, giving a peculiar *dull* appearance; colour blackish green. This is one of the commonest species of Ant in Malabar, extending from the level of the sea up to the top of the Neilgherries. It lives in the ground in small societies, often making its nest in a flower pot, occasionally under a large stone. It does not work in concert, being generally seen solitary. It lives on animal substances, but apparently will also take vegetable matter. I have seen two fighting for a ripe seed of the Lantana. I have not met with the female of this species.

(306) "*Ponera stenocheilos*, new species. *Worker*, length 3-8th of an inch; head large square behind, pointed and advancing anteriorly, widest in front of the eyes which are large; antennæ long; jaws very long, linear, ending in a strong tooth externally and a smaller one at the internal angle; thorax narrow; abdominal pedicle raised, rounded, pointing backwards; abdomen very long; sting large; legs long; colour dingy greenish brown. I have found this Ant very rarely in Malabar, and know nothing of its habits.

(307) "*Ponera processionalis*, new species. *Worker*, length 1-3rd of an inch; head oblong, advanced anteriorly; eyes medial, large; antennæ moderately long, thickened at the end; jaws triangular, strongly four toothed; thorax wide, not grooved; abdominal pedicle of equal width with the thorax, square, truncated; colour shining black. I have met this species over most of India. It lives in the ground in very numerous

societies, is most frequent in jungly districts. Occasionally a vast column of them, 3 or 4 deep, may be seen crossing a road, and I have traced the column for 40 and 50 yards. It stings very severely.

(308) "*Ponera affinis*, new species. *Worker*, length 1-3rd of an inch, head oblong, notched behind, advanced anteriorly; jaws triangular, strongly toothed; antennæ thickened at the tip; eyes somewhat anterior, moderately large; thorax slightly grooved; abdominal pedicle pointed, thin; abdomen oval colour dingy black. I have only procured this Ant once in Malabar and know nothing of its habits.

(309) "*Ponera rufipes*, new species. *Worker*, length 9-16th of an inch; head oblong; eyes anterior small; antennæ short and thick; jaws triangular, finely toothed; thorax not furrowed, truncated posteriorly; abdominal pedicle wide, thick, truncated, and excavated posteriorly; abdomen long, the division of the joint strongly marked; body rigid, furrowed, and channeled throughout; antennæ, legs, and end of abdomen dark rufous; rest of the body dull black. I have procured this Ant only on one occasion, hitherto, in Malabar.

(310) "*Ponera pumila*, new species. *Worker*, length about 1-5th of an inch; head oblong; eyes rather small, advanced; jaws triangular, strongly toothed; antennæ thickened; thorax smooth: abdominal pedicle long, square; abdomen long, cylindric; dull black, with rufous legs and antennæ. I found this Ant in Malabar, where it is rare.

(311) "*3rd Tribe. Formicites.* We now come to the last family containing those Ants that have no sting, and the abdominal pedicle of one knot only. It comprises two genera, Polyergus and Formica; but I do not think we possess any species of the former genus.

(312) "*Gen. Formica.* This genus comprises two distinct forms, the one with spines on the thorax, the other unarmed, which certainly ought to form two genera, inasmuch as this distinction is made to separate Atta from Ocodoma.

1st, without spines on the thorax.

(313) "*Formica compressa*, FABR.? Syn. F. indefessa, Sykes. *Worker*, length 4-10th to ½ an inch; head oblong, notched behind; eyes medial, of moderate size; jaws triangular, toothed; antennæ long; thorax widened anteriorly; abdominal pedicles somewhat diamond shaped above, much raised and thin as seen laterally; legs rufous, the rest of the body black. *Warrior*, 6-10th of an inch long; differs from the ordinary *Worker* in the head being proportionally much larger, and the jaws having blunt teeth. *Male*, length 4-10th of an inch; has a small triangular head, lateral eyes, three ocelli, the thorax raised in front, and the abdominal pedicle broader; wings do not reach to end of abdomen. *Female*, 5-8th of an inch long; very similar to the male, has the jaws strongly toothed, somewhat oblong; and the abdomen proportionally large. This species, well known in India as the black Ant, is found throughout every part of this country which I have traversed, except the Western Coast where I have never seen it. It appears to me that it is most probably the species described by Fabricius whose name I have accordingly adopted. It lives in very numerous societies in the ground, the entrance to the nest being often round the trunk of a tree, or close to some building. The Warriors are very numerous. Their food is chiefly vegetable secretions, sugar, &c., and Colonel Sykes has given an interesting account of the devastations committed by them on preserves, sugar, &c., which I regret that I cannot transcribe, having mislaid the volume of the transactions of the Entomological Journal in which it appeared. They bite rather severely, but the pain is quite momentary. At certain times great numbers of the winged males and females are seen at the mouth of the nest, and they remain there for several days. When they take wing, they do so in vast numbers, and always at night.

(314) "*Formica angusticollis*, N. S. *Worker* ½ an inch long; head long, oblong, ending posteriorly in a narrow neck; eyes posterior, of moderate size; jaws triangular, strongly toothed; antennæ long; thorax low, narrow, uniform; abdominal pedicle conical, high, narrow; abdomen oval; colour dull black, with antennæ and legs rufous. *Warrior*, 8-12th of an inch long; head very large, notched posteriorly; eyes much smaller; otherwise similar. I have only found this Ant in forests in Malabar and always sing-

(315) "*Formica smaragdina*. *Worker*, length about 4-10th of an inch; head long, triangular; antennæ long; eyes large, medial; jaws triangular, pointed, with sharp teeth; thorax not furrowed; abdominal pedicle, long, low, narrow, linear; legs long: colour of an uniform pale rufous. *Male* 7-24th of an inch long; head diamond shaped; eyes lateral, small; thorax raised in front; abdomen small; wings reaching beyond the abdomen; of a rufous colour. *Female* 7-10th of an inch long; head short, triangular; eyes lateral; three ocelli; thorax very large, with abdominal pedicle wide in the middle as viewed from above, very thin laterally; abdomen large; wings reaching beyond abdomen; entirely of a pale shining green colour. This Ant is well known in Malabar, and the wooded parts of Travancore, but is rare in the Carnatic, where I have only seen it in one or two large mango groves. It forms a nest of living leaves which it draws together without detaching from the branch, and unites with a fine white web; sometimes a nest is above a foot in diameter but usually smaller. The society consists of a vast number of individuals, and in large nests we find males and females and males, both with and without wings at all times of the year. They are

bold and pugnacious, and bite very severely. They live chiefly on vegetable secretions, and are very partial to the flowers and buds of some of the Loranthi, which abound on the Western Coast. They often form a temporary web round the flowers or sometimes round the fruit of various trees, viz. the Eugenia malaccensis, Artabothrys odorotissima, &c. apparently only for the purpose of feeding undisturbed, they will however also sometimes feed on decaying animal matter. It is said that the web they form is occasionally used for writing on in the N. W. Provinces of India, and that the Ants are made use of to destroy a nest of wasps that may have established themselves in a house. In this case they are said to destroy all the wasps but become so infuriated, that their own indiscriminate attacks are nearly as bad as those of their foes. In gardens they are most partial to mango trees, and also to the large leaves of the Jamei Malae, (Eugenia malaccensis), but in the jungles they select a vast number of trees, or rather make no selection at all.

(316) "*Formica longipes*, N. S. *Worker*, length 1-5th of an inch; in form exceedingly similar to the last; head more oblong than triangular; eyes more posterior; antennæ very long; abdominal pedicle shorter, proportionally; abdomen a longer oval; legs very long of a pale rufous colour throughout, tinged with dusky on the abdomen. This Ant is found in all the forests of India living in holes in the ground, in tolerably numerous societies, and feeding on vegetable secretions. I have not seen it at any distance from the jungles. At Tellicherry, for example, I have never seen it, but as soon as you go a little inland and get into the jungle you meet with it. It is often found about bungalows and out-houses.

(317) "*Formica timida*, N. S. *Worker*, length 9-24th of an inch long; head oblong, oval; eyes large, posterior; jaws triangular, strongly toothed; thorax smooth; abdominal pedicle raised, conical; colour dingy rufous, darkest on the head, and tinged with dusky on the abdomen. All the body covered with long scattered hairs. *Warrior*, ½ an inch long; differs from the ordinary *Worker* in the head being much larger proportionally, and notched posteriorly; thorax thicker; and the abdomen shorter. *Female*, like Worker, but somewhat larger, with wings, and 3 ocelli. *Male*, 7-24th of an inch long; thorax much elevated; eyes large; head small; 3 ocelli; wings reach beyond the abdomen. I have only found this Ant on the Malabar Coast where it is very common, living chiefly on vegetable secretions. It has its nest under ground. It is very different in habit from the other large red Ant (F. smaragdina) being most timid, and if approached or touched, dropping to the ground at once and hiding itself. It does not always confine itself to vegetable matter. On one occasion I had a box of pigeons containing some squabs placed in a room on the floor. I next morning found several of the squabs dead covered with these Ants, chiefly however the warriors

(318) "*Formica stricta*, N. S. *Worker*, length 7-20th of an inch; head nearly square, slightly narrowed anteriorly; jaws rough, triangular strongly toothed; eyes large, posterior; prothorax wide, metathorax narrowed; post-thorax in the form of a rounded raised narrow platform ending in two points, and truncated; abdominal pedicle blunt, rounded, raised; abdomen short oval; antennæ rufous, head and thorax dull greenish black, shagreened; abdomen shining glaucous green; legs shining black. I have found this Ant on flowers in Malabar, but have not seen its nest; it is not a very common species

(319) "*Formica cinerascens*, *Fabr.*? *Worker*, length 3-8th of an inch; head large, eyes rather small posterior; jaws strongly toothed; thorax wide in front, narrowed behind, with two glands on each side above; abdominal pedicle elevated, conic; abdomen oval; colour dull black, except the abdomen, which is glaucous green, and somewhat pubescent. *Female* ½ inch long nearly; head smaller, thorax not so wide; abdomen long oval; wings not reaching to the end of abdomen. *Male* 3-12th inch long; similar in form to the female, but with much narrower abdomen, and head still smaller proportionally. *Warrior* 5-12th of an inch long; head large; antennæ short; eyes minute. This species lives in the ground in small societies. I have only seen in the Carnatic. It is described as having the head fulvous, and a triangular spot on the abdomen, but as it is said by Fabricius to have been sent from Tranquebar, in the vicinity of which I have seen our present species, I think they are probably identical, and that the difference of colour is accidental, especially as there are only two species common in the Carnatic with glaucous abdomen, this and our F. rufoglauca.

(320) "*Formica velox*, new species. *Worker* length 5-24th inch to 6-24th; head long, oblong, eyes posterior, large; jaws strongly toothed; antennæ long; thorax smooth; abdominal pedicle raised, somewhat rounded, wide above; abdomen with the divisions of the segments strongly marked; legs long, colour dull blackish, with the abdomen greenish pubescent. This Ant is very common in Malabar and I think is also found in the Carnatic. It frequents flowers, especially delighting in those that have great quantities of pollen, such as the Cucurbitaceæ, Hibisci, &c. It runs very speedily, and is very easily alarmed, dropping to the ground on being touched. I have not succeeded in finding its nest.

(321) "*Formica rufo-glauca*, new species *Worker*, 7-24th inch long, head long, oblong, eyes large, posterior; jaws strongly toothed; thorax not grooved; abdominal pedicle raised conic, wide above; abdomen fine silky glaucous green; head, thorax and legs bright rufous

Warrior, 9-24th inch long, head large; eyes much smaller; antennæ shorter; abdominal pedicle flattened posteriorly; abdomen short and triangular; colour similar. I have found this Ant only in the Carnatic in small societies living in holes in the ground. It is possible that this may turn out to be Fabricius' species *cinerascens*.

(322) "*Formica vagans*, new species. *Worker* 3-24th inch long, eyes large, medial; antennæ long; abdominal pedicle raised, rounded; legs very long. *Female*, 3-24th inch long; the thorax shorter and wider, and abdomen very large, wings reaching beyond the abdomen. This little Ant is exceedingly common in the Carnatic, but I have not yet seen it on the Malabar Coast. It takes up its quarters in any sheltered spot in a house, under a box, a stone, a hole in the wall, or such like places, and when disturbed flits with great speed to another suitable spot. Its society is very numerous in individuals and there are many females and males, sometimes with, at other times without, wings. It feeds both on vegetable and animal substances preferring the former like all the true Formica.

(323) "*Formica assimilis*, new species. *Worker*, exceedingly similiar to the last. Length, 3-24th of an inch, differs in its colour chiefly being of a shining reddish black, in its eyes being apparently large, the thorax narrower, and in being covered all over with scattered white hairs, I have found it frequenting flowers in Malabar, but not abundant.

(324) "*Formica phyllophila*, new species. *Worker*, length 7-48th of an inch, eyes small, anterior, jaws triangular; thorax slightly furrowed posteriorly; abdominal pedicle thin, low, linear; abdomen large triangular; legs, antennæ, rather short: colour shining brown black. This little species forms a temporary nest between two leaves usually, or sometimes in a head of flowers; it lives in small societies, and feeds entirely on vegetable secretions.

(325) "*Formica nana*, new species. *Worker*, length not 1-12th inch; eyes anterior, thorax wide; abdomen long, elliptical; head and thorax brown; antennæ, legs, and abdomen pale whity brown. This very minute species is found in all parts of India and is very abundant in Mysore: from its very small size it is noticed with difficulty. It feeds on flowers and vegetable secretions.

2ndly. With spines on the thorax.

(326) "*Formica indificans*, new species. *Worker*, 5-24th of an inch long; head triangularly ovate, elevated; eyes moderate; jaws strongly 3 toothed; thorax wide anteriorly, narrowed behind, with two small spines anteriorly pointing forwards, and two large ones behind, pointing upwards and backwards, and two rudimentary spines or points behind and beneath these latter; abdominal pedicle square, raised with two large upright spines, and a smaller one on each side; abdomen short; head and abdomen rufous, thorax dark glossy brown. *Female*, 1-3rd inch long, similar to the worker; 3 ocelli on top of head; wingless. This Ant makes a small nest about ½ inch, or rather more, in diameter, of some papyraceous material, which it fixes on a leaf. I have opened two, each of which contained one female and 8 or 10 workers. It is very rare, and I have only seen it in Malabar.

(327) "*Formica sylvicola*, new species. *Worker*, 3-12th long; head narrowed in front, and rounded behind; eyes posterior, salient; antennæ inserted in front of the eyes, with a strong crest bordering their insertion internally; jaws short, with 5 teeth, the upper one much the longest and bent; thorax, wide; with two spines on its anterior angles, and two stronger ones posteriorly pointing backwards and upwards; abdominal pedicle large, square, ending behind in two large curved spines pointing backwards and outwards, and two points or tubercles behind and between them; abdomen short, oval, colour dull black, abdomen shining glaucous green. *Female*, 9-24th inch long, differs in the anterior thoracic spines being apparently shorter, and in having 3 ocelli; wingless. This Ant has the same habits as the last, but is not found except in the jungles. It appears very closely allied to *F. hastata* of Latreille from India, and to several other species said to be from Southern Asia; and as some of these *may* be found in India, I add here a brief description of them taken from St. Fargeau's work on Hymenoptera.

(328) "*Formica serspinosa*, Latr. Body black, covered with a fine silky yellowish down, especially on the abdomen; head oblong; narrowed posteriorly: antennæ long; posterior angles of the head salient; jaws large, triangular, with 3 or 4 teeth; eyes small globular, salient; thorax with two spines anteriorly on its lateral angles, and two on the posterior extremity pointing backwards; abdominal pedicle thick, rounder in front, truncated posteriorly with 2 spines *almost as large* as those on the posterior extremity of thorax; length 7 2-3rd lines (French); from Southern Asia.

(329) "*Formica hastata*, Latr. Black, finely shagreened and slightly hairy, head short; antennæ long; jaws short with small teeth, and a larger curved one at the end; space between the antennæ elevated with an arched crest on each side; eyes small, round; thorax cubical, compressed, its surface flat and the ridge on each side sharp, anteriorly wide and square with a spine on each side at the numeral angles, strong, sharp, straight, and reaching to the head; its posterior part truncated with a strong spine at each angle pointing obliquely upwards; abdominal pedicle large, triangular, with its upper edge concave, a small tooth in the middle, and a strong arched spine on its lateral angles directed backwards, with a little tooth beneath each. Length 4 lines. Hab. India.

(330) "*Formica reluceus*, Latr. Exceedingly e the last (*F. hastata.*), differs in the following ints—body covered with silky, golden, shin- ; down, with a few larger hairs ; thorax with o spines anteriorly and none posteriorly ; ab- minal pedicle with 4 spines, the upper ones irly straight ; length 4 lines. From Southern ia.

(331) "*Formica Ammon*, Latr. Very like the o last, body black, striated, with a few hairs ; orax ashy ; anterior angles advanced ; posterior- the lateral angles prolonged into a large, aight spine, pointing backwards ; abdominal licle large, triangular ; with the upper angles olonged into a very long curved spine, directed ckwards ; abdomen covered with a silky gold- down—length 2 1-5th lines. From Southern ia.

(332) "*Formica carinata*, Fabr. Head rounded, ck ; thorax black, divided into three by two p transverse lines ; the anterior portion with pine on each side directed forwards ; and the sterior part with two small straight spines ; dominal pedicle large, square with two raised rp bent spines. Length ? of medium size. uthern Asia."

"I have very little doubt but that many more cies of Ants will be discovered even in the uthern portion of the Peninsula, and I myself pe to add others to the present list, and more ecially to gain additional information on their its."

(333) ANT-EATER (*Myrmecophaga*, Linnæ- , a genus of *Edentata* distinguished by their al want of teeth and their hairy covering. The ter circumstance separates them from the Pan- lins (*Manis*), or scaly Ant-Eaters of Africa and ia, which they resemble closely in other re- cts, as well in their general anatomy as in their d and habits. These two genera form a small t very distinct family of Cuvier's order *Eden- a.—Eng. Cyc. page* 223.

(334) ANTHEMIS NOBILIS.

Camomile, or Chamomile, ENG. | Baboone phool, PERS. and HIND.

Off. The flowers. A native of Europe and rsia. Besides essential oil and bitter matter, nomile flowers contain gum, resin, and traces tannic acid. Camomile flowers afford in Eu- e a cheap and efficient antispasmodic and bit- tonic. They are much used in infusion as vehicle for other medicines employed in the atment of hysteria, colic, suppressed menstru- on, &c. The warm infusion taken freely after trate of antimony and ipecacuanha much faci- tes the action of these emetics. The powder been employed to the extent of two drachm es as a preventative of ague, and it is stated, good authority, with much success. The es- tial oil is in proportion more powerful as an ispasmodic than the other preparations, but is titute of tonic or emetic properties.—*O'Shaugh- sy, page* 413. In doses of two drams of the powdered leaves, they are reputed febrifuge. Ex- ternally they are used in infusions as fomenta- tions, and occasionally as enemas.—*Eng. Cyc. Waring.*

(335) ANTHEMIS PYRETHRUM.

Pellitory, ENG. | Akurkura, or Akurakarra HIND. TAM. and TEL.

Anacyclus Pyrethrum, D. C. Pyrethron. Diosc. iii. p. 86. A native of the south of France, Bar- bary, &c. *Off.* The roots. Akurkura or Pyre- thrum root is used as a masticatory to relieve toothache : enters into the composition of certain snuffs, and the powder is used in large quanti- ties by the Mahomedans to excite transpiration, being rubbed on the skin ; it is used internally also as a cordial and stimulant in lethargy and palsy, and in certain stages of typhus fever. Dr. O'Shaughnessy was acquainted with two remark- able cases of spontaneous salivation of the most obstinate form, which after resisting every other treatment for more than three months, were ef- fectually cured by this root.—*Dr. O'Shaughnessy, pages* 413, 414.

(336) ANTHERICUM ANNUUM—*Liliaceæ*, This genus of flowering plants comprises both bul- bous and shrubby species, and may be grown in a light loamy and sandy soil, the shrubby species can be propagated by cuttings, and the bulbous kind from off-sets.—*Riddell.* Wight gives a figure of A. tuberosus.

(337) ANTHISTIRIA. Mr. Mason noticed in the Karen jungles a large grass with lax panicles and very long awns belonging to this genus.—*Mason.*

(338) ANTHRACITE from *Anthrax* Gr. Charcoal, a black, light, mineral, called also blind- coal, because it burns without flame ; and glance-coal from its lustre. *See* COAL.

(339) ANTIARIS SACCIDORA (*Dulz.*) Nat. Ord. ARTOCARPEÆ. MONÆCIA MONANDRIA. *Sex. Syst.*

Sack tree, ENG. Araya-affjely, MAL. | Juggoory, Kurwat, CAN. MAH. Chundul, HIND.

This gigantic forest tree is indigenous on the western side of India, as in the ravines at Khandhalla and the jungles near Coorg, and is known as the Sack tree, the Sacks made from it being in general use for carrying rice, and are sold for about 6 annas each. In their manu- facture a branch is cut corresponding to the length and diameter of the bag wanted. It is soaked a little, and then beaten with clubs until the inner bark separates from the wood. This done, the sack formed of the bark, is turned in- side out and pulled down, and the wood is sawed off, leaving only, carefully untouched, a small piece to form the bottom of the sack. The natives also strip the bark of this tree into large pieces, soak it in water, and beat it well, when it be- comes white and furry, and in this state, the Hill people use it as clothing. Paper is also made from the bark. The inner bark is composed of very strong tenacious fibres, and seems excellent-

ly adapted for cordage and matting. The nuts are intensely bitter, and contain an azotized principle, which may prove an active medical agent. In the Northern Concans, the natives call the tree Jugooory and Kurwut; also Chundul. On wounding the fruit a milky viscid fluid exudes in large quantities, which shortly hardens, becoming of a black and shining colour, and of the consistency of bees-wax. —*Royle. Useful Plants. Eng. Cyc.*

(340) ANTIARIS TOXICARIA (Leshenault.)

Upas tree, ENG. | Anchar, MALAY.
Ipo toxicaria, PERS. |

A native of Java. The juice of this tree is one source of the half fabulous Upas poison. The tree is often over 100 feet in height, its bark pale and smooth, its leaves oval, coriaceous, hairy, juice viscous, bitter, white or yellow, flowing abundantly from incisions, and concreting into a gummy resinous mass. The *Upas antiar* poison is prepared in an earthen vessel with this juice, which is mixed with the seed of the Capsicum frutescens, and various aromatics. This poison at first acts as a purgative and emetic, then as a narcotic, causing death by violent fits of tetanic convulsions. The *Upas tiente* poison is prepared from a strychnos, and differs from this substance. —*O'Shaughnessy, page* 579. Upas, in Javanese, "poison", or "venom", is the sap of some plants of the Malay and Philippine Islands yielding poisonous juices, which, by concentration, produce a poison of considerable activity which has been sometimes employed by the ruder natives to render their weapons deadly. The most potent of these plants in Java are the Anchar, the Antiaris toxicaria, this large forest tree, and the Chetek, Strychnos tiente, a climbing shrub. In all these cases, the poison, even when fresh, is far less active than that of the cobra snake, for the most powerful will take an hour to kill a dog, which the venom of the hooded snake would certainly accomplish in half the time To effect a fatal purpose, too, it is necessary that the poisoned weapon should be left in the wound, and not withdrawn, so that the probability is that few human beings have ever lost their lives by means of these poisons.—*Crawfurd, Dictionary, page* 442.

(341) ANTIDESMA BUNIAS (*Spreng.*) N. Ord. STILAGINACEÆ. DIŒCIA PENTANDRIA. *Sex: Syst:*

Noelha-tahlie, TAM. Ariyaporiyan, MAL.

A middle sized tree, growing in Coromandel, Malabar, Assam, and Nepaul. The shining deep-red fruit is subacid, and esteemed for its cooling qualities. The bark is used for making ropes, especially in Travancore. It is one of the numerous plants whose leaves are considered a remedy against the bites of poisonous snakes. The leaves are acid and diaphoretic, and, when young, are boiled with pot-perbs, and employed in India in syphilitic affections. In Assam it grows to rather a large size, with the trunk 12 or 14 inches in diameter. The timber is greatly affected by immersion in water, becoming heavy and black as iron. Dr. Wight under the same Tamul name of Nolhæ talie marum, நல்லதாளிமரம், styling it Antidesma alexiteria, says, it is a common enough jungle tree and a very handsome one.—*Wight. Useful Plants.*

(342) ANTIDESMA DIANDRUM, is found on the Travancore mountains, yields a tolerable timber, which is useful for various purposes. —*Roxb. Lindley &c. quoted in Useful Plants.*

(343) ANTIDESMA PANICULATA.

Byitzin, BURM.

A small crooked timber, of a close grain, found in the Rangoon, Pegu, Tounghoo, and Tharawaddy Forests; wood red, adapted to cabinet making.—*McClelland.*

(344) ANTIDESMA PUBESCENS (*Linn.*)

Pollaie, TEL.

This tree grows in the Northern Circars, is similar to A. Bunias, and the bark is used for making ropes. The succulent drupes are eaten by the natives.—*Roxb. quoted in Useful Plants.* Wight, in *Icones*, gives figures of A. acuminata, 1991; Bunias, 819; lanceolaris, 766; paniculata, 820; tomentosa, 767-8.

(345) ANTILOPEÆ in Zoology, ANTELOPES, a family of Ruminating Mammals, belonging to the Hollow-Horned group, and distinguished by the following characters: —The horns conical, bent back, cylindrical, or compressed, and ringed at the base. The knee (or wrist) in the middle of the fore-leg. The occipital plane of the skull forms an obtuse angle with the frontal plane. Core of the horns thin, consisting of dense bone, often with a clear sinus as the base within. Teats two or four; feet-pits in hind-feet and generally also in the fore ones. —*Eng. Cyc. page* 232. The following are the better known genera of this family in Southern and Eastern Asia, and Northern Africa.

(346) *Pantholops Hodgsonii* (*Antilope Hodgsoni*, Abel), the Chiru (Hind.) is believed to be the Unicorn of the Bhotias, and supposed by Colonel Smith to be the animal which Ælian describes under the name of *kemas*, (see Homer's 'Iliad,' X. 361.) an opinion founded upon very slight and not easily tenable grounds. The whole length of this animal, from the muzzle to the root of the tail, is about 5 feet, its height 3 feet; the tail is 8 inches long; the head, from the nose to the root of the horns, 9 inches; the ears 4 inches, and the horns measured along the curves, upwards of 2 feet. The horns grow upright from the skull, are strongly compressed on the sides, bent slightly backwards at first, and afterwards, point gradually forwards, thus assuming a lyrate form, but less strongly marked than in the common gazelle; they are surrounded, to within 6 inches of the points, with from 15 to 20 annuli, forming prominent knobs in front, but more obscure on the sides and rear; the last 6 inches are smooth and round, and the points rather attenuated. The legs are long and slender; but the symmetry of the head is destroyed by two

large fleshy tumours about half the size of a hen's egg, which grow close to the outer margins of the nostrils, as well as by a profusion of bristly hair which surrounds the mouth and nose. The body is furnished with two different kinds of hair, a long external coat of the usual quality, and a short interior one of fine close wool. The prevalent colour of the latter is uniform grayish blue, and the outer coat is likewise of the same colour of the base, but it is tipped with reddish fawn, and thus gives the whole of the upper parts a tawny hue, through which the lower tinge is but faintly visible the belly and interior of the limbs are white, the nose and face black, and a dark brown band passes down the front of each leg. The Chiru, according to the information obtained by Mr. Hodgson, inhabits the elevated plains of Tibet, but never approaches the mountains, and is altogether unknown on the Indian side of the great Himalayan chain. It is gregarious, residing in herds of many hundreds on the open plains, extremely shy and difficult to approach, posting sentinels in all directions where the herd feeds or reposes, and flying with astonishing velocity on the first alarm or intimation of danger. When brought to bay, however, the males defend themselves with courage, and in confinement are sometimes mischievous, and should be always approached with a considerable degree of caution. They are very jealous and pugnacious and in their contests often break off one of their long horns—hence the belief in their being Unicorns. Like most other Ruminants, they are extremely fond of salt, and during the summer months unite in large herds to visit the beds of this mineral, which abound throughout Thibet, advancing under the guidance of an experienced leader, and as usual posting sentinels to prevent surprise.—*Eng. Cyc. p.* 236.

(347) *Procapra gutturosa*; *Antilope gutturosa*, Pallas), the Dzeren, the Hoang Yang, Whang Yang, or yellow goat of the Chinese, is nearly 4½ feet in length, and 2 feet 6 inches high at the shoulder; the body also is large and corpulent, and the legs shorter than is common to the Antelopes in general; the horns are black, lyrated, and marked to within a short distance of their points with prominent transverse rings: the suborbital sinuses are small; the laryux large and salient, forming, particularly in the old bucks, a prominent lump on the throat; upon the prepuce of the same sex there is likewise situated a bag about the size of a hen's-egg, which contains a waxy substance similar to that produced in the analogous organ of the musk animal, but without any kind of odour; the tail is short, and the knees furnished with small bunches of hair, but scarcely sufficiently long and distinct to merit the name of brushes, the summer coat is of a grayish fawn-colour above, and white beneath; that of winter almost entirely white, being tinged but slightly with a grayish yellow shade on the back and sides. The females resemble the males in colour, but are rather of smaller size, and without horns; they want the sac on the abdomen, and have two teats.—The Dzerens inhabit the dry arid deserts of Central Asia, Tibet, China, and Southern Siberia, particularly the great desert of Gobi; and prefer the most sandy and stony plains, feeding upon such scanty herbage as these localities supply, and avoiding water, to which they appear to entertain a marked aversion. They are remarkably swift, take prodigious leaps and when frightened, will occasionally pass over 20 or 25 feet at a single bound. In spring and summer they form small families which live apart from one another, but in the beginning of winter they unite into large flocks, always under the guidance of an experienced old buck. They never run, even when pursued, in a confused crowd but form single files, and follow closely in the footsteps of their leader. They rarely emit any voice. When taken they are easily tamed, and appear to have rather a predeliction for the domestic state, often mixing with flocks of sheep, and approaching human habitations during the severity of the winter season. Their flesh is tender and well tasted, and they are a favourite object of chase with the Moghuls and Tartars.—*Eng. Cyc. p.* 236.

(348) *Procapra picticauda*, the *Ragoa* or *Goa*, is an animal described by Mr. Hodgson as an inhabitant of Tibet It has brown hair with rufous tips; the inside of the ears and limbs white, and tail black. It is perhaps *P. gutturosa* in its summer coat.—*Eng. Cyc. p.* 337.

(349) *Gazella Dorcas* (*Antilope Dorcas*, Pallas), the Gazelle, the Algazel, the Corinne, is 3 feet 6 inches in length, 1 foot 9½ inches high at the shoulder, and 1 foot 10½ inches at the croup; the head is 6 inches long, the horns 9½, the ears 4¾, and the tail, with its terminating tuft, 8 inches. The Gazelle is found in Egypt, Barbary, and some say also in Asia Minor; but it is very questionable whether the animal of the Levant does not really belong to a different species. It lives in large troops upon the borders of the Tell, or cultivated country, and the Sahara, or desert. When pursued it flies to some distance, then stops to gaze a moment at the hunters, and again renews its flight.—*Eng. Cyc, p.* 338.

(350) *Gazella subgutturosa* (*Antilope subgutturosa*, Guldenstadt), the Ahu and Jairou, is of a pale brown colour, the upper part of the sides with a broad rather paler streak, the face-streak indistinct; the lower part of the sides, belly, hinder side of fore and front side of hinder limbs, and anal disk, white; the streak on the haunches dark brown; the end of the tail black. It inhabits all the central parts of Asia, Persia, Daüria, the country around Lake Baïkal, and from the eastern limits of Great Bucharia to the shores of the Hellesport. It associates with its own

species in extensive flocks, frequents the open uncovered plains and naked hills of moderate elevation, and feeds principally upon the *Absinthium ponticum*. The flesh is much esteemed, and of an agreeable taste.—*Eng. Cyc. p.* 238.

(351) *Gazella ruficollis* (*Antilope ruficollis*, H. Smith), the Andra, is a beautiful species of Eastern Africa, discovered on the barren wastes of Nubia by Rüppel, and in Senaar and Dongola by Hemprich and Ehrenberg. The whole length of this species is 5 feet 4 inches, its height at the shoulder 3 feet; the length of the head is 8 inches that of the horns 12½ inches, and that of the tail 9 inches. The horns are precisely similar to those of the Mohr, *Gazella Mohr*, as are likewise the general form and proportions of the body. This species is gregarious, and resides in flocks on the desert between Nubia, Dongola, and Kordofan.—*Eng. Cyc. p.* 240.

(352) *Tragops Bennettii* (*Antilope quadricornis*, Blainville), the Chikara, Ravine-Deer, Goat Antelope, Kalsiepie, or Black-Tail, is of a bay-brown colour, and has the end of the nose and tail black; the face streaked; chest, belly, and inside of limbs, white, the feet are black or brown. The Kalsiepie, or Black-Tail, so called by the Mahrattas on account of the deep black colour of the tail, and distinguished by the name of the Goat Antelope by the Europeans, is found on the rocky hills of the Dekhan, and, according to the report of Colonel Sykes, differs from many other antelopes in not being gregarious, there being rarely more than three or four found together in the same company, and not unfrequently a solitary individual.—*Eng. Cyc. p.* 241.

(353.) *Antilope Bezoartica* (*A. cervicapra*, Pallas), the Sasin, or Common Antelope, is remarkable for the form and beauty of its horns, which compose a spiral of two or more turns, according to the age of the animal. This beautiful animal is, when full grown, about 4 feet in length, and 2½ feet high at the shoulder; the head, measured from the nose to the root of the horn, is 7 inches long, the ears 5½ inches, and the tail, without the hair, 6 inches. The legs are long and delicate; the body round, but light, and well formed; the head small; the eye large, lively, and expressive; the years long and cylindrical, the suborbital sinus particularly developed, and in continual motion; and the horns forming a complete spiral of two or three turns, wrinkled at the base, distinctly annulated in the middle, and smooth for a couple of inches next the points. The females, and young males for the first three years of their age, are of a uniform tawny-brown on all the upper parts of the body, with a light silvery band passing longitudinally from the shoulder to the hips, about six inches below the spine, on either side; the breast, belly, and interior of the fore arms and thighs are white; as is likewise the under surface of the tail, which is rather broad, and furnished with a small tuft of black hairs at the extremity. After their third year, the males begin to assume the adult colours of their sex, and gradually darken on all the upper parts of the body, till they finally become almost entirely black above and white beneath; the nose, lips, and a large circle round each eye being likewise white, but the light bands of the sides completely obliterated. The hair is uniformly short and close over the whole head, body, and extremities, except on the knees, which are furnished with tufts of long bristles, forming new small knee-brushes. The Sasins are so swift that it is useless to slip greyhounds after them; as, unless taken by surprise, which their extreme precaution seldom allows, it is impossible to overtake them, and experience has convinced the Indian sportsmen that the dogs are more likely to be injured in the chase than the game. The bounds also which these animals occasionally take, either for their own amusement or over the long grass when pursued, are said to be almost inconceivable. Captain Williamson, in his splendid work on the 'Wild Sports of the East,' assures us that he has seen an old buck Antelope lead a herd of females over a net at least 11 feet high, and that they frequently vault to the height of 12 or 13 feet, and pass over 10 or 12 yards at a single bound. They reside on the open plains of India, where they can see to a great distance in every direction, live in large families of from 5 or 10 to 50 or 60 grown females to a single male, and when they feed, or lie down to ruminate, detach a number of the young bucks to a distance of 200 or 300 yards on every side to watch over the common safety. Nothing escapes the notice of these careful sentinels; every bush or tuft of grass that might be suspected to conceal an enemy is strictly and attentively examined, and on the first alarm the whole herd betakes itself to flight, following closely in the footsteps of the old buck, and is soon beyond the reach of pursuit. The venison is dry and unsavoury, and being held in small esteem, consequently holds out no inducement either to the occasional sportsman or to the professional Indian hunter. The species extends over every part of India, from the borders of Persia to the most eastern parts of which Europeans have any distinct knowledge. It is found on rocky open plains, avoids woody localities and the thick cover of the forest; nor is there any certainty of its existing beyond the limits of India, though many zoologists, from Ray to Hamilton Smith, are of opinion that it likewise inhabits some parts of Africa. The fakeers and dervises polish the horns, and form them into a kind of offensive arms by uniting them at the base; these they wear at their girdles instead of swords and daggers, which their vows and religious character prevent them from using.—*Engl. Cyc. p.* 243.

(354) *Tetracerus quadricornis* (*Antilope quadricornis*, Blainville), the Chousingha, is about 2 feet 9 inches in length from the muzzle to the

root of the tail; the tail itself is 5 inches long, and the height at the shoulder about 1 foot 8 or 9 inches. The superior or common horns are about 3 inches long, smooth, black, pointed, erect, and moderately divergent, bending very slightly forwards, and without the least indication of annuli. The spurious or additional pair of horns are placed in front of these, immediately between the orbits, and consist of short, erect, blunt stumps, about three-quarters of an inch in length, 1½ inch in circumference at the base, and of the same smooth and black appearance as the real horns. The head is 7½ inches long, the ears 4¾ inches, erect and pointed, the general colour of the upper parts is uniform bright bay, and that of the under parts silvery white, more or less mixed with sandy-coloured hairs; the lips are bordered with black. The females differ from the males by the absence of horns, and likewise by being of a lighter colour, which character is conspicuous at a very early age, and continues throughout life. This species, as well as the *Tragops*, called Chikara by the Hindoos, is common in all the wooded parts of India, particularly in Bengal, Bahar, and Orissa; it is monogamous, and lives in pairs in the forests and thick jungle, being exceedingly wild and active, and rarely suffering a state of confinement, unless taken young. During the rutting season the male becomes particularly mischievous, and it is then dangerous to approach him, as he butts at everything within his reach; the female produces two young at a birth, but the period of gestation has not been recorded. Baron Cuvier supposes, and apparently with reason, that the ancients were acquainted with this species, and that the Four-Horned Oryx of Ælian refers to the modern Chikara.—*Eng. Cyc. page* 244.

(355) *Tetracerus Iodes*, the Rusty-Red Chousingha, is an Indian species described by B. H. Hodgson, Esquire,—*Eng. Cyc. p.* 244.

(356) *Tetracerus paccervis*, the Full-Horned Chousingha, is another Indian species.—*Eng. Cyc, page* 244.

(357) *Tetracerus subquadricornutus*, the Jungli burka, is distinguished by its front pair of horns being rudimentary and tubercular. It is a native of the Bombay side of India, and there are four specimens, two male and two female, in the collection of the British Museum.—*Eng. Cyc. page* 244.

(358) *Capricornis Sumatrensis* (*Antilope Sumatrensis*, Desmarest), the Cambing Outan, or Sumatran Antelope, first noticed by Mr. Marsden in his 'History of Sumatra,' is about 4½ feet in length, and 2 feet 3 inches high at the shoulder. The horns are 6 inches long, very thick at the base, and much attenuated, sightly and uniformly curved backwards. The muzzle is distinct and well formed; the lachrymal sinuses open by a small circular aperture. The Cambing Outan, or Wild Goat, so called by the Malays, inhabits the hilly forests of Sumatra, and is described by Mr. Marsden as being of a wild character, extremely active and sure-footed, with much of the habit and character of the common Goat and Ibex, of which it has the roving fearless eye and bold undaunted bearing.—*Eng. Cyc. p.* 259.

(359) *Capricornis Bubalina* (*C. Thar*, Ogilby), the Thaar, Thar, Serow, or Imo, is of a gray, brown, blackish washed colour, with the crown and dorsal streak black; the nose, chin, inside of ears, lower part of mane and legs below the hocks, whitish. It is a native of Nepaul, and is principally known by the drawings and specimens presented by B. H. Hodgson, Esquire, to the British Museum. The Thar inhabits the central region of Nepaul, at an equal distance from the snows of the Himalayan range on the one hand, and the sultry heats of the low plains of India on the other. It is the most common of all the wild ruminants which are found in that country, and its chase is the favourite exercise and amusement of the hill tribes. Its flesh is indeed coarse, but there is plenty of it; and these rude people are easily satisfied on the score of quality, provided the quantity be sufficient. Its habits are wild and solitary; it is seldom found in herds, however small; the grown males, especially, live apart in the mountains, and never seek the society of their species, except during the rutting season. As might be supposed from its heavy make and short stout limbs, it is a slow runner, and is soon brought to bay; but it leaps well, and makes its way over broken ground with greater ease than in open level situations. It is found from the eastern confines of Nepaul to the banks of the Sutlej, but abounds especially towards the east. The Thars differ from the Antelopes in being stout clambering animals, but they are not allied to the Ox-Tribe.—*Engl. Cyc. p.* 259.

(360) *Capricornis crispa*, the Japanese-Goat Antelope, has a harsh crisp brown or brownish fur, with whitish sides, white cheeks, and legs black-brown. It is a native of Japan.—*Eng. Cyc. p.* 259.

(361) *Nemorhedus Goral* (*Antilope Goral*, Hardwicke,) the Goral, is of a gray-brown colour, minutely dotted with black; cheeks, chin, and upper part of throat, white. The Goral was first described by General Hardwicke in the 'Linnæan Transactions.' It inhabits Nepaul, and lives in large herds upon the elevated plains which crown the lower ridges of the Himalayan mountains. It is wild and fleet, and when pursued, flies to the rocky hills, where it easily escapes the hunter, and is indeed rarely taken, except by stratagem. Its flesh is considered excellent venison. It is entirely confined to the cold upper regions of Nepaul, and is incapable

of bearing the sultry heat of the plains of Hindustan.—*Engl. Cyc. p.* 259.

(362) *Alcephalus Bubalis* (*Antilope Bubalis*, Pallas), the Bubale, or Bekker-el-Wash, is about the size of the largest stag, and is particularly remarkable for the great length of its head, and its narrow, flat, and straight forehead and face. It is called Bekker-el-Wash, or Wild Ox, by the Arabs, and is common in every part of Northern Africa, living in numerous herds on the confines of the Tell or cultivated parts, and the Sahara or Desert, and also, according to Captain Lyon, upon the mountains south of Tripoli. Barbary seems to be the chief habitat of the species, but it sometimes happens that a few individuals find their way across the desert to the banks of the Nile, where, however, they stray from their native habitat. At the same time, it is to be observed that its representation occurs among the hieroglyphics of the temples of Upper Egypt. Dr. Shaw informs us that the Bubale is naturally of a familiar disposition, that the young calves frequently mix with domestic cattle, and soon learn to attach themselves to the herd without attempting to escape afterwards. They fight like the common bull, by lowering the head, and striking suddenly upwards with the horns, which are formidable weapons either for attack or defence. —*Engl. Cyc. page* 263.

(363) *Portax Tragocamelus* (*Antilope picta*, Pallas), the Nil-Ghau or Nyl-Ghau, one of the largest and most magnificent Antelopes known, being upwards of 4 feet high at the shoulder, inhabits various parts of India, whence it has often been brought to England, where it lives and breeds, and is not an uncommon animal. The face of this species is long and narrow; the muzzle large and naked; the horns about 7 inches long, small, round, and black, rather distant at the base, nearly parallel throughout their whole length, pointed and slightly curved forwards; they are perfectly smooth and without annuli, but rather triangular at the base, and gradually rounded and attenuated towards the points. The lachrymal sinuses are large; the ears 7 inches in length, broad and rounded like those of an ox; the neck deep and compressed like that of the horse, not round and cylindrical as in the stag and most other Antelopes; and the tail broad, equally covered with hair on the sides and at the root, but terminated by a long black tuft, and descending to the houghs. The legs are small and well-formed, the anterior rather longer than the posterior; and the spinous processes of the dorsal vertebræ so much elevated between the shoulders as to give the animal the appearance of having a small hump. When at rest, the feet are gathered close under the body, and the tail turned in between the hind legs. The hair is uniformly short and close upon every part of the head, body, and limbs, excepting along the top of the neck and on the shoulders, where it is long, stiff, and upright, forming a thin erect mane which extends from between the ears half way down the back, and on the middle of the throat, where there is a species of beard composed of stiff bristly hair. The general colour is a uniform slaty-blue on the upper parts in the male, and tawny-red in the female; on the under parts uniform white in both sexes. The limbs and face are almost brown, and the lips, chin, and under surface of the tail, white. There is a large white spot on the throat, and two smaller ones on the cheeks under the lachrymal sinuses; the pastern joints are marked in front with one spot, and in rear with two conspicuous spots of the same colour, which contrast strongly with the dark brown of the surrounding parts, and have suggested the specific name of *Antilope picta* which was given by Pallas to this animal. The Nyl-Ghau resides in the dense forests of India, whence it occasionally makes excursions very early in the morning or during the night, to feed upon the corn-fields of the natives which happen to be situated in the vicinity of the jungle. It is a vicious animal, of very uncertain temper, and as it is both powerful and resolute, and frequently turns upon its pursuers, it is seldom made an object of chase except by the more energetic youth of the company's services. The usual method which the shikarrees, or professional hunters, employ for its capture is to shoot it from an elevated platform when it comes out at night or early in the morning to feed on the confines of the jungle; this being likewise their mode of destroying tigers, wild boars, and other beasts which they dare not attack openly. Even in confinement, and when domesticated from birth, the violent and changeable temper of the Nyl-Ghau cannot be trusted. Previous to making an attack, it drops upon the fore-knees, advancing in this position till within a proper distance, then darting suddenly forwards with the velocity of an arrow, and with a force which no ordinary animal can withstand. Yet, notwithstanding its vigour and resolution, it is the most common prey of the tiger, which the shikarrees often destroy in the very act of devouring the mangled remains of this animal; for, when these are discovered, the hunters always erect their platforms in a convenient situation in the neighbourhood of the carcass, knowing by experience that the tiger is sure to return on the following night to glut himself at leisure with the produce of his previous chase. The Nyl-Ghau has often bred in confinement, both in India and in Europe. The period of gestation lasts eight months, and two young are most commonly produced at a birth. At first the young males are of the same reddish-brown colour as the females, and only assume the grayish-blue shade proper to their sex on arriving at maturity: their growth is, however, rapid, and they attain their adult size in the second or third year of their age. —*Eng. Cyc. page* 268.

(364) ANTIMONY, SULPHURET OF,

Anjana-kahloo Unjuncle, TAM.

This, or a substance sold for it, is to be found in every Eastern village, it being used by the Native Medical practitioners, also the Mahomedan women, who apply it to their eyelids to give brilliancy to the eye. Sulphuret of Antimony has been found in the Vizianagrum Zemindary, but the greater part of the mineral brought to India comes from the Eastern Islands, Burmah and the Malay Peninsula, where it occurs in immense quantities, It is a very abundant mineral in Province Amherst, and is often met with on the mountains that bound the valley of Thoun-gyeen. Mr. O'Riley found it at the sources of the Ataran and large quantities of the ore have been dug up in the neighbourhood of Maulmain, but there was no demand for it in Calcutta whither it was sent, and operations have been suspended. Mr. Piddington made the following report on specimens of the ore that were sent to him; "We received some time ago from Messrs. Fowle and Lonsdale of Maulmain, a box containing upwards of thirty specimens of ores from the Antimony Mines near that place, with a request that they might be examined, their desire being of course to ascertain carefully and certainly, if they contained any, and what, proportion of the precious metals. One of the ores sent up was forwarded as 'supposed antimonial silver.' Now, in complicated ores of this description, this sort of examination requires great care, time, and often repeated analysis, before a negative can safely be pronounced from a small specimen, to assure the miner or smelter who works on a large scale that nothing of value exists in his ores, and these references have thus occupied a very considerable portion of time and labor, and as is often the case in such investigations, have proved wholly unfruitful. Antimony, iron, arsenic, and sulphur with bismuth, and in one instance a trace of molybdena being all which can be discovered in them. The results have been sent to Messrs. Brightman, but are not worth detailing or printing. I have suggested, however, to these gentlemen that they may find it well worth their while to sink a shaft for a change of ores.' As I now understand their operations, they seem to be occupied with what one might call mere surface-digging rather than mining, and the pronouncing, as we must now do, that these ores contain nothing of value, is not to be understood as saying that the locality contains nothing, but merely that the ores *at the surface* have not been found valuable; which in Cornwall, and I think in Germany, is often thought to be a favorable indication.—*Mason.* The metal was found for the first time in Borneo, in 1823, on the North Western coast of that island. It exists in several places there, but mines of it have been worked only in Sarawak. The ore is, as usual, a sulphuret in a matrix of quartz, and at present furnishes the chief supply of Europe, being exported from the emporium of Singapore, to the yearly amount of about 1560 tons.—*Crawfurd, Dictionary, p.* 13. Perhaps the most valuable of all the samples of this ore, which have been received in the Madras Museum, is that from the mines of Sir James Brooke in Sarawak. Ores of iron, and manganese and galena are very often sold in the Indian bazaars, as Surmah, or Sulphuret of Antimony. Great Britain receives the larger portion of its supply of Antimony from Singapore, to which place it is brought from Borneo. It is imported in the shape of ore, and commonly as ballast. Its chief localities are Saxony, Cornwall, Spain, Mexico, Siberia, the Eastern Islands, and Martaban in Pegu. It is brought to Bombay from Siam and the Persian Gulf. This metal is generally of a lead-gray colour, possessing considerable splendour, and is met with compact, and in rhombic prisms of considerable size, and variously modified. When sulphuret of antimony is roasted in contact with the air, oxide of antimony is formed, which unites with that portion of the sulphuret which has not been decomposed. In this way several oxy-sulphurets are formed, which melt, and yield in cooling, some brown vitreous substances, known in commerce as glass of antimony, liver of Antimony or crocus. Glass of Antimony consists of 8 parts of oxide and 1 of sulphuret. It is transparent and of a reddish yellow colour. Crocus contains 8 parts of oxide and 2 of sulphuret; it is opaque and of a yellow red colour. Liver of Antimony is opaque and of a deep brown colour; it consists of 4 parts sulphuret and 8 parts oxide. Sulphuret of Antimony occurs both massive and crystallised, but the most common form is radiated. When obtained by fusion, free from its associated matters, it is known in commerce as *crude antimony*. Metallic antimony or regulus, is obtained from crude antimony, by roasting and mixing with it charcoal and soda. Antimony is dissolved by hot hydrochloric acid, with evolution of hydrogen, and the production of a chloride formerly called butter of antimony, a substance sometimes used with sulphate of copper for bronzing gun-barrels, the iron decomposing the chloride and depositing a thin film of antimony on its surface. The chief alloys of antimony are *type metal*, consisting of 4 lead and 1 of antimony; Stereotype metal, 6 lead and 1 antimony, music-plates consisting of lead, tin and antimony; Britannia metal, consisting of 100 parts of tin, 8 antimony, 2 of copper, and 2 bismuth. Pewter is sometimes

formed of 12 parts of tin and 1 part antimony. Antimony is also used in the preparation of some enamels and other vitreous articles, and much employed in modern medicine as antimonial powder and tartrate of antimony. James's powder is said to consist of 43 parts of phosphate of lime, and 57 of oxide of antimony.—*Madras Museum. O'Shaughnessy. Crawfurd. Mason. Faulkner. Tomlinson.*

(365) ANTIRRHINIUM MAJUS. Snap-dragon. A flowering plant cultivated for its beauty. It is a native of England, but in India, succeeds well during the cold months, the seed should be sown during the rains, it grows best in a well drained soil, not too rich, it often lives through the hot weather, young plants are preferable.—*Jaffrey.*

(366) ANTS, WHITE. *See* TERMITES.

Termites, LAT.	Shelloo, TAM.
Dewuk, HIND.	Cheddooloo, TEL.

Sets of sugar-cane and other substances are said to be protected from White Ants by steeping them for half an hour in a mixture of assafetida, 8 chittacks; mustard seed, 8 seers; putrid fish, 4 seers; bruised butch root or maddar 2 seers, with sufficient to mix them into the thickness of curds, but the poisonous influence of the butch on vegetable life is known and cannot be recommended where the product is to be eaten. A small quantity of arsenic with a few ounces of burned bread, pulverized flour or oatmeal, moistened with molasses, made into a dough and placed near their tumuli, is said to insure their destruction. *Simmonds.* The wood oils, from the various species of Dypterocarpi, applied to wood, prevents, it is said, the dry rot, and the attacks of White Ants; and the addition of catechu to the oil greatly increases its preservative powers.—*Simmonds.*

(367) ANSER INDICA. The Indian goose, occurs at Silligoree.—*Hooker Him. Journ: Vol.* I. *page* 399.

(368) APHELANDRA CRISTATA, is a useful shrub in India either for pot or border cultivation, being easily propagated from cuttings: requires a rich soil and plenty of water; native of the West Indies. Flowers, orange colored. —*Jaffrey.*

(369) APIUM GRAVEOLENS, (Celery) *Vern.* Kurufs, *Arab.* A native of marshy grounds in Europe, the Caucasus, Mexico, the Levant and Affghanistan, and now cultivated in Bengal. When wild, it is acrid and poisonous; when cultivated, blanched, aromatic, fragrant, and nutritious. The seeds are sold in every Bazar, and used as stimulants by the native practitioners. The roots are also employed in medicine, they are white, spindle-shaped, oval, and branched; odour increased by drying. The essential oil dissolved in strong spirit gives an essence, a drop of which will communicate a strong and fine flavour of celery to a tureen of soup. A tincture of the seeds has been introduced into the Bengal Pharmacopœia.—*O'Shaughnessy, page* 357.

(370) APIUM INVOLUCRATUM is the *Rhadunee* of Bengal, and *Ajmod* of Hindostan. —*O'Shaughnessy page* 357. Dr. Irvine (*General Med Top. of Ajmere p.* 124.) describes Ajmod or Ajmot, the Apium involucratum as a species of sunallage: very hot and carminative, good in dyspepsia much used in all mesalihs and as brought to Ajmeer from Harrowtee and Mewar: and sold at four seers for one rupee: the same author mentions Khorasani Ajmot, as very hot and carminative.

(371) APONOGETON MONOSTACHYON *(Wild.)* Nat. Ord. JUNCAGINACEÆ.

Parua-kalanga, MAL.	Kotee-kalangoo, TAM.
Ghechoo, HIND.	Nama, TEL.

A Perennial aquatic plant: with tuberous roots: which grows in the Peninsula of India. It is found in shallow standing water and the beds of tanks, flowering during the rainy season. The natives are very fond of the small tuberous roots as an article of diet. They are said to be as good as potatoes, and esteemed a great delicacy.—*Roxb. Ainsl. Madr. Ex. Jur. Rep. Useful Plants.*

(372) APPLE. This term is applied in India to the fruits of several plants, and we have the Cashew Apple; the Custard Apple; Love Apple; Pine Apple; Rose Apple; Greater Wood Apple and Lesser Wood Apple, and the Apple, Pyrus mala, of England, is cultivated in the higher table lands of India.

(373) APPAREL, Articles of apparel form a considerable branch of trade in India; and in the Madras Presidency alone the aggregate value of the Imports and Exports in the four years 1852-53 to 1855-6, amounted to Rupees 33,38,387.

(374) APRANG, also *Rangbharat*, *Damlakwaypi*, *Hira-dukhan*. A gum resin. A beautiful kind of kino, brought to Ajmere from Bombay: considered very astringent. It is given in intestinal hemorrhages and is also used in enamelling on gold: four tolahs are sold for one rupee. —*Irvine, General Med. Top. of Ajmere, p.* 126.

(375) APTIMUN, also *Amr-bel*; Is the yellow coloured parasite so often seen on babul trees, all over India, and very common at Ajmere. The entire plant is used in medicine: it is a creeper: is given in "munjus," which is a diluent form of medicine, employed preparatory to giving a purge.—*Irvine, General Med. Top. of Ajmere, page* 125.

(376) APTIMUN WILAYTI. Extract of the Aptimun plant from Bombay: and used in the same way as the plant: one tola is sold for eight annas.—*Irvine, General Med. Top. of Ajmere page* 125.

(377) AQUILARIACEÆ, a small natural order of plants, belonging to the incomplete Exogens, and all natives of the East Indies, among its genera are Aquilaria, Ophiospermum and Gyrinops.

(378) AQUILARIA AGALLOCHA, Aloe or Eagle Wood. Roxb. Fl. Hind. ii. 42.

Aquloogin, Arab. | Aood-i-Hindee. Pers. | Ugooro, Sans.

Roxburgh describes this as an immense tree, a native of mountainous tracts E. and S.E. of Sylhet, lat. 24° to 25° N., flowering in April, and ripening its seed in August. He regarded the tree as that which furnished the real Calambac or Agallochum of the ancients: in this opinion Dr. Royle coincides, and adduces much valuable evidence in its support; at the same time that he admits that a wood of similar properties may be afforded by other trees, especially the Aloexylum agallochum of Loureiro, referred by Decandolle to the Leguminosæ. A kind of aloe wood is moreover produced by the Excaecaria agallochum, of the natural order of Euphorbiace. A third kind is imported from Malacca and Siam. In Persian works, three kinds are described under the names of *Aood-i-sumudree, Aood-i-Hindee, Aood-i-kimaree*, probably the Al-ee-mericum of Aboo Hanifa. (*Royle.*) Dr. Roxburgh mentions his having received plants from Malacca of the supposed eagle tree, and that they were in a flourishing condition; Dr. Hamilton met the plant near Goalpara, and Dr. Roxburgh also obtained it from Sylhet. The chief consumption of aloe wood is in Siam and China, where it is burned in the temples. Merat and De Lens inform us it was used in Napoleon's imperial palaces as incense. The wood is heavy, yellowish white, shaded with green; fibrous, spongy, and resinous, its taste aromatic, its odour in combustion very agreeable.—*O'Shaughnessy, pages* 274-75. Mr. Mason is of opinion that the A. agallocha or Aloexylon agallochum produces the fragrant substance called lignaloes, or wood-aloes, which is offered for sale in all the bazars on the Tenasserim Coast, and is the produce of a tree that grows on the Mergui Islands. It is imported into Mergui by the Selungs, who, as they profit from the trade, endeavour to keep all in ignorance of the tree from which they obtain it. Gesenius says the Hebrew and Greek names are "derived from the Indian name of the tree, *agil*, Sanscrit *agaru* and *aguru*." Had he read Pali he would have been able to approach the word nearer than he has done, through the Sanscrit, for there, besides *agaru*, the Sanscrit word, we have *agalu* and *aggalu*, which come sufficiently near the "Indian name agil," and the Greek aggollochun: but it would take a pretty thorough Etymologist to get aloee, the New Testament word, out of any of them. There is, however, another Sanscrit and Pali word with which Gesenius does not appear to have met, *lauha*. This is manifestly the parent of aloe, and by transposition, not uncommon in Hebrew, of the Hebrew name also: although rendered aloes in the English version, no two plants are more dissimilar than this, and the common aloes. —*Mason.*

(379) AQUILARIA MALACCENSIS, the Bois D'Aigle, or Eagle wood, is a native of Malacca, and produces a whitish wood. It is the A. ovata of some botanists.

(380) AQUILARIA SECUNDARIA. This gives the true Aloewood, Lignum Aloes or Agallochum, of our Materia Medica, and used in perfumery. Its wood, in a healthy state, is said to be white and inodorous, but is subject to the attacks of disease, which cause the secretion of a resinous matter,

and the wood then becomes coloured and gives out a powerful scent. The secretion resembles camphor in many of its properties and has a bitter flavour, hence its name Aloe-wood.—*Eng. Cyc.*

(381) AQUILEGIA, literally the Water Gatherer, because the leaves collect water in their hollow, is a small genus of plants, commonly called Columbines belonging to the order *Ranunculaceæ*, of which several species are cultivated in the gardens of Europe. Species are found in the North of Asia, or in North America. They are all acrid plants, but much inferior to Aconite in their medicinal properties: hence little attention has been given to them.—*Eng. Cyc. page* 283.

(382) AQUILEGIA ALPINA. *Ranunculaceæ.*—COLUMBINE. In India the several species of Aquilegia, are very ornamental flowering plants, and grow in any moderate good soil, they increase plentifully by seed.—*Riddell.*

(383) ARACHIS, a genus of plants belonging to the natural order, Leguminosæ.

(384) ARACHIS, HYPOGÆA *(Linn.)* Nat. Ord. LEGUMINOSÆ: DIADELPHIA DECANDRIA. *Sex. Syst.*

Ground nut, Earth-nut, Manilla-nut, ENG.	Velaiatee-moong, DUK. Moong-phullee, BENG.
Vayer or Nelay-cadalay, TAM.	Kachang-tanah, K. China, K. Japun, MALAY.
Vairrenegaloo, TEL.	

This species is properly indigenous to South America, but is extensively cultivated in the Peninsula of India for the sake of the oil yielded by the seeds. It is found in abundance in the bazars of the Tenasserim Provinces, where it is consumed in large quantities by the natives, and with the exception of the cocoa-palm, it is, of all the oil-yielding plants, the most extensively cultivated in the Malayan Archipelago. The Arachis hypogæa, or ground pea, is known in the Malayan countries under the several names of Kachang-tanah, Kachang-China, and Kachang-Jápun, meaning ground, Chinese, and Japan pulse. *Crawfurd, Dic: page* 13. The Arachis hypogæa is particularly remarkable from the manner in which its fruit is produced. Instead of hanging down from among the leaves in the manner of other plants, this conceals itself in the earth, in which it is deeply buried at the period when it becomes ripe, a phenomenon which happens thus:—The young fruit, instead of being placed at the bottom of the calyx, as in other kinds of pulse, is found at the bottom and in the inside of a long slender tube, which looks like a flower-stalk. When the flower has withered, and the young fruit is fertilised, nothing but the bottom of this tube with its contents remains. At this period a small point projects from the summit of the young fruit, and gradually elongates, curving downwards towards the earth. At the same time the stalk of the fruit lengthens, until the small point strikes the earth, into which the now half grown fruit is speedily forced, and where it finally ripens in what would seem a most unnatural position. When mature, it is a pale-yellow wrinkled oblong pod, often contracted in the middle, and containing two or three seeds the size of a hazel-nut. These are considered a valuable article of food in Africa, and the tropical parts of Asia and America, and they are sold in the streets and bazars of every town in India. In flavour the nuts are as sweet as an almond, and they yield when pressed, clear straw colored oil, in no respect inferior to that of olives. It is believed by the natives of Bengal to be aperient, but it produces only the same effects as olive oil, given to the same patients and in the same quantities. The oil-cake affords excellent food for cattle.—*O'Shaughnessy, page* 304.—The plant will only grow in a light sandy soil, in which its pods can readily be buried, and it requires a climate as hot at least as that of the south of France. Its stems grow from one to two feet high; its leaves are composed of four broad and blunt leaflets; and its flowers are small and of a pale yellow colour. These seeds are roasted in America, and are considered a good substitute for chocolate. The oil which is expressed from them is much used in China and India for lamps, and is preferable to any other in the manufacture of soap. In Europe, a bushel of ground-nuts produces one gallon of oil when expressed cold: if heat be applied, a still greater quantity is procured, but of inferior quality. The nut, according to Dr. Davy, abounds with starch as well as oil, and a large proportion of albuminous matter, and in no other instances had he found so large a proportion of starch mixed with oil. The leaf is something like that of clover, and affords excellent food for cattle, and the cakes after the expression of the oil form a good manure. Under favourable circumstances, the nuts will produce 43 per cent of oil, and the quantity is much increased by heat and pressure. It is cultivated in the neighbourhood of Calcutta, the oil being used for pharmaceutical purposes, and especially for lamps and machinery. A great quantity of the oil is annually exported from the Madras territories, as will appear from the following account of this valuable product extracted from the Juries' reports:—"In the year 1848-49, 37,000 gallons were shipped, but in the two following years the exports exceeded 100,000 gallons. It has however fallen to 57,207 gallons in 1852-53. It is said to be used for adulterating gingely oil in North Arcot, where it costs from Rs. 1-8, to 2-12, per maund. In the Nellore District, the seeds are procured at Rs. 1-8 per maund, and in Tanjore about 200 acres are cultivated, producing annually 75 candies of oil, at Rs. 2-6 per maund. Its value in London, in January 1855, was £47-10 per ton." Simmonds has remarked upon this useful product:—"This oil is good for every purpose for which olive or almond oil is used. For domestic

purposes it is esteemed, and it does not become rancid so quickly as other oils. Experiments have been made on its inflammable properties, and it is proved that the brilliancy of light was superior to that of olive oil, and its durability was likewise proved to be seven minutes per hour beyond the combustion of the best olive oil, with the additional advantage of scarcely any smoke." And further, " that the culture of the Arachis in warm climates, or even in a temperate one, under favourable circumstances, should be encouraged, there can be but one opinion, especially when it is considered that its qualities are able to supersede that of the olive and the almond, which are but precarious in their crops. * * * I am informed by an American merchant that he cleared 12,000 dollars in one year, on the single article of ground or pea nuts obtained from Africa. Strange as it may appear, nearly all these nuts are transhipped to France, where they command a ready sale; are there converted into oil, and thence find their way over the world in the shape of olive oil, the skill of the French chemists enabling them to imitate the real Lucca and Florence oil, so as to deceive the nicest judges. Indeed, the oil from the pea nuts possesses a sweetness and delicacy that cannot be surpassed." There are two varieties of this plant grown in Malacca, also in Java, one with white, the other with brown seeds. It is there known as the Katjang oil. So useful a plant should be more extensively cultivated in Southern Asia. It will thrive well on a light sandy soil, and is very prolific. In some parts of America it will yield from 30 to 80 bushels of nuts per acre. On the Western Coast of Africa it is planted to a great extent. *Eng. Cyc: Ed. Phil. Mag. Simmonds. Jury Rep. Mad. Ex. &c. quoted in Useful Plants. O'Shaughnessy.* Of the oil, under the term Ground Nut or Manilla oil there was exported from the Madras Presidency, in the four years 1852-53 to 1855-56 chiefly to the United Kingdom, Bombay, and the Indian French ports, to the amount of 334,024 gallons, valued at Rs. 2,12,896.

(385) ARALIA. About Yoksun, in Sikkim, which occupies a very warm sheltered flat, many tropical genera occur, such as tall bamboos of two kinds, grasses allied to the sugar-cane, scarlet *Erythrina*, and various *Araliaceæ*, amongst which was one species whose pith was of so curious a structure, that Dr. Hooker had no hesitation in considering the then unknown Chinese substance called rice-paper to belong to a closely allied plant. The Chinese rice-paper, has long been known to be cut from cylinders of pith which has always a central hollow chamber, divided into compartments by septa or excessively thin plates. It is only within the last few years that the above supposition has been confirmed, by Sir William Hooker receiving from China, after many years of correspondence, specimens of the rice-paper plant itself, which very closely resembles, in botanical characters as well as in outward appearance of size and habit, the above Sikkim plant. The natives of Sikkim collect the leaves of many Aralias as fodder for cattle, for which purpose they are of the greatest service in a country where grass for pasture is so scarce: this is the more remarkable since they belong to the natural family of ivy, which is usually poisonous. The use of this food however gives a peculiar taste to the butter. In other parts of Sikkim fig leaves are used for the same purpose, and branches of bird-cherry, a plant also of a poisonous family, abounding in prussic acid—*Hooker Him: Journ. Vol. I. p. 359.*

(386) ARALIE, Porrel, Attu, Itti, are the Malayalum names of a tree which grows to about forty feet in height, and two feet in diameter; it is used by the native carpenters of Malabar for the planks in vessels, and is said by them to be a valuable wood. This tree the Hindu people worship and respect, and consider of great importance and value.—*Edye. Mal. Can.*

(387) ARANGOES. *Guz. Hind.* Chussace. A term applied to large rough cornelian beads, of various sizes and shapes, made in Cambay, and formerly extensively used in the African slave trade.—*Faulk.*

(388) ARBOR ALBA. Its leaves furnish a portion of the Cajeput oil of Commerce.—*Simmonds.*

(389) ARCHIL: ORCHIL; CUDBEAR. A violet dye, obtained from several species of lichen the most important of which are Roccella tinctoria and R. fusiformis. The dye of this makes litmus, so largely used by manufacturers under the name of Archil or Orseille des Canaries. Also from Lecanora perella, or Orseille de terre, and L. tartarea or cudbear. Archil readily yields its colouring matter to both water and alcohol; and dyes a lilac colour, but with other hues, it is merely added to enhance or brighten their colour; but the colour produced from archil is of a very fleeting character: hence the usually rapid fading of lilacs, in silks. A beautiful violet colour is imparted to marble, by archil, and this is less fugitive than other forms of this dye.—*Tomlinson.*

(390) ARDDA, the Malayalum name of a tree which grows to about ten inches in diameter, and twenty feet high: it is used, in conjunction with the other woods, in country vessels.—*Edye. Mal. and Can. &c.*

(391) ARDEA (Vieillot), the heron, a genus of birds under which Linnæus comprehended the cranes and several other divisions now formed into distinct genera by modern naturalists. M. Vieillot followed Buffon in making four divisions of the Herons; but Temminck, who has paid peculiar attention to these birds, arranges them under one genus and two sections.—*Eng. Cyc. page 292.*

(392) ARDISIA CRENULATA. *Myrsinaceæ.*—This genus contains handsome species of flowering plants of easy culture in a good soil, and easily increased by cuttings from the root, the A-elegans, lanceolata, solanacea, are natives of India.

(393) ARDISIA HUMILIS, is a common shrub at Tavoy, growing down to the plains; but its habitat, in the Indian Peninsula, is "the eastern slopes of the Neilgherries, in subalpine jungle."

(894) ARDISIA AMHERSTIANA, grows on the coasts of the Tenasserim provinces.—*Mason Riddell.* Wight in Icones figures *A. Doma*, 1212; humilis, 1212; *litoralis*, 1212; *oleracea*, 1212; *paniculata*, 1215; *pauciflora*, 1214; *pentagona*, 1213; rhomboidea, 1213; *solanacea*, 1212 *umbellata*, 1212.

(395) ARECA CATECHU (*Linn.*) Nat. Ord. PALMACEÆ.

Areca Palm, ENG.	Supearic, DUK.
Paak-marum or Camooghoo, TAM.	Adaka or Cavooghoo, MAL.
Poga chettoo, TEL.	Gooa, BENG.
Pinang, MALAY.	Koonthee. BURM.
Jombi: JAV.	Rapo, BUGIS.
Banda, BALI.	Bongs, TAGALA & BISAYA.

Judging by these names the probability is that the tree is indigenous in each country. It is a slender graceful palm, an object of extensive culture in all tropical India, and grows freely in all the islands, from Sumatra to the Philippines, in which it seems to have as many distinct names as there are languages, attaining a height of 30 or 40 feet, with a tuft of feathery leaves at the extreme top, and the trunk only a few inches in diameter. In appearance, the Areca Palm is perhaps the most elegant of the whole species of palms; It is met with all over India and the Eastern Archipelago, but chiefly in Malabar, N. Bengal, Nepaul and the S. W. coast of Ceylon; is extensively cultivated by the Burmese, and to a small extent by the Karens. It thrives luxuriantly on that coast, and Mr. Mason remarks that a grove of betel palms, with their slender, cylindrical stems peering fifty or sixty feet upward, waving their green plumes, and fragrant flowers, presents a scene of sylvan beauty rarely to be excelled under our tropical sky.

> "Thus winds our path through many a bower
> Of fragrant tree and giant flower—
> While o'er the brake so wild and fair
> The betel waves his crest in air;
> Yet who in Indian bowers has stood
> But thought on England's 'good greenwood;'
> And blessed beneath her palmy shade
> The hazel and her hawthorn glade;
> And breathed a prayer, (how oft in vain!)
> To gaze upon her oaks again."

The *A. catechu*, in the Dekhan, requires to have either matting or straw tied round it to prevent its splitting from the dry winds; when this happens, it immediately decays. It flowers there at all seasons; and the seed when ripe should be sown, if young plants are required, at about eighteen inches apart. This palm forms a very striking appearance in gardens when mixed with the cypress alternately. The nut is hard and peculiarly streaked, and used in turnery for small ornamental work, the wood is used in Travancore for spear handles and bows, for which it is well suited, being very elastic, the structure of the wood is like that of palms in general, and might be used in turnery for small objects.—*M. E. Juries' Reports. Useful Plants.* It yields the betel-nut of commerce. These nuts when young, are, in conjunction with other things prescribed in decoctions, in costiveness and dyspepsia. They are much relished by the natives, being chewed with the leaf of the betel pepper, Piper betel, spread with chunam. It sadly discolours the teeth, but the natives imagine that it fastens them, and cleans the gums. A strong decoction of the nut is used in dyeing. A tree will produce annually, on an average, three hundred nuts. By some they are considered to have astringent and tonic properties. Roasted and pounded, they make an excellent charcoal powder for the teeth. *See* BETEL NUT. The catechu which they yield is of a very inferior quality. There are two preparations of it which are respectively called by the Tamools, Cutta-camboo and Cash-cuttie; in Teloogoo, Kansee, and in Dukhanie, khrab-cutta and acha-cutta. The first (Cutta-camboo) is chewed with the betel leaf. The other is the astringent used medicinally. *See* CATECHU. Like most of the Palm tribe, the trunk is much used for ordinary building purposes. The spathe which stretches over the blossoms of this tree, and which is called Paak-muttay, is a fibrous substance with which the Hindoos make vessels for holding arrack, water, &c.: also into cups, dishes and small umbrellas. It is so fine that it can be written on with ink. It will produce fruit at five years, and continue to bear for twenty-five years. Unlike the Cocoa Palm, it will thrive at high regions, and at a distance from the sea. In the Eastern Islands, the produce of the tree varies from 200 to 1,000 nuts annually. They form a considerable article of commerce with the Eastern Islands and China, and are also one of the staple products of Travancore. The nuts are gathered in July and August, though not fully ripe till October. In the latter country the nuts are variously prepared for use. "Those that are used by families of rank, are collected while the fruit is tender; the husks or the outer pod is removed; the kernel, a round fleshy mass, is boiled in water; in the first boiling of the nut, when properly done, the water becomes red, thick and starch-like, and this is afterwards evaporated into a substance like catechu; the boiled nuts being now removed, sliced and dried, the catechu-like substance is rubbed on the same, and dried again in the sun, when they become of a shining black, ready for use. Whole nuts without being sliced are also prepared in the same

)rm for use amongst the higher classes, while ipe nuts, as well as young nuts in a raw state, re used by all classes of people generally, and ipe nuts preserved in water with the pod are lso used." When exported to other districts, ie nuts are sliced and coloured with red catechu, s also the nut whole in the pods The average mount of exports of the prepared nuts from ravancore is from 2 to 3,000 candies annually, xclusive of the nuts in their ordinary state, great uantities of which are shipped to Bombay and ther ports. According to the last survey, there ere upwards of a million trees in Travancore. he following mode of extracting the catechu om the nuts in Mysore, is taken from "Heyne's acts, on India":—"The nuts are taken as ey come from the tree, and boiled for some ours in an iron vessel. They are then taken at, and the remaining water is inspissated by ntinual boiling. This process furnishes Kassu, most astringent terra japonica, which is black d mixed with paddy husks and other impuri-es. After the nuts are dried, they are put into fresh quantity of water and boiled again; and is water being inspissated, like the former, elds the best or dearest kind of catechu called oony. It is yellowish-brown, has an earthy acture, and is free from the admixture of foreign dies." The nuts are seldom imported into ngland. The catechu has of late years superded madder in the calico works of Europe for eing a golden coffee brown, 1 lb of this being ual to 6lbs. of madder. In 1852, the value of reca nuts exported from Ceylon alone to Brit-h Colonies and Foreign States, amounted to 2,230.

(396) ARECA DICKSONII. On the mountains of Travancore and Malabar, a wild species, e A. Dicksonii, is found in great abundance. f this, the poorer classes eat the nuts as a bstitute for the common betel nut, but no her part of the tree appears to be employed r any useful purpose.—*Ainslie. Lindley. Simmds. M. E. Juries Reports. Useful Plants.*

(397) ARECA VESTIARIA, is so called om clothing being made of its fibres.

(398) ARECA GRACILIS, is a Sikkim Palm.

(399) ARENARIA. Flowering plants of no eat beauty, chiefly of a white color, and grow sandy soil.—*Riddell.* Wight in Icones, 949, ures A. Neilgherriensis.

(400) ARENGA SACCHARIFERA.

gwire or Gomuti Palm, ENG.	Anas or Anome, MALAY.
e Tree. Nawa or Nama, Am-boynese, Aren, JAVANESE.	The Sap or Juice, Sa-gen. Jav. The Gossamer, Karvel. JAV.

nchons, Macassar, Mandar, also Akel, PORT.	Ijo or Eju, or Gomuti, JAV.
gwan also Sagwire, SPAN.	

This, is one of five species of the genus *Arenga*" which chiefly inhabit the islands of e Indian Archipelago, although they also grow the continent of Asia. They are, all of them, ndsome trees, their favorite localities being dense shady forests and in the neighbourhood of rivers and rivulets; it comes into bearing about the seventh year, and flowers once only during its life time. It was so highly thought of by Dr. Roxburgh, that he introduced it largely into India, where the natives have taken kindly to them. Its commercial products are its wine, the "Barum" or "Baru," and its Eju or Gomuti. q v. The Gomuti is the only one of this genus of any commercial importance. It occurs in abundance, in a wild state, throughout the islands of the Indian Archipelago, and yields a horse hair like substance, Javanese *Duk*: *Malay*, Ijo or, Eju or Gomuti, which has given the name to the tree. The Gomuti attains a height of thirty to forty feet, and its leaves, when very young, are eaten like the American Cabbage palm. (Oreodoxa oleracea, Mart.) The fleshy outer covering of the fruit of the Gomuti, when macerated, affords a fiery liquor, appropriately denominated "hell-water," by the Dutch, and the seed, or rather the albumen when freed from its noxious covering, is made into sweetmeat by the Chinese. It yields Sago, Palm wine, Gomuti Sugar and the Baru.—*O: V:*

(401) ARGEMONE MEXICANA (*Linn.*) N. Ord. PAPAVERACEÆ.

Yellow-thistle or Mexican-poppy, ENG.	Feringie-datura or Peela, DUK.
Brumadundoo, TAM.	Buro shial kanta, BENG.
Bruhmadundie, TEL.	

An annual herbaceous plant, abundant all over India, easily recognized by its prickly, thistle-like leaves, and bright yellow flowers. It is a native of South America, now naturalized, and exceedingly common about Calcutta; the seeds have been said to be used in Jamaica as an emetic, a thimbleful being bruised with water. Barton describes them as being more powerfully narcotic than opium. But Dr. now Sir B. O'Shaughnessy, subjected the seeds to numerous experiments, and never found them to shew any emetic or narcotic influence; they contain a bland colourless oil resembling that of the poppy, and which can be used in ounce doses without producing any purgative effect. This oil, known as the "koorookoo," attracted much attention at the Exhibition of 1851. The juice, which exudes on wounding or bruising this plant, is of a bright yellow colour, and is used by the natives as an application to indolent ulcers, and to remove specks on the cornea. It has by some writers been described as possessing the activity of gamboge. Samples of the oil were produced at the Madras Exhibition. It is cheaply procurable in the bazars, and is used chiefly for lamps. The mass from which the oil is expressed is found to be extremely nutritious to cattle. The plant would form a valuable article of husbandry.—*O'Shaughnessy, Simmonds. Useful Plants.*

(402) ARGHEL. Cynanchum Arghel, the leaves of this plant are employed in Egypt for the adulteration of Senna leaves.—*Simmonds.*

(403) ARGYREIA BRACTEATA (*Choisy.*) N. O. CONVOLVULACEÆ, Ipomœa bracteata, *Heyne herb. A. bracteata. Wall. Cat.* 1419, (Sanscrit) *Samudra patta?* A twining shrub, growing in Madras, and Coromandel, filled with milky juice. Decoctions of the leaves are used by the natives as fomentations in cases of scrofulous enlargement of the joints: the boiled leaves being used as poultices at the same time.—*Wight, quoted in Useful Plants.*

(404) ARGYREIA CUNEATA. Purple Convolvulus. A large and elegant creeper, flowers during the rains and cold weather: of rose and purple colour, common throughout the country, the leaves are covered below with a mealy down; whilst the upper surface has a dull green appearance, and is applied by the natives to act as a discutient.—*Riddell.*

(405) ARGYREIA MALABARICA. (*Choisy.*)

Kattu Kalangu, MAL. | Paymoostey, TAM.

Convolvulus Malabaricus, *Linn.*—Ipomœa Malabarica, *Roem and Schult.*—*Rheede* XI. t. 51. Grows in Mysore, Malabar, and common on the ghauts. USES, &c. Root cathartic. The plant is considered by farriers a good horse medicine.—*Ainsl.*

(406) ARGYREIA SPECIOSA (*Sweet.*)

Samutra-cheddei, TAM. | Samudra Shoka or Googulee, HIND.
Samudra-stogam, MAL.
Samutra-patra, TEL.

Ipomœa speciosa, *Sims.*—Lettsomia nervosa, *Roxb.* A twining shrub growing in Malabar and in forests and hedges in the Peninsula of India. It is found wild in the Dhoon. Leaves are used by native practitioners in the preparation of emollient poultices, and also in cutaneous complaints, being applied externally to the parts affected.—*Ainsl. quoted in Useful Plants. O'Sh.* Wight, in Icones, gives figures of *A. acuta*, 1356: aggregata, 1356-9: *cuneata*, 890: cymosa, 839: *elliptica*, 1356: *festiva*, 1356, fulgens, 1357: *hirsuta*, 891: pomacea, 888: *setosa*, 1356-60: speciosa 851-1360: tilifolia, 1358.

(407) ARISTOLOCHIA. *Aristolochiaceæ.*—These are mostly climbing plants, some of the species being natives of India, growing in any good soil.—*Riddell.*

(408) ARISTOLOCHIA ACUMINATA. This plant bears large drooping flowers of a dark purple colour, the root is exceedingly bitter, and is said to be an antidote to the bite of poisonous snakes.—*Riddell.*

(409) ARISTOLOCHIA BRACTEATA (*Retz.*) Nat. Ord. ARISTOLOCHIACEÆ.

Addatticapalay, TAM. | Cattra-bangha, SANS.
Gaddday-gadda purra, TEL.

A small creeping plant, flowers nearly all the year, grows on the Coromandel Coast in cultivated places, and in Travancore. Every part of this plant is nauseously bitter. In cases of tormina, two of the fresh leaves are rubbed up with water and given once in 24 hours. Infusion of the dried leaves given as an anthelmintic: fresh bruised and mixed with castor oil, they are considered a valuable remedy in obstinate cases of itch. The fresh leaves applied to the navel of a child are said to have the effect of moving the bowels. The same, fried with castor oil and made into a ball the size of an orange, relieves horses when suffering from gripes. The leaves beaten up with water are given internally in cases of snake-bites: also in infusion in boils and inflammatory attacks.—*Roxb. Ainsl. Lindl. &c. quoted in Useful Plants. Faulk.*

(410) ARISTOLOCHIA INDICA (*Linn.*)

Indian Birthwort, ENG. | Ishwurmool, BENG.
Hari, SANS. | Caykhoaica, COCH. CHIN.
Perumarundoo, Talashroobe, TAM. | Saesander, Satasanda; CYNG.
Doolagovila, Eesaravayroo, TEL. | Isrievayl, DUK.
Perumurundoo kadalewegam, MAL. | Isarmel, HIND.
Wallas, JAV.
Hari, Ishwari, SANS.

A perennial twining plant, a native of Bengal growing every where, the root is like that of sarsaparilla, perennial. The root is nauseously bitter, and is given as an emmenagogue, and in paroxysms of gout. It is also considered by the native practitioners to be a valuable remedy in the diarrhœa of children proceeding from dentition. The dose given in India, to an adult, of the decoction of the root, is an ounce to an ounce and a half twice daily.—*O'Shaughnessy, p.* 568. A valuable antidote to snake-bites, being applied both externally and internally. Mixed with honey, the root is given in white leprosy, and the leaves internally in fever. The root, leaves, stalks, and bark of this shrub are bitter; the taste of the fruit is accompanied with a slight degree of aromatic warmth, and is reckoned by the native doctors a valuable remedy in bowel affections.—*Ainslie. Lindl. &c. quoted in Useful Plants.*

(411) ARISTOLOCHIA LONGA, and *A. rotunda*, natives of the south of Europe, are found in the medicine bazars of India, under the names of *Zurawund tuweel* (Pers. *duraz*, long) and *Zurawund mooderuj* (Pers. *gird*, round,) with *aristolochia* as the Greek name.—*O'Shaughnessy, page* 568. Aristolochia longa and A. rotunda are products of Cashmere. The roots of the former are given by the Hakeems, in diseases of the womb, ulcers and affections of the gums: the latter in itch, leprosy, for drying up sores, destroying lice; and intestinal worms, also for promoting the renal and menstrual secretions.—*Honigberger.* A. longa, Zurawand-tuweel, Pers. occurs in whitish, twisted pieces, the size of a finger, and nearly tasteless. The Guaco of the Caraccas, so celebrated as an antidote to snake poison, and the trials of which in hydrophobia by Dr. Elliotson attracted such notice some years since in London, is asserted by Dr. Hancock to belong to this family.—*O'Shaughnessy, p.* 569.

(412) ARISTOLOCHIA SACCATA. In Sikkim, in the valley of the Teesta, are many fine plants, but Dr. Hooker especially noticed the Aristolochia saccata, which climbs the loftiest trees, bearing its curious pitcher-shaped flowers

near the ground only; its leaves are said to be good food for cattle.—*Hooker, Vol.* II, *p.* 7.

(413) ARIZEMA (Arhizoma) GRACILE, abounds in the Himalayas: the roots are considered by the Hakeems to be an excellent remedy against every description of animal poison.—*Hoffigberger.*

(414) ARMENIACA VULGARIS, or Apricot.

Burkook, Khoobance, Mishmish, Bakurkhanee, Vern. | Albaricoque, Sp.

Is common about villages in the Himalayas, where it is also called Zurd-aloo, Chooloo, and Chinaroo. Oil of the finest kind is made by expression from the kernels, sold separately in the Bazars under the name of Badam kohee, or hill almonds. The oil is clear, of a pale yellow colour, and smells strongly of hydrocyanic acid, of which it contains usually about 4 per cent.—*O'Shaughnessy, pages* 222-23.

(415) ARMOSIA DASYCARPA.

Thitwajee, Burm.

This tree is found here and there widely scattered in the Swar and other Forests North of Tounghoo. Wood red, equivalent to mahogany. —*McClelland.*

(416) ARNEE MUSLINS. The town of Arnee, situated in the collectorate of Chingleput, of the Madras Presidency, is still celebrated for the muslins it produces, though the first kinds are now only manufactured on order. The Arnee colored muslins for ladies dresses exhibited at the Madras Exhibition of 1855 were considered deserving of commendation and were of a quality very far superior to that which is generally made for sale. They appeared to have been manufactured expressly for the Exhibition. The muslin next in quality was exhibited by Ruthnum Moodely, and deserved commendation. A piece of Arnee Muslin, priced Rupees 122½, attracted much attention and praise. The fineness and delicacy of its texture afforded clear proofs of what the Native workman can achieve under adequate inducement. The Jury considered the Arnee muslin (white) exhibited by I. Gooroomoorthy Chetty to be an excellent specimen, fine in quality, soft to the touch, even in the thread, which was country made, and of good color and texture, and awarded the exhibitor a 2d Class Medal.—*M. E. Jur. Rep.*

(417) ARNOTTO. BIXA ORELLANA.—

Orleaan, Rokoe, Dut. | Oriana, It.
Rocou, Fr. | Oriana, Port.
Orlean, Ger.

Annatto, Annotta, *Bixa orellana*, is now naturalised in India and Burmah and the Eastern Archipelago, but its native country is Cayenne, from which it has spread into the hottest parts of South America, and the West Indies, where it is extensively cultivated on the banks of rivers, and gives its name to the Bay of Annatto, on the North of Jamaica. It is likewise grown at the Hawaiian Islands, Tongataboo, Rio Janeiro, Peru, Zanzibar. The Arnotto is a thick extract obtained, it is said, from the seeds as well as from the soft sticky rind of the plant, and it is met with in commerce of two sorts. Flag or Cake Arnotto, is furnished almost wholly by Cayenne, from which it is brought to England in square cakes, weighing two or three pounds, each wrapped in banana leaves, from which it gets the name of Flag Arnotto, and packed in cases. A superior kind called Roll Arnotto, is a harder and more concentrated extract. The rolls are small, not exceeding two or three ounces in weight. It is hard, dry and compact, brownish on the outside, and of a beautiful red colour within. It is grown in India and Burmah; in the latter country it is extensively cultivated: the dyers obtain a red dye from its fruit. In England dyers obtain the red colour called aurora, and the liquid sold under the name of Nankin dye is a solution of Arnotto in potassa and pure water. A solution is also made in alcohol, and used in varnishing and lacquering: in Britain it is used for giving more or less of an orange cast to the simple yellows; as an ingredient in varnishes; and for colouring cheese and butter. The consumption of Arnotto in great Britain has greatly increased of late years. Formerly, it amounted to but little more than 50,000lbs. in later years, the imports have been as follows;

	lbs.	Retained for Home consumption.
1834	252,981	
1835	163,421	
1839	303,489	224,794
1840	408,469	330,490
1847	270,000	296,821
1849	162,400	145,824
1850	391,504	231,280

In the Madras Exhibition of 1855, many good specimens of fruits and seeds were exhibited. A specimen of Cake Arnotto, of a thick pasty consistence, prepared by macerating the seeds was forwarded by Lieut. Colonel Grant, from Trivandrum. An orange colouring matter is obtained in this way. This is soluble in alkalies, by which means it is fixed to silk or wool; sometimes, as appears to have been the case in Col. Grant's specimen, the colouring matter is mixed with oil before drying.—*Mason, Simmonds. M. E. Jur. Reports. Tom.* It is used as an ingredient, for tinging cheese and butter, to which it imparts various shades of colour from yellow to red and it is also mixed with chocolate, oils, spirits and varnishes as a colouring material. As Arnotto dissolves in milk, the colouring matter is diffused in the milk previous to its manufacture into cheese and butter. The Spaniards also employ it, for coloring their soups, deeming it wholesome and stomachic. Arnotto is soluble in alkalies, by which means it is fixed to silk or wool. The colour obtained from fresh pods of the plant, is so superior to that of either the flag or cake Arnotto as to lead to the conclusion that

the method of preparing these, which is by a great degree of heat and fermentation, is injurious to the colour.

(418) AROOSHA OR CHITTAGONG FIBRE, *Callicarpa Cana*, is prepared, in Chittagong from the inner bark of the plant.—*Royle.*

(419) ARRACK.

Arak, Rak ; DUT.	Araco, IT.
Arac, FR.	Araca, PORT.
Arrack, Rack ; GER.	Arak, RUS.
Arrack, HIND.	Arak, SP.

Like the word alcohol, in England, Arrack is a term applied in most parts of India and the Indian Islands, to designate every sort of spirituous liquor, however obtained. From the various substances employed in its manufacture, in the several countries, its strength and taste are found to vary much in different places. Perhaps along all the sea-board of eastern countries, where the various palms most abound, the toddies,—the sap or Palm wines of the cocoanut, Cocos nucifera : of the date palm, Phœnix dactilifera : the Palmyra, Borassus flabelliformis ; or the Caryota urens, are the materials chiefly employed for making Arrack. After this juice is fermented it is distilled and rectified, and it usually yields about an eighth part of pure spirit. The three principal kinds known in commerce however are the arrack of Batavia, Goa and Columbo, That from Batavia is the strongest, and is distilled from a mixture of 62 parts of molasses, 3 of toddy, or palm wine, and 35 of rice. The last of which Crawfurd states to be boiled ; and, after cooling, a quantity of yeast is added and the whole pressed into baskets, in which condition it is placed over tubs, and left for eight days, during which time a liquor flows abundantly from the rice. This liquor is distilled and then mixed with the molasses and toddy, which is all left to ferment for a week in large vats ; after the fermentation is over, the Arrack is distilled one, or two, or three times, according to the strength required. That made at Java is chiefly for home consumption, but is also exported to China or India, very little is brought to China, and altogether in Junks. Another statement however describes the Batavia or Java Arrack as obtained by distillation from molasses and rice, with only a small admixture of toddy. The Arrack produced at Goa, is sweeter than that which comes from Java, and being made entirely from toddy, by repeated distillation, it is preferred by the Hindus to the Batavian, on that account, though it is an inferior spirit, containing only one-seventh of pure alcohol.—*Morris.* Arrack in one part of Ceylon, is distilled from the fermented Palm wine of the Cocoanut Palm, and is prepared in certain districts of the Southern province of the Island, under licenses from the Government, but for many years past the only Exports have been to the Indian Presidencies and some of the Eastern Islands. Similar to the Indian practice, in Ceylon, the right of vending Arrack in shops and bazars, is rented out and realizes about £55,000 : the shipments of Arrack have fallen off, from 1000 pipes in 1845, to 520, in 1850. *John Capper* in Asiatic Soc. Journ. Vol. XVI. London 1856 p. 274. It should be remembered, however, that, in Ceylon—three Palms yield sugar, the coco-nut palm (*Cocos nucifera*), the Palmyra Palm (*Borassus flabelliformis*), and the kittal or jaggerry Palm (caryota urens). From each of these palms the juice of the flowering stalk is collected under the name of toddy, and from it sugar, known in the East as jaggery, is regularly prepared ; but it is from the Palmyra Palm that nearly all the Palm sugar is obtained. It is from the saccharine matter of the coco-nut Palm that Arrack is made in Ceylon. This palm becomes productive there in about six or seven years : in collecting toddy, the spathe is stripped off from the spadix before it has fully expended ; the spadices are afterwards beaten between pieces of hard wood, and slices are cut with a sharp knife so as to allow the juice to flow out. Each spadix continues to yield juice for about 40 days, at nearly the average rate of half a gallon in 24 hours. When it is intended to prepare jaggery from the toddy, great care is taken by burning pieces of wood in the small earthen vessels attached to the flowers, and rubbing their interior with charcoal, to remove any impurities likely to promote fermentation : and as an additional precaution chips of the bark of the Vateria Indica are placed in each, so as to retard fermentation. The jaggery of the central province of Ceylon, is entirely made from the Caryota urens juice, which yields a much larger quantity of sugar than does that of the other two palms, and of a quality much more highly prized by the natives. When toddy is collected for the purpose of making Arrack, no care is taken to prevent fermentation, and as it is brought from the trees it is poured into wooden vats in which that process rapidly advances. If attention be not paid to the fermentation, acetic acid is formed, and this often causes the Arrack to take up lead from any portion of that metal with which it may be brought into contact. Dr. Smith, in Edinburgh New Phil : Journal Vol. IV. No. 1 July 1856 p. 175. In most parts of the East Indies, a very intoxicating spirit is prepared from the Mahowa flower, Bassia latifolia, the petals of which contain sugar. It is largely distilled in Bhandoop, a place situated about 20 miles from Bombay, *Faulkner.* And the Mahowa with the inner part of the white keekur tree, Vachelia farnesiana, perhaps all over India, form ingredients in the manufacture of the spirit sold under the name of "Arrack" in every bazar.—*Faulkner, O'Shaughnessy.* Arrack in Madras is made from the Velvelam Puttai Acacia leucophlœa bark and Palmyra jaggery ; the quantity required for one still, being 1 viss of the bark and 18½ of the sugar, the produce

being 4½ gallons. Its cost of manufacture to the Government is 5 annas a gallon, and it is sold to the retail dealers in the city and within the boundary of ten miles at Rs. 3 per gallon, but to all beyond the limits for Rs. 1 8 per gallon. The Jaggery is usually imported from Tinnevelly and from the Northern Circars. Pariah Arrack is a phrase employed by the humbler Europeans in India to designate a highly pernicious liquor, distilled or adulterated with the nux vomica, datura, cannabis sativa and other intoxicating drugs. In the four years 1852-53 to 1855-56, inclusive, Madras.

The imports principally from Ceylon and Bombay and the exports to Cutch, Pegue and Ceylon.

(420) ARROWROOT.

Kooa maoo, TAM.	Kooa-ka-neshasteh, also, Tikhur, HIND.
Arrow-root-kalung, TAM.	Pen-bwa, BURM.

This is alike an imported and a largely exported article, into and from several of the countries of Southern Asia. The name was originally applied to the rhizome or root of Maranta arundinacea, in consequence of its supposed efficacy in counteracting the effects of wounds inflicted by poisoned arrows. Of late years, however, the signification of the term has been much extended, and it is now employed to designate almost every fecula or starch, which bears any resemblance to the true Maranta Arrow-Root, no matter how various the countries or dissimilar the plants may be, from which it is obtained; and few persons are perhaps aware of the great diversity in these particulars. In the great Exhibition of 1851, there were present the Arrow-roots of Trinidad, Bermuda, British Guiana, Montserrat: Jersey, Guernsey: Van Diemen's land, Western Africa; and East Indian varieties from Assam; Calcutta, Calicut; Rutnagherry: Vizagapatam; Borneo, Java, and Ceylon. The West Indian Arrow-root is obtained from the Maranta arundinacea, M. allongia, and M. nobilis; also from the Canna glauca and C. coccinea: to both of which the local name of tous les mois, or tulema is applied. In the East Indies, Arrow-Root is prepared from the Maranta arundinacea, also from M. ramossissima, a Sylhet species. The Maranta arundinacea was introduced in 1840-1841, into Rutnagherry, by the Collector, Mr. Elphinstone, where it throve extremely well, though it is not grown to any extent. It was introduced into the Tenasserim Provinces, several years ago, by Mr. O'Riley, and is beginning to be largely cultivated. The Arrow-root made is not inferior in quality to any imported; while it is sold for half the price, at a good profit. A gentleman at Tavoy lately sold a considerable quantity for exportation and had orders for more than a thousand pounds of the next crop.—*Mason.* At the Madras Exhibition of 1855, *Arrowroot,* from the Maranta arundinacea, was exhibited from Chittoor and Royapoorum. The plant is extensively cultivated at both places, and the article is considered of excellent quality. The Chittoor Arrow-root was remarkably pure, a fine impalpable powder without odour, and without taste. Mr. Spears of Royapoorum sent a large quantity of good Arrow-root, which was considered an equally valuable farina, if manufactured with equal care. The Rutnagherry Arrow-root is prepared principally from the "kut-cherra" or perhaps "kutchoora," which seems to be a term general in that part of India applied to all the species of curcuma. The kutchoora grows in all the villages of the Southern Kokun and that prepared in the jail sells at 4¼ to 4⅓ annas per lb. The kutchoora of the Mahabaleshwur Hills seems to be the Curcuma montana. Indeed in the East Indies large quantities are prepared from different species of curcuma, all of which have not been clearly ascertained, but the C. angustifolia and C. leucorrhæa are recognised; In the Madras Exhibition of 1855, Arrow-root from the C. angustifolia and C. montana of Roxburgh, was exhibited from Canara, Cochin, and Travancore, where it has been, for many years past, prepared in large quantities, and, from Travancore, it is a regular article of export. The West Indian Arrow-root, Maranta arundinacea, is now however, extensively cultivated at Chittoor in North Arcot and Royapoorum, a suburb of Madras, at both of which places the flour prepared is considered of excellent quality. It is also cultivated near Calcutta, where the manufacture of Arrow-root has long been carried on. The Mergui Arrow-root was formerly prepared from the Tacca pennatifida, but it was not found to agree with some constitutions. As above mentioned, several years ago, the Maranta arundinacea *(pen-bwa* BURM.) was introduced by Mr. O'Riley, and the Arrow-root prepared from it is not inferior to any imported, and can be sold at half the price of the imported article at a good profit. The M. dichotoma (*then,* BURM). also grows at Mergui. Amongst other vegetable substances from which starches that might serve as substitutes for Arrow-root, could be prepared, may be mentioned the Nelumbium seeds, from the N. speciosum, and seeds of the Trapa bi-spinosa (Singhara, HIND) which abound so much in starch that it may be easily separated from them. Both are employed as articles of diet among the natives of Southern Asia. Arrow-root from the Nelumbium speciosum was exhibited in 1851, from Cuttack. At the Madras Exhibition of 1855, the small tuberous roots were exhibited of the Aponogeton monastachyon, Roxb: which are dug up in swampy places and eaten by the natives who call them Madura kotee kalangoo. Under the name of Pannam kalingoo, the people of Southern

India and Ceylon eat the first shoot from the planted palmyra nut, Borassus flabelliformis, panamarm, TAM. It is the germ of the future tree, and is about the size of a thick leek, and nearly white. According to Simmonds, recent experiments have proved that a farina superior to Arrow-root can be obtained from it, prepared in the same way, and that 100 roots, costing three annas, yield one and a half to three pounds of the flour. The starches from these substances, however, may require to be further investigated, and they are mentioned here merely with that view. But in commerce, the flour or farina of *Manihot utilissima* is imported into England under the name of Brazilian Arrow-root. Potato-flour or Potato Arrow-root, sometimes called *British or English* Arrow-root, is prepared by rasping and grinding the well cleaned tubers of *Solanum tuberosum* into a pulp. Arum Arrow-root is procured from the tubers of the Arum maculatum, the common "cuckoo pint;" "wake robin," and "lords and ladies:" it is chiefly prepared in Portland Island; hence is generally called Portland Arrow-root. The Tacca Arrow-Root of Otaheite is obtained from the tubers of *Tacca oceanica*: it is usually designated Otaheite Arrow-root. The difficulty and confusion arising from the multitudinous sources from which this product is obtained are further increased by the variety of names given to it in the market, where it is known as West Indian, Jamaica, Demerara, Bermuda, St. Vincent, East Indian, Brazilian, African, Guinea, Sierra Leone, Portland, British, and a variety of other Arrow-roots. Pure and unadulterated Maranta Arrow-root should be of a dull and opaque white colour, crepitating or crackling when pressed beneath the fingers; and when treated with about twice its weight of concentrated hydrochloric acid, it should yield an opaque paste. The Tacca Arrow-root from T. oceanica is a white starch-like powder, having a slightly musty odour; and is sold under the names of Otaheite Arrow-root, South Sea Islands Arrow-root, and Williams' Arrow-root. Potato-starch or Potato Arrow-root forms a white and somewhat glistening powder, which crackles like genuine Maranta Arrow-root, when pressed between the fingers. The Curcuma or "East Indian" Arrow-root, as exported to England, principally from Calcutta, has a white and a brown variety. The white is the best; the powder when pressed between the fingers feels less firm, and does not crepitate to the same extent as the Maranta Arrow-root. The two varieties can, however, be distinguished from each other, only with certainty by means of the microscope. Amongst traders, the principle adulterations consist of mixtures of the cheaper Arrow-roots or starches, with those of better quality and then selling the mixtures under the name of the higher priced article. Potato-flour: Manihot or tapioca-starch and Sago starch, all being employed for this purpose. Mr. Mason mentions that a spurious kind of Arrow-root has long been made at Mergui from the same plant as that which yields the sago. But medical men have decided that it contains properties which render it unsuitable for the sick, and chemical analysis has developed that it contains only half the nutritious qualities of the genuine Arrow-root. Under the name of Palagunda or Hill Arrow-root, the Madras Revenue Commissioner, Mr. Elliot, sent a small supply of a starch from the Rajahmundry district, to the Exhibition of 1851, but it has never reappeared, and its source is unknown to me.—*Mason. Hassall. M. E. Jur. Reports. Simmonds, Faulkner.*

(421) ARSENIC. Arsenic is a metal resembling steel in colour, crystalline, volatile below a red heat, vapor of strong garlic odour, readily oxydised: with one equivalent of oxygen it forms the arsenious, with two equivalents the arsenic acid. With sulphur it forms the yellow sulphuret, orpiment, and the red, realgar.—*Beng. Phar. p.* 313.

(422) ARSENIC, WHITE, OXIDE OF, ARSENIOUS ACID.

Turabul halil, ARAB.	Arseneo uxeno, IT.
Sulfeid sumbool, DUK.	Acidum arseniosum, LAT.
Arsenic oxyde natiff, FR.	Wrongon, MAL.
Weisse arsenik, GER.	Sumbulfar, PERS.
Soomul, Sumbool-khar, HIND.	Vullay pashanum, TAM.
Sunchya, HINDO.	Telapashanum, TEL.
	Warungun putih, MALAY.

Is white, brittle, faintly sweetish in taste, more or less translucent; sometimes it has a yellow, reddish, or blueish tinge, owing to the presence of iron, sulphur, and other impurities. It is used in the manufacture of glass, dyeing, medicine, &c. Localities, Bohemia, Saxony, Persia, &c. That met with in commerce in Bombay, is brought from the Persian Gulf; the arsenic sold by chemists, is obtained from England, and is generally in the form of powder.—*Faulkner.* The substance popularly known under this name, is one of the oxides of the previously noticed metal, namely, arsenious acid, or white oxide of Arsenic. This acid, combines with bases, forming arseniates, many of which occur in nature, Arsenic also occurs as a sulphuret, and is frequently found in combination with other sulphurets, as with sulphuret of iron, forming arsenical pyrites. Traces of arsenic are to be found in many minerals and in their products, as in sulphuric and sulphurous acids, in zinc, sulphuret of antimony &c.—*Tomlinson.* White Arsenic is obtained in China by sublimation from the native sulphuret of arsenic or Hartal and is largely exported to India.

(423) ARSENIC, RED—(Bi-Sulphuret of), REALGAR, RED ORPIMENT.

Zurnelk-surkh, ARAB.	Zurnek-surkh, ARAB. PERS.
Lall-sumbool, DUK.	Manahsila, SANS.
Lall-sumbool, Munseel; HIND.	Koodiraypal-pushanum, TAM.

Is brittle, inodorous, tasteless, and insoluble in water. It is used as a colouring substance, as well as in pyrotechnical compounds. Localities,

China, Persia, Bohemia, Saxony. The red arsenic met with in Bombay is imported from China and the Persian Gulf, and is known by the name of *Munseel.—Faulkner.* There are several combinations of arsenic and sulphur; one such compound, *Realgar* Bi-sulphuret of arsenic occurs native, in brilliant red crystalline masses. It is used in the preparation of "White Indian Fire," which consists of 24 parts of saltpetre; 7 of sulphur, and 2 of realgar, finely powdered. This composition burns with a white flame of great brilliancy. Realgar is of a beautiful orange colour and is used in painting.—*Tomlinson.*

(424) ARSENIC, YELLOW, (Ter-Sulphuret of), YELLOW ORPIMENT.—

Ursanikoon, ARAB.
Hurtall, DUK.
Orpiment, FR.
Orpiment, Ranschgelb; GER.
Hurtal, HIND.
Orpimento, IT.
Auripigmentum, LAT.
Zerneik-zurd, PERS.
Haritalaka, SANS.
Oropimenti, SP.
Aridurum, Yelliekood-pashanum, TAM.
Warangan or Barangan, MALAY.

Generally occurs massive, and lamellar, of a bright lemon or golden-colour, inodorous, and insoluble in water. It is used in dyeing, calico printing, &c. Localities, S. America, Saxony, China, Persia, &c. The yellow arsenic met with in Bombay, and known by the name of *Hurtal*, is imported from China and the Persian Gulf.—*Faulkner.* Orpiment, (or king's yellow) ter-sulphuret of arsenic, (As. 1, s. 3,) is found native, and is also prepared by the action of sulphuretted hydrogen or hydro-sulphurets in a solution of arsenious acid. It is of a yellow colour, fusible, volatile, soluble in alkalies, insoluble in acids, decomposed and oxydized by boiling with nitric acid. It unites with bases to form salts termed sulpho-arsenites, and is reduced to the metallic state by being heated with the black flux. The paint called kings yellow, is usually adulterated with lime and sulphur. YELLOW ORPIMENT is much used by the Tamil painters, in preparing a yellow pigment. "Native Orpiment, the auri pigmentum of the ancients, is of a brilliant yellow colour. It is used in dyeing and calico printing. *Ainslie.* The various compounds of arsenic are to be obtained in every bazar in India, and the native medical practitioners, painters &c. considerably employ them. None of the compounds of Arsenic have been discovered to be products of Southern India, but they are imported largely. The white oxide from Bengal, the red and yellow sulphuret from Burmah, where it is found in great quantities, as also from China and Japan and the Persian gulf. It also occurs in the Mergui islands. It is now known that Arsenic, sulphate of copper, verdegris and other poisonous minerals, when employed to steep grain, previous to sowing, with the view of preventing smut, prove injurious to the health of the sowers and to those who eat the bread made from it. A preparation of sulphate of soda and lime answers with equal effect.—*Tomlinson, Simmonds.*

(425) ARTEMISIA, an extensive genus of plants belonging to the natural order *Compositæ*, and remarkable for the intense bitterness of many of its species. It is easily recognised by the multitude of fine divisions into which its leaves are usually separated, and the numerous clusters of small, round, drooping, greenish-yellow, or brownish flower-heads, with which its branches are loaded. The flowerets are all tubular, but those in the circumference of each head are very imperfect. Artemisia *acetica*, a Persian species, is said to have a strong odour of vinegar. Artemisia *Chinensis* yields the material from which moxas are made, that are burned upon the human body as a cautery in cases of gout and rheumatism. Artemisia *Maderaspatana* and Artemisia indica are used by the Indian medical practitioners. The flower-heads of A. Sieberi, Lercheana, contra, and pauciflora constitute the drugs called semen contra, or semen cinœ, which are used as vermifuges. The same part of A. Vahliana yields the Persian Wormseed, or semen cinœ Levanticum; and that of A. cœrulescens, the semen seriphii or Barbotine. A. camphorata and A. Gallica are used in France also as anthelmintics under the name of Sanguerie or sanguerite.—*Eng. Cyc. pages* 312 and 313.

(426) ARTEMISIA ABSINTHIUM. Absinth, *Afsunteen*, is afforded from this herb, and other species of Artemisia.—*Ben. Phar.* 270.

(427) ARTEMISIA CONTRA. Semen-contra of the Levant, Aleppo, and Alexandria. A native of Persia. Odour strong, nauseous, and balsamic, taste analogous, rather bitter, hot, durable, and very disagreeable; on chewing this substance a most distinct sensation of coolness is experienced. The vermifuge properties of this celebrated medicine reside in a volatile oil, and resinous extract; 500 parts of *semen-contra* furnish two of essential oil, of light lemon-colour, of bitter and burning taste, of smell resembling that of peppermint.—*O'Shaughnessy, page* 416.

(428) ARTEMISIA DRACUNCULUS.—*Tarragon.* A salad much used by the French, raised from seed and division of the plant; culture similar to mint.

(429) ARTEMISIA INDICA, Indian Absinth. Native of Nipal.

Afsunteen, ARAB.
Mustaroo, DUK.
Duna, and Murwa, HIND.
Dana, SANS.

This is a substitute for the A. absinthium, the wormwood of Europe, but weaker.—*O'Shaughnessy, page* 444.

(430) ARTEMISIA JUDAICA. Worm Seed. Saheba, *Avicenna.* Indian Worm Seed, Indian Semencontra. A native of Judea, Arabia and Cochin-China. The semen contra of Barbary is more coloured than that of the East; it is cheaper, and of more certain origin. Both varieties resemble each other in quality; one only being smooth and green, the other downy and grey.

The source of Semen-contra was long attributed to the Zedoary plant.—*O'Shaughnessy, page* 416. Indian worm seed finely powdered and sifted, is a popular worm remedy, especially in the round and long worms of children: the dose is three to ten grains given in honey or milk.—*Beng. Phar. p.* 406.

(431) ARTEMISIA CHINENSIS, a native of China and Siberia. The moxa, a slow caustic, is prepared from the down of this plant. It is made into conical masses, and burns like tinder, when touched by a spark or any red hot body.—*O'Shaughnessy, page* 417.

(432) ARTEMISIA VULGARIS.

Nagdowna, Hind.

This is a native of Europe, but the Moxa of Japan is prepared with the leaves and stalks of a neighbouring species.—*O'Shaughnessy, page* 415.

(433) ARTICHOKE. Cynara scolymus, Of four species, only two are cultivated for use. They have large pinnatifid leaves, erect, and about two or three feet long. From the centre arises a long stalk, which gives off branches, on the top of which is a large round head composed of numerous oval scales enclosing the florets sitting on the receptacle, commonly called the artichoke bottom, and which, with the fleshy part on the base of the scales, is the only part eaten. The two sorts grown are, the French conical spine-leafed, and round Dutch globular-headed. The seed may be sown in June, and continued during the rains; the soil should be light and of a good loamy description; the seed sown at least six inches apart. When they are in four or six leaves, they may be transplanted in rows, and in open situations and good soil, three or four feet asunder. The ground should be of a light consistence and well manured. Let the trenches be about six inches deep, and at least from one to two feet broad: they will require occasional irrigation if the weather is dry, after having been well watered by the hand. When first removed, at the latter end of the rains, and the plants have arrived at almost their full size, a small black fly collects upon them in the greatest abundance, and destroys the whole of the leaves. This also happens to plants raised from seed sown in October, or at the close of the rains. When the plants, in January, February, and March, have arrived at their full perfection, they may be propagated from slips that grow on the side of the old plants, which wither and dry as soon as the fruit is ripe and gone to seed. Care must be taken in removing both plants and shoots, that a sufficient quantity of earth is taken up with the roots, so that the spongioles are uninjured. When they appear to have taken root well, let the ground occasionally be loosened round them, and the stalks well earthed up. The best means of preserving the plants from being destroyed by the fly, is to cover the leaves well over with ashes from the kitchen. The seed from Europe, the Cape, Persia, and Hindoostan, all grow well, but those which have succeeded best with Dr. Riddell were from the upper provinces of Bengal: they were of the large globular kind, and from being acclimatised, he thought they did not suffer so much from the fly as others. More than one head should not be allowed on each stalk: pick all the others off. If a piece of stick is run through the stalk, across under each head, he thinks that it tends to enlarge it. The seed may be collected whenever ripe, which is mostly in May or June. The largest and finest heads do not always give the most seed, often the reverse. Young artichoke shoots if blanched may be eaten as salad.—*Riddell.*

(434) ARTICHOKE JERUSALEM. Helianthus tuberosus. Cultivated for the tubers attached to the roots, may be lifted annually, after flowering, and kept like potatoes for three months, or they may be allowed to remain for years in the same situation, if kept clear of weeds and the ground annually top dressed with manure; cooked similar to potatoes, and sometimes fried.—*Jaffrey.*

(435) ARTOCARPACEÆ, *Artocarpads*, the Bread Fruit Tribe, a natural order of plants nearly related to *Urticaceæ* (the Nettle Tribe), from which it is so difficult to separate them by any precise character that there are many who consider them nothing more than a section of *Urticaceæ*. The species are all found in the warmer parts of the world, and many of them are natives of the tropics only Their milk, which is always acrid, renders some of them intensely poisonous, as the Upas Tree of Java [Antiaris], and certain Indian species of Fig [Ficus]; nevertheless, if the milk is naturally absent from any particular part of an Artocarpad that part becomes eatable and even wholesome. Thus the fruit of the cultivated fig, up to a short period before its maturity, remains milky, and at that time it would prove exceedingly unwholesome; but when ripe the milk disappears, is replaced by sugar, and the fruit becomes, as all know, extremely wholesome. Many species are known, some of which, as *Artocarpus chaplasha* and *hirsuta*, are large trees, and yield valuable timber in the forests of Bengal and Malabar.—*Engl. Cyc. page* 318. The A. incisa of the West Indies and Eastern tropics is the celebrated Bread fruit Tree, the bark of which is stripped and beaten into cloth. *A. integrifolia* of India, the Jack or *kantal*, as also the A. Laecucha, of India, have similar properties, and they are frequently cut down on account of their wood. It may be also mentioned that the *Trap* Tree, which furnishes the Gutta used as bird lime in the Malayan Peninsula and at Singapore the fibres of its bark are used for cordage, fishing lines and nets; the *Chowat Kurnal*, similar to the above, from Baram River, also the *kumut* or bark cloth, worn by the Karens when mourn-

ag for the dead, from the river Barum, and Glam, ree bark, from Borneo, which furnishes a paper ike bark much used in caulking the seams of essels, are all supposed by Dr. Royle to be spe- ies of Artocarpus.—*Royle. Fib. Pl. p.* 341.

(436) ARTOCARPUS, SMALL BREAD-FRUIT. This yields an orange-colored fruit resembling in aste a custard apple, and in appearance a fig, ut it is a species of artocarpus, which Mr. Mason cannot find any where described, though ot scarce in the Tenasserim forests.—*Mason.*

(437) ARTOCARPUS CHAPLASHA (*Roxb*). N. O. ARTOCARPACEÆ. A large tree: grows in Chittagong and Assam. From this immense ree canoes are made for river use where the tree rows. The wood is also useful for many other urposes, particularly when required to be used nder water.—*Roxb. quoted in Useful Plants.*

(438) ARTOCARPUS COMMUNIS. BREAD-RUIT. The true seedless bread-fruit tree is ultivated at Penang, and has recently been in- roduced into Mergui, where it is said to flourish. —*Mason.*

(439) ARTOCARPUS ECHINATA. MOUN-AIN JACK.

Kanæ Kyatha, TAM.

This a large tree very common about the Balaghaut and Wynaad. The wood, though ap- arently good, is not used in Southern India. n the Tenasserim Provinces, however, the moun- ain jack is deemed a valuable timber by the na- ives, especially for canoes. Wallich says: "It pro- luces a sort of caoutchouc, with which the Bur- nese pay their boats." But Mr. Mason ima- ines this is a mistake, as the Burmese almost niversally pay their boats with a substance that s produced by a bee, mixed sometimes with lammer. It produces an echinated, agreeably cid fruit. The leaves of the young trees are ashed like some species of oak.—*McIvor. M. E. Mason.*

(440) ARTOCARPUS HIRSUTA (*Lam.*)

Anjelie, ENG.	Ayenee, MAL.
Anjelee, TAM.	

This is the Artocarpus pubescens of Willd. nd Ainslie, a native of the coast, not extending ar inland. It is a large tree used on the coast or making canoes and such like purposes. It bounds in the Forests of "Malabar" and is in- ligenous also in the Tenasserim Provinces. It is large handsome tree well suited for affording hade. It yields the Anjely wood so much used on he Western Coast for house-building, ship's rame-works, &c. As a timber, it is esteemed par- icularly useful. The fruit is the size of a large range, and abounds in a viscid juice, which freely lows from the rough rind if touched: this is manu- actured into bird lime. The pulpy substance which surrounds the seeds is much relished by he natives, being almost as good as the Jack- ruit. The bark is occasionally used in Canara for preparing a brown dye.—*Roxb. Wight. &c. quoted in Useful Plants. Joffrey. Mason. Wight.*

(441) ARTOCARPUS INCISA. BREAD FRUIT TREE.

Nengka, MALAY.

A tree of slow growth, to be found in gardens about Madras, but is a native of the South Sea Islands. This bread-fruit tree is cultivated in a few gardens at Tavoy and Maulmain, and bears very well; but the fruit is of that variety which is full of seeds and is of no value. It grows to a tole- rably large size in Bombay, and is also to be met with in some parts of the Dekhan, where it bears a fruit the size of a large orange, or small pumplemose, with a muricated rind. It seldom ripens in Bombay, the fruit falling off in the cold season. Like the jack, it bears fruit both on the branches and roots. The fruit, cut into slices and fried, has something of the flavor of a sweet potato dressed in a similar manner. It will grow from cuttings, and requires a light soil, with care, and watering at first. The bark of the Artocarpus incisa, or Bread-fruit tree, strip- ped, and then beaten and prepared, makes a kind of cloth with which the South Sea Islanders clothe themselves. At Tahiti, clothing made of it, and worn chiefly by the common people, was more common than that made from the paper mulberry, though inferior to it in softness and whiteness.—*Royl. p.* 341. It is extensively cul- tivated throughout the Malay Archipelago.— *Crawfurd Dic. Riddell. Mason. Juries Reports M. E. page* 24.

(442) ARTOCARPUS INTEGRIFOLIA (*Linn.*)

Indian Jack-tree. ENG.	Sukun, MALAY.
Pilavuh, TAM.	Kluwi. MALAY.
Panasu, TEL.	Tambul, MALAY.
Phunus, DUK.	Kuntal, BENG.
Pilavoo, MAL.	

A valuable timber tree common all over India which grows rapidly to about 2 feet and a half in diameter; and yields a wood much used for making furniture of every description, for which it answers remarkably well. It is in much request in Ceylon. It is said to be su- perior in color to mahogany, when well po- lished: the wood is yellow when cut, but turns to various dark shades of brown, and improves by age. When made into tables and well kept, it soon attains a polish little inferior to mahogany. It is well known as the Jack fruit tree in Eng- land, where the wood is used for cabinet and marquetery work, likewise for the backs of brushes. It does not bear great alternations of dryness and moisture. It affords an excellent fancy wood for tables, chairs, frames &c. and the root of the older trees is dark-colored, and ad- mirably adapted for picture-frames, and carving- work of all kinds: besides the uses described it is valued for grain measures. In Ceylon it is in general use to the South and West for building: beams, rafters, doors, and furniture are all made of it. There the tree is of rapid growth and very

fruitful: the fruit is used green and ripe; the kernels of the ripe fruit boiled or toasted answer all the purposes of Spanish chesnuts. It is not a common timber in the Circars, though some good trees are occasionally procurable from the hill Zemindaries—resembling mahogany in colour and appearance. The fruit which grows to an enormous size, issues direct from the trunk or stem, to which it hangs by a peduncle, has a rough coated appearance, hanging like a large green bag; the scent is very disagreeable. It is not in much request by Europeans, although the seed when roasted resembles a chesnut in flavor. The finest fruits sometimes grow on the roots, and will be found from the cracking of the earth above them. When this fruit tree is grown in native gardens and the stem is forked, they generally place a large stone between the branches: the reason for this is not known. In the Tenasserim Provinces, the Jack is perhaps more abundant than any other fruit, except the plantain. It is invaluable to the natives, but is an indifferent fruit to Europeans. The tree is large, and affords a very dark grateful shade, and when the fruit, which is often as large as a man's head, is hanging all around its branches it is a grand object. The fruit of the Jack when green is used in curries; the outside is cut off in thin slices and the remainder used; when ripe, the pulp and seeds are used similarly. A few miles below Coonoor on the Neilgherries, these trees produce single fruits, weighing between 50 and 60lbs. There are several varieties, but what is called the honey-jack is by far the sweetest and best. The seeds themselves when roasted are also much prized as a diet among the poorer classes. The leaves are given to goats and other cattle, and are said to be very fattening. In Travancore, the Jack-tree is a monopoly, and yields an annual tax to the Sircar. The juice which exudes from the trunk is said to check the progress of glandular swellings, and the young leaves are frequently applied externally in cutaneous affections. Bird lime is manufactured from the juice. The word Jack, is a corruption from the Sanscrit word 'Tchackka,' which means the fruit of the tree. There are no less than thirty or forty varieties in Malabar. The situation of the fruit varies with the age of the tree, being first borne on the branches, then on the trunk, and in very old trees on the roots. In Travancore, in propagating, they put the whole fruit in the ground, and when the seeds germinate and grow up they tie the stems together with straw, and by degrees they form one stem, which will bear fruit in 6 or 7 years.—*Martyn's Mill. Dict. Rees' Cycl. &c. Quoted in Useful Plants. Jaffrey, Mason. McClelland. Crawfurd.*

(443) ARTOCARPUS, or Trap tree, of Singapore, furnishes the Gutta used as bird lime; and the fibres of its bark are used there for fishing lines, cordage and nets.—*Royle. Fib. Pl. page.*

(444) ARTOCARPUS LAECUCHA, LACOOCHA BREAD-FRUIT.

Dephul, Beng. | Pain-nai. Burm.

Grown in Burmah and Bengal, and is rather common in gardens. The whole tree and unripe fruit contain much tenacious milky juice. The roots are used for dyeing yellow. The male spadix is acid and astringent, and is eaten by the natives in their curries. In the Tenasserim Provinces, this fruit is usually designated by Europeans "a kind of a fig;" but it is a species of artocarpus, occasionally raised near native houses. Dr. Royle thinks it may be found to yield fibres. *Artocarpus integrifolia* is the jack, *A. chaplasha*, the lesser or thorny Jack, and *A. laecucha*, the small Jack. The fruit of all three varieties is prized by the Burmese as an article of food, especially the first, which grows to great perfection every where throughout the province with little care.—*McClelland. Mason. Useful Plants.* Wight also figures lanceæfolia 679.

(445) ARTOCARPUS POLYPHEME, Champadah, of botanists, a fruit of the same natural family with the jack and bread-fruit; smaller than the first, but of more delicate flavour, is greatly esteemed by the Malays. It seems to be an indigenous plant of the Archipelago, and even there to be limited to the Western parts of it, such as Sumatra, the Malay Peninsula, and their adjacent islands.—*Crawfurd Dictionary, page* 93.

(446) ARUM. This genus of plants belongs to the Natural Order Aroideæ. In temperate climates, all these plants are herbaceous, but in tropical latitudes, they become shrubby or arborescent. All contain an acrid principle, volatile and soluble in water, and separable by washing from the fecula with which it is combined. A. maculatum, a native of Europe. A. triphyllum, of N. America, and A. serpentaria or dracunculus, of the South of France. A species of the Arum is cultivated in the Dekhan for the sake of its leaves, which form a substitute for spinach. Wight, in *Icones*, gives figures of A. bulbiferum, 783; companulatum, 782-85; colocasia, 786; cucullatum, 787; curvatum, 788; cuspidatum, 784; divaricatum, 790; flagelliforme, 791; fornicatum, 789-92; gracile, 793; Indicum, 794; maritiferum, 795; montanum, 786; odorum, 791; Orixense, 801; sessiliflorum, 800; sylvaticum, 802; trilobatum, 803; viviparum, 893.

(447) ARUM COMPANULATUM grows on the Himalaya Hills, its tubercular root is knobby and as large as a man's head. Used as food and made into pickles.—*Honigberger.*

(448) ARUM COLOCASIA. Egyptian ginger, the "Taro"-kuchoo, Bengalee: the roots are large, tuberous, white internally, containing fecula in great abundance, cultivated in America, Madeira, the Polynesian Islands, Greece, Egypt, Zanzibar and India. The tubers of this arum are

the chief food of the inhabitants in a great part of Egypt, and are also much used in Bengal. The root of Arum colocasia, (Colocasia esculenta and C. macrorhizon) is an important esculent root in the Polynesian Islands.—*Simmonds.*

(449) ARUM ESCULENTUM is the coco of Bourbon and of the West Indies where whole families live on this article of food.

(450) ARUM LYRATUM, (*Roxb.*) is a native of the Circar mountains, the roots of which are eaten by the natives, and reckoned very nutritious. They require, however, to be carefully boiled several times, and dressed in a particular manner, in order to divest them of a somewhat disagreeable taste.—*Roxb. quoted in Useful Plants.*

(451) ARUM MONTANUM (*Roxb.*) This is a native of the mountainous part of the Northern Circars where the root is employed to poison tigers.—*Useful Plants.*

(452) ARUM ODORUM, the Fragrant Arum, (Peing-ma-ha-yaw, Burm.) is cultivated in Burmah as a medicine, and is a most singular plant. It has a stem one or two feet high and six inches in diameter resembling a low palm, while its leaves are gigantic cabbage leaves three or four feet long by two or three wide. The flowers are said to be fragrant. The natives cultivate it, not for food, like the other species of arum, but, as they say, for medicine.

(453) ARUM ORIXENSE, Arum of Orissa,
Ghet kuchoo, BEN.

Grows in various parts of India, tubers exceedingly acrid while fresh, used as a counter-irritant in poultices; also as an application in snake bites. They are likewise given internally in doses of from 20 to 30 grains. Roxburgh describes this Arum as a most powerful stimulant in proper hands.—*O'Shaughnessy. Eng. Cyc. Simmonds.* A poultice of Orissa arum (Ghet Kuchoo) bruised to pulp, with tepid water, any quantity, is a stimulant rubefacient and counter-irritant, applied to indolent buboes and tumors by the native practitioners, and with frequent advantage.—*Beng. Pharm. page* 390.

(454) ARUM RAPIFORME, (*Roxb.*) grows in India.

(455) ARUM RUMPHII. A farina is prepared from this Arum, in the Polynesian Islands.—*Simmonds.*

(456) ARUM TRIPHYLLUM, Linn. Dragon's root. *Syn.* Arisæma atrorubens. *Blume.* A native of North America; when the acrid principle is volatilized the rhizoma yields a fine fecula like arrow-root.—*O'Shaughnessy, page* 625.

(457) ARUNDINA, a beautiful purple grassy-leaved orchid, was abundantly in flower on the hill-top, and the great white swallow-tailed moth (*Saturnia Atlas*) was extremely common, with tropical butterflies and other insects.—*Hooker Him. Jour. Vol.* II. *page* 305.

(458) ARUNDO KARKA. *Sur*, SINDEE, grows in Sind, where its culms, sur koo janee, are made into chairs, and its flower-stalks beaten to form the fibres called Moonyah. These are made into string or twine (Moonyah jo naree), and into ropes (Moonyah jo russa).—*Royle Fib. P. page* 32.

(459) ASAFŒTIDA, (*Narthex Assafœtida.*)

Hilteeth, ARAB.
Hing, BENG.
Duivels dreck, DUT.
Asafœtida, FR.
Teufelsdreck, GER.
Hing, HIND.
Asafœtida, LAT.
Angu, MALAY.
Ungoozeh, PERS.
Hinga, Hingoo, SANS.
Asafetida, SP.
Perungyum, TAM.
Ingoova, TEL.

A fetid gum-resin, having a nauseous, somewhat bitter, biting taste, and an excessively strong, fetid, alliaceous smell. It is an article of the *Materia Medica;* and is used by all classes of Hindus as a condiment with their food. The gum is brought to Bombay from the Persian Gulf, and is occasionally re-exported in small quantities to England. The British consumption is about 10,000lbs. a year.—*Simmonds. Faulkner.* Asafœtida is much used by the Burmese doctors, but the gum is imported.—*Mason.* The gum is the product of the Narthex (Ferula,) Asafœtida, which grows in Persia, the neighbourhood of Herat, mountains of Daristan and Belochistan, and on the Hindu-kosh at 7000 feet. The celebrated gum resin asafœtida, is obtained by slicing the roots. A milky juice exudes, which dries rapidly into a fœtid, pasty, bitter and pungent mass. The odour of Asafœtida needs no comment. It has gained for the gum resin the epithet of the "*devil's dung*;" the taste is bitter, acrid, and very durable. Unless triturated with the carbonate of ammonia, Asafœtida is with difficulty reduced to powder. Asafœtida occurs in commerce in shapeless masses of waxy consistence, with small transparent brittle and white tears. The fracture is vitreous, at first white, and passing to red by contact with the air, a property which distinguishes it from all other gum-resins. Another and much more valuable kind of Asafœtida is sometimes met with in the bazars and druggists' shops. It is in tears, or semi-transparent whitish granulations, free from impurities, and of most powerful odour; this kind is readily reduced to powder, and is much valued by European druggists. In India it is but rarely met with, and readily meets purchasers at a high price. For *Medical uses,* Asafœtida is a powerfully carminative and stimulant tonic, devoid of acrid and irritating properties. It produces a sensation of heat, and increased secretion in the alimentary canal, with eructation; head-ache, and giddiness are often experienced, and the urinary and genital organs seem to be sometimes materially excited. It is chiefly used in hysteria, hypochondriasis, flatulent colic proceeding from dyspepsia, in chronic catarrh, and in spasmodic asthma not connected with disease of the heart or lungs. In worm affections too it is often employed with benefit.—*O'Sh. p.* 363.

(460) ASALOO. A small plant cultivated about Ajmeer, the seeds are heating, and promote the secretions; they are also taken in milk to strengthen the body; much used in mesalihs of camels; to the taste are bitter and hot.—*Irvine Gen. Med. Top. p.* 124.

(461) ASARABACCA. *Asarum europœum.*

Asaroon, ARAB.	Oopana, SANS.
Assaret, FR.	Mootricunjayvie, TAM.
Haselkraut, GER.	Cheppoo-tatako, TEL.
Tuckir, HIND.	

Leaves remarkably kidney-shaped. Roots quadrangular, thickness of a goose quill, knotted, contorted, and having usually white fibres at each knot. Odour of the leaf none, of the roots pepper-like, especially when bruised, taste of the leaves acrid, of the roots less so. The acridity diminishes by age, and finally disappears. The leaves and roots of the Asarum are emetic in doses of from 40 to 60 grs. infused in eight ounces of water. It only acts well while fresh. In larger doses it is cathartic; the powder of the leaves used as snuff causes violent sneezing. Until the introduction of ipecacuanha into Europe, the Asarum was used for most of the purposes for which the South American drug is now employed. The dried plant is sold in the Indian bazars under the name of *Asaroon.* Royle states however that a hill plant, called *Tuggur*, is generally substituted for it.—*O'Shaughnessy, page* 569.

(462) ASBESTUS, AMIANTHUS. The long and silky fibres of Amianthus have been employed in the manufacture of a fire proof cloth: and as lamp-wicks.—*Tomlinson.* It is found in several parts of India, and largely in Salem and Mysore.

(463) ASCLEPIADACEÆ, *Asclepiads*, a natural order of Exogenous Plants, known from all others by the single character of its grains of pollen adhering together within a sort of bag which occupies the whole of the inside of each cell of the anther, and when it falls out sticks to glands of a peculiar character occupying the angles of the stigma. The roots of the whole order appear to be acrid and stimulating, and some of them, as *Tylophora asthmatica* and *Secamone emetica* are employed as emetics. The Cow-Plant of Ceylon, or Kiriaghuna Plant (*Gymnema lactiferum*), yields a milk which the Cingalese make use of as food. Species of *Cynanchum* act as purgatives. The leaves of Solenostemma Argel are used in Egypt for adulterating senna. Several species yield caoutchouc, whilst others afford indigo.—*Eng. Cyc. page* 319.

(464) ASCLEPIAS, a genus of plants of the above natural order, Asclepiadaceæ, many of the species of which possess powerful medicinal properties, and many are handsome border flowers and worthy of cultivation. The buds of A. stipitacea, are eaten by the Arabs: the whole plant of A. aphylla may be eaten. A., now Calotropis gigantea, of India is poisonous: the milky sap of A. lactifera, is drunk as a wholesome food, while the milky juice of A. laniflora and A. procera is acrid and irritating, and is used with butter and lard as an ointment for itch; that of A. procera being applied to hides for removing the hair before tanning.—*Eng. Cyc.* As flowering plants this genus thrives well in any good light soil, requiring room to spread and shew their blossoms, they are readily grown from seed which are produced in abundance.—*Riddell.* Wight, in his Icones, gives figures of nineteen species, Asclepias acida; annularia: cordifolia: echinata: herbaeea, laurifolia: longistigma: montana: ovalifolia, pallida, parasitica, pendula: pseudosarsa: racemosa: tenacissima: tenuissima, tinctoria: tingens: and volubilis.—*Riddell.*

(465) ASCLEPIAS CURASSAVICA is known as Indian Root, or Bastard Ipecacuan, or Ipecacuanha plant, and has emetic properties. It is a pretty little annual, with a small saffron and orange-coloured flower, is quite common in the Tenasserim Provinces. The root is emetic, and is so used by the negroes of the West Indies.

(466) ASGANDH, Isgandh, Ashwagandah Physalis flexuosa. This plant is commonly found all over India: the roots are employed medicinally, and are considered good in rheumatic and dyspeptic disorders, especially those accompanied by flatulency; they are of a warm nature, calculated to promote all the secretions. The root is not given alone; but is combined with other medicines and mesalihs.—*Irvine, Gen. Med. Top. page* 123.

(467) ASPARAGUS, a genus of plants belonging to the natural order LILIACEÆ. It is comprised by some botanists under the order Asphodeleæ. The species eaten under the name of Asparagus is the *A. officinalis.* There are a great number of species, natives of Asia and Africa, which are cultivated in the gardens of Europe, rather as matter of botanical interest than on account of their beauty or utility. The roots of *A. racemosa* and *A. adscendens* are employed medicinally in the North of India.—*Engl. Cyc. page* 322. Wight also figures A. Asiaticus.

(468) ASPARAGUS ACEROSUS. WILD ASPARAGUS. There is an indigenous species of asparagus in the Tenasserim Provinces, which produces a passable substitute for the English vegetable, to which, however, it is much inferior. It bears a sweet-smelling flower, and is deserving of cultivation as an ornamental plant.—*Mason.*

(469) ASPARAGUS ADSCENDENS (*Roxb*). Grows in Rohilcund. Root medicinal, and considered a good substitute for Salep in Northern India.—*Roxb. Quoted in Useful Plants.*

(470) ASPARAGUS OFFICINALIS. A very delicate vegetable raised from seed, takes 4 years to come to a proper size for the table, ought not to be eat before the 4th year; the seedlings, when one year old, should be planted in well prepared beds raised 3 inches above the surrounding level; three years after being trans-

lanted they will produce a crop if the beds have een annually top dressed with decayed leaves, nd manure. A little salt sprinkled over the eds once a year during the rains, will be useful) the plants. Native of the sea coast, a very xpensive vegetable to grow in any country.—*affrey*. Dr. Riddell observes, that the species re many, but this one only cultivated for use. The ıethod of first raising the plants from seed, is ither by sowing broad-cast, in beds of six feet quare, or in long beds of about two feet broad, here they are to remain. If sown in square eds, when the grass is about six or ten inches igh, and begins to bear small flowers, it may hen be transplanted, and must be carefully taken ıp with a sufficiency of earth attached to the oots, and planted in trenches at least six inches leep and eighteen broad. Between each trench hould be a space of one foot or more. The ılants may then be laid down in double rows in he trench prepared at six or eight inches asunler,—perhaps a greater distance may be better. The roots must be carefully covered, and well vatered. The beds cannot be of too rich and ight a soil, and must be kept clear of weeds, nd watered as occasion requires. When the asaragus is sufficiently strong to commence workng the beds after the stalks have gone to seed, he watering should be discontinued, and the stalks allowed to dry and wither ; then uncover carefully the roots, being cautious not to injure the crowns, cut or twist off the stalks, and cover up the crowns again with rich manure about two inches high ; then turn over upon it the spare ground that has been left between the trenches. Thus you will have in the middle of the rows a water-course, which will serve to irrigate the plants below. The watering must now be continued daily if necessary, which will cause the plants to send shoots up through the loose soil above them, and, if well managed, the grass will be white and fine. Before putting down the plants in trenches, plenty of good manure should be well dug into them, so as to form a rich soil for the roots to strike in. After the grass has been cut, and the shoots are getting thin, cease working the beds and let them go to seed, when they may be again worked. You will seldom get more than two crops in the year from the same beds, therefore you should have them in succession. He does not know of any animal, except rats, destructive to the roots: flooding with water is the only remedy.—*Riddell.*

(471) ASPARAGUS RACEMOSUS (*Willd.*)

Sada-bori, HIND.	Challa, TEL.
Suth-moolie, BENG.	Wari, MAL.

A straggling climbing shrub : common in Travancore and the Dekhan. This plant, says Roxburgh, will perfume the air to a considerable distance, owing to the delightful fragrance of its flowers. The root boiled in milk is given in bilious affections. It is necessary to remove the bark previous to administering it, as it is considered poisonous. The leaves boiled and mixed with ghee are applied externally to promote suppuration in boils and tumours.—*Roxb. Ainsl. quoted in Useful Plants.*

(472) ASPARAGUS SARMENTOSUS (*Willd.*)

Shtawari, MAL.	Tsulla-ghedaloo, TEL.
Tanncer-vittang, TAM.	Suffaid-mooslie, DUK.

A climbing shrub, found in Travancore and the Peninsula. The root, which is long, white, and fleshy, is bruised and soaked in water, and the latter, if drunk, is said by the natives to be a remedy in preventing small-pox from running into the confluent kind. In Ceylon, the root is mixed with milk and eaten (*Ainsl.*) and by the Chinese, it is made into a preserve, and also candied.

(473) ASPHALT. ASPHALTUM : called also *Mineral pitch, Jew's pitch : compact bitumen* and *Maltha* : Arabic *Hajar-ool moosa.*—Asphalt is found on the shores of the Dead Sea : at Arlona in Albania : also at Coxitambo in Cuenca in South America, and abounds also in the West Indian Islands of Barbadoes and Trinidad, forming in the leeward side of the latter island a lake or plain, called *the Tar lake*, and by the French *Le Brai*, from its resemblance to and answering the purposes of ship pitch. It is said to be a preventative of cholera, as, also, to kill the teredo. In many parts of the woods, this substance is found in a liquid state, being held in solution by *petroleum* or naphtha. *See* PETROLEUM. At one time, Asphalt was lauded to an inordinate degree, as a roofing and paving material, and in consequence soon fell into unmerited neglect. Where damp has to be resisted, it is useful, and in the Mauritius, Ceylon, and India, where it has been used, it is found impervious to wet, white ants or vermin, and as it does not vegetate, rot or decay, it is superior to wood, chunam (or country lime) as a flooring material.

(474) ASPIDIUM. Both in Sikkim and Nepaul, the watery tubers of this fern are abundantly eaten.—*Hooker, Him. Jour. Vol.* I. *p.* 292.

(475) ASS, a well-known and useful domestic animal, whose good qualities are too frequently undervalued, from being contrasted with those of the horse, without considering the different nature of the treatment which these two quadrupeds receive—the care and attention bestowed upon developing the form and cultivating the spirit of the one, and the neglect and ill usage to which the other is too generally subjected. The ass is despised and neglected only because we possess a more noble and powerful animal in the horse ; and if the horse were unknown, the care and attention which is lavished upon him, being transferred to his now neglected and despised rival, would have increased the size and developed the mental qualities of the ass to an extent which it would be difficult to anticipate, but which eastern travellers who have observed both

animals in their native climates, readily acknowledge. In Persia, and Arabia, the ass is a very different animal from what he is in India and in Western Europe. There, instead of being neglected and despised, half-starved and treated with cruelty, care is taken to cultivate the breed by crossing the finest specimens; even the Wild Ass is procured for this purpose, the pedigrees of the different races are carefully recorded, and the size, strength, and symmetry of the ass so much improved that he is rendered equal to the horse for most purposes, and in some cases even his superior. "The asses of Arabia," says Chardin, "are perhaps the handsomest animals in the world; their coat is smooth and clean; they carry the head elevated, and have fine and well-formed legs, which they throw out gracefully in walking or galloping. They are used only for the saddle, and are imported in vast numbers into Persia, where they are frequently sold for considerable sums and being taught a kind of easy ambling pace, are richly caparisoned, and used only by the rich and luxurious nobles." The ass is properly speaking a mountain animal; his hoofs are long and furnished with extremely sharp rims, bearing a hollow in the centre, by which means he is enabled to tread with more security on the slippery and precipitous sides of hills and craggy places. The hoof of the horse on the contrary is round and nearly flat underneath. The wild ass, called Koulan by the Persians, is still common in many parts of Central Asia. It stands much higher on its limbs than the common ass, its legs are longer and more slender, and it is altogether a more graceful and symmetrical animal. The mane is composed of short erect hair of a dusky colour and rather a woolly texture; the colour of the body is a uniform silvery gray, with a broad coffee-coloured stripe extending down the back from the mane to the tail, and crossed on the shoulder by a transverse band, as in the domestic variety. The Koulan inhabits the parts of central Asia from 40° N. lat. to the northern confines of India. They migrate from north to south according to the season. In summer they are commonly found about Lake Aral, but in autumn they collect in vast troops under the conduct of a regular leader, and proceed towards the south, arriving at Cutch and Guzerat in October or November, and returning northward again in the middle of spring. The Persians and Tartars hold the flesh of the koulan in high esteem, and hunt it in preference to all other descriptions of game. Olearius assures us that he saw no fewer than thirty-two wild asses slain in one day by the shah of Persia and his court, the bodies of which were sent to the royal kitchens at Ispahan; and we know from Martial that the epicures of Rome held the flesh of the Onager, or wild Ass, in the same estimation as we do venison (Epig. xiii. 97).—*Eng Cyc. page* 327.

(476) ASSAM, the valley of Assam is rich in natural productions, it possesses gold, tea, caoutchouc, lac and ivory. It abounds in silk, its two principal indigenous varieties of this article, being the *muga* and the *eri*. A dress made of *muga* is prized beyond all others, by the Assamese. Of woods, thirty-six species, applied to various useful purposes, have been described by Major Hannay as belonging to Upper Assam. Most of them are light, strong, and durable; while not a few combine with these qualities a fine grain, which renders them well adapted for articles of furniture. The spices of the country comprise, in addition to such as are commonly cultivated in Bengal, black pepper, long pepper, cardamums, tejpatra or malabathrum leaf, and jubrang, the capsule of a species of xanthroxylum, peculiar to the country and described as aromatic, fragrant and highly pungent.—*Dr. Taylor.*

(477) ASTER, a genus of plants belonging to the natural order *Compositæ.*—*Engl. Cyc. page* 329. These are named from Aster, a star: and furnish nearly every variety of colour. Some beautiful additions from Germany are striped and of larger size than the Chinese; the colours are, deep red, striped, pale red, pale red striped with white, dark blue, dark blue striped, pale blue, pale blue striped, yellow tinged, white, silver white, flesh coloured, grey, &c. They are propagated by seed sown at the end of the hot weather, and continued during the rains. The plants should have at least eighteen inches of space between them, and the soil rich and light. If grown in pots, the varieties are easily kept distinct, and the seed preserved as soon as the plant withers and dries. A succession of flowers may be continued until the hot season. Mr. Jaffrey observes that of the plants flowering in India the asters are of so short a duration they will scarcely remunerate for the trouble taken to raise them. Mr. Mason mentions that a species of aster, or christmas daisy, is seen occasionally in European gardens, in Tenasserim. —*Riddell. Jaffrey. Mason.*

(478) ASTERACANTHA LONGIFOLIA (*Nees.*) N. O. ACANTHACEÆ.

Neer-moollie, TAM.	Kanta-koolika, BENG.
Neer-goobbie, TEL.	Wahel-schulli, MAL.
Gokshura, HIND.	

Barleria longifolia, *Linn.*—Ruellia longifolia, *Roxb. fl. Ind.* III. 50. This small, annual plant may commonly be met with in Malabar and Travancore by the side of paddy-fields and other damp situations. The roots are considered tonic and diuretic, and administered in decoction. They are also employed in dropsical affections, and gravel.—*Ainsl. Rheede. &c. quoted in Useful Plants.*

(479) ASTRAGALUS, a genus of plants belonging to the natural order *Leguminosæ.* It has the calyx 5-toothed; the keel of the flower obtuse; the stamens diadelphous: the legume

bilocular or half-bilocular from the upper suture being bent in so much. The species are shrubs or under-shrubs, are very numerous, and above 250 have been described by botanists. Many of them are cultivated, most of them being hardy plants, but they are not remarkable for their beauty.—*Engl. Cyc. page* 331.

(480) ASTRAGALUS VERUS, Goat's-Thorn, is a small bush with pinnated gray leaves, terminated by a spiny midrib and half-covering clusters of axilla pale yellow flowers. It grows in the Levant. Its gum forms part of that used as Tragacanth. It is a natural exudation from the plant, but many other species of *Astragalus*, *A. strobilifera*, the *A. gummifer* of Mount Lebanon, the *A. creticus* of Crete and Ionia, and the *A. aristatus* of the Peloponnesus and Cyprus also afford large quantities of this very valuable gum. Several Astragali are common on the higher levels of the Himalayas, but have not yet been discovered to yield tragacanth. This gum forms the basis of some medicinal lozenges and styptic powders. In the arts it is highly valued as an ingredient in dye stuffs, and a glaze for calico and silks.—*O'Shaughnessy, page* 294.

(481) ASTRAPÆA WALLICHII, *Byttneriaceæ*.—A shrub; leaves angularly lobed, very soft to the touch; flowers in large compact umbels, scarlet with yellow anthers; having rather an unpleasant scent.—*Riddell.*

(482) ASYSTASIA COROMADELIANA. *Acanthaceæ*.

Midday-keeray, TAM.

A common weed in hedges; flowers either lilac, or white; the leaves are used mixed with others as greens.—*Jaffrey.*

(483) ASYSTASIA FORMOSA. This plant is a native of India, and abounds on the Coromandel Coast; the flowers are purple, and it is readily grown from seed.—*Riddell.*

(484) ATALANTIA MONOPHYLLA (*DC.*) Nat. Ord. AURANTIACEÆ. MONADELPHIA OCTANDRIA. *Sex. Syst.*

Wild-lime, ENG.	Trichilia spinosa, WILD.
Caateyaloo-miche marm, TAM.	Limonia pumila, BURM.
Turræa virens, KŒN.	

Simple leaved Atalantia. Like others of the orange tribe, this yields a clear white, very fine and close grained timber, hard and durable, though never found large enough to become an article of general utility. It is a native of the East Indies, is a small tree, its wood hard, heavy, very fine and close-grained: of a white or pale yellow colour, and very suitable for cabinet work, if procurable of sufficient size and in sufficient quantities. It grows in Malabar and on the Coromandel coast.—*Wight. Jur. Rep. M. E. Useful Plants.* Wight also figures A. floribunda.

(485) ATHANASIA ANNUA. *Compositæ*. A genus of Cape plants cultivated in India, many of the flowers very pretty, of a yellow colour, generally known as one of the everlasting flowers, grows in a light soil.—*Riddell.*

(486) ATRIPLEX HETERANTHA. *Thoyah keeray*, TAM.—A common weed; the leaves of which are used as greens, makes an excellent vegetable: is to be found in abundance in Southern India. Is also cultivated.—*Jaffrey.*

(487) ATR, (Arabic); UTR; ITR; OTTAR, AND OTTO, for it is spelled in all these varied forms: is a fragrance, perfume, or essence of flowers, though by Europeans the term is confined to that from roses. An *atr-dan* contains the Atr, and the perfumer, druggist or chemist, is called Attar. The perfumes sold under the name of Atr are as various as are the flowers, from which they are extracted, and the term has the same extent in India, as the word perfume in English. At the Hyderabad Exhibition of 1854, there were exhibited ten kinds of Atr; those from Aurungabad, were named Sohag: Panch: Bahar; Amber; Mootheea, Minbohvin Jasminum: Pandanus Odorotissimus; four from Hyderabad were named Mujmoorah, one from the Lawsonia inermis: and another called the Rahut i-Rooh; literally Heart's Ease. In addition to the above, in the Madras Exhibition of 1855, we observed from Hyderabad, the Atrs, named

Chumbaley,	Banjeree,	Sona Manthre,
Ryatroo,	Burmookee,	Nohrutten,
Inah,	Dhoolpend,	Sandal,
Kaserah,	Cuscus,	Muzmah.
Chumpah,	Moleserree,	
Gool,	Rowseh,	

They are sold by weight and vary in price from 4 Annas to 5 Rs. per tola.—*M. E.*

(488) ATR, ATTAR, ATHER, UTR, OR OTTO OF ROSES, is a highly valuable and delightful perfume. It is an essential oil prepared in several countries in the East, and has this remarkable composition, that it is a compound of two oils, one liquid and the other solid and inodorous. At Ghazipore in Bengal, the Attar was always made at the beginning of the season when the nights are cool. To procure the oil, the roses are put into the still and the water passes over gradually as in the rose-water process. After the whole has come over, the rose-water is put into a large metal Basin, which is covered with wetted muslin, tied over to prevent insects or dust getting into it, and being let about two feet into the ground, which has been previously wetted with water, it is allowed to remain quiet during the whole night. In the morning early, the little film of Attar which is found on the surface of the Rose-water during the night, is removed by means of a feather and carefully placed in a phial. Day after day as the collection is made, it is placed for a short period in the sun, and after a sufficient quantity has been procured it is poured off clear, and of the colour of amber, into small phials. Pure Atr has, at first, a pale greenish hue, but

in a few weeks it becomes of a pale yellow. It is generally calculated that 100,000 roses will produce 180 grains of Atr, and the price of 100,000 roses varies from 40 to 70 rupees; and the tolah, 180 grains, of the Atr is sold at 80 and 90 rupees. At this price, as may be supposed, it is rarely if ever used even by the wealthiest of natives, and the native courts employ the atrs or perfumed oils prepared by their own distillers from the Jasmine (J. sambac and grandiflora) and bela and Lemon grass (Andropogon schœnanthus). The Roosa oil, the oil of Neemaur (Andropogon Jwaranchusa), Attar of khuskhus, A. digitalis; Newar oil (A. maritima) a volatile oil, erroneously called oil of spikenard, is met with in the shops and obtained from a plant named by Dr. Royle Andropogon Calamus aromaticus. See also Citronella oil: Patchouly: Ægle marmelos; Jasmine, Gingelly, Moringa, Sandal wood oil.

(489) ATRIPLEX ANGUSTIFOLIA, Europe, seed said to be emetic. *A. hortensis*, Tartary, (orache) is of the same reputed properties. —*O'Shaughnessy, page* 524.

(490) ATROPA ACUMINATA, Royle.

Ustrung, VERN.	Luckmuna, BENG.
Merdum Seeah, ARAB.	Luckmunee, HIND.
Yebruj, PERS.	

These names are of very doubtful correctness, but are given on Ainslie's authority. *A. acuminata*, (Royle) exists in Kunawur, on the northern face of the Himalayas. The *Mandragora*, or mandrake, the root of which was so celebrated in the magic rites and toxicology of the ancients, is known in the bazars of Central Asia and the north of India. Its properties are identical in nature with those of A. belladonna but weaker in consequence of drying and decomposition of the atropia.—*O'Shaughnessy, page* 466.

(491) ATTI, Hatey or Arti, is given by Edye as the Tamil name of a Ceylon tree which grows from two to three feet in diameter, and from twelve to twenty feet high. It is used for general purposes in small country vessels. He states that it produces the wild fig.—*Edye, Ceylon.*

(492) ATTALI, the Tamil name of a tree in Ceylon which is of little value. It grows to about ten or twelve inches in diameter, and eighteen feet long. It produces a flower, and then a seed-pod, which is used as a medicent.—*Edye. Ceylon.*

(493) AUCKLANDIA COSTUS. An annual of general occurrence about Rangoon and every part of that district. It affords the *Patchakoo oil* of the Madras list.—*McClelland.*

(494) AULAX. *Proteaceæ*, A species of flowering plants which grow from one to two feet high, in a sandy soil bearing yellow flowers. —*Riddell.*

(495) AURACARIA CUNNINGHAMII, Australian or Moreton Bay Pine. A remarkable but tender species, forming vast forests along the shores of Moreton Bay in Lat. 14° to 29° S, and on the alluvial bank of the Brisbane River lat. 27° to 30° S. It attains from 100 to 130 feet in height, with a circumference of upwards of 14 feet, having a clear stem to 80 feet. It is growing in the Horticultural garden, Madras. "The introduction of 'Australian,' as timber trees is worthy the attention of Government.—*Jaffrey.*

(496) AURANTIACEÆ, Citron Worts, or the Orange Tribe, are Dicotyledonous Polypetalous Plants, and the Orange, Lemon, Lime, Shaddock, Pompelmoose, Forbidden Fruit and Citron are the produce of this order. The Wampa, a fruit highly esteemed in China and the Indian Archipelago, is produced by Cookia punctata. The fruit of Glycosmis citrifolia is delicious; and that of Triphasia very agreeable. The Ægle Marmelos is used in medicine and a perfume is made from its rind.

(497) AURICULA, a genus of Phytophagous or Plant-Eating *Trachelipodous Mollusca*, whose organs of respiration are formed for breathing air.—*Engl. Cyc. page* 349.

(498) AURICULA MIDÆ (Lam.) *Voluta Auris Midæ* (Linn.) the Midas's Ear of collectors, is a good example of the genus. It is said to be an inhabitant of the East Indies. Lamarck also names the Moluccas as its locality.—*Eng. Cyc. page* 349.

(499) AVA GEM-SAND, comes from the neighbourhood of Ava, and sometimes one of the Shan articles of merchandise. It consists of small fragments of nearly all the precious stones found in the country, but garnet, beryll, and spinelle are its principal constituents, more especially the last, which seems to constitute nearly three-fourths of the whole mass. A single handful will contain specimens of every shade, black, blue, violet, scarlet, rose, orange, amber yellow, wine yellow, and white.—*Mason.*

(500) AVENA SATIVA. *Βρωμος* and *Βρομος.* Cultivated in Bengal, in the Dekhan and Guzerat. *Groats* or cutlings are the bruised oat seeds freed of the pericard. They are much used for preparing gruel for invalids; *porridge*, an excellent article of hospital diet, is made by stirring groats or oatmeal into boiling water until the mixture thickens. It is eaten with milk, butter, or sugar. Oats grow spontaneously in Sicily near Marsama, where barley also occurs, and have been found by Anson in the island of Juan Fernandez.—*O'Shaughnessy, paye* 635.

(501) AVERRHOE BILIMBI (*Willd.*) Nat Ord. OXALIDACEÆ.

Blimbing Basi. also	Wilumpi, MAL.
Blimbinghas, MALAY. [ENG.	Bilimbi, BENG.
Bilimbi or Cucumber tree,	Kamarunga, HIND.

A small tree, timber of doubtful value, with an intensely acid fruit, which cannot be eaten raw: A syrup made from the fruit, and a conserve of the flowers are both esteemed in fevers, and bilious disorders. This fruit is commonly made into pickles or preserves, or candied. The

juice has a pleasant, acid taste. The leaves are slightly sensitive to the touch. The Bilimbi tree is grown generally in India; and in the Tenasserim Provinces it bears profusely. Its juice is an excellent agent for removing iron-mould. To the Malays it answers the same purposes as the citron, the gooseberry, the cucumber and the caper in Europe.—*Useful Plants. Jaffrey. Mason.*

(502) AVERRHOE CARAMBOLA (*Willd.*) The Kurmul or Kumruk.

Blimbing manis, MALAY.	Cumurunga, BENG.
Tamara-tonga, or Kamaranga, MAL.	Tamartun Pullum, TAM.
Meetha-kumarunga, DUK.	Zoung-yah, BURM.

This beautiful tree originally came from Ceylon. It is now commonly to be met with in the Peninsula, and has been introduced from the Moluccas into the Tenasserim Provinces, where it flourishes well, and is now quite naturalised. The fruits, which contain an acid watery pulp, are good when candied or made into syrup. They also make good pickles and tarts, and the juice of the sour variety, is very useful in removing iron-moulds from linen. Leaves are a good substitute for sorrel. Root, leaves, and fruits, are medicinal, and the latter is used for dyeing and other purposes. There are however two varieties, the acid and sweet—*Mason. Averrhoe carambola*, in the Tenasserim Provinces, is scarce and only found near towns. It is grown about Rangoon and many places in the interior for its acid fruit, which is employed like the unripe *Papaya*, and many other green sour fruits, in curry, and highly prized as a wholesome dish by the Burmese. Wood, dark brown.—*McClelland.*

(503) AXE STONE, a silicate of alumina and magnesia, is a hard tough stone of a greenish colour. Syn: Jade, Nephrite and Ceraunite.

(504) AYAPANA. The dried leaves and twigs of Eupatorium Ayapana used in medicine. —*O'Shaughnessy.* An Infusion of Ayapana is a very agreeable diaphoretic and mild tonic. Dose, two fluid ounces thrice daily. The Ayapana is a favorite remedy among the native practitioners. —*Beng. Phar. page* 298.

(505) AZADIRACHTA INDICA (*Ad. de Juss*) Nat. Ord. MELIACEÆ.

Neem or Margosa tree, ENG.	Vepa, TEL.
Weppa, MAL.	Neem, BENG.
Vaypum, TAM.	Thembau ka makah, BURM.

This is a beautiful tree, generally diffused in India, and one which may be said to be equally useful as ornamental, for its fruit, bark &c., are employed in medicine, and it comes into full foliage in the very midst of the hot weather, when nature generally is seeking repose. Its chief virtues reside in the bark, which has a remarkably bitter taste, and has been much employed, especially of late years, as a fair substitute for Cinchona. The natives consider it a most useful tonic in intermittent fevers and chronic rheumatism, administering it either in decoction or powder. The dried leaves are used as poultices, powerfully preventing glandular tumours from coming to maturity. In various diseases of the ears, eyes and teeth, they are successfully administered in many ways. Dr. Wight says, 'The leaves beaten into a pulp, and externally applied, act like a charm in removing the most intractable form of psora and other pustular eruptions.' On the decline of the small-pox, it is almost invariably the custom of the natives to cover the body with the leaves of this tree. The timber is hard and durable, fit for ship-building, and carts; and some of the samples, produced by Mr. Rohde, equalled the best fancy woods. Some of the finest furniture wood seen by Mr. Rohde was from an old tree of this description; it is, when old, very hard and difficult to work, but beautifully mottled. The wood is compact and durable, used for making cart wheels, &c. The tree is greatly venerated by many of the Hindoo tribes, and, like the shrew tree in England is often resorted to by the friends of insane people, who pass the sick person through a cleft of the tree or a stem which having parted and reunited forms a circular opening. Dr. McClelland says that it is plentiful in the Prome district only; where it is a large, but soft timber, only fit for flooring. Wood, light-brown.—*McClelland.* From the pericarp of the seed an acrid bitter oil is expressed, which is a useful remedy in leprosy, and is moreover anthelmintic and stimulant, being used externally in cases of foul ulcers, and as a liniment, in headaches and rheumatic affections. It is obtained either by boiling or expression, is of a deep yellow colour, and is much used for burning in lamps. There is a steady increase in the exportation of this oil from Madras, chiefly to Ceylon; the quantity in 1852-53 being upwards of 3,000 gallons. The oil and the seeds, after being skinned, are employed to kill insects in trees, and the hair, and the kernels, powdered and mixed with water, for washing the hair. A gum is also got from the bark, used medicinally as a stimulant. A kind of toddy, called Vaypumkulloo, is procured from the young trees, which is said to be a good stomachic.—*Ainsl. Rowb. Jury Rep. M. E. Wight. &c.* The Neem bark, although containing a powerful bitter, does not seem well suited for tanning purposes. A poultice of the leaf, viz. Nim leaves bruised and moistened with tepid water, is a favorite application among the native practitioners, in swelled testis.—*Beng. Phar. p.* 391. Mr. Mason states Linnæus placed this tree in the same genus as the Melia, pride of India, which it much resembles, but the leaves are more intensely bitter. It is cultivated by the Burmese for its medicinal qualities, for which it is famous all over India. The bark has been successfully used in India as a substitute for cinchona; the bitter oil of the fruit is a valuable an-

thelmintic; the seeds are used in the destruction of insects; and "the leaves," remarks Dr. Wight, "beaten into a pulp, and thus externally applied, act as a charm in removing the most intractable forms of psora, and other pustular eruptions." It differs from all the other species in having a one-celled, one-seeded nut, though the germ has uniformly five cells with one or two ovula in each. Roxb. ii. p. 394. The author of the "Mukhsun-ul-udwieh" describes four kinds of Neem or Melia—1st, Nim; 2nd, Bukayun; 3rd, Dek; 4th, an unknown species, which Royle supposes to be the Melia composita of the Peninsula—1st. *Nim*, (Melia Azadirachta. Azadirachta Indica. Margosa tree). Every part of this tree, especially the bark, is bitter; the bark is also astringent, the leaves are bitter and very nauseous; from the ripe pericarp of the fruit a very bitter fixed oil is expressed; the trunk of the tree yields gum, and the young trees when tapped yield a saccharine sap or toddy, capable of undergoing the vinous fermentation. The leaves are employed all over India as poultices to tumours and [illegible]en sores; the seeds (*nimbuolee*) blanched, powdered, and mixed with water, are used for cleaning the hair. The bark is considered by native practitioners as amongst their most valuable tonics, and is given with aromatics in fever and rheumatism; in Java the bark is considered vermifuge, the dose being half a tea-cup full of a decoction twice daily. The oil is also thought anthelmintic, and is applied externally to foul ulcers, and used as a liniment in rheumatic and spasmodic affections, and in headaches from exposure to the sun. The wine or toddy is believed to be stomachic, the dose being one ounce and a half every morning. Dr. White of Bombay used the bark of this tree as a substitute for Cinchona, and found its success nearly equal as a febrifuge remedy. Mr Skipton has related a case of hysteria (Trans. Med. Phy. Soc. Calcutta, vol. i. p. 123) in which a decoction of the leaves was used with the best effect.—2d. *Bukayun*, (Ban. Azad-i-durukt, Melia Bukain, or Sempervirens—Maha nimba.) The seeds are called Hub-ool-Ban, and are considered emetic, laxative, and anthelmintic, the bark bitter and anthelmintic.—3d. *Dek*. (Melia azadarch. Persian lilac, Hill margosa.) In general and medicinal properties this species corresponds with the first.—*O'Shaughnessy, pages* 244-245. Ainslie (Mat. Med. Indica) was well acquainted with the Margosa or Neem tree and its febrifuge reputation. At page 456, vol. ii. of 2nd edition of his Mat. Medica Indica, published nearly 30 years since, he describes the Melia Azadirachta "as a large and beautiful tree common in most parts of India, trunk often crooked but thick, wood of a pale yellow, and the bark of a dark purple color: the branches extend very wide, the leaves are scattered about the extremities of the branches, and are from one to two inches long: leaflets opposite, or nearly so, about six pair, sickle-lanced, serrate, of a light green color, and not of an unpleasant odour. The flowers which are small, white, and fragrant, are produced on long branching panicles from the sides of the branches; the fruit is kidney-formed, at first green, then turning yellow, and at last changing to a purple." The *purple* change in the ripe fruit here described by Ainslie however is a mistake. The fruit of the Melia sempervirens (genus Melia) is purple, but that of the Melia Azadirachta is always yellow or greenish yellow when ripe. This tree is well known throughout the plains of India. It flowers early in April, and in some places, in March. The flowers are sweet, and at evening and early morning load the air with perfume. The fruit ripens in July. From the ripe seed a bitter oil, the kurwa tel of the bazars, is obtained by expression. This oil is plentiful in all the Indian bazars, and is extensively used by native practitioners as a medicine and in external application. The medicinal properties of the oil require careful investigation. Dr. Cornish thinks it possible that it may afford a good substitute for the very nauseous compound of cod liver oil and quinine now extensively prescribed at home in scrofulous and Phthisical cases. The bazar oil is generally badly prepared and adulterated with cheaper oils, but Dr. Cornish has used it occasionally as a substitute for "fish oil" with good effect. The bark from the smaller branches is tolerably smooth on the surface, of a dullish purple color, with a shining surface. It is marked by longitudinal lines of ash-colored epidermis, from $\frac{1}{4}$ to $\frac{1}{1\frac{1}{2}}$ of an inch apart. These lines do not run more than two or three inches continuously, but are irregularly broken off and superseded by other lines running in a parallel direction, and so on to the end of the branch. On making a section of a recent specimen of the bark, the outer or "suberous" layer will be found of a bright purple color. This darkens on exposure to the air, and blackens speedily, if cut with a steel knife. This portion of the bark has an astringent taste, and is not very bitter. The inner bark or "liber" is almost white. It separates easily from the outer layer, and is the thicker of the two. If a small portion of it be chewed in the recent state, it has at first a sweetish taste, followed quickly by a powerful and lasting bitter. The bitter is somewhat aromatic and not unpleasant. Ainslie (Mat. Med. Indica, vol. ii. p. 454) describes the bark "as bitter and astringent, and by no means unpleasant to the taste: it is considered by native practitioners as amongst their most valuable tonics. They generally give it in powder, or in decoction in conjunction with some aromatic, in fevers, and also in chronic rheumatism; in fact, it is used for almost every purpose that the cinchona is in Europe." Ainslie further remarks, that Dr. White, late of the Bombay Establishment, considered the Margosa

to be equal to Cinchona as a febrifuge. Statistical analysis goes far to prove that the Margosa is quite as effective in the treatment of intermittent fevers as the old established remedies, cinchona and arsenic.—*Dr. Cornish in Indian Annals*, No. VII., *page* 113.

(506) AZALEA, in Botany, is the name of a genus belonging to the natural order *Ericaceæ*, and consisting of shrubs remarkable for the beauty and fragrance of their flowers; on which account they are very generally cultivated in Europe. By some botanists the genus is esteemed the same as rhododendron, in which it is accordingly sunk; and it must be confessed that it is difficult to point out any positive character except the thin and generally deciduous leaves by which *Azalea* can be distinguished from *rhododendron*. The Azalea is indigenous to China, where it is found wild on every hill side. About Hong-kong and Canton it is usually found high upon the sides of the mountains, from 1000 to 2000 feet above the level of the sea. In latitude 25° north, in the province of Fokien, it is met with in less elevated situations, from 500 to 1000 feet high; and when we reach Chusan, in latitude 30° north, we find it growing plentifully on the lower sides of all the hills, and never, or at least rarely, at a high elevation.—*Fortune, page* 333. The genus is numerous and remarkable for its variety of colours, the plants thrive in a light loamy soil, and are easily grown from seed, only requiring to be kept moderately moist.—*Riddell.*

(507) AZALEA AURANTIACA. This is one of a beautiful genus of plants, admired for its white, orange, purple, scarlet, and variegated flowers, which it produces in great abundance. It grows freely from seed, requiring a light soil. Each plant should be grown separately in a pot.—*Riddell.*

(508) AZALEA INDICA. (Linnæus.) This and the following are the most beautiful plants which exist in the rich flora of China, where they far exceed in splendour of appearance the camellias, moutans, chrysanthemums, and roses of that favoured climate. This forms a bush varying in height from two to six feet, with the branches usually drooping, and covered when young with rigid brown hairs. There are many varieties, of which the brick red, the double purple, and the variegated are the principal.—*Eng. Cyc. page* 358.

(509) AZALEA LEDIFOLIA, (Hooker.) This native of China is less impatient of cold than the last, from which it chiefly differs in its leafy calyx, evergreen less rusty shining leaves, larger flowers, and more numerous stamens. There are two varieties, the white and the royal purple, or Phœnicean.—*Eng. Cyc. p.* 358.

(510) AZALEA OBTUSA. Some varieties of it with semi-double flowers, were seen by Mr. Fortune in full flower, highly prized by the Chinese. The colour of this species is brilliant and dazzling in China. A beautiful variety, quite new, had small semi-double pink flowers, which it produced in great profusion. This will be a great favorite in England when its merits are known. Its novel colour, small leaves, and neat habit will render it most desirable for bouquets and for decorative purposes. He named it *Azalea amœna*, and it is now in England.—*Fortune, p.* 329.

(511) AZALEA SINENSIS (*A. pontica; A. sinensis*, 'Botanical Register,' plate 1253.) was introduced into England from China by the late Mr. W. Wells, of Redlerf, about the year 1826, and supposed to be a native of that country.—*Eng. Cyc. page* 358.

B

(512) BABAI. Ocymum pilosum. Ciliated Basil. This is very common in all the Ajmere fields: the leaves have a very fragrant smell, exactly like verbena: the plant is used to prevent the approach of insects, especially of bugs: the seeds are mucilaginous.—*Irvine, Gen. Med. Top. of Ajmere, p.* 180.

(513) BABAR, or ALLOW or BICHOO, a stinging nettle described by Mr. Charles Gubbins and sent by Captain Rainey from Simla, from which place he had sent other specimens of fibrous material: thread is prepared from its fibres. It grows in all the valleys about Simla and Subhathoo.—*Royle, page* 376.

(514) BABLAH, NEB-NEB. The rind of the fruit of the *Mimosa cineraria*. It is used as a substitute for the more expensive dye stuffs, and for communicating shades of drab to cotton. The plant is a native of Senegal and the East Indies.—*Faulkner.*

(515) BABOOL GUM, largely produced and well known in commerce as the produce of the *Acacia arabica*. It is largely used in India as a substitute for the true Gum arabic, the produce of the Acacia vera.—*M. E. Jur. Rep.*

(516) BABOON, *Cynocephalus*, Cuvier, a genus of *quadrumana*, or four-handed animals, which forms the last link in the chain that unites the *Simiadæ*, properly so called, with the lower animals. The most marked and prominent of the characters which more immediately distinguish the baboons from the other *Simiadæ* consists in the great prolongation of the face and jaws and in the truncated form of the muzzle, which gives the whole head a close resemblance to that of a large Dog, the word cynocephalus, meaning in

the Greek, "dog-headed." In their native mountains, the ordinary food of the Baboons is berries and bulbous roots; but in the vicinity of human habitations, they make incursions into the cultivated fields and gardens, and destroy a still greater quantity of grain and fruits than they carry away with them. The *Cynocephalus Hamadryas*, Linn. the "Derrias," is found in Africa and Asia, being found in the mountains of Arabia. It measures upwards of 4 feet when standing erect.

(517) BABOONA-SUFAID, A white root imported into Ajmere from Bombay and used as an aphrodisiac.—*Gen. Med. Top. of Ajmere, p.* 128.

(518) BABOONA-SOORKH, ANTHEMIS NOBILIS. The root is imported via Bombay; is taken as an aphrodisiac, and general tonic: sells at one rupee a seer.—*Gen. Med. Top. of Ajmere, p.* 128.

(519) BACON. *Fr.* Lard; *Ger.* Speek. The flesh of the hog, salted and dried. It is a coarse food, and as that prepared in India is very liable to induce disease of the bowels, its use should be avoided.

(520) BADGER, *Meles*, Cuvier, a genus of plantigrade carnivorous animals. The genus extends throughout the whole of Europe, North America and Northern and Central Asia. The number of species is very limited, and all writers follow F. Cuvier in excluding the Indian Badger, with the object of making it the type of a new genus, though, for what reason, it would be difficult to say, since the dental system of this animal has never been properly described, and in all its other characters, it differs in no respect from the common badger. —*Eng. Cyc. Meles collaris*, the Indian Badger, called Bhalloo-Soor or Bear Pig, is scarce, but to be met with about the hills. It is about the size of, but stands higher upon its legs than, the common Badger, and is at once distinguished by its attenuated muzzle ending in a truncated snout, like that of a common hog, and by its small, and nearly naked tail. The whole height of this animal is about 20 inches, and the length of its tail about 9 inches. It has the body and limbs of a bear, with the snout, eyes, and tail of a hog. Its ears are short, completely covered with hair, and surrounded by a slight border of white. They are exceedingly fierce and will attack a number of dogs.—*Eng. Cyc.*

(521) BADLA. At Bombay a kind of gold or silver thread, the Bombay tariff valuation of which is Rs. 1 8 0 per tola.

(522) BAEBOTRYS. *Schreb: gen. N.* 318. A genus of plants of the order Pentandria monogynia; of which several species are described by Roxburgh. *B. indica*, a large shrub, a native of Chittagong, flowers in February, March and April. *B. ramentacea*, Muimooriya, HIND. is indigenous in Sylhet. It grows to be a pretty large shrub, blossoms in March and April, and the seeds ripen in October and November. *B. nemoralis*, also a Sylhet species, with the same vernacular name, is a pretty large, very ramous upright shrub. *B. glabra*, a native of Chittagong, where it flowers in March; is a slender tree, with straight smooth branches and leaves. *B. tetrandra*, is a native of the Moluccas.—*Roxb. Vol.* I. *p.* 557 to 560

(523) BAGU, in the Malay; and WAGU, in Javanese; the *Gnemium gnetum* of botanists.—*Crawfurd Dic. p.* 26.

(524) BAHIRA, Terminalia bellerica; Belleric Myrobolan is the name in Ajmere of the fruit of this tree brought from Malwa, Kotah and other places, it is very astringent; considered cooling, and given in hematuria, much used in dyeing, and in mesalihs; is common in all bazars: and sells at eight seers for one rupee.—*Gen. Med. Top. of Ajmere, p.* 128.

(525) BAHU, a land measure in Java equal to 71 acres.—*Simmonds.*

(526) BAJRA. Hind. Pencillaria spicata. This is a very common grain in India, not so heating as Jawarie, and made into cakes or porridge. Sown in fields at the commencement of the rains.

(527) BAKING. The egg and custard powders, used in lieu of leaven or yeast, are combinations of carbonate of soda and tartaric acid, mixed up with wheaten flour, or other kinds of starch, and are often coloured with turmeric or chromate of lead; the latter ingredient is decidedly injurious to health, and if in large quantities, is poisonous; it is extremely doubtful how far any of these preparations may be used with safety to the public.—*Hassall.* As many Mahomedans object to eat the fermented loaf bread of Europeans, the following receipt for unfermented bread may be found applicable:—Flour 1 lb. bicarbonate of soda 40 grains, cold water ½ a pint, muriatic acid 50 drops. The following is a receipt for the preparation of egg or Baking Powder:—carbonate of soda, 56 lbs., tartaric acid, 28 lbs., potato flour, 1 cwt., turmeric powder ¾ lb.—*Hassall.*

(528) BAKKUL. The fibrous bark of the roots of certain trees, which is used in Malwa, as a cheap substitute for string and cord.—*Royle.*

(529) BAKLA, Duk.—Vicia Faba.—Garden Bean. This is cultivated at the same season and manner as the kidney bean.—*Riddell.*

(530) BAKLA ZUN, Duk.—Phaseolus Vulgaris.—Kidney Bean, dwarf.—*Riddell.*

(531) BALACHONG.

Balachan, MALAY. | Trasi, JAV. | Bagon, PHILLIP.

This is the name of a condiment made of prawns, sardines, (Engraulis meletta,) and other small fish, pounded and pickled. The proper Malay word is balachan; the Javanese, trasi; and the Philippine, bagon. This article is of universal use as a condiment, and is one of the largest articles of native consumption throughout both the Malay and Philippine Archipelago. It

is not confined, indeed, as a condiment to the Asiatic islanders, but is also largely used by the Burmese, the Siamese, and Cochin-Chinese. It is, indeed, in great measure essentially the same article known to the Greeks and Romans under the name of Garum, the produce of an Engraulis, a mediterranean fish.—*Crawfurd Dic. page* 27. A mild description of Balachong is made in Bombay, and sold as an item in Indian Oilmen's Stores.—*Faulkner.*

(532) BALAS RUBY, a term used by lapidaries to designate the rose-red varieties of spinel. It should be carefully distinguished from the Oriental ruby, the sapphire, a gem of much greater variety and value.—*Eng. Cyc. page* 374.

(533) BALBEJ OR BALTEJ. The tariff valuation of this, in Bombay, is Rs. 4 per cwt.

(534) BALÆNA, (from a Greek word) is the Latin name of the Common or Greenland Whale, and, adopted by naturalists as a generic term, to comprehend all the other species which agree with it in their zoological characters. See CETACEA.—*Eng. Cyc. page* 372.

(535) BALANOPHOREÆ. This order contains several parasitic plants, such as the extraordinary Rafflesia, and the Cytinus hypocistus, a small plant found on cisti trees in Europe, and which yields the substance long known in medicine as hypocistus juice. This is supposed to be an extract of the plant, and owes all its properties to the presence of an abundance of gallic acid.—*O'Shaughnessy, p.* 569.

(536) BALANOPHORA, is a curious leafless parasite in the Zemu valley in Sikkim, growing abundantly on maple there. This species produces the great knots on the maple roots, from which the Tibetans form the cups mentioned by MM. Huc and Gabet. Dr. Hooker was so fortunate as to find a small store of these knots, cleaned, and cut ready for the turner, and hidden behind a stone by some poor Tibetan, who had never returned to the spot: they had evidently been there a very long time.—*Hooker Him: Jour. Vol.* II. *page* 47. The Lepchas drink out of these little wooden cups, which are very curious on several accounts; they are very pretty, often polished, and mounted with silver. Some are supposed to be antidotes against poison and hence fetch an enormous price; these are of a peculiar wood, rarer and paler-coloured. Dr. Hooker has paid a guinea for one such, hardly different from the common sort, which cost but 4d. or 6d. MM. Huc and Gabet graphically allude to this circumstance, when wishing to purchase cups at Lhassa, where their price is higher, as they are all imported from the Himalaya. The knots from which they are formed, are produced on the roots of oaks, maples, and other mountain forest trees, by the above described parasitical plant, known to botanists as *Balanophora*—*Hooker Him. Jour. Vol.* I. *page* 132.

(537) BALANOPHORA GIGANTICA, is a favourite astringent remedy in Burmah.—*O'Shaughnessy, page* 569.

(538) BALANITES ÆGYPTIACA. *Rutacea.*

Nunjoonda wood tree, ENG.	Hingenbet, DUK.
Nunjoonda maium, TAM.	

This is a small thorny tree with alternate bifoliate leaves, and greenish white flowers; fruit about the size of an egg, covered with a smooth dry cortex; it flourishes in black soil.—*Riddell.* Dr. Lindley says that its leaves are slightly acrid and have the character of possessing anthelmintic properties: the fruit when ripe can be eaten without inconvenience; A fat oil called zachun is extracted from the seeds. The fruits are said to be mixed in commerce with Myrobolans. Its wood is of no value and only good for fuel.—*Jaffrey. Wight. Balanites ægyptiaca* is common about Delhi, and in the Doab as far as Allahabad, and especially on the banks of the Jumna. (Royle, p. 154.) Dr. Roxburgh describes the pulp as exceedingly bitter, and having an offensive greasy smell; the nut is used in native fire-works, the kernel being scooped out the shell is filled with gunpowder, and explodes with a very loud report. —*O'Shaughnessy, p.* 258—260.

(539) BALANUS, a genus of sessile cirrhipeds, or barnacles, most widely diffused and to be found upon almost all bodies, whether fixed or moveable, that offer an opportunity for it to attach itself to them, and are immersed in the sea: colonies of Balani are to be found on rocks left dry at low water, on ships, on timber, whether floating or at rest, on lobsters and other crustaceans, and on the shells of conchifers and mollusks. The Balanus psittacus sometimes attains the length of 5½ inches and a diameter of 3½ inches and is a very common and esteemed food.—*Eng. Cyc.*

(540) BAL-CHUR, (Valeriana Jatamansi. Spikenard?) Found near standing water at Ajmere, the roots are small and knotty, and fine like hair, hence the name: have a sweet scent: are tasteless: used to heat, strengthen and excite the system. One tola is the dose. Are very much used also in hair mesalihs; price, two seers for one rupee. Also the name of a grass, the roots of which are like fine hair, sweet-scented, and much used in cleaning the hair. This latter grass is the Andropogon schænanthus.—*Gen. Med. Top. p.* 128.

(541) BALLAST.

Baglast, DAN.	Neerum, HIND.	Lastre, SP.
Ballast, DUT.	Savorra, IT.	Ballast, SW.
Lest, FR.	Lastro, PORT.	FAULKNER.
Ballast, GER.	Balast, RUS.	

Ballast is from the Anglo-Saxon wood *be-klæsten* to lade a ship. The heavy materials, stone gravel or iron, placed in the hold of a ship in order to make the centre of gravity correspond with the trim and shape of the vessel. Iron

ballast is alone used in the Royal Navy, but in merchantmen it is of various kinds, and masters are obliged to declare the quantity they bear and discharge it at certain places. Many excellent ports have been ruined by ballast being discharged in havens, roadsteads &c.—*Tomlinson.* Many of the raw products of the world, the small value of which would not bear the expense of freight, are yet conveyed from country to country as ballast.

(542) BALLS AND BATS. These materials for the cricketers are imported wholly from England, and in the four years, 1852 to 1856, Madras received to the value of Rs. 13,938.

(543) BALM. Mellissa officinalis. A pot herb, the young tops and leaves of which are used in cookery, and, when dry, as tea; raised from seed, cuttings, &c. All pot herbs should be cut, to dry, when in flower, and dried in the shade.—*Jaffrey.*

(544) BALSAM.

Balsem, DUT.	Balsam, GER.	Balsamum, LAT.
Baume, FR.	Balsamo, IT.	Balsamo, SP.

A general term applied to various medicinal resinous juices obtained from trees. Those of most importance in commerce will be found described under their respective heads.—*Faulkner.* Many of the fragrant resins belong to the natural order of plants, the Amyridaceæ, *Amyrids*, consisting of tropical trees or shrubs, the leaves, bark, and fruit of which abound in fragrant resin. The species are natives of tropical India, Africa, and America. This order is remarkable for yielding various fragrant resins; as Myrrh, Frankincense, and other products. The Frankincense of India is the produce of a species of Boswellia. Olibanum is yielded by *Boswellia serrata*. Myrrh is obtained on the Abyssinian coast from the *Balsamodendron myrrha*. *B. Opobalsamum* yields the Balm of Mecca. Bdellium is produced in Africa by *B. Africanum*. American Elemi comes from *Icica Icicariba*. Resin of Courina from *I. ambrosica*. The gum Elemi of commerce is said to be yielded by several species of *Amyris*. (Lindley, *Vegetable kingdom.*)—*Eng. Cyc. p.* 189.

(545) BALSAMINA, THE BALSAMS, one of the two genera of which the natural order Balsaminaceæ consists. It differs from Impatiens in having all its anthers 2 celled, its stigmas distinct, and the valves of its fruits curling inwards when bursting. There are numerous species, several of which have very handsome flowers. They are chiefly found in the damper parts of the East Indies; but the only one that is much known in Europe is the common Garden Balsam (*Balsamina hortensis*), which, in its double state, has been an object of cultivation since the earliest records of modern horticulture. This plant, which is supposed to be found wild in the mountainous parts of Sylhet, in the form of what botanists call *Balsamina tripetala*, is one of those species which not only has a tendency to vary with double flowers, but has also the power of continuing to produce them when renewed from seeds. On this account it particularly deserves the attention of the cultivator, especially as it may be brought by art to a state of beauty equalled by few plants. All that is necessary in order to secure fine Balsams, is, first to save the seed with great care from the finest and most double flowers only, throwing away all whole coloured and single blossoms; and secondly, to cultivate the plants with a due regard to the natural habits of the species. A native of the hot damp shady woods of Sylhet, it is incapable of bearing much drought or bright sunshine. In Britain it is raised in a hot bed, treated with great care as a tender annual, grown in rich soil, sheltered from excessive sunlight, and kept constantly in a damp atmosphere, but freely and fully ventilated. It should not however be stimulated into extremely rapid growth until the plants have become stout bushes and the flowers have grown to the size of small peas. At that time the plants should have all the heat and moisture they can bear, and the most brilliant flowers the plant is capable of producing will be the result. In the latter stage of growth great care is still to be taken to expose the plants fully to air.—*Engl. Cyc. page* 375. Dr. Riddell mentions that, in India, Balsams require to be sown thinly in a box or seed pan; after the *plants* are 2 or 3 inches high they should be transplanted out singly in well manured soil, if to be grown in pots, they should be put in small sized ones at first and re-potted into larger, when requisite, which will be, when the small pots are filled with roots. The soil best adapted for culture is, 2 parts strong loam approaching in appearance to brick earth, and 2 parts well decayed manure, with a *little lime*, which will aid in preventing mildew, so destructive to the Balsam: the pots should be well drained and the plants must never be neglected in watering; seeds may be sown every month. Balsams, on the Khasia Hills, are next in relative abundance (about twenty-five), to the orchids, both tropical and temperate kinds, of great beauty and variety in colour, form and size of blossom.—*Hooker Vol.* II. *page* 281.

(546) BALSAMODENDRON, a genus of oriental trees belonging to the natural order *Amyridaceæ*, and remarkable for their powerful balsamic juice.—*Engl. Cyc. page* 376.

(547) BALSAMODENDRON GILEADENSE. Roughan Balsan, HIND. and PERS.

Balsam of Mecca or Gilead. Protium gileadense. Syn. Amyris gileadense. A middle sized tree, a native of Arabia, Ethiopia, and the East Indies, introduced into the Calcutta Garden in 1798. M. Fee ascribes to this tree three distinct products; Balsam of Mecca, a wood called Xylobalsamum, and fruits termed Carpobalsamum. Tradition is rich in anecdotes re-

lative to the origin of this balsam; the Mahomedans affirm that it sprung from the blood of the slain in Mahomet's conflict with the tribe of Harb, and that the prophet used the Balsam for the resuscitation of the dead. (Fee.) It is much used in medicine by the Hakims as a stimulant, tonic, and somewhat astringent remedy, and as an external application to indolent sores. It is also employed as a perfume and cosmetic. The Opobalsamum and Carpobalsamum require no particular notice.—*O'Shaughnessy, page* 285. Balasamodendron Gileadense is supposed to be that described by Theophrastus. It is described as a middle-sized tree, with the leaflets growing in threes, and the flowers single. But it is probable that, as other balsam trees are found in the same places, and produce the same substance, they are in fact nothing but varieties of the same species. They produce three different substances: 1, Balm of Mecca, or Balm of Gilead, or Opobalsamum; 2, Xylobalsamum; and 3, Carpobalsamum; the first obtained from the trunk of the balsam-trees by simple incision; the second by boiling the branches and skimming off the resin as it rises to the surface of the water; and the third by simple pressure of the fruit. They are no longer met with even in gardens, about Gilead in Palestine.—*Engl. Cyc, page* 376. Balsam of Mecca mixture:—To prepare this mixture of Mecca Balsam, take of Acacia or white mooslie mixture eight fluid ounces, Balsam of Mecca (Roghen balsan) two fluid drachms, rub well together. In use, it is a valuable stimulant and tonic, much prized by the Mahomedans of India. Dose, half a fluid ounce to one ounce, three times daily.—*Beng. Phar. page* 375.

(548) BALSAMODENDRON KATOF has fewer spines, and downy and more distinctly serrated leaves. Its wood, which is red and resinous, is a common article of sale in Egypt. Whatever may be the product of this species, which Forskal states to produce the myrrh of commerce, it is now certain that this substance is yielded by *Balsamadendron Myrrha*, which Ehrenberg found on the frontiers of Nubia and Arabia, bearing a substance identical with the myrrh of the shops. It is therefore no longer to be doubted that the suggestion of Bruce, that it is the produce of a kind of Mimosa—a most improbable circumstance, by the way—originated in some incorrect observation.—*Eng. Cyclo. page* 377.

(549) BALSAMODENDRON MYRRHA, is a small scrubby tree found in Arabia Felix, near Gison, scattered among species of *Acacia, Euphorbia*, and *Moringa*. Both its wood and bark have a strong and remarkable odour. The branches are stiff, short, and spiny; the leaves composed of three obovate unequal leaflets, with distinct crenatures, and the fruit a narrow, oval, furrowed, plum, surrounded at the base by the persistent calyx.—*Engl. Cyc. page* 377. *Myrrh*, a natural gum-resin, the source of which was long doubtful, was observed by Ehrenberg to exude from the bark of the abovementioned species of balm, much in the same way as gum tragacanth exudes from the *Astragalus verus*. It is at first soft, oily, and of a yellowish-white colour, then acquires the consistence of butter, and by exposure to the air becomes harder, and changes to a reddish hue. As met with in commerce it is of two kinds, that which is called Myrrh in Tears, and that called Myrrh in sorts.—*Eng. Cyc. p.* 377. Dr. Von Martius mentions a white Myrrh, which has a very bitter taste like colocynth, and an external appearance like ammoniacum; it is probably ammoniacum treated with tincture of colocynth. Another false myrrh may be distinguished by its transparency and less bitter taste. —*Eng. Cyc. p.* 377.

(550) BALSAMONDENDRON OPOBALSAMUM, the Balessan of Bruce, has a trunk from six to eight feet high, furnished with a number of slender branches ending in a sharp spine. The leaves consist of from five to seven sessile, obovate, entire, and shining leaflets, within which are placed the small flowers, which grow in pairs on short slender stalks, and are succeeded by small oval plums; this is to be distinguished from the B. Gileadense.—*Eng. Cyc. page* 376.

(551) BALSAMODENDROM ZEYLANICUM, is mentioned as a fifth species, producing oriental Elemi, which is very different from the American kind; but of this too little is known to enable us to do more than advert to its existence. —*Eng. Cyc. p.* 377.

(552) BALSAM OF PERU.

Baume-de-Peru, Fr. | Balsamum peruviauum, Lat.
Peru vianischer balsam, Ger. | Balsamo de Quinquina. Sp.

A resinous fluid of the consistence of syrup, of a brown colour, fragrant aromatic smell, and a pungent bitterish taste. It occurs in two states, *black* and *white*, and is procured from a tree (*Myroxylon Peruiferum*), which grows in the warmest parts of South America.—*Faulkner.*

(553) BALUNGOO.—Seeds of Dracocephalum Royleanum: mucilaginous and slightly aromatic, black, ⅛ of an inch long, pointed.—*Royle.*

(554) BALUTA; Balote, Balute or Bara Balute, so named either from being twelve in number or from the amount set apart for them being divided into twelve parts: the village servants in India who with the inferior servants Alute and Nárákárú vary in number in different parts of India, from 6 to 27, and have different names. In most cases the offices are paid by recognised fees and perquisites, by allotments of corn at harvest time, or by portions of land held rent free or at a low quit rent. In most cases the offices are hereditary, and are ca-

pable of being mortgaged or sold. They are a municipality and could be employed to the benefit of the country.—*Wilson.*

(555) BAMBOO.

Bambou, Fr.	Preng, Jav.
India-nischer rohr, Ger.	Buluh, Mal.
Bans. Bumboo, Hind.	Moorngal, Tam.
Bambu, It.	Edur Bangoo, Tel.

Bambusa, the *Bamboo,* is a genus of grasses, of which it is the most gigantic: is well known for its great economical importance, but consisting of species which are very imperfectly understood by botanists. The purposes to which different species of Bamboo are applied are so numerous that it would be difficult to point out an object in which strength and elasticity are requisite, and for which lightness is no objection, to which the stems are not adapted in the countries where they grow. The young shoots of some species are cut when tender, and eaten like asparagus. The full grown stems, while green, form elegant cases, exhaling a perpetual moisture, and capable of transporting fresh flowers for hundreds of miles: when ripe and hard they are converted into bows, arrows, and quivers, lance-shafts, the masts of vessels, bed-posts, walking-sticks, the poles of palanquins, the floors and supporters of rustic bridges, and a variety of similar purposes. In a growing state the spiny kinds are formed into stockades, which are impenetrable to any but regular infantry, aided by artillery. By notching their sides the Malays make wonderfully light scaling-ladders, which can be conveyed with facility where heavier machines could not be transported. Bruised and crushed in water, the leaves and stems form Chinese paper, the finer qualities of which are only improved by a mixture of raw cotton and by more careful pounding. The leaves of a small species are the material used by the Chinese for the lining of their tea-chests. Cut into lengths and the partitions knocked out, they form durable water-pipes, or by a little contrivance are made into excellent cases for holding rolls of paper. Slit into strips they afford a most durable material for weaving into mats, baskets, window-blinds, and even the sails of boats. Finally, the larger and thicker truncheons are exquisitely carved by the Chinese into beautiful ornaments. It is however more especially for building purposes that the bamboo is important. According to Marsden, in Sumatra, the frame-work of the houses of the natives is chiefly composed of this material. In the floorings, whole stems, four or five inches in diameter, are laid close to each other, and across these stems laths of split bamboo about an inch wide are fastened down with filaments of the rattan-cane. The sides of the houses are closed in with the bamboo opened, and rendered flat by splitting or notching the circular joints on the outside, chipping away the corresponding divisions within, and laying it in the sun to dry, pressed down with weights. Whole bamboos often form the upright timbers, and the house is generally roofed in with a thatch of narrow split bamboos, six feet long, placed in regular layers, each reaching within two feet of the extremity of that beneath it by which a treble covering is formed. Another and most ingenious roof is also formed by cutting large straight bamboos of sufficient length to reach from the ridge to the eaves, then splitting them exactly in two, knocking out the partitions, and arranging them in close order with the hollow or inner sides uppermost; over which a second layer, with the outer or convex sides up, is placed upon the other in such a manner that each of the convex pieces falls into the two contiguous concave pieces, covering their edges; the latter serving as gutters to carry off the rain that falls upon the upper or convex layer.—*Engl. Cyc. p.* 578. Mr. Morrison has also prettily described the use of Bamboo and the *bamboo ware.* He says the uses of this plant are so numerous, that it is almost as easy to enumerate them by saying what the plant is not used for as by describing them. The shoots are boiled, pickled and comfited; the roots are carved into fantastic images, or cut into lantern handles and canes, the tapering culms are used for all purposes that poles can be applied to in carrying, supporting, propelling and measuring; for the props of houses and the ribs of sails; the shafts of spears, the wattles of abattis, and the handles and ribs of umbrellas and fans; the leaves are sewed into rain-cloaks, and thatches; the epidermis, cut into splinths of various sizes, is woven into baskets of every form and fancy, plaited into awnings, and twisted into cables. It furnishes the bed for sleeping, the chopsticks for eating, the pipe for smoking, and the broom for sweeping; the matress to lie upon, the chair to sit upon, the table to eat on: the food to eat and the fuel to cook it with, are also derived from it:—the ferule to govern with, and the book to study from: the tapering plectrum for the lyre, and the dreaded instrument of the judge; the skewer to pin the hair, and the hat to screen the head; the paper to write on, the pencil to write with, and the cup to put the pencil in; the rule to measure lengths, the cup to gage quantities, and the bucket to draw water; the bird-cage, the crab-net, the fishpole, and the sumpitan, &c. &c., are one and all furnished by this plant, whose beauty when growing is commensurate to its usefulness when cut down. Bamboo ware as chairs, screens, couches, &c., is largely exported from China, but no account of the amount or direction has ever been kept.—*Morrison, p.* 171. Of bamboos on the Khassia Hills there are fifteen, and of other grasses 150, which is an immense proportion, considering that the Indian flora (including those of Ceylon, Kashmir, and all the Himalaya), hardly contains 400.—*Hooker Vol.* II. *p.* 281.

Uspar, Uspet, Uspit, Usken, Uskong, Uktang, Usto, Silee, Namlang, Tirra, and Battooba, are some of the names given to Bamboos on the Khassia Hills. Writing regarding the Bamboos of the Tenasserim Provinces, the *Bambusa spinosa*, (*thorny bamboo*), *Bambusa gigantea*, (*gigantic bamboo*,) *Bambusa nana* (*Penang, or China bamboo*), Mr. Mason remarks, that bamboo is there used for all purposes to which timber is usually applied. Most of the native houses in the Provinces are built principally of Bamboos tied together with ratans. Cots, seats, and tables are often formed of the same material. The Karens have names for seventeen species or varieties, one of the strongest of which is covered with large thorns, and makes an impenetrable fence; but the China bamboo, which has been introduced from Penang, makes the closest and prettiest hedge, and when cut annually, looks like an English quick-set hedge. The gigantic bamboo, the largest bamboo in the world, is indigenous, but in the southern provinces is seen only in cultivation. He mentions that a FUNGUS, like a mushroom, grows at the root of the bamboo in these Provinces, hence called the bamboo-fungus, which is regarded by the natives as quite a specific for worms. It has also been introduced into European practice, and is regarded by some physicians as superior to any anthelmintic in the Materia Medica. Mr. Mason also adds, that the young shoots of some species of bamboo are sold in the market for a vegetable. They are also used by Europeans for a pickle and a preserve, and in times of scarcity the seeds of the bamboo have often been used by the Karens as a substitute for rice.—*Mason*. The following comprise the principal of the Bamboos of Southern and Eastern Asia.

I. *Asiatic Bamboos, with the Flowers either in Spikes or Panicles.*

(556) BAMBUSA ARUNDINACEA. Roxb. (Bans, Hind. and Beng). Spiny. Its leaves are very narrow, covered with asperities on the margin and upper surface. It is common in rich, moist soil, among the mountains of India. The stems grow in clusters, from 10 to 100, from the same root-stock, and are straight for 18 or 20 feet. When in flower it is usually destitute of leaves, and as the extremity of every ramification is covered with blossom, the whole tree seems one entire immense panicle. Its seeds are used as rice. Tabasheer is found in its joints.

(557) BAMBUSA STRICTA, Roxb. Somewhat spiny. Flowers in extremely compact whorls. Said to be a smaller species than the last: it grows in a drier situation, has a much smaller cavity, and is very straight. Its great strength, solidity, and straightness, render it much fitter for many uses. From this the shafts of lances are made in India.

(558) BAMBUSA VULGARIS, Wendl. Not spiny; leaves very narrow, covered at the edge

and on the upper surface with asperities. Found in the East Indies, whence it is thought to have been carried to the West. Its stems are from 20 to 30 feet long, and as thick as a child's arm.

(559) BAMBUSA SPINOSA, Roxb. Strongly armed with both single and compound spines; leaves very narrow, and rarely more than six inches long. (*Behor Bans*, Bengal.) Common about Calcutta, and in the south of India, forming an impenetrable jungle; also often cultivated round Indian villages. It has a smaller hollow than most of the others, and is consequently stronger than many of them. Dr. Roxburgh describes it as rising in such dense tufts as to appear like a single trunk at some distance; and by help of their spiny branches so bound together that it is a most arduous task to cut down an old clump of them. The stems are from 30 to 50 feet long.

(560) BAMBUSA TULDA, Roxb. Not spiny; leaves broad, rounded or heart-shaped at the base. (*Tulda Bans*, Beng.; *Peka Bans*, Hind.) Common all over Bengal. Its growth is so rapid that the stems which are sometimes as much as 70 feet long and 12 inches in circumference, rise to their full height in about 30 days. Before their lateral shoots are formed, they are described as resembling fishing-rods of immense size. The young thick shoots, when about two feet high, are tender, and form an excellent pickle. It is chiefly used for scaffolding and for covering the houses of the natives; it is found to last much longer, if steeped in water some time before being used. Of this species Dr. Roxburgh mentions several varieties. *Jowa Bans* is a larger variety, with longer and thicker joints; *Basini Bans* has a larger cavity, and is chiefly used to make baskets. *Behoor Bans* is of a small size, very solid and strong, much bent to one side, and armed with numerous strong thorns. A staff of it is placed in the hand of every young Brahmin when invested with the sacerdotal robe. It is probably a distinct species.

(561) BAMBUSA BALCOOA, Roxb. Not spiny; leaves narrow, heart shaped at the base. (*Balcoo Bans* in Bengal.) A native of Bengal, and even more gigantic than the last. It is reckoned by the workers in bamboo the very best for building purposes. Previously to being used, it is immersed in water for a considerable time. Two varieties are distinguished *Dhooli Balcoo*, the larger, and *Balcoo Bans*, which is smaller and stronger, with a less cavity.

(562) BAMBUSA BLUMEANA, Schultes. Armed with triple recurved spines: leaves very narrow, quite smooth, suddenly tapering into a short stalk. A native of Java. Stems about as thick as a child's arm.

(563) BAMBUSA AGRESTIS, Poir. Stems crooked, at the lower part very spiny; leaves narrow, small, smooth. On mountains, and in dry

and desert places in all China and Cochin China; it is common also in various islands in the Malay Archipelago, its crooked, sometimes creeping, stems and rugged aspect distinguish it. The trunk is a foot thick, and the joints (we presume near the base) a foot and a half long, and often nearly solid.

(564) BAMBUSA THOUARSII, Kunth. Stems very much branched. Found wild in Madagascar, where however it is not believed to be indigenous.

(565) BAMBUSA MITIS, Poir Stems perfectly unarmed; leaves very narrow, and clasping the stems at their base. Cultivated in the fields and hedges of Cochin China, and found wild in Amboyna, where several supposed varieties exist. Its stems grow 30 feet long, and are said by Rumphius to be the strongest of all the species, although its sides are thin. It is sometimes as thick as a man's leg.

(566) BAMBUSA MAXIMA, Poir. Stems very straight, branching only near the summit, and densely covered with spines. The most gigantic of all the species, from 80 to 100 feet high, and sometimes as thick as a man's body. Its wood is however very thin. It is found wild in Cambodia, Bally, Java, and various islands of the Malay Archipelago.

(567) BAMBUSA ASPERA, Schultes. Stems covered all over with a sort of white mealy down. Found at the foot of mountains in Amboyna, with stems from 60 to 70 feet high, and as thick as a man's thigh. It does not branch, but emits little hard spine-like roots at its nodes.

(568) BAMBUSA APUS, Schultes. Leaves very large, taper-pointed, and gradually narrowing to the base, extremely scabrous at the edge. Another gigantic species, with the dimensions of the last, growing on Mount Salak, in Java.

(569) BAMBUSA BITUNG, Schultes. Leaves very large, taper-pointed, narrowed at the base into a sort of bristly, very short stalk, very scabrous at the edge and on the upper surface. Found in Java with the last, and remarkable for its extremely broad and scabrous leaves. Its dimensions are not stated.

(570) BAMBUSA NIGRA, Loddiges. Not spiny. Stems slender, swelled at the nodes, dark-brown, and polished, not more than a man's height. Leaves narrow, very smooth, rounded and narrowed at the base into a short stalk; ligule with long stiff fringes. A native of the neighbourhood of Canton where its beautiful slender stems are cut for the handles of parasols, walking-sticks, &c. It is by far the most patient of cold, having been living for several years without protection in a morass in the garden of the London Horticultural Society, and is no doubt capable of being acclimated in the south-west of England or on the west coast of Ireland.

(571) BAMBUSA ARISTATA, Loddiges. Stems slender, smooth, not spiny. Leaves very smooth, narrowed gradually at the base into a short stalk with downy fringed sheaths. Ligules divided into very long coarse fringes. Nodes mealy when young. Native of the East Indies. A very elegant species, related to the last.

(572) BAMBUSA NANA, Roxb. A native of China. It makes most beautiful close hedges.

(573) BAMBUSA PUBESCENS, Loddiges. Not spiny. Young shoots, leaf-sheaths, and leaves on the under side, covered with short down. A very remarkable species, obtained by the English from the collections of France. Its native country is unknown. The stems are 30 feet long, and an inch and a half in diameter.

(574) BAMBUSA STRIATA. Not spiny. Stems slender, polished, yellow with green stripes. Leaves narrow, rather glaucous on the under side tapering into a short stalk at the base, quite smooth, except a few short black hairs on the sheaths. A native of China. Often cultivated in the hot-houses of England on account of its beautiful variegated stems. Grows about 20 feet high.

(575) BAMBUSA GLAUCA, Loddiges. Not spiny. Stems very slender, green. Leaves very small, not downy, taper pointed, almost heart-shaped at the base, covered on the under surface, with very close bright glaucous bloom. Leaves scarcely above an inch long, and not more than two lines broad. A native of India. A very remarkable species, not growing above 2 feet high, with entangled branches.

II. *Asiatic Bamboos, with the Flowers not Panicled, but in simple Terminal Whorled Spikes.*

(576) BAMBUSA VERTICILLATA, Willd. Leaf-sheaths covered with stinging hairs. Stems whitish. Fifteen or sixteen feet high, and, when full-grown, of a pale colour, which becomes nearly white in drying. The hairs of the leaves occasion so much itching, that this kind is troublesome to collect. It is the *Leleba alba* of Rumphius, who says the edges of its leaves are so sharp as to wound the gatherers. It is found in Amboyna.

(577) BAMBUSA ATRA. Leaf-stalks covered with stinging hairs. Stems black and shining; very like the last, and found also in Amboyna. It chiefly differs in the colour of the stems. It is the *Leleba nigra* of Rumphius.

(578) BAMBUSA PRAVA. Leaves very large, stiff, and broad, extremely hispid, with stinging hairs. The most common in Amboyna, forming large woods, which come down to the coast. It flourishes equally in dry and moist situations, and is readily known from the others of this section by its very large leaves, which are as much as 18 inches long and 3 or 4 inches broad.

(579) BAMBUSA PICTA. Joints very long, variegated with white and green. Leaves narrow and not very hairy. Common in Cerama, Kelanga, Celebes, and some other Malayan islands. Its joints are as much as 4 feet long and about

2 inches thick : the wood is thin, and it is consequently used principally for light walking-sticks ; it is however extremely strong.

(580) BAMBUSA AMAHUSSANA. Joints short. Leaves with stinging hairs on the upper part of the stem, but smooth near the ground. Less straight, and more short jointed than any of the preceding species of this section. Its wood is very thick. Grows in Amboyna and Manipa.

(581) BAMBUSA MULTIPLEX, Lour. Stems long-jointed, not spiny. Leaves stingless, narrow, and clasping the stems at their base. Cultivated in the north of Cochin China for hedges Its leaves are very narrow, and of a brownish-green. The stems are about 12 feet long and an inch thick.

(582) BAMBUSA TABACARIA, Poir. Stems slender, very straight, of nearly equal thickness, branched ; with very long rough joints. Wild in the black and argillaceous soil of Amboyna, Manipa and Java, in the plains and moister parts of the mountains. Its stems are nearly solid, and excessively tough and hard. The joints are 3 or 4 feet long, and not thicker than the little finger. When polished they make the finest pipe-sticks. The outside is so hard, that it emits sparks of fire when struck by the hatchet. The species runs very much at the root.—*Eng. Cyc. pages* 378 to 380.

(583) BAMBOO PAPER. When travelling in the Himalayas, Dr. Hooker observed a manufactory for making paper out of the bamboo. Large water-tanks were constructed in the fields for the purpose of steeping the bamboo stems. They appeared to be steeped for a length of time in some solution of lime. They were then taken out and beaten upon stones until they became quite soft, or till all the flinty matter which abounds in their stems was removed.—*Hooker Him. Journ. page* 311.

(584) B'DELLIUM.

Aflatoon, ARAB.	Mukl, PERS.
Gugula, CYNG.	Kookul, TAM.
B'dellium, FR.	Gugula, TEL.
Googul, GUZ. HIND.	

Bdellium, commonly called a gum, is in reality a gum-resin, but its origin has been a subject of doubt. It would appear that there are several kinds of Bdellium, the source of two of which seems now to be ascertained, the others continue matters of controversy. The Bdellium of the ancients, said by Pliny (xii. 9) to be brought from Bactria and other parts of Asia, still comes from Asia. The Bdellium of Africa is yielded by the *Balsamodendron Africanum*. Dr. Royle says that Indian Bdellium is produced by a species of *Balsamodendron*, called by Dr. Roxburgh *Amyris Commiphora* ('Fl. Ind.' ii., p. 244), *Amyris Agallocha* ('Calcutta Catalogue,' p. 28), the native name of which is Googul. (Royle, 'Illustrations of the Flora of the Himalaya,' part vi., p. 176.) The opinion of its being obtained from a palm, either the *Lontarus domestica* (Gærtn.) or the *Borassus flabelliformis*, is very improbable. This substance occurs in masses of variable size and shape, sometimes as large as a walnut, in oblong or angular pieces of a yellow, red, or brownish colour. The clearest pieces are transparent ; the odour is weak and peculiar, the taste bitter, balsamic, and resembling myrrh or Venice turpentine. It is tolerably brittle at the ordinary temperature of the atmosphere, but with a slight increase of heat, the finer kinds may be kneaded between the fingers. Its specific gravity is 1·371. Resembling myrrh in appearance, it also resembles it in its effects upon the human system, and is often fraudulently substituted for it ; it is however weaker, while it is more dissgreeable and acrid. [Balsamodendron] It was formerly used in many compounds and plasters, such as Diachylon. It is now disused in Britain ; but is to be found intermixed with gum-Arabic. The Sicilian Bdellium is produced by the *Daucus Hispanicus* (Decand.), the *D. gummifer* of Lamarck, or perhaps the *D. gingidium* (Linn.), according to Boccone ('Museo di Piante Rare della Sicilia,' &c., tom xx.), which grows on the islands and shores of the Mediterranean. The Egyptian Bdellium is conjectured to be produced by the *Borassus flabelliformis* (Linn.), the *Chamærops humilis*, or the *Hyphœne cuciphra* (Pers.) The Bdellium mentioned in the second chapter of Genesis is obviously a mineral, and has no reference to the substances above mentioned.—*Eng. Cyc. p.* 400. Bdellium, in the Bombay tariff valuation, is rated at Rs. 4 per cwt. The Bdellium met with in Bombay, is imported from Cutch and the Persian Gulf. It is re-exported to China and to England under the name of Myrrh. At the Madras Exhibition of 1855, of the *Bdellium* from the Amyris Commiphora, two varieties were exhibited—the solid gum, and the balsamic fluid, as obtained from the tree, and living specimens of the balsamic tree were sent to the Horticultural Gardens of Madras by Surgeon Lovell.—*M. E. Jur. Rep.* The Commiphora Madagascarensis, (Lindley) is the Amyris Commiphora, (Roxb.) the Balsamodrendron Commiphora, (Wight and Arnott). It is a native of Sylhet, Assam and Madagascar, and blossoms in the Calcutta Botanic garden about February and March, but seldom ripens its seed. Dr. Ainslie, (Vol. 1. p. 29) gives an excellent summary of all the information extant when his work was written.

(585) BANANA.

Mouz, HIND. | Waray-pullum, TAM. | Andi-pundoo, TEL.

The plantain and Banana tribe of plants, MUSACEÆ, are found in the hot tropical parts of the world, and are all conspicuous for their size, among herbaceous plants. They form a spurious stem of considerable thickness, by their leaves, which, as they rise from the root-stock, sheath at their bases, and encircle each other enveloping layer within layer the slender

flower and fruit stalk. Every part of the plant abounds in fibres, as well the sheathing as the exposed parts of the leaves, and their fruits furnish a portion more or less large of the daily food of the people. One species of this very useful tribe of plants is the Musa textilis, of the Philippine Islands, which furnishes the important article of commerce known as Manilla Hemp. The edible varieties extend through the Indian Archipelago, northwards as far as Japan, while in China are found M. coccinea and M. Cavendishii. Again M. glauca is indigenous along the Malayan peninsula. Dr. Helfer mentions that 20 varieties are found in the Tenasserim Provinces, and M. ornata grows in Chittagong. In the valleys of the south of the Peninsula of India and of the Dindigul mountains, M. superba is found. The common edible varieties of M. paradisiaca, or musa sapientum, flourish even in the poorest soils and also near brackish water. The natives of Bengal generally prefer the larger and coarser fruited kinds, called plantain, to the smaller and more delicately tasted fruit, known as the banana, which is alone esteemed by Europeans. Major Munro has seen the wild plantain at 7000 feet above the sea, in the Khondah slopes of the Neilgherries. That cultivated in Nepal has been called M. nepalensis, and a similar species may be seen growing below the Mussoorie range, as well as near Nabu. The fruit however in all these situations consists of little else than the hard dry seeds. A similar variety of M. sapientum, having seeds surrounded with a gummy substance, instead of a pulp-like fruit, was found by Dr. Finlayson, on Palo Ubi, near the southern extremity of Cambodia. In Batavia, also, there is stated to be a variety full of seeds, which is called Pisang batu or Pisang bidju—that is, seed plantain. See *Manilla Hemp*: *Plantain fibre.*—In Khasia the name of the wild Plantain is Kairem, and the cultivated Kakesh.—*Hooker Him. Jour. Vol.* II, *page* 268. The Malays reckon forty varieties of the cultivated banana, and the Philippine islanders carry them to fifty-seven, both people having a distinctive epithet for each variety. The qualities are as various as those of apples and pears in Europe, the ordinary sorts being very indifferent fruit.—*Crawfurd Dic. page* 31. In the West Indies the Banana and Erythrina are mingled with the Cacao trees to guard the Cacao from the rays of the sun without depriving them of heat.—*Simmonds, page* 15.

(586) BANDALA. The name given in the Philippine Islands to the fibre extracted from the harder and stronger outer layers of the Manilla Hemp plant, *Musa textilis.* It is employed in the fabrication of cordage.—*Royle.*

(587) BANDANA. A term applied to a particular style of calico printing; also to a kind of silk or cotton handkerchief with bright figures, &c. upon a red or dark ground.—*Faulkner.*

(588) BANDICOOT. In Australia (*Perameles*, Geoff. St. Hilaire), a genus of marsup mammals, which appears to occupy, in Austr lia, the situation which the shrews, tenrecs, a other Insectivora fill in the old world.—*Cyc. page* 381. In India, it is the name given the *Mus giganteus*: which see.

(589) BANE. Flea-bane, Insect-bane, Mu quito-bane, Bug-bane, Rat-bane &c. There a few residents in India who have not suffer from the attacks of insects, and from their d predations; and it may be useful to be awa that many substances are known to po sess properties, the influences of which a avoided by noxious creatures and annoyi vermin. It is supposed that some species of *Ar* will drive out the termites or white ants, b this point is not yet fully ascertained. T whole family of "Apocynaceæ," termed "do banes," are truly so. One of them, the Nerin piscidium, common in the Khossia or Sylh mountains, and the bark of which contains mu useful fibre, proves deadly to fishes.—*Dogs* refu to sleep on rugs beneath which mint has be placed, and this simple plant thus affords a goo means of ensuring cleanliness. *Deer* refuse to a proach crops, in which the safflower, Cartham tinctorius, has been intermixed. White mustar sown round vegetables, as the cabbage, preven the inroads of *caterpillars.* *Snakes* are said avoid the fennel plant as well as all places whe the fennel seed (Nigella sativa) is strewed, (Sy Siah Daneh, *Pers*: Magrela, *Bengal*; Kala jir *Hind*:) The rasped wood of the oleander employed as ratsbane. To destroy flies in E ropean countries, a decoction of quassia, place in a plate, is frequently had recourse to. I Southern India, plants of the "Ghi-gowar" " Kulbunda," the Aloe perfoliata, are suspende with their roots upwards, with a longitudin incision in each leaf, to permit the aroma of th juice to become apparent, and disperse mu quitos from the room. Flies, fleas and musqu toes, avoid rooms in which branches of penny royal have been suspended. Fortune mentio that the Chinese expel musquitoes from the rooms and boats, by the smoke of pastilles. In In dia they are smoked out by burning chips of woo A species of ant, *Formica smaragdina*, well know in Malabar and the wooded parts of India, is em ployed in the North-West Provinces to destroy th nests of wasps that have established themselv in a house. In this case they are said to destro all the wasps, but become so infuriated that the own indiscriminate attacks are nearly as bad a those of their foes. Honigberger states that twig of the walnut tree, Juglans regia, is kept i a room, as a means of dispelling flies. The sam author mentions that bitter almonds are poisor ous to wild beasts; and when writing on th *Conyza anthelmintica*, (Vernonica anthelmintic *Serratula anthelmintica*) he adds that when flea

bane is roasted, flies take to flight, and when sprinkled on the floor, fleas disappear.—*Honigberger, p.* 261. &c. Dr. Hooker mentions that Clerodendron leaves, bruised, are used to kill vermin, flyblows &c. in cattle.—*Hooker Him. Jour. Vol.* I, *p.* 387. The Inula Pulicaria, or *Flea-bane*, a common road side plant in Britain, strewed or burned in any place, destroys *gnats* and *fleas*: and the same properties are attributed to the common Ox-eye daisy of England, *Chrysanthemum leucanthemum*. A powder, the *Poudre mismaque*, is sold in Paris, in boxes at from two to twenty francs, warranted effectual for destroying immediately, bugs, fleas, ants, lice, black beetles, caterpillars and all insects. "Camomille rouge" the beautiful red Pyrethrum (P. carneum, formerly chrysanthemum coccineum), in England a pretty garden, ornamental flower, is a dread enemy to the Caucasian, Persian, Koordish and Russian fleas. It is prepared from the flower heads of the plant which, when dried and crushed, form the famous Persian flea powder. When used by being sprinkled in beds &c. it kills all disagreeable and hurtful insects, and a small quantity of the spirit distilled from it, destroys insects in green houses, or can be applied to vegetable life in the open air against green fly, house fly &c. without injuring the plants. A half tea-spoonful of the powder sprinkled between the sheets will effectually dispel all fleas, bugs and lice, gnats and musquitos, and it is said also to destroy maggots which breed in wounds, a property which the valuable *Decamulle* gum of India, the gum of the Gardenia lucida, also possesses. More than twenty villages in the district of Alexandropol are occupied in the cultivation of the red chamomile, and thirty-five tons of this flea powder are manufactured annually for Russian use, in Trans-Caucasia alone, being equal to about 40,000 kilos of powder from 80 millions of pounds weight of fresh flowers. The red Pyrethrum is now largely cultivated in various circles and governments of Southern Russia. The flower heads lose vastly in weight by drying, and to get one pound of dried flowers, 1000 lbs of the fresh are required. It begins to flower in June and lasts more than a month. The flowers are plucked in dry weather, and a good collector will pluck 30 to 80 lbs. daily. They should be dried in the shade and care taken to stir them frequently. The Pyrethrum powder, seems the same as the well known Pire-oti of Koordistan, is largely imported into Turkey and was lately greatly used in the barracks and hospitals of Turkey and the Crimea, by the English and French officers: it accomplishes very effectually the destruction of fleas &c. Mr. H. H. Calvert, at first, considered the plant might be a Pulicaria, a Matricaria or Anthemis; but, that the Pire-oti is the powder of the half ripe flower heads of Pyrethrum carneum, there now seems no doubt. The Pyrethrum carneum, does not grow in India, but its introduction merits favorable consideration. The property it possesses, of dispersing the vermin which infest beds and bed rooms, probably depends on the pungent oil it contains; but until its introduction into India, attention might be directed to other species of pyrethrum and to the allied genus of chrysanthemum, or christmas flower, as likely to contain an oil with properties similar to the flea-bane. The red Mr. Mason mentions two species of pyrethrum, P. indicum, and P. sinense, as growing in the Tenasserim Provinces. The odour of the common fever few, of Britain, P. parthenium, is peculiarly disagreeable to bees, and these insects may be easily kept at a distance by a person carrying a handful of the flower heads: perhaps, also, the "*akarakarum*" of India, the Pyrethrum officinale or common pellitory, may have equal power. Allusion has been made to the well known Chrysanthemum, or Christmas flower, as likely to possess an oil of similar character, and perhaps possessing similar properties to that of pyrethrum. One species, the C. Indicum, the common Gool Dawadee, and of which there are several varieties, grows all over India, and is at any rate worth a trial, as indeed is every other unexpensive suggestion, which holds out a promise of increasing the comforts of the sleeping room. It is the habit of the Natives of India, to suspend in their houses a few branches of the milk hedge (Euphorbia tirucalli), to destroy fleas. They likewise make pastilles containing sulphate of copper, "Neela toota," *Hind.* which when burned destroy bugs, musquitoes and fleas, using three or four in a day. The sherifah or custard apple seed, disperses vermin. Flies are reported never to settle on the tree or its fruit, though ants will attack both. Bugs have a great antipathy to the leaves of the custard apple, and instantly quit a bed in which they are placed, and Dr. Irvine mentions that *Balai*, the roots of Ocymum pilosum have the same effect. The leaves of the American species of the sweet flag are said to be noxious to insects and to be never eaten by cattle. Sweet-flag, ENG.; Vaesamboo, TAM.; Vudya, TEL.; Vyamboo or Vashampoo, MAL.; Shwet-Buch, BENG.; Buch, DUK. The Gum Anime, is a protection against the attacks of insects; and colocynth is useful for protecting shawls and feathers against their inroads. Camphor-wood is valuable for the construction of chests and almirahs, as its powerful odour protects the contents from the ravages of white ants and other insects.—*O'Shaughnessy, page* 545. The leaves of the various Margosa trees, Melia and Azaderachta, dried and kept in books, are much used by the people of India to preserve them from the attacks of insects. To prevent injury to furs, feathers, books, papers and clothes that are lodged in trunks, book cases &c.; it is useful to place along with them small packets of camphor; or little cups of camphor dissolved in

alcohol; packets of the seeds of the small fennel flower, Nigella sativa, the "*kala jira*" of the bazars: pieces of the roots of the Aconitum ferox, the dreadful "*bish*;" "*Ati Singeea bish*," or bishnak of the bazars, may also be used, but its highly poisonous effects on animal life, require its use to be had recourse to with the greatest precautions. Insects are very destructive to books in India and the pastes or gums employed in the bindings, form special objects for the attacks of certain tribes: it may be useful to be known, therefore, that insects refuse to attack the gum of the cashewnut fruit, and that a little sulphate of copper or blue vitriol mixed with the rice or flour paste, used for joining papers, very effectually keeps these destructive pests at a distance. The leaves of the Justicia gandarussa, Lin.; Caar noochi, Tamul; Nalla Wawalee, Tel; Neela Nirghoondee, Sans., dried and powdered, are used as a preservative to keep insects from books. "Our boatmen, says Fortune, who heard us talking about the musquito, asked Sing-Hoo why he did not go and buy some musquito tobacco, which they said might be had in the village, and which would drive all the musqitoes out of the boat. I immediately despatched him to procure some of this invaluable substance. In a few minutes he returned with four long sticks in his hand, not unlike those commonly used for burning incense in the temples, only somewhat longer and coarser in appearance. He informed me they cost only two cash each—certainly cheap enough if they answered the purpose. Various substances are employed by the Chinese to drive away musquitoes. This which we had just purchased was made with the sawings of resinous woods—I believe procured from juniper-trees—and mixed with some combustible matter to make it burn. A piece of split bamboo, three or four feet in length, is then covered all over with this substance. When finished it is as thick as a rattan or a small cane. The upper end of the bamboo has a slit in it for hooking on to any nail in the wall, or to the roof of a boat. When once lighted, it goes on burning upwards until within six inches of the hook, beyond which there is no combustible matter, and it then dies out. A somewhat fragrant smell is given out during combustion, which, at a distance, is not disagreeable. Sometimes the sawdust is put up in coils of paper, and is then burned on the floors of the houses. Various species of wormwood are likewise employed for the same purpose. The stems and leaves of these plants are twisted and dried, and probably dipped in some preparation to make them burn. The musquito has a mortal aversion to all these substances and wherever they are burning, there the little tormentors will not come. I procured the sticks in question, and burnt them daily, after this; and although the insects were often swarming when I entered the boat or an inn, the moment *their* "tobacco" was lighted they quickly disappeared, and left me to sit at my ease, or to enjoy a refreshing sleep. Whoever discovered this precious tobacco was a benefactor to his country, and should have been honored with the blue button and peacock's feather at the least. But I suppose, like all other Chinese discoveries, it is so old that the name of its original discoverer cannot now be traced.—*Fortune's Tea Districts, page* 180.

(590) BANGLES.

Bangreean, Hind | Wallacel, Tam. | Gazloo, Tel.

This is the name given to the wrist and ankle rings so generally worn by orientals. The Chinese make them of a clouded or plain vitreous substance to imitate jade stone or chalcedony. They are packed in boxes containing a thousand pairs, each box estimated to weigh a pecul.—*Morrison, page* 171. Bangles are imported into and also exported from Madras. In the last four years, the imports were to the value of Rs 1147, chiefly from Bombay. The exports were in number 19,53,000, of the value of Rs. 3,078 and to Bombay and Sinde. The following is the tariff valuation of Bangles, in Bombay:—

Country Glass Bangles	Rs.	150	per Cwt.
Broken do. do. do.		3½	do.
China gilt, glass do. do.		8	per 100 pairs.
Do. not do. do. do.		4	do.
Lac Bangles..... .. do.		5	per 1000.

(591) BANGRA. The name of a cloth fabricated from the gigantic stinging nettle of the Nipal and Sikkim Hills. The fibres of which are mentioned by Dr. Campbell and applied for this purpose. The preparation is the same as the "Pooah," but the Bangra is harder and stiffer than Pooah, and not adapted to making cordage and nets.—*Royle.*

(592) BANOPHSHA. The "Banophsha" of the Eastern bazars is the dried plant of the Viola odorata. The infusion is a good nauseant and diaphoretic.—*Beng. Phar. page* 305.

(593) BANYAN TREE, Bar-ka-jhar, *Hind.* See Ficus Indica. Some of these trees cover an immense space. In the Botanical Gardens at Calcutta, the great Banyan tree, which is still the pride and ornament of the garden, Dr. Falconer ascertained satisfactorily to be only seventy-five years old. Annual rings, size, &c. afford no evidence in such a case, but people were alive a few years ago who remembered well its site being occupied, in 1782, by a kujoor (Date-palm), out of whose crown the Banyan sprouted, and beneath which a Fakir sat. It is a remarkable fact that the banyan hardly ever vegetates on the ground; but its figs are eaten by birds, and the seeds deposited in the crowns of palms, where they grow, sending down roots that embrace and eventually kill the palm, which decays away. This tree is now eighty feet high, and throws an area, 300 feet in diameter, into a dark, cool shade. Had

this tree been growing in 1849 over the great palm-stove at Kew, only thirty feet of each end of that vast structure would have been uncovered: its increase was proceeding so rapidly, that by this time it could probably cover the whole. Larger banyans are common in India; but few are so symmetrical in shape and height. As the Banyan tree gets old, it breaks up into separate masses, the original trunk decaying, and the props becoming separate trunks of the different portions. —*Hooker Him. Jour. Vol.* II. *p.* 246.

(594) BAPCHI. Seed of a small bush found near Ajmeer; is very mucilaginous, cooling and demulcent: is taken in sherbet.—*Gen. Med. Top. of Ajmere, page* 128.

(595) BAQUAIS OR VACOA. The general name given in the Mauritius to a species of Pandanus, the screw pines. One of these appears to be the P. sativus of Du Petit Thouars, but, according to Mr. Henley, is P. Vacoa. It is described as growing to the height of 30 feet, when left unpruned. The leaves are cut every second year, beginning when the plant is three years old, and each plant yields enough for two large bags. The preparation of the fibre must begin with the leaves, immediately they are removed from the trees. This consists first, in splitting the leaves into fillets which are from three fourths to one inch broad at the base, but taper to a point, and are from three to four feet in length. One of them will support the weight of a bag of sugar, or about 140 lbs. without breaking. Mr. Henley states that the leaves of the other species with which he is acquainted, are comparatively weak. Dr. Roxburgh (Fl. Ind. c. iii. p. 741) has described the purpose to which the species most common in the Mauritius is applied, and having observed the valuable uses to which the plant was put to there, he recommended its introduction into India, in some of the dry southern parts of which, it would, no doubt, though slow of growth, be a valuable acquisition, from the facility with which good sacking may be manufactured from its leaves. This has never yet been effected. The plant is remarkable for the aerial leafless roots which it sends down to support its stem, and which are of so fibrous a nature as to be employed for making paint brushes for common purposes.—*Fib. Pl. Royle, p.* 36.

(596) BARASAMA. The leaves of various species are known in the Calcutta bazar as Buchu, and may be used in infusion and decoction for Uva Ursi. The infusion and decoction is a useful astringent bitter, having a special tendency to remedy purulent and mucous discharges from the kidneys and bladder; dose one to four ounces, repeated according to the effect.—*Beng. Phar. p.* 281—298. A tincture of Buchu, is an astringent diuretic, valuable in chronic diseases of the urinary organs in dose from one to two fluid drachms.—*Beng. Phar. page* 422.

(597) BARB, the name of a noble breed of horses reared by the Moors of Barbary and Morocco, and introduced into Spain during their dominion in that country, where however it has been suffered to degenerate greatly since their expulsion. The noble race of Barbary horses commonly called Barbs are of rare occurrence even in their own country, where the tyranny of the governors holds out no inducement to private individuals to rear an animal, of which they may be deprived without scruple or compensation, by the first man in power who happens to fancy it. It is only among the wild nomadic tribes of the desert, whose roving habits and inhospitable country place them beyond the control of the ordinary powers of the state, that this breed exists in perfection. The common horse of Barbary is a very inferior animal, which, if originally derived from the same source as the noble race of Barbs, has greatly degenerated. In the beauty and symmetry of their forms, however, even the latter are far from excelling: their valuable qualities, and in these they are perhaps unequalled by any other breed in existence, are, unrivalled speed, surprising bottom, abstinence, patience and endurance under fatigue, and gentleness of temper.—*Eng. Cyc. p.* 383.

(598) BARBIROUSSA, or Horned Hog of travellers. This wild hog inhabits the woods of Java, Celebes, and others of the larger Sunda Isles. Its upper tusks are of great length, and curved form, and grow upwards and backwards like the horns of the *Ruminantia*. It is probably the *Sus tetraceros* of Elian.—*Eng. Cyc. page* 359.

(599) BARILLA.

Kali, ARAB.	Barriglia, IT.
Soda, DUT.	Solda Barilha PORT.
Soude, FR.	Socianka, RUS.
Soda Barilla. GER.	Barilla, SP.
Sajeekhar, GUZ HIND.	Applicarum, TAM.

An impure carbonate of soda, obtained by lixivating the ashes of sea weeds. The best quality is of a blueish gray colour, and the commoner kinds of a colour approaching to black. It is used in the manufacture of soap, glass, and in bleaching, &c. Localities, Spain, Sicily, Canary Islands, and Persia. It is brought to Bombay from the Persian Gulf, and is known in the bazars by the name of *Sajeekhar.*—*Faulkner.* Barilla; Kelp; Salsola Soda and Natron are all Carbonates of Soda. Two species of Salicornia and one of Salsola, are extremely abundant on the Coromandel Coast, and Dr. Roxburgh was of opinion that they might be made to yield Barilla sufficient to make soap and glass for the whole world. At the Madras Exhibition of 1855, Captain Blagrave contributed a specimen of Barilla, or crude subcarbonate of Soda, prepared from the ashes of "Salicornia Indica," and the jury remarked that this is a source, from which large quantities of alkali might be procured, as these saline plants grow abundantly in the salt marshes and back

waters of this presidency. But it is doubtful, whether even taking into consideration the cheapness of labour, the manufacture could come into competition with the more economical processes for procuring this substance from dhobee's earth (native carbonate of soda), or from sea salt. The genus Mesembryanthemum is rich in alkaline carbonates, and usually frequents the Sea Shore. Dr. Helenus Scott received the Gold Medal of the Society of Arts, for sending from Bombay the mineral alkali.—*Prod. Res. Royle, p.* 75-76. Mineral Soda or Saji Matti of Bengal, the Applicarum of the Tamul people, occurs in immense quantities in many parts of Bengal, especially in the districts of Monghyr, Purnea, and Cawnpore. It contains from 40 to 50 per cent of carbonate of Soda, with organic matters, clay, sand, and oxide of Iron. The salts can be extracted by washing the mineral without incineration, but the organic matter is dissolved at the same time and gives a deep brown solution from which pure crystals cannot be obtained. The firing destroys this substance, and then the solution is colourless, but care must be taken not to push the heat beyond low redness, for the alkali, at a higher temperature combines with the sand and clay, and the whole runs into a green glass, insoluble in water. The earth of a large tract of unproductive land in the Puttoocottah and Trevandy Talooks of Tanjore is greatly impregnated with impure carbonate of Soda, and a small export trade goes on of Dhobie's earth. In the years 1826 to 1830, the late Mr. Hart and Dr. McLeod commenced working it on the large scale, and about 1000 tons of barilla containing 25 per cent of pure alkali, and equal to the best Spanish, was the estimated produce.—*Scientific Records of the Madras Government.* In Europe, this salt is prepared either by burning sea weeds and lixiviating the ashes, the product being termed kelp and barilla, or by decomposing common salt by sulphuric acid and then roasting the resulting sulphate with chalk, sawdust, and fragments of iron. The mass when washed gives the carbonate of Soda.—*O'Shaughnessy.* The celebrated Natron lake of Loonar, produces six principal varieties of Salt, to which the natives give the following names. 1. Dulla—2. Numuck Dulla—3. Kupphul—4. Pappree—5. Rhooskee, and 6. Mahd Khar. Dulla and Numuck Dulla are used for dying silks, fixing colors,—also as medicine, and in the manufacture of bangles;—of Khuppul, there are two kinds, one of greater value than the other;—this salt is used in fixing the red dyes of cloth. Puppree is used in the manufacture of bangles, of which there are two manufactories near the lake. When these are in full operation, bangles are manufactured in large quantities, each man being able to manufacture from 6 to 700 daily. The eyesight of these men fail soon, owing to the entire want of protection from the glare of the glass furnaces. Some are employed, also, in the baking of a cake called papur, and by the native hukeems as an antacid in dyspepsia. There is also an inferior description of Puppree. Bhooskee is a white saline salt, left as a deposit on the margins of the lake, and is principally used in the manufacture of soap. Madhkar, is an inferior kind of Bhooskee, used by Dhobies in bleaching clothes. The purest salt is found close to the saline springs, and the other salts, in their order, as entered above, are found on receding from that point towards the margin of the lake. —*Dr. Smith.*

(600) BARJURI. Bark of the root of a climber found in Rajwarra, is tasteless, one fourth of a tola is a dose, is given to women after childbirth, in "luddoo," said to augment the secretion of milk, to relieve the after pains, and to strengthen.—*Gen. Med. Top. p.* 127.

(601) BARK.

Putta, Tam. | Kusher, Arab.
Putta, Tel. | Chal, Guz. Hind.

The outer rind or covering of trees. Bark, in Vegetable Physiology, is the external coating of the stem and branches of plants, ensheathing the wood. In woody *Exogens* it separates spontaneously from the wood in spring and summer, and in herbaceous plants of the same class it may be easily removed with a little care; but in *Endogens* and *Acrogens* it is so continuous with the central part of the stem that it can never be divided except by violence, and by lacerating the tissue which lies immediately below it. This difference arises from the manner in which the plants of these three great natural classes respectively grow. Exogens add annually new matter to the inside of their bark and the outside of their wood, which renders it necessary that a spontaneous separation of wood and bark should take place in order to make room for the newly-generated substance; but Endogens, which grow by addition to their centre, and Acrogens, by elongation of their point, require no such separation.—*Eng. Cyc. page* 389. The outer rind of plants, just described, in some cases yields an astringent principle called tannin, highly useful in medicine and the arts. The most important kinds of bark in a commercial point of view, are, undoubtedly, Oak bark, Peruvian bark, and the barks of some of the Acacias. Oak bark is powerfully astringent, 3½ lbs of it being equal to 2¼ lbs of galls: to 3 lbs of sumach: to 7½ lbs of the Leicester willow: to 11 lbs of the bark of the Spanish chestnut: to 18 lbs of Elm bark: and to 21 lbs of common willow bark. The importance of Oak bark has however been greatly diminished since the introduction of the Sumachs as *Rhus cotinus*, the Venus sumach, and *R. coriaria*, the hide or *elm leaved sumach*: also of the *Divi-divi*, or *Cæsalpinia coriaria*: of *Valonia*, the acorn cups of *Quercus Ægilops*, of Catechu and Gambir, from the Acacia cate-

chu and Uncaria Gambir: of the Indian Myrobolans, the Mimosa or wattle bark of Australia, the cork tree bark of Spain and willow bark. Next in importance to Oak bark, is the Peruvian or Jesuit's bark, of which three principal kinds are known in commerce, the pale, red and yellow. The pale bark is the produce of *Cinchonia longifolia* and is the original Cinchonia of Peru. It is received in chests covered with skins, each containing 200 lbs., consisting of pieces 8 or 10 inches long, and singly or doubly quilled or rolled inwards. It is of a pale fawn or cinnamon colour, and has very little odour when dry, but the decoction is agreeably aromatic. The taste is a fine bitter, but austere. The second, or red bark, is obtained from *Cinchonia oblongifolia*, grows in the Andes, and is received in chests weighing from 100 to 150 lbs. each. This kind is mostly in flat pieces of various sizes, with occasionally some that are quilled, the internal bark being woody and of a rust red colour. Red bark has a weak peculiar odour, and a less bitter, but more nauceous taste than the other barks. The third, a yellow bark, is the produce of *Cinchonia cordifolia*, of Santa Fe and Quito, and is packed in chests containing 90 to 100 lbs. each, in pieces from 8 to 10 inches long, some quilled, but the greater part flat. The interior is yellow, approaching orange colour. It has nearly the same odour in decoction, as the pale, and has a more bitter and less austere taste. The Peruvian bark trees are said to have been naturalized in India; The Reverend Mr. Livingstone, in his travels, discovered great forests of them in South Africa. —*Tomlinson.*

(602) BARLERIA, a genus of plants belonging to the natural order *Acanthaceæ*, and characterised by the spiny processes of its bracts, the large size of the upper and lower sepals, and its funnel-shaped corolla, which is often so twisted that the upper segment becomes lowest. The species are natives of various parts of the East Indies. A few of them have been introduced into English gardens, of which *Barleria lupulina*, with its large bracts resembling hops, and *B. prionitis*, a common swamp-plant in Java, are the most remarkable. In Europe, however, they all require to be cultivated in a hot-house, and are propagated readily by cuttings.—*Eng. Cyc. page* 391. In addition to those noticed below, Wight, in his Icones, gives figures of *Barleria Courtallica; Cuspidata; Hochstetteri, longiflora and nitida.*

(603) BARLERIA BUXIFOLIA, Cara-schulli, Rheede. A native of Malabar and Mysore; it blossoms during the hot season.—*Roxb.*

(604) BARLERIA CÆRULEA,

Dasee, Beng.

This is a flowering shrub, cultivated for the sake of its numerous large and beautiful light blue flowers. It is a native of the moist, shady valleys amongst the mountains of the Northern Circars, and also of Bengal.—*Roxb.*

(605) BARLERIA, CILIATA Roxburgh. Grows in the northern parts of Bengal.

(606) BARLERIA CRISTATA, is a large very ramous shrub, found in gardens about Calcutta and wild in the forests of Sylhet.—*Roxb.*

(607) BARLERIA DICHOTOMA. Roxb.

Sada Jatee, Beng.

(608) BARLERIA PRIONITES.

Kooruntuka, Sans.	Mooloo govinda, Tel.
Kanta-jatee, Beng.	

This is one of the most common and at the same time most elegant of the small shrubby plants of India. It is in flower all the year round and every soil and situation seems to suit it equally well.—*Roxb.*

(609) BARLERIA PURPUREA. A shrubby spreading plant, with opposite, sub-rotund nearly sessile leaves; spines in axillary pairs longer than the leaves; flowers solitary, large, of a beautiful pink colour.

(610) BARLEY.

Shair, Dhourra, Arab.	Gerstengraupen, Ger	Orzo, It.
Ryg, Dut.	Jow, Guz. Hind.	Hordeum, Lat.
Orge, Fr.	Pers.	Fatschmea, Rus.
		Cebada, Sp.

This grain is cultivated in most parts of Europe, Asia, and Africa. Barley is sometimes brought to Bombay from the Persian Gulf, and also from Candahar, &c. via Kurrachee. It is grown on the Neilgherry hills, and is to be had in the Dekhan.—*Faulkner.* There are several distinct species of Barley, but the Hordeum distichon, or two-eared barley, is that commonly cultivated in England. As met with in commerce, the seeds or grains are usually enclosed in the Palæ or husks: denuded of these they form "Scotch or pot barley;" when rounded they constitute "pearl barley," and this again reduced to powder is called "patent barley."—*Hassall.* "This last grain," says Crawfurd, speaking of the Malay Peninsula barley, (*Hordeum hexastichon,*) "is not known to the natives, and when we pointed it out, they imagined it to be unripe grains of wheat." Notwithstanding this testimony, the Burmese have a name for barley which frequently occurs in their books. It constitutes one of their seven kinds of *saba* or cereal grasses, and its corresponding Pali name is identical with the Sanscrit name of barley.—*Mason.* Barley is one of the cheapest of the grains found in the Bazars of Kaira in Guzerat.—*Spry's Suggest. page* 41.

(611) BAROMETER, from two Greek words meaning measure of weight, is one of the most wonderful instruments ever contrived for assisting the philosopher in searching out the laws of the wonderful ocean of air in which we live. There are several kinds in use, the *common Barometer*, the lower priced articles of which, are generally so inaccurate as to be useless: the *Water Barometer*, 40 feet long invented by Professor Daniell,

which is extremely sensitive of the fluctuations in the height of the air; and the *Aneroid Barometer*, invented by M. Vidi of Paris, the action of which depends on the effect produced by the pressure of the atmosphere on a metallic box from which the air has been exhausted and then hermetically sealed.—*Toml.* The following table shews the mean altitude of the Barometer at some remarkable places and elevations in India.

Places.	Feet in height above the sea level.	Barometer mean.

O'Shaughnessy, page 18.

(612) BARRINGTONIA, WHITE FLOWERED. There is a species of Barringtonia in the Tavoy and Mergui jungles with drooping spikes of white flowers three or four feet long; and which would be much admired if introduced into the cities. The leaves are very large and lyre-shaped, and both flowers and foliage would contrast well with the other trees around it. The species is not described in any of the books to which Mr. Mason could refer.—*Mason.*

(613) BARRINGTONIA ACUTANGULA. *Myrtaneæ.*

Sumundur phal, also Hijjul, HIND. | Radami, TAM. Kyai-tha, BURM.

A large tree, flowers in pendulous racemes of a dark scarlet colour, fragrant; fruit oblong, four sided sharp angles. *Barringtonia acutangula* is most plentiful in the Tharawaddy district. The wood is hard and of fine grain, red, and equivalent to mahogany. It is used in constructing carts.—*McClelland.* It is also a native of Chittagong, and is found in a clump of trees at Saharunpore, near Mr. Grindall's house, (*Royle*, p. 216.)—*O'Shaughnessy, page* 337. In the Tenasserim Provinces, this tree, which Mr. Mason calls the scarlet flowered Barringtonia, bears long pendulous bunches of scarlet flowers, and is very abundant in the forests, to which it is a great ornament.—*Mason.*

(614) BARRINGTONIA RACEMOSA. This stout timber tree is a native of the Moluccas, the delta of the Ganges and Malabar. Its root is slightly bitter, and considered by the Hindus to be aperient, cooling, and febrifuge.

(615) BARRINGTONIA SPECIOSA.

Kyai-gyee, BURM.

This large and beautiful tree is a native of Pegu, the Tenasserim Provinces, the Malay Archipelago, and the South Sea Islands. It is very plentiful in Pegu. Its wood is red, hard, of a fine grain, and equivalent to mahogany. It is used in the construction of carts.—*Roxb. McClelland.* The fruit is mentioned by Ainslie as being used in Java for intoxicating fish.—*O'Shaughnessy, page* 337.

(616) BARTAM, Eugeissonia tristis, Griff. A palm growing on the hills about Ching, Malacca and Penang. The leaves are used in Penang in making mats for the sides of houses, also for thatch, and for all the purposes to which those of the Nipa fruticans are applied.

(617) BARTONIA AUREA. *Loasaceæ.*—A beautiful species, for garden culture, the flowers of a yellow and white colour, opening at night effusing a sweet odour; they should be planted close together, so that the ground may be covered with its leaves.—*Riddell.*

(618) BARTUNG. Seed of a bush, brought from Delhi considered cooling, and astringent, used in sherbets, in diarrhœa.—*Gen. Med. Top. page* 126.

(619) BARU, *Malay*; Kawal, *Javanese*: is a gossamer-like substance, found at the base of the petioles of the Gomuti palm, the Arenga saccharifera. It is imported into China where it is applied like oakum, for caulking, and also for tinder.

(620) BARUNG SADAB. Leaves of a plant from Delhi; heating and as such used in medicine to cure flatulency and dyspepsia; sells at two rupees for one seer.—*Gen. Med. Top. of Ajmere, page* 129.

(621) BARYTES OR BARYTA, the *Oxide of Barium.* This is found in the earth in combination with acids, principally the sulphuric and carbonic. Native *Sulphate of Barytes*, known by the name of *Heavy Spar*, also *Hepatite* and *Bologna Spar* is found near Kurnool and other parts of India. It presents itself in various forms as crystalline, fibrous, saccharoid, compact, and earthy. The crystals are usually tabular, in modified rhombic and rectangular prisms. Its degree of hardness is from 3 to 3·8, and the specific gravity from 4·3 to 4·7. Some varieties are fetid when rubbed. It is composed of sulphuric acid 34, and barytes 66. It decrepitates before the blowpipe, and fuses with difficulty. It is distinguished by its heavy specific gravity from *Celestine* and *Arragonite*, and from the various carbonates by not effervescing with acids. *Heavy Spar* is often associated with the ores of other metals. *Eng. Cyc. page* 392. This substance

is much used in the arts. It is ground up and used as white paint, and also for adulterating white lead. Mixed with equal parts of white lead, it is sometimes called *Venice White*; and another variety, with twice its weight of of barytes, is called *Hamburgh White* ; and another, with one-third white lead, is called *Dutch White*. The barytes in these mixtures seems to prevent the white lead from being tarnished by sulphuretted hydrogen,and they are therefore prepared for some kinds of painting. The variety called *Bologna Spar* is highly phosphorescent after calcination. *Allomorphite* is a synonym of *Heavy Spar*. Cawk is a massive variety. *Dreelite* is a sulphate of barytes and lime.—*Eng. Cyc. p.* 392. Sulphate of Barytes occurs in quantity in Kurnool.

(622) BASALT, a hard dark-coloured rock of igneous origin. The chemical composition is variable, as appears from different analyses, two of which, by Beudant and Phillips, are as follows :—

	24 Beudant. Beaulieu.	Phillips. Saxony.	Difference.
Silica, ...	59·5	44·50	15·00
Alumina, ...	11·5	16·75	5·25
Lime, ...	1·3	9·50	8·20
Magnesia,... ...	0·0	2·25	2·25
Soda, ...	5·9	2·60	8·30
Potash, ...	1·6	0·00	1·60
Oxide of Iron, ...	20·2	20·00	0·20
Oxide of Manganese,	0·0	0·12	0·12

Basalt is a rock of very extensive occurrence on the surface of the earth, and is very frequently detected in the vicinity of volcanoes, both extinct and active. The greatest mass of volcanic rocks yet observed is that noticed by Colonel Sykes in the Dekhan, constituting the surface of many thousand square miles of that part of India. This immense mass consists of greenstone and amygdaloid, and is either massive, prismatic, or globular, occurs in horizontal beds, and is traversed by dykes which sometimes cross each other. Except the hollow of the Loonar Lake there is no trace of any crater in this volcanic region ; and indeed this is the case with numerous other volcanic districts, whence it has been inferred that such tabular masses have not been ejected from a conical vent similar to those of volcanoes, but that the fluid of which they are formed rose through cracks and fissures while in a highly liquid state, spreading out in sheets of melted matter over the adjacent rocks. As Basalt is frequently columnar, it is a rock which has excited much popular attention, and travellers have been sometimes induced to describe rocks as basaltic merely because they were columnar, which however is a character that this rock possesses in common with many others of igneous origin. When Basalt occurs in horizontal tabular masses, and is columnar, the columns are generally perpendicular. When basalt forms the substance of a perpendicular dyke, cutting through other rocks, and is columnar, the columns are usually horizontal. Basaltic columns are sometimes also curved, and of this mode of occurrence there is a beautiful example in the island of Staffa.—*Eng. Cyc. page* 393.

(623) BASELLA ALBA. Malabar night-shade or White Basil, or Indian Tea. Eng.

Badroojee Abbeez, ARAB.
Suffeid Toolsie, DUK. GUZ. HIND.
Viswa-tulasi, SANS.
Cunja koray, TAM.
Kooka tolasie, TEL.
Butsalla-hura, TEL.
Alla-batsala, TEL.
Poi, also Bun-Poi, BENG.

The natives of the Coromandel Coast reckon five varieties of this, three of which are cultivated and two wild ; the Yerra or Poha-batsalla, the Mattoo batsalla, and the Pedda batsalla. But Roxburgh was inclined to regard them all as varieties of one species and to think B. Japanica of Burmann, another.—*Roxb.* This is a twining plant, with succulent stems and leaves, which the natives of India and Burmese cultivate for spinage ; and it is said to be not inferior to the common English spinage, which belongs to the same natural family.—*Mason.* The leaves of the white basil, have a pleasant aromatic taste, and an agreeable smell. An infusion of them is used as tea by both Europeans and natives in India. The juice of the leaves is prescribed by native practitioners in doses of a tea-spoonful thrice a day, to a child suffering from catarrh.—*Faulkner.*

(624) BASELLA RUBRA. POOTIKA, *Tam.* MALABAR NIGHTSHADE.—Perhaps a variety of B. alba A succulent plant of the same genus, only with red leaves, and is used as the former ; grows in any garden soil from seed, but requires sticks for it to climb upon.—*Jaffrey.*

(625) BASIL. Ocymum Basilicum and minimum. Herbs used in salads, and soups, raised from seed, require little care in the culture : almost weeds in Madras.—*Jaffrey.*

(626) BASILISK, a genus of Saurian reptiles, belonging to the Iguanian Family, and comprises only two species. One of these, the crested basilisk, the *Basaliscus Amboiensis* (Daudin), is an inhabitant of Amboyna and the Islands of the Indian Archipelago. It is upwards of 3 feet long, of a green colour, marked with white lines on the head and neck, brown on the back and tail, and silvery white on the belly, irregularly dotted with numerous white points. It keeps in the vicinity of rivers and fresh-water ponds, where it loves to bask on the branches of the trees which overhang the stream. On the first appearance of danger it drops into the water, and conceals itself beneath some rock or stone, whence it may be taken with the naked hand or a noose, for it is a timid animal. It is caught for the sake of its flesh, which is white and as tender as chicken, and in taste is said to resemble venison. The female deposits her eggs in the sand, and leaves them to be hatched by the sun, paying no attention afterwards to her young progeny.—*Eng. Cyc.*

(627) BASKETS.

Corbeilles, Fr.	Kumpa, Tel.
Korbe, Ger.	Koota, Maleal.
Tokra, Guz. Hind.	Canastas, Port.
Paniere, It.	Korsinu, Rus.
Kooray, Tam.	Canastas, Canastos. Sp.

Well known articles of various shapes and sizes, made of willows, twigs, rushes, splinters of bamboos, canes, &c. according as these are most abundant in the various countries of the world. Country bamboo baskets, in the tariff of Bombay, are valued at Rs 4 per hundred. Baskets in India, are generally made of bamboo, of palm leaves or of rattans or canes; basket making is a coarse kind of weaving, and in India is an art pursued by Hindoo races of the mixed castes, but the facility with which a knowledge of it can be acquired renders it a favorite employment for the blind. —*Tomlinson. Faulkner.*

(628) BASSIA, a genus of plants belonging to the natural order *Sapotaceæ*. It has a calyx of four or five leaves, a monopetalous fleshy corolla, with its border generally 8-parted, and a great number of stamens. The ovary terminates in a long taper style, and contains from six to eight 1-seeded cells. The fruit has a pulpy rind, with not more than three or four cells, the remainder, being abortive. The species are found in the East Indies and in Africa, where they are of great economical importance on account of the abundance of a sweet buttery substance which is yielded by their seeds when boiled.—*Eng. Cyc. p.* 396.

(629) BASSIA BUTYRACEA.

Indian Butter Tree, Eng.	Yel-pote, Lepcha.
Fulwa or Phulwara, Hind.	

The Indian Butter-Tree is found wild in Nepal and Sikkim and on the Almora hills in India, where it grows to a considerable size, its trunk sometimes measuring 50 feet in height, and 5 or 6 feet in circumference. It has broad, oval, long-stalked leaves, from 6 to 12 inches long, smooth on their upper surface, hairy on their under. The flowers, which appear in January, are large and pale-yellow, hang down near the tips of the branches, from the axils of the leaves, and generally grow three together. They are succeeded by smooth pulpy fruits, about as large as a pigeon's egg usually containing two or three roundish light-brown seeds which ripen in August. From these is produced a fat-like substance, which is a kind of vegetable butter, concerning which we find the following information in the 'Asiatic Researches,' by Dr. Roxburgh: — "On opening the shell of the seed or nut, which is of a fine chestnut colour, smooth and brittle, the kernel appears of the size and shape of a blanched almond. The kernels are bruised on a smooth stone, to the consistency of cream, or of a fine pulpy matter, which is then put into a cloth bag, with a moderate weight laid on, and left to stand till the oil or fat is expressed, which becomes immediately of the consistency of hog's lard, is of a delicate white colour and is solid at 95°. Its uses are in medicine, being highly esteemed in rheumatism and contractions of the limbs. It is also much valued, and used by natives of rank as an unction, for which purpose it is generally mixed with an *utr* (aromatic oil) of some kind. Except the fruit, which is not much esteemed, no other part of the tree is used. After the oil has been expressed, the dregs are employed by the poor as food. This Phulwara Butter will keep many months in India without acquiring any bad colour, taste, or smell, and might no doubt be substituted advantageously for animal butter. The timber is of no value, being nearly as light as that of the semul, or Cotton-Tree (*Bombax heptaphyllum*)."—*Eng. Cyc. page* 396. *Hooker. O'Shaughnessy.*

(630) BASSIA LATIFOLIA. (Mowa tree, Roxburgh).

Ipei, Tam.	Epi, Tel.	Madooka, Sans.

Bassia latifolia, the Mahwa, Madhaca, or Madhooka, is a native of the mountainous parts of the Circars. It is very common in several parts of India and is deciduous in the cold season. The tree has oblong leaves, and a corolla, with a very protuberant tube. It is a native of the mountainous parts of the Northern Circars and of Bengal, where it forms a middling sized tree. Its wood is hard and strong, and proper for the naves of wheels; its flowers contain sugar; they are eaten raw by the natives and by jackals, and they yield by distillation a strong intoxicating spirit. From their seeds a considerable quantity of semi-solid greenish-yellow oil is obtained, which is found useful for the supply of lamps; it is, however, inferior to that of the Bassia butyracea. It is curious that this oil (Epi oil ఎప్ప నూనె, Epi nuna, Tel. இலுப்பை எண்ணை, Elloopoo yennai, Tam.) stains linen or woollen cloth as animal oil does, while the fatty substance of the Bassia *butyracea* possesses no such property, but when rubbed on cloth leaves no trace behind.—*Engl. Cyc. page* 397. On the apices of the flowers of this plant, before they open, there is frequently a drop of a whitish, soft, tasteless resin to be found.—*Roxb. Madras Ex. Juries Reports.*

(631) BASSIA LONGIFOLIA.

Yepa, Tel.	Yelloopai, also Ennay carray marum, Tam.
Mohe-ka jhar Hind.	

An Indian Oil-Tree. It is a large tree, a good deal like B. latifolia, but its leaves are narrower, and its flowers much more fleshy. It is a native of the peninsula of India, and is found in plantations along the southern coast of Coromandel. In the southern part of the Tenasserim Provinces also, a large timber tree is indigenous, from the seeds of which the natives express an oil which they eat with their food, and use for other purposes. It is a species of bassia, and does not differ sufficiently from the tree which produces the illiepie oil of Hindustan to constitute a new species. It may therefore be regarded, with Mr. Mason, as

the Bassia longifolia. In the southern part of the Tenasserim Provinces, this bassia is quite abundant in a few localities; and it is said to afford a timber in no way inferior to teak.—*Mason.* Mr. Rohde adds; This is, I believe, the Ippi of the Teloogoo country and is valued for keels of ships and for planking below the water line. Exposed to the wind and sun in the log, it rends into strips, it is considered a good wood for trenails, it is comparatively free from the attacks of the Teredo navalis, it is procurable among the logs brought down the Godavery. At Trichinopoly, the carpenters state that a hard straight grained, rather heavy wood sold as Shemonotti is a species of Ippi.—*Rohde.* In the Wynaad, it is known as Oodagoo marum, and is there an ordinary sized tree: its wood being much used on the Malabar side for building.—*McIvor. M. E.* The wood is as hard and durable as teak, so that this is one of the most generally useful trees found on the continent of India.—*Eng. Cyc. page* 397. In some parts of India, the flowers of this tree are roasted and eaten by the peasants, or bruised and boiled to a jelly, and made into small balls, which are sold or exchanged for fish, rice, and various sorts of small grain. Its fruit is yellowish, and yields by pressure a valuable oil, which is used by the poorer natives of India for their lamps, to make into soap, and instead of better oil, for cookery. Its semi-solid oil (ఎప్పనూనె, Eppa nuna TEL. இலுப்பு யெண்ணை, TAM. Elloopoo yennai; Mohay-ka-tael HIND.) in Southern India, is seldom sold in the bazar, but the seeds are collected, and the oil manufactured by the Natives for private consumption. The seeds contain about 30 per cent of oil of a bright yellow colour. 12½lbs of seed, in the ordinary native rude way of expressing, produce 2 English gallons of oil. The oil or its seed may form an important article of export as a putty oil. It is procurable in South Arcot at Rs. 25 per candy, or Rs. 1-4-0 per maund--in Bellary at 3 8 0, in Bhopaul at Rs. 31-2-0. In Tanjore, it may be had to the extent of 2,702 candies at the rate of 2-8-8 per maund. This oil makes excellent candles and soap. Its chief use is, however, for burning in lamps, and as a substitute for butter in native cookery. The very great difference in colour, consistence and flavour, observable in specimens of this oil, is entirely attributable to the mode of preparation, and to the presence in some cases of a very large proportion of mucilage and other extraneous matter. A bright colored specimen from Tanjore, on being treated with dilute sulphuric acid, proved remarkably pure, samples of the same oil from Rajamundry and Tinnevelly were equally good, but those from Nellore and Mysore deposited a large amount of mucilage.—*Madras Exhibition Jur. Report.* In medicine the oil is used externally to cure the "Itch" and other cutaneous disorders; and the leaves, milk of the green fruit, and bark, are boiled in water as a remedy in rheumatic ailments.

(632) BASSIA PARKII, is believed to be the Shea-tree, or African Butter-plant, which is a very important article of African internal commerce; and which it would apparently be extremely desirable to introduce into the West and East Indies as a new source of internal wealth. This is the plant which is frequently spoken of by Park, who, in his 'Travels in Africa,' found the people everywhere employed in collecting the fruit of the shea-trees, from which they prepare a vegetable butter. These trees grow in great abundance all over part of Bambarra. They are not planted by the natives, but are found growing naturally in the woods; and in clearing wood-land for cultivation, every tree is cut down but the shea. The tree itself very much resembles the American oak, and the fruit, from the kernel of which, first dried in the sun, the butter is prepared by boiling the kernel in water, has somewhat the appearance of a spanish olive. The kernel is enveloped in a sweet pulp, under a thin green rind; and the butter produced from it, besides the advantage of its keeping the whole year without salt, is whiter, firmer, and to Park's palate of a richer flavour than the best butter he ever tasted made of cow's milk. The growth and preparation of this commodity seem to be amongst the first objects of African industry in this and the neighbouring states, and it constitutes a main article of their inland commerce.—*Eng. Cyc. page* 397.

(633) BAST. The peculiar structure of Exogenous plants is well seen on making a transverse section of the stems or branches, thus exhibiting rings of wood and layers of bark: but, in the stems of annual exogens, we see, in the centre, a circle of white cellular tissue, called pith, and round it a layer of wood like matter, which, in some plants, is called *boon* or *shove.* This is surrounded by layers of cellular tissue, which, when examined longitudinally, form a tubular sheath, enclosing the other parts. It is in some plants composed of long and tough elongated cells or fibres, which are sometimes called Bast, and is covered externally by a delicate skin or cuticle. It is these Bast fibres which are separated from the flax and hemp plants and familiarly known by these names. If we proceed to examine the transverse section of the branch or tree of an exogenous plant, we see a number of rings, proportioned to its age. In the centre is the pith. This is usually small when compared with the bulk of the wood, and is surrounded by a longitudinal canal, called the medullary sheath, and which contains spiral vessels. Outside of this are the rings of wood formed of vessels and of wooden tissue, those near the centre, called the *heart-wood* are denser and more highly coloured than those which are more external. Of these, the youngest are known by the name of *sap-wood,*

and are those most recently formed, as, in these trees, all additions of wood form on the outside of the growth of previous years. On the outside of the layers of *wood*, we find the part called bark, this also being composed of a series of layers, the oldest of which are on the outside, and may in some trees be seen splitting and scaling off in a withered and dried state. The new layer of bark will however be found inside of all, and next to the young wood. The structure of this part can be best examined in the bark of a young shoot. It will be found to be composed of two layers of cells, which receive different names from botanists, having the delicate epidermis or cuticle on the outside : but in the inside of all, the layer consists of tough, elongated cells and vessels, and is called *liber* or *Bast*. This part is very conspicuous in the lime tree of Europe which by the stripping of its bark, yields the bast of which Russia mats are made. In the East Indies, species of Grewia, of Hibiscus, and of Mulberry, are remarkable for this product and will be found mentioned under their proper names, as also the Theng-ban-shaw ; the Pa-tha-you Shaw, the Shaw-phyoo : the Ngau-tsoung-shaw : Shau-nee and Ee-gw-ot-Shaw, of Arracan.—*Royle Fib. Pl. p.* 80. 129, 199, 236, and 237 ; Mr. Jaffrey at the Madras Exhibition of 1857, exhibited a very powerful new bast from the Eriodendron anfractuosum.—*Madras Ex. Jur. Report.*

(634) BASTARD CEDAR. Vide CEDRELA TOONA.

(635) BATATAS, the Malayan name of a Convolvulaceous plant, the root much eaten in the South of Europe before the cultivation of the potato, which both became a substitute for it, and appropriated its name. It has generally been considered a species of *convolvulus* ; but Professor Choisy, in his recent classification, has erected it and a few others into a peculiar genus, distinguished by having an ovary with four cells, in each of which there is only one seed.—*Eng. Cyc. page* 398.

(636) BATATAS EDULIS.

Vullee-kalungoo, TAM. | Nutr-allo, HIND.

This is the *Convolvulus Batatas* of authors : the sweet Potato is the only species of any general interest. This plant, originally found wild in the Malayan Archipelago, has been gradually dispersed over all the warmer parts of the world, where it is still an object of culture for the sake of its roots, which, when roasted or boiled, are mealy, sweet, and wholesome, but slightly laxative. It is a perennial plant, with long creeping stems, leaves variously lobed and angled, and pale purple flowers about an inch long. It is impatient of cold, and consequently unfit for cultivation in the northern parts of the world ; but it is a productive agricultural plant in many warm countries. It is partially cultivated in the south of Spain and of France, whence its roots are sent to the markets of Madrid and Paris, where they are held as a delicacy. They however have the great fault of keeping badly, being very apt to become mouldy and to decay, unless extraordinary pains are taken to preserve them dry. They are sometimes raised in the hothouses of the curious in England. There are two or three varieties cultivated in the Tenasserim Provinces and the potatoe like roots are used in various ways. It is very abundant, but is vastly inferior both in size and quality to the sweet potatoe of the Southern States of America.—*Mason.*

(637) BATATAS——? Four small roots were sent from Australia by Mr. Dowdeswell, and planted by Mr. Rohde at Guntoor, whence it has been already largely distributed. It has been in daily use as a vegetable for the last six months, and is preferred to the common sweet potato, as being less sweet and more farinaceous.—*Juries Reports.*

(638) BATATAS JALAPA has none of the properties of the plant after which it is named.—*Eng. Cyc. page* 398.

(639) BATATAS PANICULATA. (*Convolvulus paniculatus*, Roxb. Fl. Ind. i. 478.) East Indies generally. Bhoomi koomra, BENG. Root perennial, tuberous, young shoots round and smooth. The large tuberous root is cathartic.—*O'Shaughnessy page* 505. It has beautiful dark purple flowers.—*Riddell.*

(640) BATATAS PENTAPHYLLA.—Stems twining, very hairy, flowers to the rains, cream coloured.—*Riddell.*

(641) BATHS. Places constructed purposely for washing the body, with hot, cold or tepid water : a practice, the healthful effects of which has been recognized by all nations. It was one of the legislations of Moses, and many eastern nations exalt ablution and bathing into religious observances. The functions of the skin cannot be preserved in healthy activity, nor the changes of climate effectually guarded against without the frequent use of the bath. The warm, tepid, cold, or shower bath, as a means of preserving health, ought to be of as common use as a change of apparel. Baths in India are generally constructed of the staves of casks, but these are apt to grow mouldy. Perhaps the best material and easiest procured is wood, which has been soaked in linseed oil, or wood varnished with the coach builders varnish. On a large scale baths are economically heated by steam. The sickly, the aged, the weak, and the intemperate should avoid the use of the cold bath, which should seldom be used in the higher table lands of India, even by the strong.—*Tomk.*

(642) BAUHINIA, a genus of plants belonging to the natural order *Leguminosæ*. Linnæus applied the name very happily to commemorate the merits of the two Bauhins, for the genus is remarkable for its leaves being generally divided into two twin lobes. The species are usually

twining plants, found in the woods of hot countries, and often stretching from tree to tree like living cables, forming with other plants an almost insurmountable obstacle to the traveller who would penetrate the recesses of a tropical forest. Some of them, however, are small trees, as for example *Bauhinia porrnta*, which in Jamaica is called Mountain Ebony, because its wood is sheathed with black. Their flowers are often very beautiful, for which reason they have long been cultivated in the hot-houses of Europe; but they are too impatient of the wretched treatment they usually receive in stoves to flourish and produce their noble blossoms. So long as these plants are cramped in earthern pots Europe must not hope to see those noble flowers which are described by the travellers who have visited the forests of America and India.—*Eng. Cyc. p.* 400. A thousand feet above Punkabaree in the outer Himalaya the prevalent timber is gigantic and scaled by climbing Leguminosæ, as BAUHINIAS and Robinias, which sometimes sheath the trunks or span the forest with huge cables joining tree to tree.—*Hooker, Him. Jour. page* 108. In the Tenasserim Provinces, a scandent species of bauhinia creeps up to the tops of the highest trees. It has very large leaves, and its flowers have the fragrance of mignonette. It approaches Vahl's bauhinia in size and habit, but its petals are red and yellow while in that they are said to be white. It is probably one of the species named by Wallich.—*Mason.* The bark of *Bauhinia racemosa* and *parviflora* has been employed in making ropes. A brownish-coloured gum is said by Roxburgh to be yielded by *Bauhinia retusa.* A gum is also collected from *Bauhinia emarginata* in the Deyra Doon, which is called Sem-ke-gond. The flowers and buds of *Bauhinia tomentosa* are dried, and used in India as remedies in dysentery. Their astringency is probably due to the presence of tannin, and one species, *Bauhinia variegata*, has a sufficient quantity of this substance in its bark to render it useful in tanning. The leaves of various Bauhinias are used in Brazil under the names of Unha de Boy, or Ox-Hoof, as demulcent remedies.—*Eng. Cyc. p.* 400. Loudon calls bauhinia, mountain ebony, and the wood, though not much like ebony, is quite hard and might be applied to many useful purposes. To the five species which are enumerated among the Burmese flowering plants, may be added a small timber tree bearing a sour leaf, and a pod containing sweet pulp, like the honey locust of America. Its twin leaf is that of a bauhinia. —*Mason.*

(643) BAUHINIA ACUMINATA.

White Bauhinia, ENG. | Mandareh, TAM. also
Chitka, also Cauchun, BENG. | வெள்ளைமந்தாரமரம்
Cuchunar, HIND. | Vella Munthara marum, TAM.

This plant grows in India and Burmah. It is the B. candida of Ainslie, which some botanists think a variety of koochnal (B. variegata) a larger and more common tree.—*Wight.* Mr. Mason calls it a handsome shrub, with large blue-white flowers. It grows rapidly from seeds, and flowers in the second or third year.—*Mason.* Its wood, hard, and veined, is black, called by the inhabitants of America Mountain Ebony. It is in flower most parts of the year.—*Roxb.* Bauhinia acuminata, is described by Dr. Riddell as a shrub with white flowers.—*Riddell.*

(644) BAUHINIA ALBIDA.

Vellay-munthary-poo, TAM.

The flower buds of this pretty tree yield an excellent vegetable for curries, but it is not generally known that it can be so used; the flowers are very handsome when open being almost pure white, with a sweet odour.—*Jaffrey.* This is perhaps the species called by Roxb. B. candida.

(645) BAUHINIA ANGUINA.

Nag-poot, HIND.

An extensive and rambling shrub, with flexuous compressed stems and small white flowers. This Bauhinia is highly ornamental.—*Riddell.*

(646) BAUHINIA BRACHYCARPA.

Bwai-jin, BURM.

Attains to nearly three or four feet in the Tenasserim Provinces, its wood is white coloured and adapted for fancy work and cabinet making. —*McClelland.*

(647) BAUHINA CANDIDA, *Willd.*

Kuvidara also Yooga putra, SANS | Kana-raja, HIND.

A small handsome tree flowering at the commencement of the hot season.—*Roxb.*

(648) BAUHINIA DIPHYLLA, Grows in Nellore, where it is called *Yepi,* Tel.—*M.E. Jur. Rep.*

(649) BAUHINIA MALABARICA. This pretty large tree is a native of Malabar, where it blossoms in October and November.—*Roxb.*

(650) BAUHINIA NITIDA. WHITE BAUHINIA.

Kana raja. HIND.

Cultivated in gardens at Kotah.—*Irvine Gen. Med Top. p.* 191.

(651) BAUHINIA PARVIFLORA. Bwai-jin. Attains three or four feet in girth, and is very plentiful throughout the Tounghoo and Prome Forests. The Wood, white colored, adapted for fancy work and cabinet making.—*McClelland.*

(652) BAUHINIA PURPURESCENS.

சிகப்பு மந்தாரை மரம், Segapoo Munthari marum. A small tree, with beautiful purple flowers: quality of wood unknown.—*Jaffrey.*

(653) BAUHINIA PURPUREA.

Deva-Kanchun, BENG. | Shegaypoo-munthari-poo,
Sona, HIND. | TAM.

This tree grows to a large size on the mountains of India, *Roxb.* Its fragrant flowers are of a deep rose colour; it flowers at the commencement of the rains.—*Riddell. Jaffrey.*

(654) BAUHINIA RACEMOSA.

Maloo, climber, Maloo Malijhun or Patwa Mawal or Ada, TEL. | Atche marum. TAM. Maweel Ghila, HIND.

This is B. parviflora of Roxb., not mentioned by Ainslie. The tree is small but the heart wood exceedingly hard and fine. The bark furnishes a kind of natural rope, being merely peeled and slightly twisted when it is ready for use.—*Wight.* This is found all over India. Along the forests of the Sewalik Hills and the hot valleys of the Himalaya from the doons of the North West to the valley of Assam, may be seen this magnificent climber, with its two lobed leaf, hanging in elegant festoons from the tops of lofty trees, which, from the distance from the roots to the stems, one is at a loss to imagine how it could have ever ascended. But occasionally a half killed tree discloses the mode of its progress and indicates the destruction it must have created in the forest. With the bark of this plant, which when stripped off is of a reddish brown colour, the natives of these mountains make ropes ; the stems are usually cut in July and August : the outer bark being stripped off is thrown away and the inner is used for ropes, as wanted, by being previously soaked in water, and twisted when wet. It is also said to be boiled and beaten with mallets, which renders it soft and pliable, for being twisted into ropes and strings, for charpaes. The fibre makes very strong ropes, but it is not over durable, and rots if kept constantly in water. Though not collected for sale, it is abundant all along the foot of the mountains. Major Swetenham describes its strong coarse ropes as answering well for suspension bridges. Specimens of the fibre and rope made from it were sent to the Exhibition of 1851.—*Royle p.* 296. *Jaffrey. Madras Museum.*

(655) BAUHINIA RETUSA, Roxb. Grown in the Calcutta Botanical gardens ; yields a brownish mild gum.—*Roxb.*

(656) BAUHINIA RICHARDIANA—Introduced from Madagascar, of this wood we have no knowledge. The trees in this country being still young.—*Hort. Garden* 58.

(657) BAUHINIA SCANDENS. ESCULAPEAN ROD BAUHINIA. Mr. Mason mentions that he has never seen the flowers of this species but they are mentioned as small. The tree is remarkable for its contorted stem, and it is said to have been, remarks Loudon, the origin of Esculapius' snaken rod which he brought from India. Bauhinia scandens, in its properties and uses, is similar to the B. racemosa. It is not uncommon about Gowhatti, and is a common species in Silhet. Its fibre is used by the Nagas, and cloth made therefrom was sent to Major Jenkins by Major Hannay. A line made from the fibre sustained for forty-five minutes, 168 lbs, having stretched six inches only in three feet, and therefore is almost of the same strength as the best Sunn Hemp of Bengal. But Captain Thompson reported that, whether from the nature of the material or the mode of preparation, he found the fibre so harsh and stubborn and to so stick together that the heckles tore it to pieces and injured its strength. —*Mason, page* 68. *Royle, page* 296.

(658) BAUHINIA TOMENTOSA, Ains. YELLOW BAUHINIA. காட்டாத்திமரம் Caat Attie (ebony, Ains.) also திருவலவெகாண்டை Theerovalaconnaie, TAMIL. Usamaduga, SANS. A native of Ceylon, Malabar, and Coromandel ; the dried buds and flowers are used in dysentery.—*O'Shaughnessy, page* 317. This bears a large sulphur-coloured flower, and the upper petal has usually a deep purple spot on the inside. A large shrub never exceeding 12 feet in height. Wood very hard but too small to be of any great value in commerce. The native physicians use the buds and young flowers in certain dysenteric cases.—*Jaffrey.* This like the B. racemosa, atche marum, is a strong very dark coloured wood, hence we presume, the name *ebony.* Even the younger branches show the heart-wood very dark brown, the bark of this is also employed as extempory cordage. The plant furnished to Dr. Wight under the name of Caat Attie was the *bauhinia racemosa.—Wight.*

(659) BAUHINIA TRIANDRA, (*Roxb.*) This is a native of Bengal ; when in flower is one of the most beautiful of the Bauhinias. Its trunk is strait and of considerable size.—*Roxb.*

(660) BAUHINIA VAHLII. CHAMBOOLEE. Duk. An immense scandent shrub ; leaves about a foot in breadth, with rounded lobes ; legumes pendulous, from twelve to twenty inches long, covered with a brown velvet down. —*Riddell.*

(661)BAUHINIA VARIEGATA : VARIEGATED BAUHINIA.

Kuvidara. SAN. Ructa-kanchun, BENG. | Kuchnar, HIND. Irkumbalitha, CAN.

Common in India, Burmah and at Ajmeer. When in blossom the tree is very splendid, and the fragrance delightful. The flower buds are eaten as a vegetable. This tree would be highly ornamental in compounds.—*Gen. Med. Top. p.* 191. *Jaffrey, Riddell. M. E. Jur. R.* Mr. Mason says that when in blossom this is a very handsome tree.—*Mason.*

(662) BEAD PLANTS. Several plants in India produce bright coloured seeds, used as beads, amongst these is the red seed with a black eye, of the *Abrus precatorius,* which is also used by the Burmese as a weight. Mr. Mason informs us that the Karens in the southern provinces cultivate one or two species of Job's tears for the seed. The Pwos plant a species with round seeds which are used to ornament the borders of their tunics, but they are never seen on a woman's gown. The Sgaus on the contrary, cultivate a species bearing an oval seed, and use them merely for embroidering female dresses. In Amherst Province, the Pwos seldom appear in their native costume, and many deny that their tribe

ever had any other than that which they now wear, which is Burmese.—*Mason.* The *Abrus precatorius* is a native of the East Indies, but is found in the tropical parts of Africa and America. The seeds are in much request as ornaments, and are strung together as beads, with shells and other hard seeds, also as rosaries, hence the name precatorius. The common variety are red, with a black spot, whilst other varieties produce various coloured seeds. The leaves and roots secrete the sweet substance which characterizes the liquorice plant, (*Glycyrrhiza glabra*,) and in the East and West Indies it is called wild liquorice and used for the same purposes. Beng. Sweta : Koonch : Tamul, Condumiunie. The shining scarlet seeds of the *Adenanthera Pavonina*, are used as weights, by jewellers, and are made into ornaments, in the form of beads, bracelets &c. The round, hard, black seeds contained in the hairy pericarp of the *Canna Indica*, Krishna Tamara, TEL : Kata-bala : Kull Valei munnie, TAM : Seela rumba, SANS : Ukkil bar ke munkeh, HIND : Sabba jaya, HIND : are made into necklaces and other ornaments. The UTRASUM BEADS, are the very rough seeds of the *Elæocarpus lanceolatus*, *Utrasum*, TAM : *Oodraj*, DUK : They are brought to India from Java, of which country the tree is a native, are about the size of small nutmegs, and are made into bracelets for European ladies. The Sheva Brahmins and Pundarums, religious devotees of the Sheva sect of Hindoos, who live by alms, wear them round their heads and necks and form them into rosaries. The dark colored oval seeds of the *Caryota urens*, are made into buttons, and used as beads by Mahomedans, *koondel-panei munnie* TAM. *Erim panna*, CAN. The dark colored roundish seeds *Kodda panei munnie*, TAM : of the Corypha umbraculifera, are used as beads by Hindo devotees, the Taders, or Dassari wanloo, who live on alms. The *Tolasee Beads*, *Tolasee vayr munnie*, TAM : Toolsi ke munké, DUK : are made from the root of the holy basil, Ocimum sanctum, a plant sacred to Vishnu and held in esteem by all his followers, the Brahmins and Taders of which sect, wear it round their necks and arms. A very handsome bead is made from polishing the betel nut, called by the Tamil people Paak munnie.—*Ainslie, &c.*

(663) BEADS.

Paternosters, DUT.	Munke, HIND.
Rosaires, FR.	Corone, IT.
Rosen-kraaze, GER.	Kulkooroo, MAL.
Munneeara, GUZ.	Coronas, SP.

These small wares are formed of glass, ivory, wood, cornelian, and other materials, and used as rosaries, necklaces, &c. The glass beads manufactured in China are sent wholly to India or the Archipelago ; those for India are shipped to Bombay. Five boxes are estimated to weigh a pecul : 1345 boxes were shipped in 1836, at $. 18 per box. In the four years 1852-53 to 1855-56 inclusive, the import of beads into the Madras Presidency was to the value of Rs. 1,37,722, and the value of the exports for the same period was Rs. 24,491.

(664) BEANS, FRENCH—WHITE, BLACK, AND YELLOW.—These beans are runners and dwarfs ; they should be sown in rows about two feet apart, and may commence at the close of the hot winds. The dwarf white are preferable at the early part of the season, as they bear sooner than the other sort, which require sticks at least six feet high, and strong, so that they may stand the rain and wind ; may continue to plant them until March with success. All that is necessary is not to put them too close, and to remove caterpillars that are found upon them during the months of July and August. These beans are very hardy, and grow well in almost any soil. The Portuguese bean, or Chevaux de Frize, is cultivated like all other beans. Its pod has four fringed angles, the edges jagged : they are dressed like French beans. All the other sorts are grown in the same manner.—*Beans, Broad and Windsor*, should be sown in the cold weather, in drills, the same as peas, each bean at six inches apart ; the rows sufficiently separated to admit a person to pass between them for picking, weeding, &c. The best time in the Dekhan for sowing is in November, and if the ground is light and well manured, there is no chance of failure. Dr. Riddell recommends the seed to be changed every season. Rats and porcupines are very destructive to them.—*Riddell.*

(665) BEAR, the English name for a family of Plantigrade Mammalia, forming a natural group, with six incisor teeth and two canine teeth in each jaw, twelve molars in the upper and fourteen in the lower jaw, pentadactyle or five-toed feet, armed with strong claws, and a short tail. The bears exhibit but a comparatively small carnivorous development, for notwithstanding their strength, their dentition, particularly in the form of the crowns of their molar teeth, indicates a propensity bordering on the frugivorous exclusively.—*Eng. Cyc. p.* 401.

(666) *Ursus Euryspilus* (Helarctos Euryspilus of Horsfield), the Bornean Bear, differs from the Malayan Bear principally in having a large orange-coloured patch, deeply notched at its upper part upon the chest. The individual which was exhibited in the Tower of London, and from which Dr. Horsfield wrote his description, measured along the back from muzzle to tail 3 feet 9 inches. It was obtained in Borneo when very young, and during the voyage was the constant associate of a monkey and other animals. In confinement, its manners greatly resembled those of the Malayan Bear. Its habits in a state of nature do not appear to be known, but are most probably similar to those of the Malayan species. Dr. Horsfield, speaking of its habits in captivity, says, " The Helarctos readily dis-

tinguishes his keeper and evinces an attachment to him. On his approach it employs all its efforts to obtain food, seconding them by emitting a coarse but not unpleasant whining sound. This it continues while it consumes its food alternately with a low grunting noise; but if teased at this time, it suddenly raises its voice and emits at intervals harsh and grating sounds. Our animal is excessively voracious, appears to be disposed to eat almost without cessation. When in a good humour, it often amuses the spectators in a different manner. Calmly seated in its apartment, it expands the jaws, and protrudes its long and slender tongue as above described. It displays on many occasions not only much gentleness of disposition, but likewise a considerable degree of sagacity. It appears conscious of the kind treatment it receives from its keeper. On seeing him it often places itself in a variety of attitudes to court his attention and caresses, extending its nose and anterior feet, or suddenly turning round exposing the back, and waiting for several minutes in this attitude with the head placed on the ground. It delights in being patted and rubbed and even allows strangers to do so; but it violently resents abuse and ill treatment, and having been irritated, refuses to be courted while the offending person remains in sight. The individual whose manners are here described fell a victim to its voracity; during the hot weather of the summer of 1828, it overgorged itself one morning, and died within ten minutes after the meal. Its skin is preserved in the Museum of the Zoological Society.—*Eng. Cyc. p.* 411.

(667) *Ursus Isabellinus*, Isabella-coloured Bear. Dr. Horsfield first described this species from a skin forwarded from the mountains of Nepaul. The skull had been removed, but the front teeth in both jaws and the claws remained. —*Eng. Cyc. p.* 408. "Our animal," says Dr. Horsfield, "is of a habit decidedly different from that of several species of Ursus from the same part of the world, which have been recently added to the systematic catalogues, namely, the Ursus Thibetanus, the Ursus labiatus, and the Ursus Malayanus. All these have a jet-black fur, a semilunar mark of a white colour on the breast, and other peculiarities affording types of sub-genera, among which Prochilus and Helarctos have been defined. Our animal, on the contrary, appears to resemble the European bears in its structure, as far at least as can be determined from the parts which have been preserved in the specimen. Among these the claws afford the best means of comparison; they are small, obtuse, and straight: while those of the Asiatic bears above mentioned are large, strongly curved, acute, and fitted for climbing." It is a native of the whole Himalayan range, and is so light-coloured as to have led to the supposition that it was another form of the white Bear.—*Eng. Cyc. page* 408.

(668) *Ursus labiatus* (Melursus Lybius, Meyer), Labiated Bear or Sloth Bear. This uncouth animal, on its arrival in Europe about sixty years ago, was taken for a Sloth, and obtained the name of Bradypus pentadactylus and Ursinus, Five-fingered Sloth, Sloth Bear, or Ursine Sloth. By the two last names it was formerly shown in menageries; and Bewick gave an excellent portrait of it in his 'Quadrupeds,' as "an animal which has hitherto escaped the attention of naturalists." Meyer called it a Melursus; and Fischer a Chondrorhynchus. It is the Bradypus ursinus of Shaw (though it bears no relation to the true Sloths either in structure or habits); the Ursus labiatus of DeBlainville; and the Ursus longirostris of Tiedemann; the Ours Paresseux and Ours Jongleur of the French. The short limbs, the depressed air of the head, surmounted by the hillock of a back, and the whole colour of the apparently unwieldy mass, give the idea of deformity, and make it a favorite with the Indian mountebanks or jugglers, who rely much on the attraction of its ugliness. The cartilage of the nose is capable of extension, and the lips of considerable protrusion, as may be seen if the spectator hold a morsel of fruit or biscuit at a proper distance for exciting the animal to exert this faculty. The muzzle is elongated, and, with the ends of the feet, is whitish or yellowish. The forehead rises almost abruptly from the muzzle. The fur, with the exceptions above noticed and that next mentioned, is deep black, with here and there some brown spots, and is rather long, particularly round the head in old individuals. Upon the under side of the neck and breast is a white mark resembling the letters V or Y. In bulk it is about the size of the Brown Bear. The food of this species in a state of nature is said to consist of fruits, honey, and the white ants, which are so destructive. It inhabits the mountainous parts of India, where its retreat is stated to be in some cavern. Major (now Colonel) Sykes noticed it in the Dekhan.

(669) *Ursus Malayanus*, (Raffles, Helarctos Malayanus, Horsfield), the Malayan Bear, the Bruang of the Malays, is jet-black, with the muzzle of a yellowish tint and has a semilunar white mark upon the breast. The sagacity of the Malayan Bear is said to be great, and its liking for delicacies extreme. The honey of the indigenous bees of its native forests is supposed to be a favorite food; and certainly the extreme length of the tongue is well adapted for feeding on it. Vegetables form the chief diet of this bear, and it is said to be attracted to the vicinity of man by its fondness for the young shoots of the cocoa-nut trees, to which it is very injurious; indeed Sir Stamford Raffles found those of the deserted villages in the Passumah district of Sumatra destroyed by it. It has not unfrequently been taken and domesticated.—*Eng. Cyc. page* 410.

(670) *Ursus Thibetanus*, (Helarctos Tibetanus), the Tibet Bear.—M. Duvancel discovered

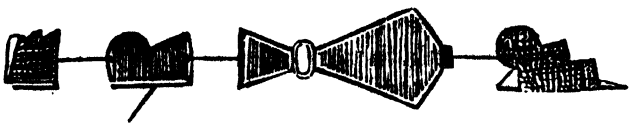
this species in the mountains of Sylhet, and Dr. Wallich found it in those of Nepaul. The Tibet bear has the neck remarkably thick, and the head flattened, the forehead and muzzle forming almost a straight line. The ears are of a large size. Its clumsy limbs support a compact body, and the claws are comparatively weak. Its general colour is black; but the lower lip is white, and there is a large mark of the same colour, somewhat in the form of the letter Y supposing the stem of the letter to be placed in the middle of the breast and the forks to pass up in front of the shoulders. In bulk it is about intermediate between the Sloth Bear (Prochilus labiatus) and the Malayan Bear (Ursus Malayanus). Mr. Bennett, in his "Tower Menagerie," gives a figure and description of one which was brought from Sumatra, and could not be prevailed on to touch flesh either raw or cooked, bread and fruits forming his only food. In his disposition he was moderately tame, and particularly fond of play.—*Eng. Cyc. page* 408.

(671) BEATY, OR CARROO MARUM, Tamul: Blackwood, Dalbergia latifolia. Common in Wynaad on open and grass lands, where the tree attains a great size.—*McIvor. M. E.*

(672) BEAUMONTIA GRANDIFLORA. *Apocynaceæ.* A gigantic climbing shrub; flowers in February, and is very showy. Native of Nepal. This magnificent Apocynaceous climber was found by Dr. Hooker in the Terai, east of Siligorec, in full bloom, ascending the loftiest trees, and clothing their trunks with its splendid foliage and festoons of enormous funnel-shaped white flowers.—*Hooker Him. Jour. Vol.* I. *page* 401.

(673) BEAVER, the English name for the genus Castor (Cuvier), one of the order of rodent or gnawing animals (Rodentia, Cuvier, Glires, Linnæus), with 2 incisors, or cutting teeth, and 8 molars in each jaw, 20 in all, and particularly distinguished from all the rest of that order by a broad horizontally-flattened tail, which is nearly oval, and covered with scales.—*Eng. Cyc. p.* 415. The Little Beaver is the *Castor Zibethicus* of Linnæus, *Fiber Zibethicus* of Cuvier, *Ondatra* of Lacepede, the Musk-Rat of Canada, and Musquash of the Cree Indians. (Musquash.)—*Eng. Cyc. page* 419. The tails of this animal form a considerable article of import into India.

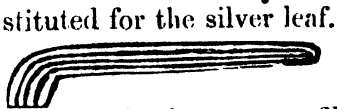
(674) BEH-DANA, Pers. The seeds of the quince (Pyrus tomentosa); but those brought to Ajmere appear more like dried mulberry seeds (Morus nigra): the tree in Cabul is called "bai"; the seeds are demulcent and cooling: very mucilaginous: are used in sherbets: one seer costs four rupees.—*Gen. Med. Top. page* 128.



(675) BEDER WARE. The tutenague work of Beder has been described by several observers, Dr. Heyne, Dr. Buchanan Hamilton, Captain Newbold and Dr. Smith. It is a metallurgical compound of considerable interest, named Bedery, from Beder, a city situated about sixty miles to the north-west of Hyderabad. The articles are always greatly admired for the elegance of their form, as well as for the gracefulness of the patterns with which their surface is covered. Though the groundwork of this composition appears of a blackish colour, its natural colour is that of pewter or of zinc. Dr. Heyne informs us that it is composed of copper sixteen ounces, lead four ounces, tin two ounces. These are melted together, and to every three ounces of the alloy sixteen ounces of spelter, that is of zinc, is added, when the alloy is melted for use. But to give the whole the black colour which is esteemed, probably from bringing out the pattern, it is dipped into a solution of sal-ammoniac, saltpetre, common salt, and blue vitriol.—*Royle, Arts &c. of India, page* 471. Dr. B. Hamilton saw of zinc 13,360 grains, copper 460 grains, and lead 414 grains, melted together, and a mixture of resin and bees-wax introduced into the crucible to prevent calcination. It was then poured into a mould made of baked clay, and the article handed over to be turned in a lathe. Artists then inlay flowers or other ornaments of silver or of gold They first smear it over with sulphate of copper and water, which gives the surface a blackish colour, and enables the artist more easily to distinguish the figure which he draws—this he does with a sharp-pointed instrument of steel, and cuts it with small chisels of various shapes, and then with a hammer and punch fills the cavities with small plates of silver, which adhere firmly to the Bedery. It is then polished and stained as described above. The various articles made from it are vases, wash-hand basins and ewers, hookah-bottoms, spittoons, cups and dishes, small boxes and weights. These are inlaid commonly with silver, but sometimes with gold. The patterns are usually as much to be admired as the forms of the vessels. Though usually called Bedery, sometimes Vidry, it is also manufactured at other places. According to Captain Newbold, "The mould of the vessel is first prepared, in the usual manner, of clay turned into shape on a wheel: over the smooth surface of the mould a coat of wax and *rall* (rosin) in equal proportions, with a little oil is laid, of the thickness of the sides of the vessel required: over the wax another thick coat of clay is applied. Gradual heat is next resorted to, to harden the clay part of the mould; but principally to melt out the wax, which of course leaves a vacuum on the space it occupied. Into this space the molten alloy is poured, cooled, the mould broken, and the vessel in rough taken out polished and set aside, to receive a black colour preparatory to inlay, from a smearing of *Mor tuta* (Blue vitriol). The alloy itself is of a pewter white colour and is composed of the following proportions:—1 Seer *Just* (Zinc) to 1 Chittak or 6 Shahi pice weight of *Tamba* (Copper). The pattern of the ornamental device, to be inlaid

either in silver or gold, is next drawn lightly with a steel point on the blackened surface of the vessel, and then cut out to the depth of the inlay required, with a tiny delicately pointed chisel, worked by a small hammer. A thin bit of paper is pressed into the excavated pattern to receive the impression—taken out and placed upon a thin plate of silver (the inlay) which is itself laid out evenly on a bed of mixed wax and *rall* (rosin), and cut into the exact shape of the impression. The cut-out bit of silver is then pressed into its corresponding cavity engraved on the side of the vessel, and firmly inserted by means of a steel-point. This done over all parts of the vessel, it is again polished preparatory to receiving its finishing coat of black. This is done by subjecting the vessel to a gentle heat and smearing it with a mixture composed of: 1 Tola (B'hur) *Shorah ki Mutti* (Saltpetre) 3 Mashas—*Nousagur* (Sal Ammoniac) ground up into the consistence of cream with brackish water. After allowing this mixture to lie upon the vessel for a few hours, it is washed off with a little brackish water. The inlaid silver devices are little altered in colour, but the intervening portions of alloy remain of a permanent dead black. He witnessed the whole process of inlaying and could not help admiring the precision, lightness of touch, and celerity with which it was performed by a Lingayet, which caste and a Jaina are the only persons skilled in the art. It seems divided however into three branches. The mould maker, smelter and inlayer.—*Extract of a Letter from Captain T. J. Newbold, to the address of Major General Fraser.* Bedery does not rust, yields little to the hammer, and breaks only when violently beaten. According to Dr. Hamilton it is not near so fusible as zinc or tin, but melts more easily than copper. —*Royle, Arts &c. of India, page* 472. The most recent observer, however, is Dr. George Smith, who thus records the results of his examination of the process :—" On passing through Beder about two months ago, I thought it will be well, to make a few enquiries into the mode of manufacturing the unique and elegant ware, commonly called Bedery; accordingly I procured two workmen, who, partly showed and partly explained to me the several stages of the manufacture; the information thus obtained may assist those desirous of imitating this beautiful ware. Suppose the vessel to be made, resembling in form the common small hookah bottom (1):

(1)



The steps of the manufactures are as follows: A mass of finely pounded and sifted old laterite dust mixed with cow dung, is put upon a rude lathe, and when dry is carefully turned into the correct shape. The lathe is rude and simple and is

(2)

turned either by the hand alone, or by a short rope attached to a small piece of wood (2): with the other hand the workmen holds a sort of chisel, with which he cuts and smooths the model. The model thus carefully prepared, is next covered with a mixture of wax and oil boiled together: when dry, the whole mass is again turned, carefully thinned and smoothed. Over this coating is plastered a second layer of laterite dust moistened with water, but without cow dung—this coat is rough, and is not subsequently smoothed down. The next stage consists in boring two openings in the composite mould, and in placing it in the fire—the effect of this being to melt in the intermediate layer of wax, and thus to leave a vacant space for the reception of the alloy. Into this space is poured the alloy (consisting of copper 1 part and pewter 4). The vessel has now a dull leaden look; it is hard, but easily cut. This model or shell is carefully turned and smoothed. Upon the smooth surface of this shell, the pattern is etched by hand, a small pointed graver being used. This etching is done rapidly. The workman next takes a small chisel and hammer, and following the lines of the pattern, cuts it deeply and expeditiously, scooping out the tracing of the little leaves &c., and leaving an indented but rough surface. This rough surface is next smoothed down by hammering gently with another blunt pointed chisel, and the space is then ready for the process of inlaying. Thin plates of very pure silver are taken, and the little leaves are cut out with a small hammer and chisel—each little leaf is then raised separately by the chisel and finger tip, and hammered gently but carefully into the depression intended for it. This part of the process is tedious. In the more durable kinds of Bedery ware silver wire is substituted for the silver leaf. The vase in this state

's rough and requires smoothing—this is done with a common file and with a curved scraper of a rude and clumsy form. The hole in the bottom of the vessel is filled up with lead and is smoothed down—finally the vase is gently heated, and whilst warm, it is blackened by the application of a powder supposed to consist of chalky earth and muriate of ammonia—this imparts a brilliant black polish to the shell, and careful hand rubbing brings out the lustre of the silver. The value of the ware depends upon the thickness of the silver inlaying—the common ware of the bazars rarely lasts long. Inlaying is also executed in the same way with copper leaf, but the artistic effect, I think,

is inferior to the silver. The price of a small hookah bottom like that described, varies in Beder, from 7 to 10 Rupees."

(676) BEEF, POTTED. Beef prepared in this mode has been found often adulterated with Bole Armenian, to heighten the colour.—*Hassall.*

(677) BEEF-WOOD. CASUARINA MURICATA. A hard, close-grained, reddish wood, variegated with dark and whitish streaks. It is chiefly used in England in forming borders, to works in which the larger woods are employed. It is procured from New South Wales.—*Faulkner.* Beef-wood is imported into the United States in considerable quantities, for various purposes where a hard heavy wood is required, and the casuarina on the Tenasserim Coast (*Casuarina muricata*) can furnish almost any quantity of this timber, but it is very little used. Roxburgh says it resembles toon in appearance. The natives call it by the same name as the pine.—*Mason.*

(678) BEER. Biere, FR. ; Bier, GER.

A fermented liquor made from the malt of barley, and flavoured with hops. Beer is extensively used in India, and is solely imported from Great Britain in hogsheads, and in small quantities bottled.—*Faulkner.* At nearly all periods in the world's history and among nearly all nations, the art of making a fermented drink from some kind of grain appears to have been known ; but of all the cereals, barley is the best adapted to the making of beer. In India the bitter pale ales of Messrs. Bass and Allsop, are used to the almost entire exclusion of all others.—*Tom.* See ALE.

(679) BEERA or BEEREE, (pan ka) a small packet of betel leaf.

(680) BEESHA, a genus of grasses nearly allied to *Bambusa*, with which it is actually combined by some botanists, but from which it differs, according to the concurrent testimony of all authors, in the otherwise incredible circumstance of its seeds being inclosed in a fleshy pericarp. Two species are known, both of which have the aspect of the spineless bamboos. Of these *Beesha baccifera* is found on the mountains of Chittagong, where it is called Pagu Tulla, growing in dry places on the sides of hills, where the upper stratum of soil is sandy. It perishes after yielding its fruit. It yields more or less Tabasheer, of a silicious crystallisation ; sometimes it is said the cavity between the joints is nearly filled with this, which the people call Choona, or Lime. ('Flora Indica,' ii. 197.)—*Beesha Fax* is a smaller species, not above 18 feet high. It is found in Amboyna and other parts of the Malayan Archipelago, where it is applied to many useful purposes. It is the Arundarbor cratium of Rumphius's Herbarium of Amboyna.—*Eng. Cyc. page.* 434.

(681) BEES' WAX, YELLOW.

Peela moom, HIND. | Ten-muricoo, TAM, | Mynum, TEL.

Secretion of the bee, Apis mellifica. Bees wax is the chief source of the wax of commerce, and is an organic product of considerable importance In its natural state it is more or less yellow, and has an odour of honey ; it is brought into the market, after allowing the honey to drain from the honey-comb, and then boiling the combs in water, frequently stirring to prevent burning. The wax thus obtained is melted a second or a third time and pressed through hair bags, of increasing fineness, allowing the molten substance to drop into cold water to firm it and prevent sticking. Another process, however, has been recommended, and it is commendable from its simplicity, viz. to put the combs into a pot with water and nitric acid, one quart of the former to one ounce of the latter, and after boiling it allow them to cool, the pure wax floats on the surface and two layers of dregs settle, the inferior one being almost worthless. This is sometimes adulterated by pease-meal ; but, to purify it, melt and strain through cloth, and the meal remains on the strainer. It is adulterated also with tallow, which cannot be detected, but by the smell. The quantity of Bees wax exported from Madras was 56,602 lbs. in 1853-54, valued at Rs. 19,914. Bees wax has been introduced into China by foreigners from the Indian Archipelago and Europe, though the Chinese also collect it themselves. In the islands where the bees are found, the natives collect the wax from the nests in the forests, disregarding the honey, which is little in quantity and worthless. The islands of Timor and Timorlaut afford bees wax in sufficient quantity to form an important article of export : the Portuguese there send away 20,000 peculs annually to China and India, at a prime cost of $5 per peeul ; Chinese junks import it through Macao. The consumption is small. In the eastern parts of China, the product of the tallow tree (*Stillingia sebifera*), and beef and hog's tallow in the south, are used in the manufacture of candles. Wax is only employed to incase the tallow or lard, which, from the heat of the climate and its unclarified condition, never becomes hard.—*Morrison, p.* 141. Bees wax has always been a considerable article of exportation from the Islands of the Archipelago, chiefly the produce of the wilder parts of them.—*Crawfurd, p.* 445.

(682) BEET. This important plant belongs to the natural order Chenopodiaceæ, which also includes Spinach, Orach, Mercury, Goose-foot &c. Beet, now much known in England by its German name of Mangel Worzel, has afforded a new source of sugar, capable of being produced in Northern Countries.—*Tom.* Dr. Riddell remarks that in the Dekhan, Beet root is grown from seed and thrives best in a light grey soil. The seed may be sown in the latter end of May, and transplanted either in rows or beds. This crop will not produce such large roots as those sown later, but with care some roots fit for salad may be

forthcoming in September; and Dr. Riddell advises the plants being grown on ridges during the rainy season. The leaves, when not too large, of both species, are used and eaten as spinage. The plants should be at least a foot apart, and in transplanting them, care must be taken to draw the root up unbroken, and the hole in which they are put should with a dibble be made quite even, and the plant put in straight. They may be transplanted at any period of their growth, except when going to seed, which all the early sown is apt to do. Fresh seed, if procurable, is to be preferred, though, if seed grown in the Dekhan were sent to another part of the country it would thrive well. Beet-root is always the finer for not being transplanted. The soil cannot be too light, and should be of a rich, old vegetable manure. Mr. Jaffrey observes that this well known esculent root, is used in salads, as a pickle, and preserve; the best are the small varieties; it is raised from seed, and requires a deep, well prepared soil, sown in drills or broad cast. When the plants have formed a few leaves, they ought to be thinned out to about 9 inches apart.

(683) BETA BENGALINENSIS. Bengal Beet. *Palak Sag.* The leaves only of this vegetable are eaten: when boiled it resembles spinach in flavour. The roots are tough and stringy. It may be sown in beds or rows. The leaves shoot out again after being cut down

(684) BETA CICLA. *White Beet.* Leaves used in salads; the midrib of the leaves as a substitute for asparagus; treatment similar to red beet.

(685) BETA MARITIMA. *Sea Beet.* Requires a sandy soil; used as spinach, or a pot herb, raised from seed; of little value.

(686) BEG-BANUFSHA. Root of a small plant brought from Delhi; used as a fine scent in medicine, and in compounding Atrs.

(687) BEGONIACEÆ. Begoniads; a natural order of Exogens, consisting of three genera, Begonia, Eupetalum and Diplocliuium. The species are 159, and are found exclusively in the dampest parts of the tropics in both the new and old world, particularly in Asia and America.—All the species of the genus, Begonia, of whch the order principally consists, have irregular fleshy leaves, often richly coloured with crimson, succulent stems, and neat looking pink flowers, growing in a few flowered panicles. Most of the species at present described may be procured in a living state in the gardens of Europe. The roots of the various species of Begonia are astringent and slightly bitter. B. Malabarica and B. tuberosa, with others, are used as potherbs in the countries where they grow. Endlicher says that some of the Mexican species are drastic purgatives.—*Eng. Cyc. p.* 435.

(688) BEGONIA. A genus of the natural order Begoniaceæ. Natives of the tropics. In cultivating them as flowering plants they require a rich vegetable soil, mixed with pieces of charcoal. They are propagated from cuttings which require to be kept somewhat dry till they root, and by division of the roots also; seed is very uncertain.—*Riddell.* The great yellow-flowered Begonia was abundant in the Bablang pass in the Sikkim Himmalaya, and its juicy stalks were cut by the travellers to make sauce (as we do apple-sauce) for some pork which they expected to get at Bhomsong; the taste is acid and very pleasant.—*Hooker, Him. Jour. Vol.* I. *p.* 29.

(689) BEGONIA. *Sp.*: A pretty little annual, a species of begonia: is common in the neigbourhood of both Tavoy and Maulmain.—*Mason.*

(690) BEGONIA RENIFORMIS. An herbaceous succulent plant, flowers of pale pink colour, and fragrant. Native of the moist forests of India.

(691) BEHAR HILLS, *Acanthaceæ* is the prevalent natural order, at Tope Chooney in the Hills of Behar, consisting of gay-flowered Eranthemums, Ruellias, Barlerias, and such hot-house favourites. Other plants gathered here, and very typical of the Flora of this dry region, were Linum trigynum, Feronia elephantum, Ægle marmelos, Helicteres Asoca, Abrus precatorius, Flemingia; various Desmodia, Rhynchosiæ. Glycine, and Grislea tomentosa very abundant, Conocarpus latifolia, Loranthus longiflorus, and another species; Phyllanthus emblica, various Convolvuli, Cascuta, and several herbaceous Compositæ.—*Hooker, Him. Jour. Vol.* I. *p.* 16.

(692) BEKH-KURPUS. Root of a small plant, comes from Delhi; heating; one seer costs two rupees.—*Genl. Med. Top. of Ajmere, p.* 30.

(693) BEKH-UNJUBAZ. Red colored root of a plant, that is brought from Delhi; considered as cooling and astringent.—*Genl. Med. Top. of Ajmere, p.* 130.

(694) BEL, BELGAR. Fruit of the Ægle marmelos: Cratæva marmelos: Bengal quince. The leaves are sacred to Mata jee (from the milk of whose breast this tree is believed to have sprung up). The punsaris of Ajmere believe that one pice's size of the bark of the root of this tree, rubbed up with ghee, will, if given soon, recover a person who has taken an overdose of opium.—*Genl. Med. Top. of Ajmere, p.* 128. Mr. Adolphus, London, 1853, mentions that the Bel fruit is described in the works of Ainslie, Persoon, Roxburgh, Sir W. Jones, Royle and others. It is the fruit of the Ægle or Cratæva marmelos of Linnæus, and is generally, although incorrectly, termed the Bengal quince, as it is one of the Auranthaceæ or orange tribe. This fruit has already received some notice when describing the Ægle marmelos; but we may here observe that a chemical examination of the Bel fruit shews it to contain tannin, either pure or in conbina-

tion; a large amount of mucilage; a concrete essential oil; and an aromatic as well as a bitter principle. It would also appear that a sedative or narcotic property exists in one or other of these. According to Lindley, a decoction of the root and bark of *Ægle marmelos*, is used on the Malabar Coast, in hypochondriasis, melancholia, and palpitation of the heart: a decoction of the leaves in asthmatic complaints, and the fruit, a little unripe, is given in diarrhœa and dysentery. Roxburgh adds that the fruit is most delicious to the taste, exquisitely fragrant and nutritious, but laxative. The decoction of the dried fruit is aromatic, slightly bitter and astringent, gummy and mucilaginous, something like a mixture of a decoction of quince and pomegranate, but bearing an aroma peculiar to the Bel. Different from most vegetable astringents, however, its use does not confine the bowels, but appears rather to strengthen and regulate their action. Its great value is doubtless in diarrhœa and chronic dysentery. The Bel preserve or jelly is a gentle but effectual laxative. It is eaten at meals, like marmalade, every morning, and acts moderately on the bowels during the day. This is found very useful to women and children, whom it is injurious to accustom to continual purgation.

(695) BELEMNITES, are officinal in Arabic medicine.—*Honigberger, p.* 242.

(696) BELGAUM WALNUT OIL, ALEURITES TRILOBA—HIDJLEE BADAM KA TEL. (HIND). The Moluccа tree which produces the "Lumbang nut" grows plentifully near Hyderabad. The nuts yield a very large per-centage of oil, and the tree is found to be very prolific. The nuts, strung upon a thin strip of bamboo and lighted, will burn like a candle; a notice of this interesting substance may be found in the Transactions of the Agri-Horticultural Society of India, Vol. VIII. p. 220.—*Mad. Ex. Jur. Rep.*

(697) BELLIS, from bellus (pretty), a genus of plants belonging to the natural order Compositæ. DeCandolle enumerates five species belonging to this genus. One of them the B. perennis, is the comman daisy, and is a native of Great Britain and all Europe. There is a double variety called Large double, another Double-quilled, and a proliferous variety known by the name of Hen-and-Chickens. These varieties assume various colours, from deep red to pink and white. They are easily cultivated, and form pretty plants for edges and borders, and continue in blossom a long time.—*Eng. Cyc. p.* 437. In India, a species of this well known flower is easily cultivated by seed after the rains, it thrives best in a rich loamy soil, and should be grown in pots.

(698) BELAMCONDA, See MORŒA CHINENSIS.

(699) BELL METAL.

Klokspys, DUT.	Glockengut, GER.
Metal de Fonte ou de cloches, FR.	Kolokhnaja-mjed, RUS.
	Campanil, SP.

An alloy consisting of three parts of copper and one of tin, of which bells are made. *The bells of Tanjore* are excellent in tone, superior in finish, and very moderately priced.—*Faulkner.*

(700) BEN TREE. In India, the Moringa pterygosperma: in Egypt, Guilandia moringa.

(701) BEN-NUTS, the fruit of *Moringa pterygosperma*, from which Ben-Oil, much used in perfumery, is obtained.—*Engl. Cyc. page* 440.

(702) BEN OR MORINGA OIL, MORINGA PTERYGOSPERMA.

Morunghy yennai, TAM.	Sahujna, HIND.
Moronga noona, TEL.	

Ben nut oil has long been valuable on account of the lengthened period, which it may be kept without contracting rancidity. The tree, from which the "nuts" are obtained, is common in all parts of Southern Asia, the flowers, leaves and fruit are eaten by the natives, and the rasped root is used by Europeans as a substitute for horse-radish, to which circumstance it owes its common name of "horse-radish tree." The oil however is seldom made in India, nor does it now form an article of export. In the Tenasserim Provinces, the tree which yields the celebrated oil of ben is very abundant, though Mr. Mason is not aware that any oil is pressed from the seeds in these Provinces. But in the West Indies, the oil of this tree is used for salad oil, and because it does not congeal or turn rancid, is employed by watchmakers, and for retaining the aroma of delicate flowers.—*Mason.* A ben oil is also procured from the seeds of the *Guilandia moringa*, which grows in Ceylon, Arabia, Egypt, and Ethiopia. The oil is inodorous, and does not generally become rancid, nor freeze readily, and is consequently much used by perfumers in the manufacture of scented oils.—*Faulkner.* Many delicious perfumes might be obtained by means of the ben oil from various flowers, especially from those of two species of Hedychium and a species of Dendrobium, on the Western coast of India, which we have no doubt would be highly prized at home.

(703) BENJAMIN, BENZOIN.

Lúban, ABAB.	Benzoinum, LAT.
Caloowell, CYNG.	Cominyan, MAL.
Loobance-ood, DUK.	Sambranee. MALEAL.
Benzoin, FR.	Luban, PERS.
Benzoe, GER.	Kaminian, PALEM.
Looban, GUZ. HIND.	Devadhupa, SANS.
Belzuino, IT.	Bengui, SP.
Menian, JAV.	FAULKNER.

In Upper India, Benjamin is the name given to the resin of Boswellia thurifera, but it is generally applied to the resin of the *Styrax Benzoin*, Benjamin tree, which grows in Sumatra, Borneo, Siam, and Java. It is a lofty tree, loaded with rounded branches with whitish and

downy bark. Benjamin occurs in dry and hard grey masses, rather shining, brittle, formed of ovoid, whitish tears, like stripped almonds, and placed as it were in a cement of a greenish red porous mass. Fracture resinous. Sp. gravity 1092. Odour sweet, peculiar, very agreeable, increased by friction, taste sweetish, subresinous, balsamic, irritating, powder yellowish grey, disposed to cake. With the resin generally sulphuric acid strikes a deep red colour. The Styrax benzoin occurs chiefly in Java and Sumatra. The balsam is obtained by incisions practised in the trunk of the tree after it has attained the age of five or six years. The resin is white, and transparent at first. About 3 lbs. are given by each tree, for six years. Benjamin is a word of Hebrew origin. It is most likely that the Hebrews applied the term to some other similar balsam, and that it has in the lapse of time been adopted for the present article.—*O'Shaughnessy, page* 430, 431. The white or superior Benjamin, is distinguished by the term *Cowrie luban* in India. Benjamin is chiefly employed to yield Benzoic acid, also as a cosmetic, and as an incense in Roman Catholic and Mahomedan countries. Real Benjamin is imported into Bombay from Singapore, and an inferior or factitious description from Calcutta.—*Faulkner*. Crawfurd mentions that the Stryax benzoin tree is raised from the seed, is of moderate size, and confined to the Islands of Sumatra and Borneo. In the first, in the country of the Bataks, and in the last, on the northern coast of the Brunai territory. The trees produce Benzoin when seven years old.—*Crawfurd, page* 50. Benzoic Acid is procured from this substance. The word *Benzoin* has also been given by Hayne to the plant which yields the resin.—*Eng. Cyc. p.* 445.

(704) BENZOIN ODORIFERUM. Nees. *Syn.* Laurus Benzoin, *Linn.* Oil of the berries aromatic, bark highly stimulant, and tonic.—*O'Shaughnessy, page* 548.

(705) BENZOIN NEESIANUM. Nipal berries, have a smell of cajeput oil. A bush 8-10 feet high, bark highly aromatic and tonic, infusion of twigs vermifuge, berries yield aromatic oil. The name Benzoin has been applied to this genus from its strong odour of Benjamin, but it is not to be mistaken for a source of that article.—*O'Shaughnessy, page* 558.

(706) BENT GRASS. The species of *Agrostis* have this name.—*Eng. Cyc. p.* 445.

(707) BENTEAK. See LAGERSTRŒMA MICROCARPA. This timber tree is common in Wynaad and on the western ghauts; wood prized for making coffee cases.—*McIvor. M. E.*

(708) BERBERIS, a genus of plants belonging to the natural order *Berberidaceæ*, among which it is immediately known by its shrubby habit, berried fruit, and the presence of glands upon its petals. It is also remarkable for the irritability of its stamens, which, when the filament is touched on the inside with the point of a pin or any other hard instrument, bend forward towards the pistil, touch the stigma with the anther, remain curved for a short time, and then partially recover their erect position: this is best seen in warm dry weather. The species of this genus are interesting both for their utility and beauty. The value of the bark and root of the Common Barberry for dyeing leather and linen of a yellow colour is well known. Dr. Royle has shown that this property exists in the species of India, especially in *Berberis aristata*; and it has been ascertained by Vauquelin that a plant found on the Neilgherries (*Berberis tinctoria*) is inferior to few woods for dyeing yellow. The acid quality of the fruit has rendered all the species more or less esteemed; that of *B. aristata* and *B. Nepalensis* is dried by the mountaineers of India as raisins, and sent to the plains for sale. The bitterness and astringency of the bark has caused them to be received into the list of useful medicinal plants; and it has been ascertained by Dr. Royle that the λυκιον ινδικόν (Lycium Indicum) of Dioscorides, concerning which so much doubt has always existed, was an Indian species of Barberry now called *Berberis Lycium*. (Royle's 'Illustrations of the Botany of the Himalayan Mountains, &c. p. 63). The species of *Berberis* are obviously divided into two great groups, of which the first has undivided leaves, like the common Barberry, and the others are pinnated, after the manner of the leaf of an ash tree. Botanists call the latter Mahonias. Ash-Barberry may be taken as their English designation.—*Eng. Cyc. page* 442. In the lower and outer Himalayas, B. Asiatica is almost the only species found in Kumaon. B. lycium is found in Gurhwal, and it is likely more abundant to the westward. B. aristata is the common Barberry of the upper regions in the outer hills. The other varieties of B. aristata are all from the forests of the higher ranges in the interior of the mountains. B. vulgaris *var*: is the species found among the snowy mountains themselves, and is probably more abundant to the westward in the drier vallies cut off from the rains. B. concinna is a form of the highest regions also, but rather of the wetter climate, and reaches into Sikkim. There is much doubt as to the actual number of species. Roxburgh, in his Flora Indica, gives three species. B. Asiatica, B. augustifolia; B. pinnata. He also describes a species mentioned by Captain T. Hardwicke, as B. illicifolia.—Vide Asiat. Researches, Vol. vii. page 357. Wight and Arnott give two species, viz. B. tinctoria and B. Leschenaultii, which latter they mention as perhaps not distinct from B. Nepaulensis. Lindley, in his Vegetable Kingdom and Natural System of Botany, mentions merely the B. vulgaris and Asiatica. Royle states that the most remarkable and best known Indian species of Berberis are B. Nepaulensis, B. Wallichiana, B. Asiatica and B. aristata: to these a new species from Ku-

nawar has been added. He also describes the B. lycium. Madden, in his description of the Turaie and outer mountains of Kumaon, mentions that the Berberis illicifolia, as noted above, is identified by Roxburgh with B. Asiatica, and states that, unless an abrupt change occurs at Mussoorie, the B. Asiatica is the B. lycium of Royle. It is known at Mussoorie by the name of Kingora, whereas in Kumaon "Kilmora" is the term used. Don again identifies the B. augustifolia with the Berberis aristata. The B. pinnata Roxburgh mentions as so like the Ilex Japonica of Thunberg, that he thinks that they are identical; thus we are left in a dilemma whether to put this plant down as a Berberry or a holly. Gerard mentions, in his tour through Kunawar, that the Berberry is very plentiful at the elevation of 10,000 feet, he does not however describe the plant. We find that the B. Asiatica is found at very nearly the same elevation and possibly the B. Kunawarensis, and it may prove by further investigation to be the same plant. We find then from enumeration of the above, an aggregate of eleven species is procured which may safely be reduced to the five or six, as borne out by the researches of various authorities: Berberis Vulgaris; B. Wallichiana; B. Asiatica; B. Aristata; B. Nepaulensis. In general terms, they may be called "spring shrubs with yellow flowers and acid berries." They inhabit essentially the northern hemisphere and chiefly mountains; being very common in the hilly regions of India. Dr. Griffith found Barberry growing with Viburnum and Bucklandia, in the Churrah hills, at 5,921 feet; it is well-known in the Neilgherries; and indeed, forms an important part of the woody vegetation of Indian mountains generally. It does not, perhaps, grow at a lower elevation than 3,500 feet, though one kind is common at 10 and 11,000. In Kumaon and Gurhwal the B. lycium and B. aristata are very abundant: the former (vernacular Kilmora), is confined to low, and the latter (Chitra) to high, elevations. The Barberry is a very hardy shrub, and easily propagated. It has been seen (the B. aristata), at the foot of the "everlasting snows" far beyond the limits of forest, (in a land of rhubarb and wild sheep :) but stunted to a level with the mountain gooseberry, by the side of which it grew. All the Barberries are characterized by a sweetish acidity, caused by oxalic acid in the leaf and berries. In some countries the latter are dried in the sun like raisins; by the presence of a strong yellow colour in both bark and wood used as a dye and by an extreme astringent bitterness, pervading more or less the entire shrub, but residing chiefly in the bark. In this astringent bitterness exists the efficacy of Barberry as a febrifuge; and it is best found in the bark of the root.

(709) BERBERIS ARISTATA, Chitra, Hind.

Bristle-leaved Barberry.—Spines 3-parted, simple, or wanting; leaves obovate, acute, shining on both sides, with a few bristle-pointed teeth on either edge; racemes always more or less compound and corymbose. A native of the mountains of Hindustan, extending from the Himalayas down the Neilgherry Hills as far as Adam's Peak in Ceylon. It is a hardy sub-evergreen bush in English gardens.—*Eng. Cyc. page* 443. Fruit sun-dried, used as raisins. Bark and root used for making *Rusot*.

(710) BERBERIS ARISTATA, (D. C.) *var.* Chitra, Hind. Binsar, Nainee tal ke, Hind. From 6,500—10,000 feet. The commonest form of this species have longish fruit and branched pedicels and long thin peduncle. *Berberis aristata*, D. C.) *var. floribunda*, Hook and Thorp. (Dwali, 8,500 to 10,000 feet. This form has larger and rounder fruit than the last, of a dark purple colour, the peduncle thicker and pedicels one flower; the clusters of flowers much larger than the last. *Berberis aristata*, (D. C.) *var. Nainee*, 7,000—8,000 feet. This is somewhat intermediate between the two last. *Berberis aristata*, (D. C.) *var. petiolaris*, Wall. (Dudutoli 8—10,000 feet). The leaves of this variety are much thinner in their texture than any of the others, being membranous not coriaceous; the lower end of the leaf gradually tapers off so as to give the petiole the appearance of being winged, whence the name petiolaris. Its bark and root is used in making Rusot.

(711) BERBERIS ASIATICA, Raisin Barberry. (Huding-Nioong-Mari, Hind.) Spines small and weak, simple or 3-parted; leaves oblong or obovate, acute, somewhat glaucous beneath, either entire or coarsely or even finely toothed; flowers in short compact racemes not longer than the leaves. Found in Nepaul and Kumaon very abundantly, forming a tall bush with the habit of the common European Barberry. The fruit is round, covered over with a thick bloom, and has altogether the appearance of the finest raisins. It is produced abundantly in Britain, where the plant is now not very uncommon. The very short racemes are the principal distinction of this species when in flower.—*Eng. Cyc. page* 442. *Berberis Asiatica*, (Rox.) *var. tinctoria*. (Almora &c. 3,000—7,500). This is the common Barberry of the lower and outer hills; the peduncle of the flower raceme is very short indeed there is hardly any, numerous pedicels springing out in a thick cluster all together. The leaves harsh and more coriaceous than any of the preceding. It is used for dyeing yellow. Dr. Riddell remarks that this tree is found in the hills of Nepal, and most probably on the Neilgherries. He met with it first in Deyrah Dhoon. There is a large and small blue fruited sort, as well as the red. He had never seen it in

the Dekhan. The trees have blossomed in the Botanical Gardens at Calcutta.

(712) BERBERIS CARAGANÆFLORIA, a Chinese plant with the points of the leaves hardened into spines.—*Eng. Cyc. page* 444.

(713) BERBERIS CONCINNA, Hook and Thorp—angulosa, Wall. Ramri and Pindari 9,000—12,500. A small shrub, only a foot and a half high, flowers solitary, red fruit, the leaves and stems very spiny. In the Ryott valley in Sikkim at Laghep, Iris was found by Dr. Hooker abundant, and this small bushy barberry (*Berberis concinna*) with oval eatable berries. The north wall of the house (which was in a very exposed spot) was quite bare, while the south was completely clothed with moss and weeds.—*Hooker Him. Jour. Vol.* II. *p.* 197.

(714) BERBERIS FLORIBUNDA, Many Flowered Barberry. Perhaps a variety of B. aristata. Spines very stiff, and 3 parted; leaves oblong or oblong-lanceolate, nearly entire or toothed in various degrees, sometimes very deeply and coarsely veined; flowers in long loose slender racemes. Apparently extremely common in the whole of the north of India, where it forms a tall bush, varying considerably in the size and form of the leaves, and in the degree in which they are toothed, but always well marked by its slender, pendulous, or erect racemes of flowers which are much longer than the leaves, and in no degree corymbose. It is to be found occasionally in the more choice collections of England. Out of accidental variations in its mode of leafing and flowering, the spurious species called *B. affinis* and *B. ceratophylla* have been constituted.—*Engl. Cyc. p.* 443.

(715) BERBERIS INSIGNIS, a plant of the Sikkim Himalaya. It is a magnificent species, and forms a large bush with deep green leaves seven inches long and bunches of yellow flowers. —*Hooker, Him. Jour. Vol.* I. *page* 364.

(716) BERBERIS KUNAWARENSIS, is found in Kunawar and employed for Rusot.

(717) BERBERIS LESCHENAULTII (the *Berberis acanthifolia* of some), a fine pinnated plant with round black fruit, found on the Neilgherry mountains at the elevation of 8,000 feet.

(718) BERBERIS LYCIUM; *Vern.* Chitra, Kushmul. Wood—dar huld and dar chob. Extract, hooziz, rusot, the λυχιον of the Greeks. Grows in the Himalaya. A watery extract called *Rusot* is prepared in the hilly districts of India from the sliced root, stem, and branches of this plant. This extract is to be found in all the bazars, and is much employed by the native practitioners. Dr. Royle has very ably traced the history of this substance, and identified it perfectly with the celebrated λυχιον ινδικον of Dioscorides, the *Hoosiz hindee* of the Arabs. Alone, or rubbed with equal parts of opium and alum, and diffused through water, it is used as

an external application in incipient or chronic ophthalmia, being applied around the eye. Dr Playfair, Dr. Royle, and other high authorities speak in very favourable terms of the success of this practice. *Rusot* of best quality is a pale yellow, uniform, pasty extract, soluble in water and alcohol, to which it communicates a brilliant yellow colour; exceedingly bitter to the taste, of rich heavy smell, blackened by salts of iron, precipitated by solution of gelatine, and consequently containing tannic and gallic acid. Dr. O'Shaughnessy was induced to use it internally as a tonic in consequence of the popular reputation in Europe of the bark of the common barberry, as a remedy for agues, being also aware that M. Buchner had used *Berberite* as a tonic as far as ten grain doses, with considerable benefit. Lastly, the intense bitterness of this principle, and its yielding azote on ultimate analysis, led him to anticipate utility in the treatment of periodical fevers. In his experiments he employed a specimen of extremely fine *rusot*, supplied by Dr. Campbell of Nepal, and also an extract prepared at the Calcutta Medical College from the bark and stems of the Berberis asiatica, obtained from Dr. Wallich from the Botanic Garden. Rusot is best given as a febrifuge in half drachm doses diffused through water, and repeated thrice, or still more frequently, daily. It occasions a feeling of agreeable warmth at the epigastrium, increases appetite, promotes digestion, and acts as a very gentle, but certain aperient. The skin is invariably moist during its operation, on the whole, we deem the rusot a most important accession to the Materia Medica, and worthy of being substituted in a multitude of cases for cinchona bark. Its aperient action renders it especially valuable. The rusot is manufactured in Nipal and the Dhoon, at about eight annas the seer. What is found in the Bengal bazars is often of a very inferior description, old, mouldy black, and mixed with half its weight of impurities. *Berberite* may be given in five-grain doses. It has not been employed much, as it is a preparation very troublesome to make in a pure state and as the administration of the extract and tincture prove so satisfactory. The pharmaceutical preparations of this genus generally are the Tincture made from the bark of the root, extract from the same, and an extract is also prepared from the wood of the stem and bark mixed, this latter is the Rusot of the Indian bazars. Berberine has also been obtained from the bark. The first of these preparations, viz. The tincture of the Root Bark, is considered by far the best mode of administering the medicine. In consequence of its containing all the active properties of the plant, and from its purity the dose necessary to be given is not bulky or so likely to cause nausea and sickness: it is prepared with Barberry bark 52 ounces, Alcohol 24; ditto From Berberis lycium and other species, common in the lower ranges of the Himalayas, of the

extract of bark and wood, there are several sorts of varying quality: the best are of a deep yellow colour, totally soluble in water, and made from the bark of the root. It is undoubtedly a powerful febrifuge, in which many have confidence and besides being tried extensively at the Medical College Hospital by Dr. W. O'Shaughnessy, it has been much used in Rohilcund, by Dr. Kirk, Stiven and Hay, and by Medical Officers before them, it acts especially as a diaphoretic, and in this respect its effects have often been compared to those of Warburg's drops, for they are both certain diaphoretics. Its use however, is not attended with the intense degree of discomfort, which in the first instance follows the administration of the drops. Part of the efficacy of Rusot is no doubt owing to the presence of Berberine which has been experimented with in Europe—however without any very striking effects. This alkaloid has not been used in India. But though its preparation be troublesome it should be made in considerable quantity from the Rusot, and have a fair trial given it. Rusot according to O'Shaughnessy, is best given as febrifuge in half drachm doses diffused through water, and repeated thrice or still more frequently daily. It occasions a feeling of agreeable warmth at the epigastrium, increases appetite, promotes degestion &c., and acts as a gentle but very certain aperient. He found it most useful in curing ague, but it has been employed with success in remittent fevers in the upper Provinces. Rusot is used extensively at some dispensaries in the North-West, and many in that part of India think it second to quinine only. The substance well deserves further investigation, especially as it appears to exercise a beneficial power over remittents as well as intermittents, (the great test of the value of a febrifuge) and the Bengal Medical Board not long ago took measures with the view of having its powers more fully tested, by the preparation on the large scale of the tincture, probably its best form for exhibition. The experiment has been in the main a successful one, and Rusot is the most promising of our Indian febrifuges. Royle mentions that a variety of B. lycium grows at Nandakni River at an elevation of 3,500 feet; the racemes of the flowers are simple, the peduncle being one or two inches long with short flowered pedicels. *Berberis lycium*, var. 2 Ramri 9,500 feet, said to be a form of B. aristata with the flower racemes like B. lycium from the sliced root stem and branches; the extract Rusot is prepared from it.

(719) BERBERIS NEPALENSIS, a native of the mountains of the North of India, where, according to Dr. Royle, it grows twelve feet high in shady places, at 5000 and 6000 feet of elevation; this is a noble species, and would in all probability succeed in Britain.

(720) BERBERIS SINENSIS, Chinese Barberry. Spines 3-parted or none; leaves lanceolate, very acute, much netted, entire or regularly toothed; flowers numerous, in drooping racemes, which are not much longer than the leaves. A native of the North of India and of China. Leaves leathery, evergreen; flowers solitary, or in clusters.—*Eng. Cyc. p.* 442.

(721) BERBERIS TINCTORIA. This is possibly a variety of B. asiatica. It yields a yellow colouring material, the colouring matter is found in the whole of the root, but in the stem it is only deposited round the pith and near the bark: the great bulk of the woody fibre contains no colour. The colour is quite as good as that of the root imported into England from Cologne and Hamburgh, and it would be profitable for India to export the extract.

(722) BERBERIS TRAGACANTHOIDES, with not more than one or two pairs of leaflets, is found along the banks of the river Kur, Tiflis.

(723) BERBERIS UMBELLATA, Wall, perhaps a variety of B. aristata—Duali 9,500—10,000 feet. A shrub like B. aristata but having the flowers in umbells or in racemes on which the pedicels are arranged in umbells.

(724) BERBERIS VULGARIS, Lin. *var.* cretica, Hook and Thorp (Bampa Pindari 9,000 feet.) A small shrub of four or five feet in height only found high up among the snowy mountains. It has a short raceme nearly simple. Red fruit. The bark of the B. vulgaris, (principally) is extensively used in Poland and Australia, to dye leather a deep yellow. Its ripe fruit is made into preserve and pickle.

(725) BERBERIS WALLICHIANA, Wallich's Barberry. Spines long, slender, 3-parted; leaves oblong, lanceolate, deep-green, sharp-pointed, finely serrated; flowers very numerous, in clusters shorter than the leaves. A native of Nepaul, and apparently of the higher part of the country. *Berberis atroviridis* is another name for this species.—*Engl. Cyc. page* 442. Leaves leathery, evergreen; flowers in racemes.

(726) BERGAMOT OIL, (OR OIL OF THE RIND OF THE BERGAMOT LIME,) Citrus Limetta. To prepare this, rasp the rind, express the raspings between flat porcelain slabs, allow the oil to settle, and then filter. The exquisite flavor of this oil is injured by distillation. It is used chiefly as a perfume, colour yellow, sp. gr. 0.888, freezes at 32°.—*Beng. Phar. p.* 378. Bergamot is also obtained by distillation from the root of the fragrant citron, the citrus. More than 22,000 lbs. of this essence was imported into England in 1848.—*Simmonds, page* 566.

(727) BERGERA KONIGII.

Bursunga, BENG.	Careypawkoo Kura, TEL.
Karivepa. TEL.	Kuroo apilai marum, TAM.
Karivepilli, TAM.	Bursunga, MAL.
Kristna neemboo, SANS.	Kurrepak, DUK.

The Koodia Neem, a small tree, a native of the mountainous parts of the coast. Indigenous, of easy culture, is common throughout the country;

ultivated also generally in gardens for its leaves, which retain their flavour when dry, (*O'Shaughnessy, page* 232), and are used to flavour curries, mullagatawny, chatnies, &c. and mixed in curry pastes nd powders; prepared in this country for transmission to England, and other parts of the world; he mixture of these leaves not only imparts a eculiar flavour to the above, but adds a zest to hem. It grows to a tree of tolerable dimensions, with pinnate leaves; strongly scented; flowers in February and March; fruit of a deep purple colour, wood hard and close grained; medicinally, the leaves are considered stomachic and onic, used raw in dysentery and when roasted are administered in decoction to stop vomiting. The bark and root employed as stimulants.—*Royle Ill.*

(728) BERRYA AMMONILLA.

Trincomallee wood, Eng. | Somendilla also Halmilile
Tircánamalay marum, Tam. | also Hameniel, Cyng.

Introduced from Ceylon to the continent of ndia; the wood is annually imported from Trincomallee, by which appellation it is known n the Madras market. It is highly esteemed or its lightness and strength, is straight grained—slightly pliant, tough and little affected by the atmosphere, and is employed in the construction of the Massoola boats of Madras (Wight,) t is also used for spokes of wheels, helves, handles, planes, frames, poles and shafts of carriages, it is inferior to *Saul* for spokes, and to he babool for some other purposes, but it is omparatively light and easily worked (Rohde) The market is still dependent on importation rom Ceylon.—*M. E. Jur. Rep.* Dr. Helfer nentions this tree, which produces the Trincomalee wood, as growing on King's Island opposite Mergui, and as a light, strong, valuable wood. —*Mason.* In the Tamil and Malabar of Ceylon, *Somendilla*: it is commonly called *Halmilile* and *Hameniel*, by the Dutch and Portuguese. The tree ields the best and most useful wood in Ceylon or naval purposes. It grows straight, from wenty to forty feet high, and from twelve to hirty inches in diameter. This tree, with the atin wood, was reported by Mr. Edye to be the nost plentiful and valuable found in Ceylon; and o be obtained at a moderate rate to answer the lemands of the navy in India: it may be considered superior to any wood for capstan bars, ross and trussel-trees, cask-staves, battens for ards, fishes for masts, boat-building &c. The ame authority states that at Madras, it is highly valued for coach-work from the toughness and ineness of its grain.—*Edye, Ceylon.*

(729) BERTHELOTIA LANCEOLATA, is plant which grows in the Punjab, but is seldom used by the Hakims—*Honigberger, p.* 243.

(730) BERTHOLLETIA, a genus of plants belonging to the natural order *Lecythidaceæ*, and named after Berthollet, the celebrated chemist. The only species is a tree of large dimensions, which forms vast forests on the banks of the Oronoco, and might with advantage be introduced into India. The fruit is figured and described by Humboldt as a spherical case as big as a man's head, with four cells, in each of which are six or eight nuts; its shell is rugged and furrowed, and covered with a rind of a green colour. The nuts are irregularly triangular bodies, having a hard shell, which is very much wrinkled, and which is fixed to a central placenta by their lower end; their seed, as is well known, is a firm oily almond of a pure white colour. They are sold in the shops of London under the name of Brazil Nuts. "The Portuguese of Para," says Humboldt, "have for a long time driven a great trade with the nuts of this tree, which the natives call Iuvia and the Spaniards Almendron; they send cargoes to French Guyana, whence they are shipped for England and Lisbon. The kernels yield a large quantity of oil well suited for lamps." The same traveller describes himself and his companion Bonpland as having found these nuts a great luxury when they were following the course of the Oronoco. For three months they had lived upon bad chocolate, rice boiled in water, always without butter, and generally without salt, when they met with a store of Bertholletia nuts. It was in the course of June, and the Indians had just gathered in their harvest of them. The kernels were found delicious when fresh, but unfortunately they are apt to become rancid on account of the great quantity of oil which they contain.—*Eng. Cyc. page* 448.

(731) BERYL, Aqua Marine. An ornamental stone differing little from the emerald except in colour. Localities, France, Brazil, Siberia, India, Burmah, and United States. Beryl is a mineral, among the varieties of which are found two of the most beautiful and costly gems with which we are acquainted, namely, the *Emerald* and the *Precious Beryl*. This species contains several varieties, of which the two known among lapidaries under the name of Emerald and Aquamarines or Precious Beryl, are the most worthy of attention. These varieties, though distinguished by some mineralogists as forming distinct species, differ however only in colour, the term Emerald being applied to those possessing the peculiar rich deep green so well known as the emerald-green, while all the other varieties are comprehended under the name of Beryl; those which are clear, transparent, and possess a good colour, present various shades of sky-blue or mountain-green, being the Aqua-marine or Precious Beryl. The colour of the Emerald is attributed to the small quantity of green oxide of chromium which has been found in the specimens from Peru; while the varieties in the tints of Beryl may be considered to be produced by admixtures of the oxides of iron, the yellow being the colour of the peroxides of iron, and the mountain-green and the various shades of blue

being the effect of varying quantities of the protoxide, to the presence of which the common bottle-glass owes its tint.—*Engl. Cyc. p.* 446. The following localities produce the finest Emeralds:—The mines in the Tunca Valley, situated in the mountains between New Granada and Popayan, and not far from the town of Santa Fé de Bogota, where, according to Humboldt, they are found in veins traversing clay-slate, hornblende-slate, and granite: the Henbach Valley, in the district of Pinzgau, Salzburg, where they occur imbedded in mica-slate, and are inferior in colour to those from Peru; varieties have also been lately found in some old mines in Mount Zabarah, in Upper Egypt, from which spot the ancients are supposed to have derived their emeralds.—*Eng. Cyc. p.* 449. Beryls are found in the sands of the Irrawaddy; and may probably be found in some of the rivers, that descend from the granite mountains in these provinces.—*Mason.* Amethysts, and Aqua marine chrystals are obtained from a mine near Cangium in Coimbatore. The amethysts seem wanting in depth of colour. The aqua marine stone are better in that respect, but small. They are procured from a deep well in the Cangium talook in considerable quantities, formerly they were worked to some extent but not now; owing to the quantity of water impeding, the work has been discontinued. The varieties known in commerce by the name of Beryl are found principally in Siberia and Brazil: in the former country it occurs in the granite district of Nestschinsk and also in the Uralian and Altai Mountains, sometimes in very large crystals, having been found upwards of a foot in length. In the granitic mountains of Odon Tchelon, in Daüria, three very interesting mines occur at different elevations in the mountain; in the lowest are found, irregularly disseminated through a mass of semi-decomposed granite mixed with ferruginous clay and nodules of Wolfram, prismatic crystals of Beryl of a greenish-yellow colour, rarely exceeding one inch in length. Some hundred feet higher occurs the second mine in a vein of micaceous clay, from which the most valuable crystals are obtained: their colour is of a pale but pure green, and their size frequently considerable. The third mine is situated in a vein of white indurated clay on the summit of a mountain; in this mine the varieties are usually of a pale greenish-blue, but sometimes they are found of a pure but pale sky-blue. They are here remarkably transparent. Imbedded crystals and massive varieties are also found at Limoges, in France: near Zwiesel, on the Rabenstein, in Bavaria; at Fimbo and Brodbo, near Fahlun, in Sweden; and likewise in some of the tin-mines in Saxony and Bohemia. An enormous specimen is also described in Silliman's 'Journal' as having been found at Acworth in New Hampshire, United States. Its dimensions are stated to be 4 feet in length and 5½ inches across the lateral planes, and weight to be 238 pounds. Specimens of Beryl have also been found in several of the primary districts of Ireland; those from the granite of the Mourne Mountains, in the county of Down, are the finest. In this locality they are associated with topaz, black quartz, felspar, and mica. In Scotland it is found in the granite at Rubeslaw quarry, near Aberdeen, and also in broken pieces in the sand of the rivers of that country.—*Engl. Cyc. p.* 449. The value of the Emerald depends not only on its size, colour, and brilliancy, but also on its being free from flaws, by which this gem is frequently greatly deteriorated in the eye of the jeweller. The following is the rate at which varieties of a fine colour and free from fissures may be procured, as stated by Beudant:

A stone of	5 grs.	from 100	to 120 francs.
,,	8	,, 240	francs.
,,	15	,, 1500	,,
,,	24	,, 2400	,,

Eng. Cyc. page 450.

(732) BETA, a genus of plants belonging to the natural order Chenopodiaceæ, among which it is known by its having large succulent roots, and a green calyx united halfway to a hard rugged nut. The species are found in Europe, the north of Africa, and southern and eastern Asia; four are cultivated as esculents, the others are mere weeds.—*Engl. Cyc. page* 450. See Beet.

(733) BETA BENGALENSIS, (palung), *Spinacia tetratacea* (Ispanack), and *Basella rubra* (pocc) are cultivated by the natives as articles of food. Of Basella, Roxburgh describes three wild, and two cultivated varieties. The *red beet* and *mangel wurzil* also afford abundance of amylaceous and saccharine matter.—*O'Shaughnessy, page* 524.

(734) BETA VULGARIS, Common Beet, is said to be found in a wild state along the whole of the sea-coast of the Mediterranean, and in Egypt; it is however chiefly known as a plant cultivated in gardens, for its carrot-like, sweet and tender roots. Several sorts are mentioned by writers on gardening, varying in the size, form, colour, and sweetness of their roots: of these however two are much more worth cultivating than the others, namely, the small red variety and the long yellow variety; they are the most delicate, the sweetest, and have the richest colour when served at table.—*Eng. Cyc. page* 450.

(735) BETEL LEAF.

Tambool, Arab.	Betela, Maleal.	Tambuli, Sans.
Pan, Duk.	Sireh. Mal.	Vettilei, Tam.
Pan, Guz. Hind.	Burg-i-tambool, Pers.	Tamola-akoo, Tel.
Suro, Jav.		

Betel Leaf, Piper Betel, belongs to the pepper family of plants and furnishes the celebrated leaf of the Southern Asiatics, in which they enclose a few slices of the areca nut and a little shell lime. This they chew to sweeten the breath and keep off the pangs of hunger. It is, also, slightly narcotic. The "*pan*," of the East Indies is even

a more extensive article of commerce than tobacco. Rumphius describes six species of this vine, besides several wild and uncultivated varieties. It is very easily reared in the Indian Archipelago, but in the Peninsula of India, it requires manuring, frequent watering and great care, and in the northern parts of Hindustan it becomes an exotic very difficult to rear. The vine affords leaves fit for use in the second year, and continues to yield for more than thirty, the quantity diminishing as the plants grow older. The leaf of the *Piper betel*, which, mixed with the fruit of the areca palm, commonly called betel nut, and quick-lime, forms a hot and acrid masticatory, is in almost universal use in India and the Malayan Archipelago. The Betel-leaf tree grows in almost every part of India. In the Tenasserim Provinces the Karens plant the vines on their uplands, where there are tall forest trees. The branches of the trunks are lopped off, leaving only the topmost boughs, and the vines readily climb up and weave their dark, glossy leaves all over the summits, making a betel-vine farm a most beautiful object. Karen boys and maidens engage in this leaf harvest with great zest, and it is not uncommon for young men, in seeking companions, to inquire who are the most agile climbers of *poo-lah*, or betel-leaf trees. The Karen forests produce a wild species of piper, the leaf of which is used as a substitute for the common betel-leaf.—*Mason.*

(736) BETEL-NUT, ARECA NUT, PENANG NUT.

Fooful, ARAB.	Fooful, PERS.
Puwak, CYNG.	Areca, PORT.
Sooparee, GUZ. HIND.	Kramuka, Guvaka, SANS.
Jambi, JAV.	Paaku, TAM.
Penang, MAL.	Vukka, TEL.
Araca, MALEAL.	

Betel-Nuts, or Areca-nuts, are the fruit of the Areca Catechu, or Faufel; they have a thin brown rind, and in size are intermediate between walnuts and hazel nuts. Their general substance is of a faint oily grey colour, thickly marked with curly streaks of dark brown or black. The betel-nuts, although softer, resemble ivory, and in the arts are made into necklaces, rulers, tops of walking sticks, walking sticks, and other small objects.—*Holtzappfel.* The Betel or Areca or Penang Nut palm is grown in many parts of the East Indies and Eastern Archipelago, from the Red Sea to the Pacific Ocean, and the people use the kernel of its fruit as a masticatory to a very great extent. It is of elegant growth and rises with a very erect and slender trunk to a height of forty or even sixty feet, the summit terminating in a tuft of dark green foliage; the trunk is seldom more than eighteen inches to two feet in circumference. The tree produces fruit from the age of five to its twenty-fifth year: it begins to blossom in March and April, and the nuts are fit to gather in the months of July and August and are fully ripe in September and October. Fourteen pounds is the average annual produce of a single tree. The fruit ripens only once during the year, but the nuts vary greatly in size, though their quality depends solely on the amount of astringent matter they contain, a point which is judged of by cutting them. If the white or medullary portion, which intersects the white or astringent part, be small, has assumed a bluish tinge, and the astringent part is very red, the nut is considered of good quality; but when the medullary portion is in large quantity, the nut is considered more mature, and, not possessing so much astringency, is not esteemed valuable. The quantity of nuts produced on the coast of Sumatra, is stated at 80,000 piculs. The quantity imported annually by the Chinese, amounts to 45,000,or 48,000,piculs, exclusive of that brought there from Cochin China. It is carried by the people of the East in pouches and presented to guests in the houses of the rich, in silver trays, wrapped in gold and silver leaf, and in this form becomes an essential part in all ceremonial visiting. Indeed among some of the inhabitants of the Eastern Archipelago, to refuse to accept betel nut when offered, would give irreconcilable offence. It is believed to sweeten the breath, strengthen the stomach, and preserve the teeth: and when chewed with betel leaf, the *piper betel*, (Linn.) gives the saliva a red colour which it imparts to the lips and gums. But only some nations chew it with the betel-leaf, others add to it lime, tobacco, gambir (an extract from the foliage of *Uncaria gambir*, Roxb.) and the leaves of various species of pepper. The best Betel nut of the Madras Presidency grows in the Nuggur district of Mysore, and in Travancore. It occurs in the market sliced and in whole nuts, also boiled and raw, or split and dried hastily over a fire, or dried slowly in that manner. That used by families of rank in Travancore, is collected while the fruit is tender, the husk or outer pod is removed; the kernel, a round fleshy mass, is boiled in water. In the first boiling of the nut, when properly done, the water becomes red, thick, and of a consistence like starch, which is afterwards evaporated into a substance like catechu and is indeed known by the same name. The boiled nuts being then removed are sliced and dried, the catechu like substance is rubbed over them, and, on being dried in the sun, they assume a deep black colour. Whole, unsliced nuts are also similarly treated, Nuts are fit for the slicing process in the months of July and August. Ripe nuts preserved in the pod are also in use. Nuts for exportation to Trichinopoly, Madura and Coimbatore, are prepared in thin slices, and colored or left in their natural hue. For Tinnevelly and other districts, the nuts are simply dried, or cut into two or three slices; nuts are exported in their pods to Bombay. 2000 candies on the average are annually exported from Travancore. In China they are met with both cut and

whole and the imports are mostly the growth of Java, Singapore, Sumatra and Penang. The number of the trees of the Betel Palm, in Travancore alone, is calculated at 1,02,32,873. It may give an idea of the great extent to which this masticatory is used in Southern Asia to notice the quantity and value of their Imports and Exports into the Madras Presidency alone, for the four years 1852-53 to 1855-56 inclusive.

	Imports.	
	Quantity.	Value.
Betel nut boiled.	Cwt. 2,09,827	Rs.11,63,361
Do. raw,	Cwt. 76,688 No. 1,05,13,23,180	„ 11,23,709
		Rs. 22,87,070

	Exports.	
	Quantity.	Value.
Betel nut boiled.	Cwt. 1,49,874	Rs. 7,80,646
Do. raw,	Cwt. 75,544 No. 2,44,39,600	„ 4,39,910
		Rs. 12,20,556

The Imported nuts were chiefly brought from the Straits of Malacca, Ceylon, Indian French Ports and Travancore; and the Exports were made to Bombay, the Concan, Cutch, Sind, Guzerat, Persian Gulf and Bengal.

(737) BETULA. A genus of plants of little importance in a medicinal view. The white birch yields a bark which the Kamschatdales chop up with the eggs of the sturgeon, and use as their ordinary food. The sap is acid, and an agreeable beverage, and may be kept for years without undergoing fermentation. There are numerous other economical uses to which the products of this valuable tree are applied.

(738) BETULA ACUMINATA, THE TAPERING-LEAVED BIRCH. Leaves ovate, lanceolate, somewhat simply serrated, taper-pointed, smooth, dotted beneath, leafstalks and twigs quite smooth; ripe catkins, very long, pendulous, cylindrical, crowded; their rachis and the bracts, which are auricled at the base, downy. Found on many of the mountains of Nepaul, and in the great valley of that country, following the course of rivers.—*Eng. Cyc. page* 452.

(739) BETULA BHOJPATTRA.

Bhurja, HIND.

Indian Paper Birch has the leaves oblong, acute, with nearly simple serratures, somewhat heart-shaped at the base: their stalks, veins, and twigs hairy; ripe catkins, erect, cylindrical, oblong; bracts smooth, woody, two-parted, blunt, much longer than the fruit, which has narrow wings. It is found on the Alps of Gurwal and Kumaon, where it was discovered by Dr. Wallich, who informs us that its thin delicate bark furnishes the masses of flexible laminated matter, of which great quantities are brought down into the plains of India for lining the tubes of hookahs. The Sanscrit name of the substance is Boorja. (Wall. 'Plant. As. Rar.', vol. ii. p. 7,) The bark of this species is of a pale cinnamon colour. It is nearly allied to *Betula papyracea* of North America.—*Eng. Cyc. page* 452. So late as the age of the Dramas, about the beginning of the Christian Era, Professor Wilson mentions that the Hindoos still used the inner bark of this Birch as paper.—*Royle, p.* 383.

(740) BETULA CYLINDROSTACHYA, Cylindrical spiked Birch, is found in Kumaon. —*Eng. Cyc. p.* 452.

(741) BETULA NITIDA, the shining birch, grows in Kemaon.

(742) BEZOAR, COW BEZOAR.

Faduj, Hejr-ul-bucher, ARAB.
Visagul, CYNG.
Ghyroon, Zehr-morah, DUK.
Bezoard, FR.
Bezoarsteen, GER.
Goorochundun, GUZ. HIND.
Gawzerah, Padzehr-kanie, PERS.
Bazar, PORT.
Gorochana, SANS.
Koroshanum, Vishih-kulloo, TAM.
Goliga, Mantika, Matika, MALAY.
Gerooda patsa rai, TEL.

There are several kinds of bezoar, all being concretions found in the gall-bladders or intestines of various animals. Some are prized for the fine yellow colouring matter in which they abound; others are celebrated in eastern works as remedies for snake bites, hydrophobia, &c. Bezoars are never used by European practitioners, and do not deserve the least confidence.—*O'Shaughnessy, page* 691. That known as Oriental Bezoar, was formerly used in medicine in Europe, and formerly in India a stone weighing an ounce was sold for £5 and one of 4¼ oz. for £100. When genuine, it varies in form, is smooth and glossy on the surface, of a dark green or olive colour, and in size is generally less than a walnut. The name was at first applied to a concretion found in the stomach of a goat in Persia, but is now used to designate similar substances found in various other animals, as the cow, horse, boar, camel, &c. That produced by the goat was formerly much prized as medicine, sometimes selling for ten times its weight in gold; but since its constituent parts have been ascertained, it has ceased to be sought after. Different animals produce bezoar, the composition of which differs often in the same kind of animal, as well as in dissimilar species. The oriental bezoar is formed of bile and resin; other kinds are found to be made of hair, others of wood, and some principally of magnesia and phosphate of lime. The true bezoar from Persia is counterfeited so well by pipe-clay and ox-gall that

even those have been deceived who procure the genuine from the animal. The genuine throws off only a small scale when a hot needle is thrust into it, and put into hot water it remains unchanged; when rubbed on chalk, the trace should be yellow, but green on quick lime. That found in the camel is highly esteemed as a yellow pigment by the Hindús. The cow bezoar is valued in the Chinese market at from $20 to $25 a catty, and is used by the Chinese solely as a medicine. The little which is brought there is from India.—*Morrison.* Crawfurd mentions that the Bezoar stones brought from Borneo are said to be obtained from the stomach and intestines of monkeys.—*Crawfurd, page* 52. Dr. Honigberger, p. 244, mentions that a Bezoar of the Eastern doctors (Padzuhr seeah, Pers: kanee zuhr, mohra, Ind.) is dark green serpentine, and a specimen in the Madras museum brought from Delhi by Mr. Charles Gubbins, as Zehr mohra, is undoubtedly, this mineral. While this part is passing through the press, a Mahomedan has called to offer for sale two large rings of "Zehr mora," both formed of a serpentine marble. Faulkner's description seems also that of serpentine, he says it has a smooth, glossy surface, and is of a dark green or olive colour. Localities, Borneo, India, &c. It is brought to Bombay from Guzerat and Malabar in small quantities, which is chiefly re-exported to China. Ainslie mentions that it is brought to India from Ceylon, Bussorah, and the sea ports in the gulf of Persia, also that as a medicine, Bezoar is supposed, by the native practitioners, to possess sovereign virtues as an external application in cases of bites of snakes or stings of scorpions. He adds that this calculous concretion appears to have been first used as a medicine by the Arabians. Razis, in the "Continens," describes it fully, and extols its good properties.—*Ainslie, p.* 6.

(743) BHABHUR, Eriophorum cannabinum, Royle; a sedge, employed in India for making ropes. It is very common in the Himmalayas, both in low valleys and at considerable elevations. —*Royle, p.* 34 and 389.

(744) BHAGULPORE. Hooker, in his 'Him. Jour. Vol. I. page 92,' mentions that he found growing here the *Tecoma jasminoides*, Erythrina; Adansonia Bombax, teak, banyan, peepul, sissoo Casuarina Terminalia Melia and Bauhinia.

(745) BHAI-BIRRUNG. The seed of a plant brought to Ajmere, from Harowtee, considered warm and used in mesulihs, and in prescriptions to promote digestion.—*Genl. Med. Top. p.* 126.

(746) BHAI-PHAMBA. The flowers of a plant brought to Ajmere from Harowtee, considered warm, and used to promote degestion.—*Gen. Med. Top. p.* 126.

(747) BHANG. Bhung, Cannabis sativa.

Subjah, Subjee, Sidhee, Duk. Guz. Hind.	Bengh, Pers. Banghie, Tam.

The larger leaves and capsules of the dried hemp plant are usually termed Bhang. They are used by the natives of India for making an intoxicating-drink bearing the same name, also for smoking.—*Faulkner.* The inebriating preparation made from the leaves of the ganja or Bhang the Cannabis sativa, is generally in a liquid form and is a fiercely intoxicating draught. Its recipe is, Hemp leaves, washed in water, 3 drams; black pepper, 45 grains; cloves, nutmegs and mace, of each 11¼ grains; triturate the ingredients with eight ounces of water, or milk, or with the juice of watermelon seed or cucumber seed: and strain. The spices render it more inebriating.—*Herklots.* The hemp-plant in tropical countries also exudes a gum, that is "a very powerful stimulating narcotic," which it does not produce in cold countries. The dried leaves under the name of bhang, partake of this narcotic principle, and are used all over India, to produce intoxicating effects. Under the Burmese government at Tavoy, no one was allowed to cultivate the plant without a licence from Government. Sometimes a general permission was given, and at other times a general prohibition would be issued.—*Mason.* Throughout India however the Bhang is one of the exciseable articles and the trees are taxed for revenue.

(748) BHANG-I-GUNDUNA, Duk. Allium tuberosum.—Indian Chive. This very much resembles the English chive; it is grown in square beds or rows and should be planted at the close of the rains; it is easy of culture either by slips or dividing the roots; it should be set about twelve inches apart, and when the bunches have increased to a large size, must be again divided. It is served in various ways for the table.—*Riddell.*

(749) BHARANGI. Verbesina prostrata. The bark of the stem of this small plant is brought to Ajmere from Harowtee, It is considered warm, and is used to promote digestion.—*Gen. Med. Top. p.* 126.

(750) BHENDEE. See Abelmoschus esculentus. Syn. Hibiscus esculentus.—Benday kaya. The long capsules, when green, are either boiled whole and eaten or sliced and put into soup or curries; the inside is filled with albumen, but, when dressed, not unpleasant. The seed is sometimes laid upon toast with butter, pepper and salt. Another species, A. moschatus, has a smaller capsule; the seeds when rubbed between the fingers have a strong scent of musk; the Arabs flavour their coffee with it.

(751) BHERE FRUIT. See Ziziphus Jujuba.

(752) BHIDAIRA. This is the root of a small bush found in Ajmeer, and brought from Delhi, has little taste: used in medicine; women take it during pregnancy, believing it can cause the womb to rise out of the pelvis when tardy in so doing.—*Gen. Med. Top. p.* 129.

(753) BHILAWA OR BHILAWUN, Hind.
Belader, ARAB. | Bhela, DUK. | Bhalataka. SANS.

Bhilawa, is the nut of a large forest tree, the Semicarpus anacardium, which is common throughout India; the acrid viscid oil which the nut contains, is used as an escharotic and as a counter-irritant: it leaves a mark for life: it creates great pain and often very intractable sores, but ignorant natives, unacquainted with the blisters of Europe, have a greater dread of them than of the Bhilawa. It is given in medicine in small doses, and is considered a stimulant and narcotic; is much used in the mesalihs of elephants; given in large doses, it renders these animals furious, is considered good in venereal diseases, especially of women. The farina of the anthers of the flowers, is very narcotic and irritating; people of a peculiar habit accidentally sleeping under the tree when in blossom, or even going near the flowers, are stupified and have their faces and limbs swollen: and the use of the Bhilawa as a counter-irritant very frequently causes the whole body and face to swell with erythematous inflammation and much constitutional disturbance. The mature corolla and the receptacle are fleshy and sweetish sour, and are eaten roasted or boiled as a vegetable, and aphrodisiac along with cocoanut and chironjie.—*Gen. Med. Top. p.* 127. The Bhilawa nut is worn on the arm, as a charm, in guinea worm.

(754) BHIRMI-SUGAN. Leaves of a small plant brought to Ajmere from Delhi employed in making scents.—*Gen. Med. Top. p.* 129.

(755) BHIRMI-VIDAYA. Leaves of a climber from mount Aboo, very stimulating, and, in Ajmere, used in the "seet," a disease simulating catalepsy.—*Gen. Med. Top. p.* 129.

(956) BHO-PHULLI. A small scandent plant, abundant about Ajmere. It contains a great quantity of mucus, and is used in great quantity, as an aphrodisiac, rubbed up with water and strained. It is also considered cooling, and is used in prescriptions as such.—*Gen. Med. Top. page* 127.

(757) BHULL. Like all large rivers which flow through an alluvial soil, for a very lengthened course, the Indus throws up patches of alluvial deposit at its mouth. In Sind, these are called bhulls, and they are in general of great value in the cultivation of the red rice of the country. They are dreary swamps and exist on both sides of the principal mouths of the Indus, in the Gora baree and Shah bunder pergunnahs, but produce a considerable portion of the rice consumed in Sind. —*Simmonds, p.* 293.

(758) BICHE DE MAR, SEA CUCUMBER.

Tripang, MALAY. | Beche de mer, PORT.
Biche de mar, biche-de Mer. | Hoy-shun, CHIN.
Sualla, Celebes. | Balate, PHIL.

Biche-de-mer or Tripang is the name given to a species of Holothuria, found in most of the shallow seas of the Malay and Philippine Archipelagos. The word tripang is Malay, and the animal is called by the people of Celebes, süala, which our traders write swalloe. It is the beche de mer, or sea-worm of the Portuguese, and our own "sea-cucumber," for in appearance and shape, although not in colour, for it is a dirty brown, it greatly resembles a cucumber. The esculent holothuria is by no means confined to the seas of the Archipelago; it is found in the upper part of the Gulf of Siam, and is so abundant on the northern coast of Australia that the people of Celebes, receiving advances from the resident Chinese, have been long in the habit of making annual voyages thither in quest of it. Gutted, dried in the sun and smoked, it is considered cured, and fit for its only market, that of China, to which many hundred tons are yearly sent for the consumption of the curious epicures of that country. The fishery of the tripang is to China what that of the sardine, tunny, and anchovy is to Europe. It is, for the most part, caught by hand, for it has little power of locomotion, but, in deep water, sometimes by diving. Mr. Windsor Earl, in his account of the fishery on the shores and banks of the Aroe Islands, where this animal appears to be very abundant, mentions that their great sources of wealth are the pearl and tripang banks, which lie on the eastern side of the group. These extend the entire length of the islands, and are often several miles in width, being intersected by deep channels, some of which will admit vessels of burthen. The tripang, or sea-slug, on that coast, is of several varieties. The greater portion is caught in shallow water, where it can be picked up off the bank without diving." See *Journal of the Indian Archipelago, Vol.* iv, *p.* 480. The tripang, although an article of considerable importance in the trade of the Indian Islands, is never found in the printed price-currents of an European emporium, because seldom dealt in by Europeans, which arises from nice or rather capricious distinctions in their quality, which no European is competent to appreciate. We can discover no mention of the tripang in the early Portuguese writers; which seems to be another proof that the Chinese, who carry on the trade and advance the funds, had not yet settled in the Archipelago when the Portuguese first appeared in it.—*Crawfurd Dict. page* 440. The Hon'ble Mr. Morrison mentions that it forms one of the important articles of commerce between the islands of the Indian Archipelago and China. That it is found on all the islands from New Holland to Sumatra, and also on most of those in the Pacific: but is produced in the greatest abundance on small coral islands, especially those to the south and east of the Sulu group. Among the islanders it is known by the name of *tripang*, the Chinese at Canton call it *hoy-shun*, which means *sea-ginseng*. It has but few powers of locomotion. It is sometimes two feet long; but its common length is from four to ten inches, and its diameter two or three. Its tentaculæ are short, and when the animal is cap-

tured are folded up under its body. It is taken with the hand by natives, who often dive for it; and after it has been cleansed, dried, and smoked it is fit for sale. For a long time the Chinese were the sole carriers of the article; but recently foreigners have engaged in the trade. In the market, it appears hard and rigid, and has a dirty brown color; when brought to the table, it resembles pork rind in color and consistency. The Chinese use it by-itself, or as an ingredient in other dishes, and consume large quantities under the belief that it is an aphrodisiac. The varieties into which they devide it are about thirty, varying in price from $80 down to $1½ per pecul, but unless one is well acquainted with the article it is impossible to distinguish them; a great deal of this article is imported into Macao, in junks and Portuguese vessels. In the Chinese tariff, all the sorts are arranged under the two heads of black and white.—*Morrison p.* 141 Mr. Faulkner mentions as its localities, the Eastern Archipelago, Australia, Mauritius, Ceylon, Zanzibar, &c, and that it is occasionally brought to Bombay from the latter place, and re-exported to China.

(759) BIGHA. Bigha, Beegha, corruptly Beegha, Beegah, Begah, &c. A measure of land, varying in extent in different parts of India. The standard Bigha of the Revenue surveys of the North-West Provinces is equal to 3025 square yards, or 5-8ths of an acre. In Bengal, the Bigha contained only 1600 square yards, or little less than 1-3d of an acre. In Benares it was, at the time of the settlement, determined at 3136 square yards. In other pergunnahs it was to 2025 to 3600, or to 3925 square yards. A kacha (an immature or crude) Bigha is in some places a third, in others only a fourth, of a full or standard Bigha. Akbar's Bigha contained 3600 Ilahi-gaz, which have been considered as equal to the 3025 square yards of the Bigha of Hindustan. Mr. Elliot specifies the following as some of the variations found in the Upper Provinces.

	Acres.	Bighas.	Biswas.	Kittas.
Farakhabad, ...	100 =	175	12	0
East and South Gorakhpur,	„ =	192	19	7
Allahabad and part of Azimgerh.	„ =	177	5	6
Part of Azimgerh and Ghazipur,	„ =	154	6	8
Bijnur, ...	„ =	187	19	15
In the upper Doab (Kachhu),	„ =	582	3	0

In Cuttack, the Bigha is now considered to be an English acre. The Maratha Bigha is called twenty pands, or 400 square kathis or rods, each five cubits and five hand-breadths: as the rod varies, so does the bigha: under the Aadil Shahi dynasty it was equal to 4683 square yards, or only 457 square yards less than an English acre. The Guzerat Bigha contains only 2844 square yards.—*Glossary of Indian Terms by Wilson, page* 85.

(760) BIHULL, is the inner bark of Grewia oppositifolia, and employed in the Himmalayas for making ropes.—*Royle.*

(761) BIJUCO; A fibre exhibited from Manilla, in the Exhibition of 1851. Its source is not known.—*Sleman.*

(762) BIJBAN, is the seed of a plant found in all Rajpootanah. It is heating, and used at Ajmere in aphrodisiac prescriptions.—*Gen. Med. Top. page* 126.

(763) BIKH. Bish; Vish; Visha, Ata visha. See ACONITUM. Bikh, or Bish, is the name given amongst the Hindoos to a most powerful and destructive vegetable poison. Dr. Wallich refers the plant to the Aconitum ferox, (*Engl. Cyc. page* 455.); but it seems to be a name given to the roots of the various Aconites, for Dr. Hooker, in one part of his journal, mentions that amongst the herbs he met with were many of great interest, as a rhubarb, and the Aconitum palmatum, which yields one of the celebrated "Bikh" poisons. Bikh, he adds, is yielded by various *Aconita.* All the Sikkim kinds are called "gniong" by Lepchas and Bhoteeas, who do not distinguish them. The *A. napellus* is abundant in the north-west Himalaya, and is perhaps as virulent a Bikh as any species. At another place he mentions that magnificent gentians grow in the Lachoong valley, also *Senecio, Corydalis,* and the *Aconitum luridum,* a new species, whose root is said to be as virulent as *A. ferox* and *A. napellus.* The result, however, of Dr. Thomson's and his examination of the Himalayan aconites (of which there are seven species) is that the one generally known as Aconitum ferox, and which supplies a great deal of the celebrated poison, is the common Aconitum napellus of Europe.—*Hooker Him. Jour. Vol* I. *p.* 168 and *Vol.* II. *p.* 108.

(764) BILE. Modern chemists regard bile as a soda-soap; and, as such, that of the ox, or ox-gall, is used in the arts, by painters in water colours, scourers of clothes, and many others, but from its green colour it requires, for many purposes, to be clarified or prepared. *Prepared gall* combines with colouring matters and pigments, and gives them solidity either by being mixed with or passed over them on paper. It adds to the brilliancy of ultramarine, carmine, green, and more delicate colours, and makes them spread more evenly upon paper, ivory, &c. Mixed with gum Arabic, it thickens the colours without giving a glistening appearance: it prevents the gum from cracking and fixes the colours so well, that others may be applied over them without running into them. Mixed with lamp black it forms a good imitation of China ink. A coat of ox-gall upon black lead or crayon drawings prevents the lines being effaced, and such drawings may be safely coloured by first mixing the colours with ox-gall. Miniature painters also use it for removing the unctuous matter from the surface of ivory; and when ground with the colours, it enables them to be spread easily and renders them fast. It is, also, useful for transparencies, by passing them over the varnished or oiled paper

and allowing it to dry. The colour is mixed with gall and then applied, and cannot afterwards be removed. It takes out spots of grease and oil, and is useful to the laundress in washing dresses, the colours of which would run or be removed by the ordinary process of washing. A small portion dropped into ink renders it fluid. To clarify gall, the fresh substance is allowed to settle for a day or two: the liquor is then poured off from the sediment into an evaporating dish, and exposed to a boiling heat, in a water bath until it is somewhat thick. It is then spread upon a dish and dried before the fire, in which state it may be kept for years in jelly pots covered with paper. When required for use, a piece, the size of a pea, may be dissolved in a table spoonful of water.—*Toml.*

(765) BID-ARI-KHAND. Root of a climber found in the Ajmere hills, considered of a warm nature, and used among a great number of ingredients of many prescriptions.—*Gen. Med. Top. p.* 126.

(766) BIGNONIA, a genus of plants named by Tournefort after the Abbé Bignon, librarian to Louis XIV. It forms the type of the monopetalous order of Exogens, *Bignoniaceæ*. They are usually climbing shrubs furnished with tendrils, having opposite, single, conjugate, ternate, pinnate, or digitate leaves. The flowers are mostly in terminal or axillary panicles. The corollas are trumpet-shaped, and are coloured variously, white, yellow, orange, purple, violet, or rose.—*Eng. Cyc. page* 454. There are betwixt 60 and 70 known species and varieties. In floriculture, they grow in any situation or soil; but do not succeed well in pots owing to their rapid growth. The leaves of Bignonia chica yield a red colouring matter. The bark and capsules of B. indica are astringent, and used in tanning and dyeing. The pleasant tasted and fragrant flowers of B. chelonoides (suaveolens) are described as being used as a cooling drink in fevers.—*O'Shaughnessy, page* 489. Mr. Mason mentions that the Karens often build their boats with the wood of a species of Bignonia, as the genus is defined by Roxburgh; and the timber, which is sometimes large, is frequently used in joinery.

(767) BIGNONIA CHELENOIDES. *Syn.* Bignonia suaveolens. பாதிரிமரம் Pathire marum, TAM. This tree is held sacred by the Hindoos, in consequence of which the wood is obtained with difficulty, and its quality unknown. It deserves attention, as the Bignoniaceæ in Brazil, where the trees attain a large size, furnish some fine timber.—*Jaffrey.* Its pleasant tasted and fragrant flowers are used to make a cooling drink in fevers.—*O'Shaughnessy, page* 408. *Mason.*

(768) BIGNONIA CHICA. Its leaves yield a red colouring matter.—*O'Shaughnessy, p.* 380.

(769) BIGNONIA CORONARIA, a large tree with white flowers, very plentiful in the Tharawaddy and Pegu districts; it and *Bignonia Spathoidea*, found throughout the province, both afford from their inner bark material for rope employed for local purposes. The inner bark of *Sterculia ramosa* also affords a strong and durable rope in common use.—*McClelland.*

(770) BIGNONIA INDICA, grows in Behar, and immense pods hang from its branches in its leafless state. *Hooker Him. Jour. Vol.* 1 *p.* 16. In the Tenasserim Provinces, its large terminal erect racemes, are often seen near the dwellings of the natives; and its seeds are frequently noticed on account of the large membranous wing with which they are surrounded.—*Mason.* Bignonia Indica, is a tree which grows more luxuriantly in the cold regions of the Himmalaya than in the botanical gardens of Hindostan; and might probably grow in the open air of Europe also. At Lahore, was received from the hills a gigantic pod, not less than half a yard in length and four inches in breadth—*Honigberger, p.* 244. The bark and capsules of this tree are astringent and used in tanning and dyeing.—*O'Shaughnessy, page* 480.

(771) BIGNONIA RADICANS. This ash-leaved trumpet-flower has stems with rooting joints; flowers in large bunches, of a scarlet orange colour: is of easy cultivation.—*Riddell.*

(772) BIGNONIA SPATHOIDEA. This large tree is found throughout the Tenasserim Provinces. It is plentiful and its inner bark affords a material for rope.—*McClelland.*

(773) BIGNONIA STIPUTALA. *Syn.* Spathodea stipulata. Stipuled triumpet flower tree. A common flowering tree throughout Tenasserim: this species of Bignonia bears a long twisted pod. It is common at Maulmain: and the flowers are often seen in bazars where they are sold for food. The tree enters the native materia medica, as affording a cure for psora.—*Mason.*

(774) BIGNONIA SUBEROSA. Cork-barked Bignonia.

Neemi Chambeli, HIND. | Cork marum, TAM.

A fine tree, with deeply cracked spongy bark, from which an inferior sort of cork can be made; quality of wood unknown. It is a native of the East Indies, and is common in gardens in India. This beautiful tree is of very rapid growth. The rough bark peels off in small pieces about once a year. In January the tree is covered with blossoms which are beautiful and fragrant in a high degree.

(775) BIGNONIA UNDULATA. Wave-leaved Bignonia. Bohira Reora, HIND.

A tree with drooping branches like the weeping willow; leaves covered with micaceous scales; flowers in lateral racemes, very large, orange-coloured, and scentless. It is a very common tree in Marwar and other parts of Rajwarra. When covered in the month of March with its immense quantities of orange-coloured blossoms, this tree is a most splendid object and would be

highly ornamental in compounds; the wood is fine grained and valuable, having a scent like the walnut leaf.—*Gen. Med. Top. p.* 200.

(776) BIGNONIA XYLOCARPA.

Vadencoorni marum, TAM.

A large tree, wood brownish yellow, rather close grained, employed for cabinet-making, takes a good polish in turning.

(777) BILIMBI.

Bilimbi, is the Malayan name of the acid fruit Averrhoa Bilimbi.—*Engl. Cyc. p.* 458.

(778) BINDRABUN, or Vrindawand, signifying a grove of "Toolsee" trees, is a town situated on the right bank of the river Jumna from over which in a boat, a most picturesque view may be obtained of it, presenting a panorama of of great beauty. The circumstance which imparts most to the sacredness of Bindrabun, is its having been the seat of the early revels of Krishna, the Apollo of the Hindoos; Mutra having been his birth place. While many a Hindoo Anacreon courts the muses with lays dedicated to this youth, prominent in Hindoo mythology, minstrels and maids join in soft strains towards his praise. Bindrabun, among other things, is now noted for the manufacture of pretty toys made of a composition that may be mistaken for mineral. Indeed the venders pass them off as such, and to enhance their value, declare that they are brought from Jeypoor, where articles of this description and marble toys especially receive a fine finish.—*Tour of India by French, p.* 214.

(779) BIRD LIME.

Glu, FR. | Vogelleim, GER. | Pania, IT. | Liga, SP.

An adhesive, tenacious, vegetable product, obtained from the inner bark of the holly by bruising, boiling in water, and fermentation. It has a bitter taste, and the appearance of linseed-oil. The substances now known in Europe under this name are the viscid juices of several trees. The most powerful of these, in Southern India, is obtained from a tree, which Mr. Lascelles calls the Palay, and reports that Lindley named it the Isonandra acuminata. The imports into England is now in great part from Turkey.—*Tom.*

(780) BIRD FEATHERS. Bird's feathers, from the cranes and king fishers, form a considerable article of trade in Southern Asia. The feathers of a large, green king-fisher, are exported from Madras, one lac at a time, to Singapore, to be used by the Malays, Javanese and Chinese. They sell there at 200 per cent profit. See FEATHRRS.

(781) BIRD-NESTS.

Indiaanische-vogelnestjes, DUT.	Ababel, HIND.
Nids de Tunkin, FR.	Nidi-di-Tunchino, IT.
Indianische-vogelnester, GER.	Susuh, JAV.
	Nidos-de-la China, SP.
	Sarang-burung, MALAY.

The Bird nests of Southern Asia are the esculent nests perhaps of several species, but certainly of the Lawit of the Javanese, a small dark-colored swallow, of a greenish hue on the back, a bluish one on the breast and no white mark. In Malay, the nest is called Sarangburung, of which our own name is a literal translation; and the Javanese name, expressed by one word, Susuh, is equivalent to it. The swallow producing the esculent nest is found all over the Malay and Philippine Archipelagos, on the Malabar Coast, and the Tenasserim Provinces, wherever there are caves to afford it shelter and protection, and these, as usual, are most frequent in the limestone formation. But Java and Borneo seem to be their chief resort. The celebrated caves of Karang-bolong (hollow rocks) situated in the province of Baglen in Java, and on the shore of the southern sea, may be taken as an example. The entrance into these caves is at the sea level, and at the foot of limestone rocks several hundred feet in height, in one place 200 perpendicular feet, before coming to the first ledge. The mouths of the caves are about 18 feet broad and 30 high, while, within, they expand to breadths of from 60 to 114 feet, and to heights of from 420 to 480, the sea penetrating them to the extent of one-fourth of their length, and in rough weather rendering them inaccessible. The descent of the collectors to the caves is effected by narrow rattan ladders, usually about 74 feet in length, attached at top to a stout tree. Within the caves there are bamboo scaffoldings, in order to reach at the nests, which are detached from the sides by the hand, and from the roof by hooks attached to long poles. There are three periods for making the collection, April, August, and December. The nest-gatherers are persons bred to their dangerous calling, and before the commencement of the first gathering, plays are acted in masks, and there is feasting on the flesh of buffaloes and goats to invoke the aid of the "lady queen of the south" (Nai ratu kidul), an imaginary being, without whose tutelary aid the work of robbing the nests would not, as they think, prosper. After the crop has been taken, the caves are hermetically sealed against human ingress. The whole annual gathering, which is effected at little cost, amounts to from 50 to 60 piculs yearly, or, on an average, to 7,370lbs. This, which is worth at Batavia about £18,000, forms a convenient and unobjectionable branch of the revenue of the Netherland government, since it is paid by strangers in the indulgence of a harmless folly. Esculent swallows' nests are by no means confined, as in the instance now given, to the sea-coasts, for we find them in caves in the interior both of Java and Borneo, and no doubt they exist also in other islands. On the north-western side of Borneo, and not far from the banks of the river Baram, birds'-nest caves are found 140 miles from the sea by the course of the river. They consist of three chambers, one of which is reckoned to be no less than 200 fathoms in length. These are the property of the power-

ful tribe of the Kayan, and like those of Karangbolong are carefully guarded.—*Crawfurd, Dic. p. 54 and 55.* The nests used by the Chinese, are brought principally from Java and Sumatra; though they are found on most of the rocky islets of the Indian Archipelago. The nests are composed of a mucilaginous substance, but as yet have never been analyzed with sufficient accuracy to show their constituents. It is supposed by some that the Gelidium corneum enters into their composition, but it is more probable that they are formed by mucus eliminated from the stomach of the swallow. Externally, they resemble ill-concocted, fibrous isinglass, and are of a white color, inclining to red; their thickness is little more than that of a silver spoon, and their weight from a quarter to half an ounce. When dry, they are brittle and wrinkled; the size is little larger than a goose-egg. Those that are dry, white, and clean, are the most valuable. They are packed in bundles, with split rattans run through them to preserve their shape. The quality of the nests varies according to the situation and extent of the caves, and the time at which they are taken. If procured before the young are fledged, the nests are of the best kind; if they contain eggs only, they are still valuable; but if the young are in the nests or have left them, the whole are then nearly worthless, being dark-colored, streaked with blood, and intermixed with feathers and dirt. The nests are procurable twice every year; the best are found in deep, damp caves, which, if not injured, will continue to produce indefinitely. It was once thought that the caves near the sea-coast were the most productive; but some of the most profitable yet found, are situated fifty miles in the interior. This fact seems to be against the opinion that the nests are composed of the spawn of fish or of biche de mar. The method of procuring these nests somewhat resembles that of catching birds in the Orkney isles. Some of the caves are so precipitous, that no one but those accustomed to the employment from their youth, can obtain the nests, 'being only approachable,' says Crawfurd, 'by a perpendicular descent of many hundred feet, by ladders of bamboo and rattan, over a sea rolling violently against the rocks. When the mouth of the cave is attained, the perilous task of taking the nests must often be performed by torch-light, by penetrating into recesses of the rock, where the slightest slip would be instantly fatal to the adventurers, who see nothing below them but the turbulent surf making its way into the chasms of the rock. After they are obtained, they are separated from feathers and dirt, are carefully dried and packed, and are then ready for the consumer. The Chinese, who are the only people that purchase them for their own use, bring them in junks to the Chinese market, where they command extravagant prices; the best, or *white* kind, often being worth $1800 per pecul, which is nearly twice their weight in silver. The middling kind is worth from $1200 to $1800; and the worst, or those procured after fledging $150 or $200 per pecul; it is according to these three qualities, that the duty is now levied. The most part of the best kind is sent to Peking for the use of the court. It appears, therefore, that this curious dish is only an article of expensive luxury among the Chinese; the Japanese do not use it at all, and how the former people acquired the habit of using it is only less singular than their persevering in it. They consider the birds'-nests as a great stimulant and tonic, but its best quality, perhaps, is its being perfectly harmless or useful in so far as it resembles gelatine. The labor bestowed to render it fit for the table is enormous; every feather, stick, or impurity of any kind is carefully removed; and then, after undergoing many washings and preparations, it is stewed into a soft, mucilaginous jelly. The sale of birds'-nests is a monopoly with all the governments in whose dominions it is found. It is estimated by Crawfurd that about 243,000 pounds, at value of $1,263,570, are annually sent away from the Archipelago, most of which is brought to China. Java alone sends about 27,000 lbs.; mostly of the first quality, estimated at $60,000. The most of the trade heretofore has been in the hands of the Chinese and Portuguese, and foreign merchants have had but little to do with it; no account of the amount or value of the importation can therefore be ascertained. This is the reason why the estimated importation is placed so low in the Tabular Statement, as it is perhaps not one half of the amount brought to China.—*Morrison*, 143. A few birds' nests of the esculent swallow are to be got from a rocky island about 20 miles South of Tellicherry, named Sacrifice Rock. Small quantities are occasionally brought to Bombay from the Malabar Coast, which are re-exported to China. Strange as it may seem that a taste for birds' nests should exist among any people, yet so strong is this taste in China, that the trade in birds' nests forms a very lucrative and extensive branch of commerce. Burnett, in his 'Outlines of Botany,' observes, "It has been estimated that 242,400 lbs. of birds' nests, worth in China £234,290 and upwards, are annually exported from the Indian Archipelago." The only preparation the birds' nests undergo is that of simple drying without direct exposure to the sun; after which they are packed in small boxes. They are assorted for the Chinese market into three kinds, according to their qualities, and the common price for birds' nests of the first sort at Canton is no less than 3,500 dollars the pecul, or £5 18s. 1½*d.* per lb; for the second, 2,800 Spanish dollars the pecul, and for the third 160. The Edible-nest swallows, or swiftlets, are so numerous in the limestone caves on the islets and islands on the Tavoy

coast, that the Government revenue from the bird-nest farm in 1847 was nearly eleven thousand rupees; but in 1849, it was more than four thousand rupees less. At Mergui they are not so numerous. The nests, which are taken before the bird lays its eggs, sell in China for about forty-five rupees the pound. In relation to the identification of the species, Mr. Blyth says: "As regards the *Hirundo esculenta* of Linnæus, there is no reason to suppose that this, as described, with yellow irrides and white-tipped tail, has any prototype in nature: the latter would be an anomaly throughout the Cypselidæ, but may refer perhaps to the white tail-markings of some real hirundo, erroneously supposed to be the constructer of the edible nests. Dr. Horsfield gives the species termed *lawet* by the Javanese as *Hirundo esculenta*, Osbeck stating that the specimens which he examined in Java, and those which he took to England, differ from Latham's description in being uniformly of a blackish colour, without a white extremity to the rectrices. Another species, the *linchi* of the Javanese, he gives as *H. fuciphaga*, Thunberg stating that 'its nest is constructed of mosses and lichens, connected with the same gelatinous substance which composes the edible nest of the preceding species.' In the Journal of the Indian Archipelago, the same two species are distinguished by the names *lawet* and *lintye*, and the nest of the latter is described to be without the least value. And, it is added: 'the residence of these swallows, or swiftlets, termed *lintye*, in the caves, contributes greatly to the injury of the holes, for which reason they are destroyed as much as possible at each gathering. The nests which they make are constructed of grass-stalks. They are, however, of the same form, and are as artfully made as the others.' 'Heer Hooyman likewise states, that besides the *lawet*, other species resort to the same caverns, which are named *momomo*, *boerongitam*, *boerong-zoekoe*, and *lintje*. 'These,' he adds, 'are very similar to each other, excepting the second, which has the head larger; and the feathers of all are entirely black. The nests which they construct are black and friable, composed of a light down,' (agglutinated?)—'An opinion prevails that the presence of these birds is injurious to the caverns, on which account they are driven away as much as possible.' Another writer in the same volume of the Bataviaasch Genootschap, mentions the *momos* or *boerongitam* (thus bringing together M. Hooyman's first two species,) as a large kind with plumed tarsi, indicating thus a true cypselus, which is probably the constructer of the nests assigned by Dr. Horsfield and others to the *linchi*. Assuredly, however, the *Collocalia fuciphaga*, *Hirundo fuciphaga*, (Thunberg,) *linchi* or *lintye* of the Javanese, identical upon comparison with Javanese specimens, would appear to be the sole producer of the numerous nests gathered on the rocky coasts of the Bay of Bengal: and the often quoted notice by Sir G. Staunton, in his account of the Earl of Macartney's Embassy to China, must refer either to *C. fuciphaga*, or to an entirely new species, which is hardly to be supposed in the locality. For, he remarks: 'the birds which build these nests are small grey swallows, *with bellies of a dirty white*. The white belly is characteristic of *C. fuciphaga*; and this particular species occurs abundantly on parts of the coast of the Malayan Peninsula, in the Nicobar Islands, and the Mergui Archipelago, and so high as on certain rocky islets off the southern portion of the coast of Arracan, where the nests are annually gathered and exported to China. From all this range of coast we have seen no other species than fuciphaga, nor does it appear that any other has been observed; and we have examined a multitude both of the adults and of young taken from the nests, collected in the Nicobars and preserved in spirit, all of which were of the same species. Still, what appears to be *C. nidifica* inhabits the mountains far in the interior of India, though hitherto unobserved upon the coasts; and it is worthy of notice that *C. fuciphaga* does not appear to have been hitherto remarked inland in this country." It may be here added that *C. fuciphaga* is constantly seen inland in these Provinces. The Karens in the valley of the Tenasserim in the latitude of Tavoy, are well acquainted with the bird, and they say it crosses the mountains to and from the interior every year. That it is the same species there can be no doubt, for the Karen name of the bird is "the white swallow," from its white belly.—*Mason.*

(782) BIRD OF PARADISE, ENG. Burung-devota, MALAY. lit. birds of the Gods. Manuk-dervata, JAV. With no family of birds has fiction been more busy than with the Birds of Paradise. The high value set upon them awakened the cupidity and the fraud of the Chinese, who made up from parrots, parakeets, and others, artificial Birds of Paradise, Ornithologists seem to agree in placing these birds either among the crows (Corvidæ) or in their immediate neighbourhood; and this, from the form of their beak and legs, and from their habits, to which we shall presently allude, appears to be their proper place.

(783) *Parotia sexsetacea, the Siflet.* This is the Paradisea aurea of Gmelin.

(784) *Lophorina superba.* The superb, is the Paradisea superba of Latham.

(785) *Concinnurus.* Of this genus, the *Cincinnurus regius* is the *Paradisea regia* of Linnæus and King-Bird of Paradise of Petiver, who has this note—"Brought from the Molucca Islands, and rarely to be seen here but in the cabinets of the most curious, as with Dr. Sloan, and in the repository of the Royal Society," and Le Manucode of Buffon, is given as an example.

(786) *Paradisea magnifica* of Latham, the P. apoda of Linnæus, is perhaps the most elegant of all these birds; is that which is best known and most often seen. It is the great Emerald, Le grand Emeraude, of the French. "The Birds of Paradise," says M. Lesson, or at least the Emerald, the only species concerning which we possess authentic intelligence, live in troops in the vast forests of the country of the Papuans, a group of islands situated under the equator, and which is composed of the Islands Arou, Wagiou, and the great Island called New Guinea. They are birds of passage, changing their quarters according to the monsoons. The females congregate in troops, assemble upon the tops of the highest trees in the forests, and all cry together to call the males. These last are always alone in the midst of some fifteen females, which compose their seraglio, after the manner of the gallinaceous birds." In order to shoot Birds of Paradise, travellers who visit New Guinea should remember that it is necessary to leave the ship early in the morning, to arrive at the foot of a teak-tree or fig-tree, which these birds frequent for the sake of their fruit—(our stay was from the 26th of July to the 9th of August)—before half-past four, and to remain motionless till some of the males, urged by hunger, light upon the branches within range. It is indispensably requisite to have a gun which will carry very far with effect, and that the grains of shot should be large; for it is very difficult to kill an Emerald outright, and if he be only wounded it is very seldom that he is not lost in thickets so dense that there is no finding the way without a compass. "The little Emerald Paradise-Bird feeds, without doubt, on many substances, in a state of liberty. I can affirm that it lives on the seeds of the teak-tree, and on a fruit called Amihou, of a rosy white, insipid and mucilaginous, of the size of a small European fig, and which belongs to a tree of the genus *Ficus*."—*Engl. Cyc. page* 474 *to* 478.

(786) BIRDS OF EASTERN AND OF SOUTHERN ASIA.

Aves, LATIN.	Patchi also Coorvi, TAM.
Ορνιθες, GREEK.	Pitta, TEL.
Parindah, PERS.	Chooree, DUK.
Taer: Moorgh, ARABIC.	Chiria, HIND.

It is from the Greek name that we derive the term Ornithology. Birds are a class of Vertebrated, Oviparous, Feathered Bipeds, generally formed for flight. We say generally, because, though their mechanism is, in its most perfect development, designed for enabling them to support their bodies in the air and to make progress in that medium, it is also calculated for motion on the ground and for perching on trees. Some families of Birds indeed, are framed entirely for moving on the ground, and others for that motion and for making their way both on the surface of the water and even for a short period below it, without the power in either case of raising themselves into the air; others have the power of supporting themselves in the air, through journies of several hundreds of miles, in their annual migrations. Birds appear to have been objects of interest from the earliest periods. In comparatively later times we find them mingling in the superstitions of Greece and Rome, as they still do with those of the people of Southern Asia, and it is evident that their history and habits were familiar not only to the Grecian husbandman and the augur, but to the great mass of the people. Without such a familiarity on the part of the Athenians, Aristophanes would hardly have ventured on introducing his audience to Νεφελακοκκυγία (see his play entitled "Ορνιθες," 'The Birds'); nor would other poets, Grecian and Roman, so often have referred to these animals as well-known harbingers of certain times and seasons.—*Engl. Cyc. p.* 460. The Birds of Eastern and Southern Asia have been described by several naturalists. In 1831, a Catalogue of birds collected on the banks of the Ganges and the Vindhian range of mountains by Major Franklin, was published in that useful compendium, the Proceedings of the Zoological Society of London. This comprised 156 species, of which more than 20 were described for the first time, many of them very common birds, as *Otus bengalensis*, *Thimalia chatarœa*, *Alauda gulgula*, *Mirafra phœnicura*, *&c. &c.* Notwithstanding the difference of latitude in which these were collected, there are only 6 or 7 which Dr. Jerdon has not since met with in Southern India, which shews the very great similarity of the ornithology of India throughout. In 1832, a catalogue of birds collected by Colonel Sykes in the Bombay presidency, was published in the same work as the last. In this are enumerated 226 species, of which above 40 are described for the first time, many of them common and abundant birds. This catalogue was undoubtedly the most valuable account of the birds of India published, and contains descriptions, with many highly interesting observations on the habits, food and structure of many of the species. Of those enumerated by Colonel Sykes there are about 9 or 10 which Dr. Jerdon, when writing in 1839, had not observed, most of which are probably peculiar to the more northern portion of the range of ghauts and neighbouring table-land. In that year, Dr. Jerdon published a catalogue of the Birds of the Peninsula of India, arranged according to the modern system of classification; with brief notes on their habits and geographical distribution, and descriptions of new, doubtful, and imperfectly described species. The total number of this catalogue was nearly 390: which, however, included of 10 of Colonel Sykes,' and nearly as many more observed by Mr. Walter Elliot, of the Madras Civil Service, who placed valuable notes on birds procured by him at Mr. Jerdon's disposal; by which, in addition to the new species added, this naturalist was enabled to

elucidate several doubtful points, to add some interesting information on various birds, and to give the correct native names of most of the species. Subsequent to this, Dr. Jerdon published a series of supplements to his catalogue of Birds, correcting some points and adding others; and those were followed by a paper from the pen of Lord Arthur Hay. Mr. B. Hodgson of Nepaul, furnished a large amount of valuable information on the ornithology of the Himmalaya; Captain Tickell of the Bengal army has also contributed largely to our stock of knowledge regarding the ornithology of Central India. The birds of the Tenasserim provinces have been largely described by the Reverend Mr. Mason, and those of Ceylon by Dr. Kelaart, but the most important writings have been a continued series of valuable articles from Mr. Blyth, who is the most constant in his pursuit of science, as he is the ablest naturalist in Southern Asia. It is to him, doubtless, that we are indebted for the recent valuable article in the 55th No. of the Calcutta Review, where it is remarked that "there are few persons, other than professed zoologists, who have an idea of the extent to which the feathered inhabitants of the British islands are found in Southern Asia, identically the same in species. In general, so limited are the opportunities which an ordinary Indian life allows for *field observation*, that the only familiar reminiscence of home which an European sojourner in the plains of India will recall to mind, among the feathered tribes of this country, is afforded by the pretty, little, clean-looking, sprightly Water Wagtail, usually the first and most welcome harbinger of the coming cold weather, and remaining with us so abundantly whilst it continues. This bird, and the harsh chattering of a very common kind of Shrike (*Lanius superciliosus*) in our gardens, are regularly the earliest intimations that most of us receive of the coming change of season; but a Snipe (*Gallinago stenura*) precedes them, which, though few sportsmen discriminate it from the common British Snipe, which makes its appearance somewhat later, is nevertheless a different bird, at once distinguished by having a set of curious pin-feathers on each side of its tail, whereas the British Snipe, which is equally abundant with us has a broad fan-shaped tail, as unlike that of the other as can well be. The pin-tailed is the common Snipe of the Malay countries; and is unknown in Europe, excepting as an exceedingly rare straggler from its proper habitat the east. But the Snipe is unobserved save by the many who delight in exercising their skill in shooting it, or who wonder to see it so soon in the provision-bazar; and our little piebald friend the Water Wagtail, in its season, and the common Sparrow, at all seasons, so abundant as to be overlooked and forgotten, are probably all that the European reader unversed in the study of ornithology will be able to recall to mind, as yielding associations of home; unless, perchance, he may also recollect the common small Kingfisher of this country, which differs from the British bird only in its more diminutive size. We have somewhere read of the delight expressed by one who had been many years in India, at seeing, upon his return to his native land, the Sky Lark rise from the sod at his feet, and mount higher, and still higher, till reduced to a mere speck in the heavens, or utterly lost to view, all the while making the air ring with its music. Had he ventured forth into the fields of any part of India, he would have seen and heard the very same; although the species (*Alauda malabarica*) is different, and may be somewhat inferior to the European Sky Lark in song, so far at least as regards variety in the notes; but there is really very little difference, so little that the two birds could assuredly not be distinguished by the voice alone, nor by the mode of flight. Examined, the common Indian Lark may be described as resembling the European Wood Lark in size and shape, with the plumage of the Sky Lark. It may, indeed, be remarked that even the Pied Wagtails of India (*Motacilla luzoniensis* and *M. dukhunensis*) are specifically different from those of Europe (*M. alba* and *M. Yarrellii*), however similar in appearance and habits; but the Grey Wagtail of Britain (*Calobates sulphurea*) is identically the same in India and Java, and a specimen has been seen in a collection from Australia. This delicate little bird, so clean and bright in its appearance, is of very general diffusion over Southern Asia during the cold season, being indeed much commoner than in Britain. The most abundant Lark, however, on the plains of Upper India and table land of the Peninsula, is the *Chándul* or Crested Lark, (*Galerida cristata*), which is also a European species, though of rare occurrence in Britain; and the song of this bird, also, its mode of delivery of it in the air, is not very unlike that of the Sky Lark, although it does not soar to so lofty an altitude. The community of species among the birds inhabiting or visiting India and the British islands is most remarkable among the diurnal birds of prey, and, as might be expected, among the wading and swimming tribes; but as these are mostly rare in Britain, and do not fall much under common observation, their presence in India fails to convey any sort of reminiscence of home. The relentless persecution by gamekeepers has now very nearly extirpated, as a permanent inhabitant of Britain, that fine handsome bird, the common European Kite (*Milvus regalis*); though, were it as numerous in England now as in the days of the Tudors, the Scavenger Kites of India (*M. Govinda*) might help to remind the British exile in this country of his distant home in the west. But whatever may be the amount of British species of birds actually obtained, in Lower Bengal for instance there is enough in the *ensem-*

life of the various birds under daily observation in Eastern and Southern Asia, to remind us of the present familiar ornithology of Great Britain. In Bengal, the newly-arrived observer from that region will particularly be struck with the number of birds of large size which he sees everywhere, even in the most densely populated neighbourhoods; flocks of Vultures, huge 'Adjutants' in their season, swarms of Kites in their season too, for they disappear during the rains,—and all three soaring and circling high in air as commonly as at rest,—Brahmini Kites, various other birds of prey, among which four kinds of fishing Eagle, including the British Osprey, are not uncommon,—water-fowl in profusion in all suitable localities, Herons especially of various kinds very abundant,—several sorts of Kingfisher, mostly of bright hues, the common Indian Roller, also a bird of great beauty, and the little bright green Bee-eater (*Merops viridis*) conspicuous everywhere, —the common Crow of India, of unwonted familiarity, impudence, and matchless audacity,—the different Mainas remarkable for their tameness, the Drongos or 'King Crows,' the *Sát-bhais* (or 'seven brothers') with their discordant chattering, two sorts of melodiously chirruping Bulbuls, the bright yellow 'Mango-bird' or Black-headed Oriole, the pretty pied Dhyali, the only tolerably common sylvan songster worthy of notice, the brilliant tiny Honey-suckers; also with musical voices, the lively and loud Golden-backed Woodpecker, and two monotonously toned species of Barbet, the pleasingly coloured Rufous Tree-magpie (*Dendrocitta rufa*), the noisy koel, remarkable for the dissimilarity of the sexes, and for parasitically laying in the Crows' nests, the Crested Cuckoos (*Oxylophus*) during the rainy season (parasitical upon the *Sat-bhais*), with other *cuculine* birds, especially the Coucol or 'Crow-Pheasant,' another noisy and conspicuous bird wherever there is a little jungle; and last, but not least characterestic, in this most summary presentment of the birds commonly observed in Lower Bengal, the harmonious cooing of two or more kinds of Dove, soothing to repose and quiet, and the loud screaming of flocks of swift-flying green Parakeets, with sundry other types all strange to the newcomer. While he misses the familiar types of home, the various Thrushes, Finches, Titmice, &c., which are feebly or not at all represented in the ordinary observed ornithology of this part of the world: the bright little *Iora* may perhaps seem to represent the Titmice, and the tiny 'Tailor-bird' the Wren; while the northern forms of Finches are replaced by the *Bayas* or 'Weaver-birds' with their curious pensile nests and the diminutive thick-billed *Munias*: but he will be much struck with the prevailing silence of the jungle, and the paucity of small birds even in the cold season, so different from the woods and gardens and hedge-rows of Britain, teeming with small feathered inhabitants, among which are so many pleasing songsters of all degrees of merit: of the swallows, occasionally and somewhat locally, a few of the *Hirundo rustica*, may be seen chiefly over water, and young birds of the past season; and along the river-banks, where high enough, the small Indian Bank Martin (*H. sinensis*) will occur abundantly; but the Swallows are replaced by two non-migratory Swifts, the common House Swift (*Cypselus affinis*) and the little Palm Swift (*C. balasiensis*). Let him travel, and wherever the telegraph-wires extend he will see the Roller and the 'King Crow' habitually perching on them, to watch for their insect prey: the former displaying his gaily painted wings to advantage, as he whisks and flutters about, regardless of the fiercest sun; and he will soon make acquaintance with the small white Vulturine bird, *Neophron percnopterus*, the 'Rachamah' or 'Pharaoh's chicken,' introduced as British, because a single pair has been known to stray so far beyond its ordinary haunts. Of the smaller British land-birds only few occur, and these are mostly rarities in the west; but the Wryneck is not uncommon, though little observed, and the European Cuckoo will now and then turn up, more frequently in the barred plumage of immaturity; the Hoopoe, too, is common, but is much too rare in England to awaken a reminiscence, and so with others. Of course we allude to the cold season, and to birds in their winter quarters. Among the Hawks, the Kestrel will occasionally be observed in extraordinary abundance; and Harriers (*Circus*) are often seen beating over the open ground; but the small waders are particularly common in all suitable places, including most of those found in Britain, in greater or less abundance. It would be tiresome to particularize further. But wonderful is the number of fishers, and vast indeed must be the consumption of their finny prey. Otters (*Lutra nair*) among the mammalia, but no Seals; and of birds, sundry fishing Eagles, and a great bare-legged fishing Owl, with various Kingfishers in abundance, numerous kinds of Heron in surprising numbers, Pelicans, Darters (*Plotus*), Pygmy Cormorants, and Grebes or 'Dabchicks;' besides Gulls, Terns, and rarely Skimmers (*Rhynchops*). Gulls, however, are less numerous than in Britain; and we have met with three species only, the common British *Larus ridibundus* and a nearly affined species, with the fine *L. ichthyaëtus* chiefly towards the mouths of the Gangetic rivers. Over the salt-water lake near Calcutta, we have seen a very uniformly scattered flight of the great White Egret, so prized at home, as far as the eye could reach in every direction, all pursuing one course to some favorite fishing-ground, and flying just above the reach of gunshot. The Gull-billed Tern is there one of the common birds, and the Whiskered Tern (*Hydrochelidon leucoparia*), replacing the Black Tern of the Kentish marshes; and the Peregrine Falcon

may not unfrequently be seen, well meriting the name of 'Duck Hawk' bestowed on it in North America: also great flocks of Longshanks (*Himantopus*) wading and seeking their subsistence in the expanse of shallow water. And yet we may pass for hours along the reed-fringed *nullahs* or water-courses in the immediate vicinity, and scarcely see a living thing or hear a sound in those watery solitudes; but the muddy banks are honeycombed with the footsteps of wild Pigs of all sizes, and various *Rallidæ* are swarming around, as the numbers of them captured in trap-cages abundantly testify. No sign whatever of the proximity of the great emporium of the east, within an hour's distance or less of its outskirts in a rude canoe; and human inhabitants, fowlers and fishermen or both combined, who have never seen Calcutta in their lives, and actually know not that they are living under the British Government! These men bring their captured produce to certain ghâts, and there sell to other people whose business it is to re-sell to the provision-bazar dealers. Of a number we once questioned, a few only had ever journeyed to Calcutta, and of them but one had seen the Government House! Passing from the delta of Lower Bengal, no matter in what direction, a considerable replacement of species may be observed, characteristic of the fauna of Behar and of the plains of Upper India to the west and north, and of the Burmese countries eastward: but it is not our object to proceed to minute details; nor even to treat of the assemblage of forms in different regions of the sub-Himalàyas, where those of Europe and of W. and N. Asia prevail more and more towards the N. W.: Malayan forms eastward, and Chinese types, and even species to a great extent, or, to express it more correctly, particular sub-Himalàyan genera and species, the range of which extends eastward to China. Again, on the highlands of the Peninsula of India, and still again in those of Ceylon, distinct species of the northern types occur, but *no different genera*. Thus the Jungle-fowl of N. India is replaced by a different species (*Gallus Sonneratii*) in the Peninsula, and by a third (*G. Stanleyi*) in Ceylon: and not a few similar instances might be adduced. We will quote Dr. G. Buist's highly graphic sketch of a curious ornithological incident observed annually in the island of Bombay. "Two events," he remarks, "strike with surprise the ornithologist on the approach of the monsoon. Nearly all the Kites, Hawks, Vultures, and other carrion-birds disappear from the seacoast, while the Crows begin to build their nests and hatch their young just at the season that seems most unsuitable for incubation, when the eggs are often shaken out, or the nests themselves are destroyed by the storm, and the poor birds are exposed, in the performance of their parental duties, to all the violence and inclemency of rain and tempest. At the instigation of a sure and unerring instinct, the carnivorous birds, as the rains approach, withdraw themselves from a climate unsuitable to the habits of their young, betaking themselves to the comparatively dry air of the Dukhun, where they nestle and bring forth in comfort, and find food and shelter for their little ones. The scenes connected with this, which follow the conclusion of the rains, are curious enough. While the Mahomedans bury, and the Hindus burn their dead, the Parsees expose their dead in large cylindrical roofless structures, called TOWERS OF SILENCE, where birds of prey at all times find an abundant repast. Their family cares and anxieties over for the season, the carrion-birds, which had left in May for the Dukhun, return in October to Bombay, and make at once for the usual scenes of their festivities, now stored with a three months' supply of untasted food. As they appear in clouds approaching from the mainland, the Crows, unwilling that their dominions should be invaded, hasten in flocks to meet them, and a battle ensues in the air, loud, fierce, and noisy; the fluttering of the wings, the screaming and cawing of the combatants, resounding over the island, till the larger birds succeed, and having gained the victory are suffered henceforth to live in peace. In Bengal, the Kites and Bramini Kites breed chiefly in January and February, and disappear during the rains. The adult 'Adjutants' make their appearance as soon as the rains set in, and becoming in fine plumage towards the close of the rains, depart at that time to breed in the eastern portion of the Sundarbuns upon lofty trees, and along the eastern coast of the Bay of Bengal upon trees and rocks. Vultures are permanently resident; and the Crows propagate chiefly in March and April, their nests being not unfrequently exposed to the fury of the nor-westers and destroyed by them altogether. As will be shewn in the sequel, a very large proportion of the feathered inhabitants of the British islands are equally natives of, or seasonal or irregular visitants to Southern Asia. Not a few migratory species are common to the polar circle and to Lower Bengal, and even further towards the equator, according to season: but the individual birds may not migrate so far north and south. The *Calliope camtschatkensis*, a delicate little bird much like a Nightingale, but with a brilliant ruby-throat, which is not rare in the vicinity of Calcutta during the cold season, arrives "early in April, with the snowfleck, in the Lower Kolyma district" in Northern Siberia, as we are told by Von Wrangell; that is to say, before the last of them have left Bengal: but it is remarkable that this bird has never been seen in the very numerous collections from the Himalaya examined hitherto; though another and non-migratory specie of the same genus (*C. pectoralis*), peculiar, so far as known, to the Himalaya, is of common occur-

rence in such collections. It is, however, enumerated in Mr. Hodgson's list of the birds of Nepal: still it seems to follow that the *C. camtschatkensis* does not breed extensively on this side of the snow; although the Bengal birds may not have to find their way quite so far as to Northern Siberia to pass the summer. The Hoopoe (*Upupa epops*), another species common in Southern Asia during the cold season, and on the table lands at all seasons, is, to all appearance, a bird of fluttering and feeble flight; but has repeatedly been observed, during the seasons of migration, at altitudes considerably above the limits of vegetation. "On the western side of the Lánák pass, about 16,500 feet, I saw a Hoopoe," writes Major Cunningham; and at Momay (14,000 to 15,000 feet elevation), under the lofty Donkia pass in Northern Sikhim, Dr. J. D. Hooker observed, in the month of September, that "birds flock to the grass about Momay; Larks, Finches, Warblers, abundance of Sparrows (feeding on the Yak droppings), with occasionally the Hoopoe: waders, Cormorants, and wild Ducks, were sometimes seen in the streams, but most of these were migrating south." Dr. J. D. Hooker's sketch of the grand but most desolate panorama beheld by him from the summit of the Donkia Pass (18,466 feet elevation) ought to be familiar to all readers; and he elsewhere remarks that "no village or house is seen throughout the extensive area over which the eye roams from Bhomtso, and the general character of the desolate landscape was similar to that which I have described as seen from the Donkia pass. The Kiang grazing with its foal on the sloping downs, the Hare bounding over the stony soil, the Antelope, the *Tchiru* and also the *Goa*, *Procapra picticaudata* of Hodgson, scouring the sandy flats, and the Fox stealing along to his burrow, all are desert and Tartarian types of the animal creation. The shrill whistle of the Marmot alone breaks the silence of the scene, recalling the snows of Lapland to the mind; while the Kite and Raven wheel through the air, with as steady a pinion as if that elevation possessed the same power of resistance that it does at the level of the sea. Still higher in the heavens, long black V-shaped trains of wild Geese cleave the air, shooting over the glacier-crowned top of Kinchinjhow, and winging their flight in one day, perhaps, from the Yaru to the Ganges, over 500 miles of space, and through 22,000 feet of elevation: one plant alone, a yellow lichen (*Borrera*) is found at this height, and that only as a visitor for, Tartar-like, it migrates over the lofty slopes and ridges, blown about by the violent winds. I found a small beetle at the very top, probably blown up also; for it was a flower-feeder, and seemed benumbed with cold." "An enormous quantity of water-fowl," remarks the same scientific traveller, Dr. Hooker, "breed in Tibet, including many Indian species that migrate no further north. The natives collect their eggs for the markets of Jigatzi, Giantchi, and Llassa, along the banks of the Yaru river, Ramchoo, and Yarbru and Dachen lakes. Amongst other birds, the *Sáras*, or giant Crane of India (see Turner's Tibet, p. 212) repairs to these enormous elevations to breed. The fact of birds characteristic of the tropics dwelling for months in such climates is a very instructive one, and should be borne in mind in our speculations on the climate supposed to be indicated by the imbedded bones of birds." We may remark that the *Sáras* (*Grus antigone*) also breeds south of the Himaláya; and that specimens too young to fly are occasionally brought for sale even to Calcutta. Turner, describing the lake "Ramtchoo," remarks,—"that it" is frequented by great abundance of water-fowl, wild-geese, ducks, teal, and storks, which, on the approach of winter, take their flight to milder regions. Prodigious numbers of saurasses, the largest species of the crane kind, are seen here at certain seasons of the year, and they say, that any quantity of eggs may there be collected: they are found deposited near the banks. "I had several of them given to me when I was at Tassisudon, during the rains; they were as large as a turkey's egg, and I remember being told that they came from this place; but whether or not they were those of the Sauras, I cannot venture to pronounce." We have known instances of the *Sáras* breeding in captivity, when a pair was allowed the range of a large walled garden (protected from Jackals) containing shallow inundated enclosures for the growth of rice: in these the nest is commenced under water, and raised for some inches above the surface; and the eggs are two in number, about $3\frac{3}{4}$ inches long by $2\frac{1}{2}$ inches broad, of a bluish-white, with a few distantly placed rufous specks and blotches. The nest of the European Crane (*Grus cinerea*), also a common Indian bird, is thus described by Major Lloyd, as observed by himself in Scandinavia. "It usually breeds in extended morasses, far away from the haunts of men. It makes its nest, consisting of stalks of plants and the like, on a tussock, and often amongst willow and other bushes. The female lays two eggs," &c. Again, Major Cunningham, in his 'Ladak,' &c., remarks that "the water-fowl swarm on the lakes and on the still waters of the Upper Indus. I have shot the wild Goose on the Thogji, Chanmo and Chomoriri lakes at 15,000 feet; and Col. Bates and I shot three Teal on the Suraj Dal, a small lake at the head of the Bhága river, at an elevation of upwards of 16,000 feet:" but the time of the year is not mentioned by this author. Those birds which are common to India and the polar circle appertain for the most part, as might be supposed, to the wading and web-footed orders; and a few of them are of very general dis-

tribution over the world, as especially the common Turnstone (*Strepsilas interpres*), which seems to be found on every sea-coast. The *Lobipes hyperboreus* is a little arctic bird, of rare occurrence even in the north of Scotland, Orkney and Shetland: but a specimen was not long ago procured near Madras, which is now in the Calcutta museum; and there also may be seen an example of the nearly related *Phalaropus fulicarius*, obtained so late in the year as May 11, 1846, in the Calcutta provision-bazar. The well-known naturalist of the Madras Presidency, Dr. T. C. Jerdon, obtained in Southern India a single example of a little Australian Plover, *Hiaticula nigrifrons*, which figures in his catalogue as a supposed new species by the synonyme *H. russata*. The Tibetan Raven is considered as a peculiar species by Mr. Hodgson, an opinion to which the Prince of Canino seems to incline: it may be presumed to inhabit the lofty mountains of Butan to the north, but the smaller crow of Southern Asia is the *C. splendens*; while the common black Crow of all India, *C. culminatus*, would seem to stand here alike for the 'Raven,' the 'Carrion Crow,' and the 'Rook!' The true Rook (*Corvus frugilegus*) however, is known to inhabit or visit the Peshâwur valley, Afghânistân, and Kashmir. The Rook of China and Japan is considered a distinct species, *C. pastinator* of Gould; and the Jackdaw (*C. monedula*) accompanies it in those countries, while the true northern Raven *Corvus corax* is met with not only there, but also over a great portion of the Punjâb. In other parts of India the comparatively small *C. culminatus* is popularly known to Europeans as "the Raven:" but the northern Raven would make a meal of one and not feel much the worse for it. Dr. Francis Buchanan Hamilton, remarking upon the hawking or falconry observed by him in the Shâhabâd district, mentions that "the only pursuit worth notice that he saw in several days' hawking was from a large bird of prey named *Jimach*, which attacked a very strong Falcon as it was hovering over a bush into which it had driven a Partridge. The moment the Falcon spied the Jimach it gave a scream, and flew off with the utmost velocity, while the Jimach equally pursued They were instantly followed by the whole party, foot, horse, and elephants, perhaps 200 persons, shouting and firing with all their might; and the Falcon was saved, but not without severe wounds, the Jimach having struck her to the ground; but a horseman came up in time to prevent her from being devoured." The *Wokhab* or *Ukab*, as it is also termed, is a small Eagle, very abundant in the plains of Upper India, the Dukhun, &c., bearing many systematic names, the earliest of which is *Aquila fulvescens*; for it is a different bird, not quite so large and robust, as the *Aq. nævioides* of Africa, with which it has been supposed identical. The Hon'ble Walter Elliot, of the Madras C. S., remarks that—"the *Wokhab* is very troublesome in hawking, after the sun becomes hot, mistaking the *jesses* for some kind of prey, and pouncing on the Falcon to seize it. He had once or twice nearly lost Shahins' (*Falco peregrinator*) in consequence, they flying to great distances for fear of the *Wokhab*," *i. e.* the Jimach. The principal species employed in Indian falconry are identical with those of Europe; namely, the *Bauri* of India, which is the Peregrine Falcon of the West; and the *Bâz* of India, which is the Goshawk or 'Gentil Falcon' of Britain. In a curious Persian treatise on the subject, by the head falconer of the Mogul Emperor Akbar, the various species used are enumerated, and may be recognised with precision: among them is the *Shangar*, which is clearly the Jer Falcon of the north; represented as extremely rare and valuable, taken perhaps once or twice only in a century, and then generally in the Punjab. The *Shahin* (*Falco peregrinator*), another favorite Indian Falcon, does not inhabit Europe, but is clearly the *Falco ruber indicus* of Aldrovand, rather than the small hobby-like Indian species (*F. severus*), on which Temminck bestowed the name *F. Aldrovandi*. With five or six exceptions only, the whole of the European diurnal birds of prey are met with in India, many of them being much commoner in this country; and they are associated with numerous other species unknown in Europe. The sport of falconry is widely diffused over Asia, even to the Malayas; but whether extending to China and Japan, we are unaware. It may further be noticed that the "quarry" hawked by Dr. Layard's Bedouin companions on the great plain of Mesopotamia, and rightly enough denominated by him a "Bustard," is no other than the Houbara (*Houbara Macqueenii*) of Sindh and Afghânistân; being a different species from that of Spain and North Africa (*H. undulata*;) and it appears that the former has most unexpectedly turned up, of late years, in England and Belgium, if not also in Denmark. The great spiny-tailed Swift of the Himalàya (*Acanthylis nudipes* of Hodgson) was obtained, a few seasons back, in England. Mr. Gould identifies this British-killed bird with his *Ac. caudacuta* of Australia, but it appears identical with the Himalàyan species; upon comparing Himalàyan specimens with Mr. Gould's plate, no difference can be detected. The great Alpine Swift (*Cypselus melba*) is common to the Himalàya, the Nilgiris, and high mountains of Ceylon, but the great *Acanthylis* of the Himalàya has never been observed in S. India, and is replaced in the Nilgiris, Ceylon, and also across the Bay of Bengal, (in Penang, &c.) by a distinct species, the *Ac. gigantea*. Gold and Silver Pheasants are inhabitants of China; but the Golden Pheasant, according to M. Temminck, inhabits not only China and Japan, but the northern parts of

Greece, as also Georgia and the Caucasus; and it has been met with even in the province of Orenbourg. M. Degland informs us, that M. Gamba, French Consul at Tiflis, met with this gorgeous bird in numerous flocks on the spurs of the Caucasus, which extend towards the Caspian sea; and that now it has gone wild and multiplied in some of the forests of Germany. In Southern Asia, the birds familiarly known as 'Bulbuls' must not be confounded with the Persian Bulbul, which is a species of true Nightingale (*Luscinia*), a genus very closely related to some of the small Thrushes of America. We have no true Nightingale wild in India; but the 'Shama' *Cercotrichas macrourus*, undoubtedly the finest song-bird of this part of the world, is not unfrequently designated the Indian Nightingale, a misnomer which only leads to confusion. It is common to India and the Malay countries; and there is a second species (*C. luzoniensis*) in the Philippines, and a third (*C. erythropterus*) in Africa. We may remark that the *Orocetes cinclochyncha* is also termed *Shama* in the Madras Presidency. Our esteemed Indian songster is *le Merle tricolor de longue queue* of Levaillant (*Oiseaux d' Afrique, pl.* 114). The *Bhim-raj* (*Edolius paradiseus*) is popularly denominated "the Mocking-bird" by Europeans. Several eminent naturalists persist in ignoring the very great differences between 'Storks' and 'Cranes,' in their appearance, habits, anatomy, modes of breeding, and everything, except that both happen to be long-legged birds. They do so by designating the *Hurgila* or 'Adjutant' (*Leptoptilus argala*) "the gigantic Crane." The three ordinary Indian Cranes (*Grus antigone*, *Gr. cinerea*, and *Gr. virgo*; the *Gr. leucogeranos*, occur rarely in the North West provinces. Now the words *Crane* and *Grus*, and the Hindustani names of the three common Indian species, *Saras*, *Kurranch*, and *Kakarra*, all have reference to the loud trumpeting of these birds, which have a curious internal conformation resembling that of the Trumpeter Swans; whereas the Storks are voiceless birds, having actually no vocal muscles, and can make no sound but by clattering their mandibles together, which they do pretty loudly. *Yunx indica* appears to be met with in Afghanistan and Tibet. Mr. Gould describes a kind of Nuthatch to inhabit the Himalayan masses towards Kashmir, but the bird in question is unknown in Central India properly so designated. The *Acrocephalus arundinaceus* (*Sylvia turdoides* of Temminck), and the *Acr. salicarius* (*S. arundinacea* of Temminck), and also the three common British species of *Phylloscopus*, have been noted by different authors as occurring in India; but however nearly the three Indian species of *Acrocephalus* may resemble their European compeers on a superficial view, it will be found, on minute examination that they have a somewhat different form of wing; and that their habits are appreciably diverse: the European species evince a marked preference for watery situations, and this can hardly be affirmed of the Indian. Even where such situations abound, they come more into gardens; moreover the song of the three Indian species is soft and melodious, devoid of the harsh babbling notes of the European *Acrocephali*, in common with most other "aquatic warblers." In India, various instances occur of closely affined Indian and European birds, which every ornithologist would at once pronounce to be distinct: *e.g Oriolus galbula* and *O. kundoo*; *Lanius excubitor* and *L. lahtora*; *Troglodytes europæus* and *Tr. sub-himalayanus*; *Certhia familiaris* and *C. himalayana*, *&c.*: and not unfrequently the exact European species inhabits this country, in addition to another which would otherwise be regarded as its counterpart or representative, or according to the views of some naturalists a mere local or climatal variety of the same species: thus *Circus Swainsonii* (the *pallidus* of Sykes) is regarded by Prof. Schlegel as a local variety of *C. cinereaceus*; had he said so of *C. cyaneus* it would be more intelligible, as the affinity is much closer with *cyaneus*; nevertheless, both *Swainsonii* and *cinereaceus* appear to be common throughout Africa, as both likewise are in India, inhabiting the same districts, and each remaining ever true to its distinctive characters; while *cyaneus* also inhabits the vicinity of the Himalaya, together with both the others. There are precisely the same grounds for regarding the European *Phylloscopus trochilus* and *Ph. rufus* as being 'climatal' or 'local' varieties of one species; only these birds happen to be better known, much as they resemble each other. Again, we have the true *Falco peregrinus* common in India, together with *F. peregrinator*, which would otherwise be regarded as its Indian counterpart: *Hypotriorchis subbuteo* found together with *H. severus*; *Hirundo sinensis* (the ordinary Indian Sand Martin,) together with *H. riparia*; *Cuculus canorus* (the European Cuckoo,) as also several affined species; and so on. In some cases, a European species may have two or more 'representatives' in India, or *vice versa*. Thus *Nucifraga caryocatactes* of the pine forests of Europe and Siberia is replaced by *N. hemispila* in those of the Himalaya generally, and by *H. multimaculata* about Kashmir; *Parus major* by *P. monticolus* and *P. cinereus*, if not also *P. nuchalis* (in addition to *cinereus*) in S. India; *Picus major* by *P. himalayanus* and *P. darjellensis*; *Accentor alpinus* by *A. nipalensis* and *A. variegatus*: while, on the other hand, *Lanius lahtora* in India is represented both by *L. excubitor* and *L. meridionalis* in Europe; *Sitta cinnamoventris* by *S. europæa* and *S. cæsia*, *&c.* Some ornithologists regard the *Passer domesticus*, *P. italiæ* (vel *cisalpinus*), and *P. salicarius* (vel *hispaniolensis*,) of Europe, as being local varieties merely of the same: yet they hold true to their

distinctive differences of coloring, wheresoever found; and examples of the last-named race from Afghanistan and the extreme N. W. of India differ in no appreciable respect from Algerian specimens with which we have compared them: moreover, this race is of far more gregarious habits even than *Passer domesticus*; a fact noticed of it alike in N. Africa and in Kohat. For the *Bauri* or Peregrine Falcon of India, Mr. Gould adopts Latham's name *F. calidus*, thereby implying a distinction from true *peregrinus*. It may be doubted exceedingly if any one difference could be detected. It is true, that many highly approximate races (considered, therefore, as species) do maintain their distinctness, even in the same region and vicinity; as *Falco peregrinus* and *F. peregrinator*, *Hypotriorchis subbuteo* and *H. severus*, *Circus cyaneus* and *C. Swainsonii* in India. *Coracias bengalensis* of all India meets, in the Punjab, &c., the European *C. garrula*; and we are unaware that it interbreeds with it: but in Asam, Sylhet, Tippera, and, more rarely, Lower Bengal, it co-exists with the *C. affinis*, specimens of which from the Burmese countries are ever true to their proper coloration, as those of *C. bengalensis* are from Upper and S. India; but we have seen every conceivable gradation or transition from one type of colouring to the other, in examples from the territories where the two races meet: so also with the *Treron phœnicopterus* of Upper India and the *Tr. chlorigaster* of S. India and Ceylon, which blend in Lower Bengal; and *Gallophasis albocristatus* of the W. Himalaya and *G. melanotus* of Sikhim, which produce an intermediate race in Nepal; and *G. Cuvieri* of Asam and Sylhet, and *G. lineatus* of Burma, which interbreed in Arakan, &c., so that every possible transition from one to the other can be traced, as demonstrated by a fine series of preserved specimens in the museum of the Asiatic Society in Calcutta. If inhabiting widely separated regions, the (assumed) distinctness of such races would be at once granted; as with *Phasianus colchicus* and the Chinese *Ph. torquatus*, which readily intermix and blend, wherever the latter has been introduced in Europe. How, therefore, with *Garrulus glandarius* and *G. japonicus*? *Turdus viscivorus* of Europe and the so called *T. Hodgsoni* of the west Himalaya? *Palumbes torquatus* and *P. casiotis* of the same regions respectively? These would probably soon blend more or less completely; whereas such races as those of the Crossbills, the *Bauri* and *Shahin* Falcons of India, the British *Phylloscopus trochilus* and *Ph. rufus*, and the different European Sparrows, maintain themselves persistently distinct; and this while the common Sparrow of India would probably blend with the British Sparrow (though considered distinct by some), if an opportunity should occur of its doing so.

The names, synonyms and localities of most of the Birds of these countries, are given in Mr. Blyth's catalogue, and are as follows:

Class AVES, Order I. SCANSORES. Fam. PSITTACIDÆ. Subfam. CACATUINÆ. (Cockatoos).

Genus CALYPTORHYNCHUS, Vigors and Horsfield.

(787) *C. galeatum* (Gould's *B. A.* Vol. V. pl. 14.)

Syn. Psittacus galeatus, Latham.
Callocephalon australe, Lesson.

Inhabits S. Australia; Islands in Bass's Straits; V. D. Land.

GENUS CACATUA, Brisson.

(788) *C. moluccensis* (Lear's *Psittacidæ*, pl. 2.)

Syn. Psittacus moluccensis. Gmelin.
Ps. rosaceus, Latham.
Cacatua rubrocristata, Brisson.
C. erythrolophus, Lesson.

Inhabits the Moluccas.

(789) *C. cristata* (Daubenton's *Pl. Enl.* 263).

Syn. Psittacus cristatus, L.
Cacatua leucolophos, Lesson.

Inhabits the Philippines.

(790) *C. galerita* (Lear's *Psittacidæ*, pl, 3; Gould's *B. A.* Vol. V, pl. 1.)

Syn. Psittacus galeritus Latham.
Cacatua chrysolophus, Lesson.

Inhabits (with local variation) N. Guinea, Australia, and V. D. Land.

(791) *C. sulphurea* (Lear's *Psittacidæ*, pl. 4).

Syn. Psittacus sulphureus, Gmelin.
Cacatua luteocristata, Brisson.

Inhabits Timor, &c.

Subfam. PSITTACINÆ (Parrots).

Genus CORACOPSIS, Wagler.

(792) *C. nigra* (Edwards, pl. 5.)

Syn. Psittacus niger, L.

Inhabits Madagascar.

Genus TANYGNATHUS, Wagler.

(793) *T. macrorhynchos* (Daubenton's *Pl. Enl.* 713).

Syn. Psittacus macrorhynchos, Gmelin (the male).
Ps. sumatranus, Raffles (the female).
Ps. pileatus, Scopoli } Young male?
Ps. marginatus, Gmelin }
Kiki, Sumatra (Raffles).

Inhabits Sumatra? Celebes; N. Guinea.

(794) *T. malaccensis* (Swainson's *Ill. Orn.*, 1st series, pl. 254).

Syn. Psittacus malaccensis, Latham (nec Gmelin).
Tana, Malayan.

Inhabits Malayan peninsula; Sumatra.

Genus PALÆORNIS, Vigors.

(795) *P. alexandri* (Edwards, pl. 292; *Nat. Libr., Psittacidæ*, pl. 2.)

Syn. Psittacus Alexandri, L.
Ps. cupatria, L. } The female.
Psittaca ginginiana, Brisson. }
Psittacus guinneensis, Scopoli (nec guineensis, Gmelin).
Ps. Sonneratii, Gmelin.
Palæornis nipalensis, Hodgson, As. Res. XIX, 177.

Chandana (*sandal-wood coloured*, alluding to the yellowish tinge of the under-parts and upper portion of the back), Beng. : *Karan suga* and *Kararia* of Nepal (Hodgson) : *Raee Totah (Royal Parrakeet)*, Hind. (Jerdon) : *Kyai Phoungkha ?* Arracan. Inhabits the Hilly regions of all India Proper, from the sub-Himalayas to Ceylon inclusive : Assam ; Sylhet ; Arracan ; Tenasserim.

(796) *P. torquatus* (Daubenton's *Pl. Enl.* 551).

Syn. Psittaca torquata, Brisson.
Psittacus Alexandri, var. B., Latham.
Ps. cubicularis, Hasselquist.
Ps. docilis, Vieillot.
Var. Sulphur Parrakeet, Shaw.

Tiya, or *Teeah* (imitative of voice), Hind. : *Tent'hia suga*, Nepal (Hodgson) : *Lybar Totah*, S. India (Jerdon) : *Kyaiggyot*, Arracan. Inhabits the Plains of India : Arracan, Tenasserim, and Malayan peninsula to the latitude of Penang. W. Africa (apud Swainson) : smaller variety.

(797) *P. bitorquatus (?)*

Syn. Psittacus bitorquatus (?), Kuhl.
Ps. torquatus, var. B. (?), Latham (2nd. edit.)
Psittaca borbonica torquata *(?)*, Brisson.

'Ring Parrakeet' of the Mauritius. Inhabits Mauritius. According to Latham *P. bitorquatus (i. e.* his *Ps. torquatus*, var. *B.*,) "inhabits the Isle of Bourbon, and other parts of the same latitude both in Africa and Asia." The last named habitat is extremely doubtful.

(798) *P. columboides*, Vigors, (Jerdon's *Ill. Ind. Zool.* pl. 18 ; and figured also in *Madr. Journ.* XI, 209).

Syn. Psittacus melanorhynchus, Sykes, P. Z. S. 1832, p. 96. (The female).

Muddun Gowr Totah, Hind. (Jerdon). Inhabits Nilgiris ; Malabar.

(799) *P. schisticeps*, Hodgson, *As. Res.* XIX, 178.

Syn. Conurus himalayanus (?), Lesson, in Belanger's Voyage.
Madhana suga, Nepal, Hodgson. The same name, slightly modified, which is applied to P. barbatus, and in S. India to P. columboides.

Inhabits the Sub-Himalayan region, exclusively.

(800) *P. cyanocephalus*, (Edwards, pl. 233 ; Daubenton's *Pl. Enl.* 264).

Syn. Psittacus cyanocephalus, L. } The female.
Ps. flaviterquis, Shaw. }
Ps. annulatus, Kuhl. }
Palæornis flavicollaris, Franklin. }
Psittaca bengalensis, Brisson.
Psittacus erythrocephalus, Gmelin.
Ps. ginginianus, Latham.
Ps. rhodocephalus, Shaw.
Var. Ps. narcissus, Latham (with coloured figure).

Faridi, and *Fariadi* (Plaintive), Bengal. *Tui suga* (the first or specific name imitative of cry), Nepal (Hodgson). *Tooeeah Totah*, S. India (Jerdon). *Totá bangáli*, Punjab. *Kyai-ta-ma*, Arracan. Inhabits the Hilly regions of all India Proper, Assam, Sylhet, Arracan, Tenasserim. It occurs also in open jungle, in the Bengal Sundarbans. To the westward, leaving the alluvial soil, it seems entirely to take the place of *P. torquatus*, which abounds throughout the Ganges delta.

(801) *P. Malaccensis* (Daubenton's *Pl. Enl.* 887 ; Levaillant, pl. 72 ; *Nat. Libr. Psittacidæ.* pl. 3).

Syn. Psittacus malaccensis, Gmelin (nec Latham).
Ps. erubescens, Shaw.
Ps. ginginianus, var. *C.*, Latham.
Ps. barbatulatus, Bechstein.
Barong Bayan, Sumatra (Raffles).

Inhabits Malacca ; Sumatra.

(802) *P. erythrogenys*, Blyth.

Inhabits the Nicobar Islands.

(803) *P. caniceps*, Blyth.

Inhabits the Nicobar Islands ; Malayan Peninsula (latitude of Penang).

(804) *P. barbatus*, (Swainson's *Ill. Orn.*, 2nd series, pl. 16 ; Daubenton's *Pl. Enl.* 517).

Syn. Psittacus barbatus, Ps. pondicerianus, et Ps. borneus, Gmelin.
Ps. bimaculatus, Sparrman.
Ps. javanicus, Osbeck.
Ps Osbeckii, Latham.
Palæornis nigrirostris, Hodgson (the female).
P. modestus, Fraser, P. Z. S. 1845, p. 16 (young female).

Madná (charming, pleasing), the red-billed bird : *Kajlá* (as having the black pigment, *kájal*, applied to the eyebrows ; alluding to the black loral line),—the black-billed : Hind. *Imrit Bhela*, Nepal (Hodgson). *Bettet*, Javanese. Inhabits the hilly parts of Bengal, Nepal, Assam, Sylhet, Arracan, Tenasserim, Malayan peninsula (to latitude of Penang), Sumatra, Java, and Borneo. It is extremely doubtful as an inhabitant of the Pondicherry coast, or any other part of peninsular India.

Subfam. PLATYCERCINÆ (Ground-Parrakeets)

Genus APROSMICTUS, Gould.

(805) *A. erythropterus*, (Gould's *B. A.* Vol. V, pl. 18.)

Syn. Psittacus erythropterus, Gmelin.
Ps. melanotus, Shaw.

Inhabits E. and S. Australia ; Timor ; N. Guinea

Genus PLATYCERCUS, Vigors.

(806) *Pl. flaviventris*, (Gould's *B. A.* Vol. V, pl. 24.)

Syn. Psittacus flaviventris, Temminck.
Ps. Brownii, Kuhl.
Ps. caledonicus ? Latham.

Inhabits V. D. Land ; Islands in Bass's Straits.

Sub-fam. LORIINÆ (Lories).

Section I. (With the tongue not filamented).

Genus ECLECTUS, Wagler.

(807) *E. polychloros*, (Edwards, pl. 231; Daubenton's *Pl. Enl.* 514),

Syn. Psittacus polychloros, Scopoli.
Ps. magnus et Ps. sinensis, Gmelin.
Ps. viridis, Latham.
Ps. lateralis, Shaw.
Muscarinus prasinus, Lesson.

Hira-mohan ('prized favorite'), Hind. Inhabits the Moluccas.

(808) *E. grandis* (Brown, *Ill. Zool.* pl. 6; Daubenton's *Pl. Enl.* 683).

Syn. Psittacus ceylonensis, Boddaert.
Ps. grandis et Ps. janthinus, Gmelin.
Ps. guebiensis, var., Latham.

Lal-mohan ('red favorite'), Hind. Inhabits the Moluccas.

Genus LORICULUS, Blyth.

(809) *L. pumilus* (Edwards, pl. 293, f. 2),

Syn. Psittacus pumilus, Scopoli.
Ps. galgulus, Shaw.

Seren-dak, *Sindada*, Malayan: *Serindit*, Sum. Inhabits the Malayan peninsula, where very common: also Sumatra.

(810) *L. vernalis* (Swainson's *Zool. Ill.*, 2nd series, pl. 1; and figured as identical with the preceding species, apud Wagler, in *Nat. Libr.*, *Psittacidæ*, pl. 24).

Syn. Psittacus vernalis, Sparrman.

Latkan, ('pendent'), Hind. *Kyai-tha-da*, Arracan: *Silindid*, and *Silinditum*, Jav. Inhabits the Hilly parts of India, from the sub-Himalayan region to S. India, also Assam, Sylhet, Arracan, Tenasserim, Java: in the Malayan peninsula it appears to be completely replaced by *L. pumilus*; and in the Philippines and also in Ceylon, by the next species.

(811) *L. philippensis*? (Edwards, pl. 6; Lear's *Psittacidæ*, pl. 41?)

Syn. Psittacus philippensis? Brisson.
Ps. asiaticus, Latham.
Ps. indicus, Gmelin.
Psittacula rubrifrons? Vigors, P. Z. S. 1831, p. 97.

Inhabits Philippines (?): Ceylon.

Section II. (With filamented tongue.)

Genus LORIUS, Brisson.

(812) *L. philippensis*, Brisson (Edwards pl. 170; *Pl. Enl.* 168).

Syn. Psittacus lory, L.
L. tricolor, Stephens.

Inhabits the Moluccas: Philippines?

(813) *L. domicella* (Edwards, pl. 171; *Pl. Enl.* 168; *Nat. Libr.*, *Psittacidæ*, pl. 18).

Syn. Psittacus domicella, L.
Ps. raja, Shaw.
Ps. rex, Bechstein.
Ps. radhea, Vieillot.

Inhabits the Moluccas.

(814) *L. garrulus* (Edwards, pl. 172; *Pl. Enl.* 216; Swainson's *Zool. Ill.* 2nd series, 1, pl. 12).

Syn. Psittacus garrulus et Ps. aurora, L.
Ps. moluccensis, Brisson.

Inhabits the Moluccas.

Subgenus EOS, Wagler.

(815) *E. rubra* (Edwards, pl. 173).

Syn. Psittacus ruber, Gmelin.
Ps. borneus, Latham.
Ps. cæruleatus, Shaw.
Ps. cyanonotus, Vieillot.

Inhabits Borneo, Celebes, &c.

(816) *E. cyanostriata*, G. R. Gray (*Ill. Genera of Birds*, pl. 103).

Syn. Lorius borneus, Lesson.
Blue-necked Lory, Latham.

Inhabits Borneo, Celebes, &c.

(817) *E. ornata* (Edwards, pl. 174; *Pl. Enl.* 522).

Syn. Psittacus ornatus, Gmelin.

Bangau, and *Bandhua*, Hind. (Names referring to a mode of dyeing silk, whence *bandhana* handkerchiefs, &c.) Inhabits Eastern Archipelago (Malayan peninsula apud Raffles, but this very doubtful).

(818) *E. novae guineæ*.

Syn. Psittacus novæ guineæ, Latham. } The young.
Ps ater, Scopoli. }
Ps batavensis, Latham,—the adult.

Inhabits N. Guinea.

Genus TRICHOGLOSSUS, Vigors and Horsfield.

(819) *Tr. hæmatodes* (J. and S., *Ill. Orn.*, 1st series, pl. 111; *Pl. Enl.* 61).

Syn. Psittacus hæmatodes, L.
Psittaca amboinensis varia, Brisson.

Inhabits the Moluccas; Amboyna. There have been seen several individuals devoid of the dusky marginings to the pectoral feathers, described as characteristic of this species.

Order II. RAPTORES. Tribe DIURNÆ. Fam, FALCONIDÆ. Sub-Fam. FALCONINÆ.

Genus FALCO, Lin.

(820) *F. gyrfalco*, L. (*Pl. Enl.* 210: Gould's *B. E.* pl.)

Syn. F. islandicus, Brunnich.
F. candicans, Gmelin.
F. grœnlandicus, Hancock.

Shanger Hind. Inhabits Northern regions

(821) *F. juggur*, Gray, (Hardw. *Ill. Ind. Zool.*)

SYN. F. luggur, Jerdon.

Juggur Falcon, and probably also *Justin Falcon*, Latham. *Jhaggar*, male; *Laggar*, female; *Hind*: *Luggadoo* (Jerdon), Telegu. Inhabits India generally. Common along the banks of the Ganges above the tideway; rare and accidental in Lower Bengal within the reach of the tides.

(822) *F. peregrinus*, L. (*Pl. Enl.* 421. 430, 469, 470).

SYN. F. barbarus, L.
F. communis, Brisson.
F. hornoticus and F. ater, Gmelin.
F. lunulatus, Daudin.
F. abietinus, Bechstein.
F. calidus, Latham.
F. anatum, Bonap.

Eauri, H. (female): *Bauri Batcha* (male), H. *Raja Wali*, Malay: *Sikap Lang*, Sum.: *Lagi Angin* of the Passummahs. Inhabits the Northern hemisphere chiefly: common in India, many adults remaining in Lower Bengal during the cold season, and especially frequenting the vicinity of jheels, to prey on the water-fowl which resort to them; hence they are tolerably numerous in the Sundarbans.

(823) *F. peregrinator*, Sundevall (Jerdon's *Ill. Ind. Zool.* pl. 12, 28.)

SYN. F. shahin, Jerdon.
F. sultaneus, Hodgson.
F. ruber indicus, Aldrovand.

Shahin ('royal') female; *Koela* ('charcoal'), male: H. Inhabits India generally; chiefly the hilly parts: much more rare in Lower Bengal than *F. peregrinus*.

(824) *F. chicquera*, Shaw (Lev. *Ois. d' Afr.*, t. 30; Gould's *Century*, pl. 2).

SYN. F. ruficollis, Swainson.
F. cirrhatus, var., and
Fasciated Falcon, Latham.
Probably F. biarmicus apud Vigne, P. Z. S. 1841, p. 6.

Tarmati, (*Turumtee*, Jerdon: *Toomtra*, Burnes), female; *Chetra* or *Chetoya*, male. H. Inhabits Asia and Africa; very rare in the S. of Europe: common in India.

Subgenus HYPOTRIORCHIS, Boie.

(825) *H. severus* (*Pl. Col.* 128).

SYN. Falco severus, Horsfield.
F. Aldrovandi, Reinwardt.
F. guttatus, G. R. Gray.
F. rutipedoides, Hodgson.

Jhuter quære (*Jata*, 'there goes?'), H.: *Allap Allap Gingeng*, Jav. Inhabits Himalaya, Java, Philippines: visiting the plains of Lower Bengal in the cold season, where somewhat rare.

(826) *H. subbuteo*.

SYN. Falco subbuteo, L.
F. barletta, Daudin.
F. pinetarius, Shaw?

Karjanna, *H.*: *Surkhpushtak* ('rufous-vent'), of Kabul (Burnes). Inhabits Europe, Asia, and Africa: visits Lower Bengal in the cold season where far from common.

Subgenus TINNUNCULUS, Vieillot.

(827) *T. alaudarius*.

SYN. Falco alaudarius, Brisson.
F. tinnunculus, Linnæus.
F. interstinctus, McClelland.
F. fasciatus, Retzius.
F. brunneus, Bechstein.

Khurmutia, *Kurrowtia*, *Karontea*, and *Narzinarzanak* ('tête à tête'), H.: *Nardunak*, Sinde: (Burnes): *Gyo-thin*, Arracan: *Allap Allap Sapi*, Jav. (Horsf.) Inhabits Europe and Asia: very common in Lower Bengal, where frequently seen in parties of 20 or 30 individuals, beating over the cultivated lands.

(828) *T. cenchris* (Gould's B. E. pl.).

SYN. Falco cenchris, Naumann.
F. tinnunculoides and F. xanthonyx, Natterer.
F. tinnunculariu, Vieillot.
F. Naumannii, Fischer.

Inhabits the warmer parts of Europe and Asia; and found near Calcutta; also N. Africa.

(829) *T. vespertinus* (*Pl. Enl.* 431: Gould's *E. E.* pl.).

SYN. Falco vespertinus L.
F. rufipes Beseke.
F. subbuteo, var., Latham.

Inhabits Europe and Asia.

(830) *T. æsalon* (*Pl. Enl.* 447, 468: Gould's *B. E.* pl.).

SYN. Falco æsalon and F. lithofalco, Gmelin.
F. regulus Pallas.
F. cæsius, Meyer.
F. intermixtus, Daudin.

Inhabits Europe and northern Asia, N. W. Himalaya?

(831) *T. punctatus* (*Pl. Col.* 45).

SYN. Falco punctatus, Cuvier.

Inhabits Madagascar; Mauritius.

Genus HIERAX, Vigors.

(832) *H. melanoleucos*, Blyth (J. A. S. XII, 179—*bis*). Inhabits Assam.

(833) *H. eutolmos*, Hodgson.

SYN. H. bengalensis apud Blyth, J. A. S. XII, 180 (bis)
Bengal Falcon, var, A., Latham.

Doung oo-uhouk, *Arracan*. Inhabits Nepal; Sylhet; Arracan.

(834) *H. fringillarius* (*Dict. Class. d'Hist' Nat.*, pl. 21: *Pl. Col.* 97).

SYN. Falco fringillarius, Drapiez.
Hierax malayensis, Strickland.
Malayan F. cærulescens, auctorum.

Seeap Belang, Penang: *Allap*, or *Allap Allap*, Java. Inhabits Western Malasia: replaced by other species in the more Eastern Islands.

Subfam. PERNINÆ.

Genus BAZA, Hodgson.

(835) *B. lophotes* (*Pl. Col.* 10).

Syn. Falco lophotes, Temminck.
B. syama, Hodgson.
Falco et Lepidogenys Lathami, Gray.
Lophotes indicus, Lesson.

Syama, ('*black*'), Nepal. Inhabits India generally; rarer to the South: not uncommon during the rainy season in Lower Bengal.

(836) *B. Jerdoni.*

Syn. Lophastur Jerdoni, Blyth, J. A. S. XI, 464.

Probably *Falco Reinwardtii*, Muller. Inhabits Malayan peninsula.

Genus PERNIS, Cuvier.

(837) *P. christata*, *Cuvier* (*Pl. Col.* 44).

Syn. Falco ptilorhynchus, Temminck.
P. Elliotti, Jameson.
P. maculosa, and probably P. torquatus, ruficollis, and atrogularis, Lesson.

Madhava, (from *Madhu*, 'honey'), Nepal (Hodgson): *Shahutela*, (from *Shahut*, 'honey'), H. (Jerdon). Inhabits India generally. Not rare in Lower Bengal.

Subfam. ELANINÆ.

Genus ELANUS, Savigny.

(838) *E. melanopterus* (Lev., *Ois. d'Afr.* t. 36).

Syn. Falco melanopterus, Daudin.
F. sonninensis et vociferus, Latham.
F. clamosus, Shaw.
E. cæsius, Savigny.
Petite Buse Criarde, Sonnerat.
Kotta Falcon, and (the young) Indian Falcon, Latham.

Kapasi, ('cottony'), H.: *Angkal Angkal*, Java. Inhabits S. Asia; Malayan Archipelago; and all Africa, if not also the extreme S. of Europe occasionally; common in Lower Bengal, and generally over India.

Subfam. CIRCAETINÆ.

Genus CIRCAETUS, Vieillot.

(839) *C. gallicus* (*Pl. Enl.* 413.)

Syn. Falco gallicus, Gmelin.
F. brachydactylus, Temminck.
F. leucopsis, Bechstein.
F. longipes, Wilson.
Aquila leucamphomma, Borkh.
A. pygargus, Brisson.

Sap-marilo, ('snake-killer'), Beng.: *Sampmar* (ditto), H.: *Mulpatu*, Can. Inhabits Europe, Asia, and Africa. Common on the plains of India, preferring an open country. It preys chiefly on snakes.

Genus HÆMATORNIS, Vigors.

(840) *H. cheela* (Gould's *century*, pl. 1.)

Syn. Falco cheela, Latham.
H. undulatus, Vigors.
Circaetus nipalensis, Hodgson.
H. et Buteo bacha, apud Franklin and Sykes.
F. albidus, Cuv., and Buteo melanotis, Jerdon, the young.

Tilai-baj ('spotted Hawk'), Beng.: *Sabchur* ('full-crested'), young. *Goomcan-mooryala*, Mahr.: *Doung-tswon*, Arracan. Inhabits India generally: extremely common in Lower Bengal; preferring a jungle country, with shallow jheels and tanks, where it preys much on frogs which it clutches in the mud.

(841) *H. bido.*

Syn. Falco bido, Horsfield., Lev. Ois d'Afr. t. 15.
F. bacha (?), Daudin.
F. cheela, var.?

Bido, Javan. Inhabits Malay countries, Africa?

Subfam. CIRCINÆ.

Genus CIRCUS, Lacepede.

(842) *C. æruginosus* (Gould's B. E. pl. 32).

Syn. Falco æruginosus, L.
F. rufus, Gmelin.
F. arundinaceus, Bechstein
Accipiter circus, Pallas.
Circus palustris, Brisson.
C. variegatus, Sykes.
C. rufus var. indicus, and C. Sykesi, Lesson.
Konta Falcon, Muskooroo Falcon, and Rufous-eared Falcon, Latham.

Ch'oa or *Mat Chil* ('Meadow Kite'), Beng. (generic): *Kutar*, and *Kulehsir* (capped), Hind. *Safid Sira* ('white-headed'), and *Tika Bauri* (Hawk with the *tika* frontal mark), (B. Ham). Inhabits Europe, Asia, and Africa.

(843) *C. cyaneus* (Gould's *B. E.* 33).

Syn. Falco cyaneus, Lin.
F. bohemicus, albicans, griseus, et montanus, Gmelin, &c. &c.
F. uliginosus (?), Gmelin.

Tupoos, or *Moosh-khor* (rat-eater), of Kabul (Burnes). Inhabits Europe and middle Asia: replaced on the plains of India by the next species.

(844) *C. Swainsonii*, A. Smith (Gould's *B. E.* pl. 34).

Syn. C. pallidus, Sykes.
C. dalmaticus, Ruppell.
C. albescens, Lesson.
Falco herbæcola, Tickell (?)
F. cyaneus, var. A, Latham.

Dast-mal ('hand-soiler'), Hind.: *Teea* (Burnes, from the voice), Derajat: *Pandouvi*, (B. Ham.); Inhabits India and Africa; very rare in Europe. Less common in Lower Bengal than C. cinerascens.

(845) *C. cinerascens* (Gould's *B. E.* pl. 35).

Syn. Falco cinerascens, Montagu.
C. Montagui, Vieillot.

Inhabits Europe, Asia, and Africa: all India; Ceylon.

(846) *C. melanoleucos.*

Syn. Falco melanoleucos, Pennant.

Pahatai, H.: *Ablak Petaha*, ('Pied Harrier'?; *Petaha*, &c. probably from the voice), Nepal, (H.) *Thin-kya*, Arracan. Inhabits India generally inclusive of Ceylon.

Genus POLIORNIS, Kaup,

(847) *P. teesa.* (*Hardw. Ill. Ind. Zool.*)

Syn. Circus teesa, Franklin.
Astur hyder, Sykes.
Zuggun Falcon, Latham.

Tisa, or *Teesa*, (from the voice), Hind. Inhabits Plains of India, where very abundant: never met with on the mud-soil of Lower Bengal, though appearing immediately this is quitted in a westerly direction: Tenasserim provinces; Malacca?

Subfam. ACCIPITRINÆ.

Genus ACCIPITER, Ray.

(848) *Acc. nisus* (*Pl. Enl.* 467, 412),

Syn. Falco nisus, L.
F. nisosimilis, Tickell, J. A. S. II, 571.
A. fringillarius, Ray.
A. Dussumieri apud Jerdon, Madr. Journ. X, 84.
Bassun Falcon, Latham.

Basha, female;—*Bashin*, male—Hind. Inhabits Europe, Asia, and N. Africa: in India, numerous in the hilly parts, rare and accidental on the alluvium of Lower Bengal.

(849) *A. nisoides*, Blyth (J. A. S. XVI, 727).

Syn. Falco soloensis (?), Horsfield.
F. cuculoides (?), Temminck, P. C. 110, 129.
Sumatran Acc. fringillarius of the Appendix to Lady Raffles's memoirs of Sir T. S. Raffles, p 549.

Sikap Ballam (?), Sum.: *Allap Allap Lallar* (?), Jav. Inhabits Malayan peninsula.

(850) *A. virgatus* (Jerdon's *Ill. Ind. Zool.* pl. 4, 29).

Syn. Falco virgatus, Temminck, P. C. 109.
Nisus minutus, Lesson (apud G. R. Gray).
A. besra, Jerdon; and the female
A. fringillarius apud Jerdon, Catal.
A. Dussumieri apud Sykes.

Basra (dimunitive of *Baz*, 'Goshawk'), and the male—*Dhasti* ('a handful', 'or held in the hand'), Hind. Inhabits India generally, but chiefly the hilly parts; also the Malay countries: rare and accidental in Lower Bengal.

Genus MICRONISUS, G. R. Gray.

(851) *M. badius* (*Pl. Col.* 308, 336).

Syn. Falco badius, Gmelin.
F. Brownii, Shaw.
F. Dussumieri, Temminck (nec apud Sykes's or Jerdon's Catalogues).
Accipiter dukhunensis, Sykes.
Calcutta Sparrow-hawk and Chippuck Falcon, Latham.

Shikra, from *shikar karna*, to pursue game), female, *Chippuck* (or *Chipka*, Jerdon, from the voice), male H. *Thinkyet-ma*, Arracan. Inhabits India generally and Malay countries, being numerous throughout India, and in Ceylon; not uncommon in Afghanistan.

Genus ASTUR, Bechstein.

(852) *A. palumbarius* (*Pl. Enl.* 418, 461, 423).

Syn. Falco palumbarius et F. gentilis, L.
F. gallinarius. Gmelin.
F. albescens, Boddaert.
Accipiter astur, Pallas.

az or *Baz Khani*, female. *Jurra*, male. Hind. The *Kurrungosh* is probably a variety. Inhabits Europe and Asia: in India, confined (or nearly so) to the sub-Himalayas.

(853) *A. trivirgatus* (*Pl. Col.* 303).

Syn. Falco trivirgatus, Reinwardt.
Astur indicus, Hodgson.
A. palumbarius apud Jerdon, Madr Journ No. XXIV, 85.
S. cristatus, G. R. Gray.
Spizaetus rufitinctus, McClelland, P. Z. S. 1839.

Gar (fort or Mountain) *Bazra*, *Manik* (esteemed) *Bazra*, *Kotesaor*, (fort-chieftain), H.: *Churiali*, (frequenting peaks), Nepal. Inhabits India and Malay countries; being confined to the hilly parts.

Subfam. THRASAETINÆ.

Genus PSEUDASTUR, Blyth.

(854) *Ps. pœcilonotus* (*Pl. Col.* 9).

Syn. Falco pœcilonotus, Cuvier.
F. skotopterus, Pr. Max.

Inhabits S. America.

Genus SPIZAETUS, Vieillot.

(855) *Sp. nipalensis.*

Syn. Nisaetus nipalensis, crested variety, Hodgson, J A S. V. 229.
N. pulcher. Ibid., J. A. S. XII, 305
Falco orientalis (?) et F. lanceolatus (?) Temminck and Schlegel.

Inhabits Himalaya, and mountain ranges N. of Sylhet.

(856) *Sp. limnaetus* (*Pl. Col.* 127, 134).

Syn. Falco limnaetus, Horsfield.
F. caligatus, Raffles.
F. niveus, Temminck.
Limnaetus unicolor, Vigors.
Nisaetus nipalensis, crestless variety, Hodgson, J. A. S. V. 229.
N. pallidus, ibid., young.
Lake Falcon, Bauj Eagle, and probably Jerwied Eagle, Latham.
Lang Tanjbikar, Sum. Wuru rawa Sav.
Var. Falco cristatellus, Temminck.
F. Lathami, Tickell.
F. cirrhatus (?), Gmelin.

Shah Baj, and *Sadal*, Hind. Inhabits India and Malay countries: the crested variety found chiefly in the peninsula of India.

(857) *Sp. alboniger.*

Syn. Nisaetus alboniger, Blyth, J. A. S. XIV, 173.

Inhabits Malayan peninsula (Penang, Malacca).

(858) *Sp. Kienerii.*

Syn. Astur Kienerii, de Sparre.
Spizaetus albogularis, Tickell, J. A. S. XI, 456.

Inhabits Himalaya; Central India.

Subfam. AQUILINÆ.

Genus EUTOLMAETUS, Blyth.

(859) *Eu. Bonellii* (Jerdon's *Ill. Ind. Orn.* pl. I.)

Syn. Falco Bonellii, Temminck.
Aquila intermedia, Bonelli.
Aq. fasciata, Vieillot.
Nisaetus grandis, Hodgson, J. A. S., V, 230.
N. niveus? apud Jerdon, Catal.
Genoese Eagle, Latham.

Moranga, or *Morangi*, Hind. Inhabits S. of Europe and Asia, and N. Africa. Nepal.

Genus AQUILA, Meyer.

(860) *Aq. chrysaetos.*

Syn. Falco chrysaetos, F. fulvus, at F. melanaetus L.
F. niger, Gmelin,
F. melanotus, Latham.
Aquila nobilis, Pallas
Aq. regia, Lesson.

Inhabits mountainous regions of Europe, Asia, and N. America, within the temperate zone, Himalaya and Nepal.

(861) *Aq. imperialis.*

Syn. Falco imperialis, Bechstein.
F. mogilnik, Gmelin.
F. ferox, and Brown-backed Eagle, Latham
Aquila heliaca, Savigny
Aq. bifasciata, Gray.
Aq. nipalensis, Hodgson, As. Res XVIII, pt II, 13. pl. 1.
Aq. chrysaetos apud Meyer, et Jerdon, Catal

Jumiz, or *Jumbiz*, Hind.: *Frus*, Bengal. *Wonio*, Arracan. Inhabits S. E. of Europe, Asia, N. Africa, Mymunseng, Aracan, and Nipal.

(862) *A. nævioides.*

Syn. Falco nævioides, Cuvier.
F. rapax, Temminck.
F. senegallus, Cuvier.
F. albicans, Ruppell.
F. choka, A. Smith.
A. fulvescens, fusca, et punctata, Gray.
A. vindhiana, Franklin.

Wokhal, also *Jimach* (vide J. A. S. XV, 8), Hind. Inhabits the Plains of India and Africa generally: but not found on the alluvium of Lower Bengal.

(863) *A. nævia.*

Syn. Falco nævius et F. undulatus, Gmelin.
A. malanaetus, Savigny.
A. clanga, Pallas.
A. bifasciata, Hornsch

Spotted Eagle, and *Brown-backed Eagle* var. A. Latham. *Kaljanga*, *Bakayari*. *Jiyadha* (B. Ham.) Inhabits S. E. of Europe, Asia, and N. Africa. Common in the Bengal Sunderbans, and found likewise in Central and S. India.

(864) *Aq. hastata.*

Syn. Morphnus hastatus, Lesson.
Spizaetus punctatus, Jerdon.
Limnaetus unicolor apud Blyth, J. A. S. XII, 128.

Jiyadha, and *Gutimar* ('Cocoon-destroyer'), H. Inhabits, Common in the Bengal Sunderbans, and found likewise in upper Bengal, and in Central and S. India.

Genus ICTINAETUS, Jerdon (nec Kaup).

(865) *I. malaiensis.*

Syn. Falco malaiensis, Reinwardt.
Aquila et Heteropus et Neopus perniger, Hodgson.
Nisaetus? ? ovivorus, Jerdon.
Black Eagle, Jerdon, Catal. and Supp

Inhabits S. E. Himalaya; Nilgiris; Malay countries.

Genus HIERAETUS, Kaup,

(866) *H. pennatus.*

Syn. Falco pennatus, Gmelin.
F. Legopus, Bengal variety, Latham.
Aquila minuta, Brehm.
Spizaetus milvoides, Jerdon
Butaquila strophiata, Hodgson.

Inhabits S. E. of Europe, and Asia: India generally.

Subfam. BUTEONINÆ.

Genus ARCHIBUTEO, Brehm.

(867) *A. hemiptilopus*, (J. A. S., XV, 1).

Syn. A. cryptogenys, Hodgson, Calc. Journ Nat Hist. VIII, 96

Inhabits Tibet; Sikim? Darjiling.

Genus BUTEO, Cuvier.

(868) *B. rufinus.*

Syn. Falco rufinus, Ruppell
B. canescens, Hodgson
B. longipes, Jerdon
Circus pectoralis (?), Vieillot.
Nasal Falcon, Latham

Chuha mar ('Rat-killer'), Hind. Inhabits India generally; plains and lower hills. In Lower Bengal, found only above the tideway of the river: also N. Africa.

(869) *B. vulgaris*, Bechstein (Jerdon's *Ill. Ind. Orn.* pl. 27).

Syn. Falco buteo, Lin
F. glaucopis, Merrem.
F. variegatus, versicolor, cinereus, et obsoletus, Gmelin.
B. mutans et fasciatus, Vieillot.
B. albus, Daudin.
B. communis, Cuvier.
B. Swainsoni, Pr. Bonap.
B. montanus, Nuttall.
B. rufiventer, Jerdon.

Inhabits Northern hemisphere; rare and to the northward only in America. The loftier hills only, in India.

(870) *B. pygmæus*, Blyth (J. A. S. XIV, 177).

Inhabits Tenasserim provinces.

Subfam. HALIAETINÆ.

Genus PANDION, Savigny.

(871) *P. haliaetus.*

Syn. Falco haliaenus, L.
P. fluviatilis, Savigny.
P. indicus, Hodgson
Bengal Osprey, Latham.

Match-morol, and *Bulla*, B.: *Mucherera*, H. (Jerdon); also *Match-manga*, H.: *Wonlet*, Arracan. It is of general distribution; the Australian race (*P. leucocephalus*, Gould,) alone

slightly differing. Common throughout India, in all suitable localities.

Genus PONTOAETUS, Kaup.

(872) *P. ichthyaetus.*

Syn. Falco ichthyaetus, Horsfield.
Ichthyaetus bicolor, G. R. Gray.
I. plumbeus, Hodgson, J. A. S. VI. 367

Match-morol ('Fish-tyrant'), Beng.: *Madhuya*, H. (B. Ham): *Jokomaru*, Java. Inhabits India and Malay countries: common in Lower Bengal.

(873) *P. nanus.*

Syn. Ichthyaetus nanus, Blyth, J. A. S. XI, 202, and XII. 304

Inhabits Malayan peninsula.

Genus BLAGRUS, Blyth.

(874) *Bl. leucogaster.*

Syn. Falco leucogaster, Gmelin.
F. blagrus (?), Daudin.
F. dimidiatus, Raffles
F. albicilla, var.?, Latham.
Ichthyaetus cultrunguis, Blyth, J. A. S. XI, 110 the semi-adult.
Haliaetus sphenurus, Gould, young.

Sampamar Eagle, the semi-adult; and *Maritime Eagle*, the adult, Latham. *T'hampa-mar* ('snake-killer'), Orissa; *Kohasa*, H.: *Langlaut*, Sum. Inhabits India; Africa (?); the Malay countries; Australia, and the vicinity of Calcutta.

Genus HALIAETUS, Savigny.

(875) *H. Macei.*

Syn. Falco Macei, Temminck.
H. albicilla apud Vigors and Horsfield.
H. ossifragus (?) apud Raffles.
H. fulvigaster, Vieillot.
H. albipes, Hodgson.
H. lineatus, (the young), and H. unicolor, (the semi-adult), Gray (Hardw. Ill, Ind. Zool.)

Matcharang, *Match-manggar*, *Korol*, or *Match-korol* ('Fish-Eagle'), and *Bala*, C.: *Kokna*, or *Oogoos* (Tickell): *Lang-laut*, Sum. Inhabits Northern India generally: abundant in Lower Bengal, and the vicinity of Calcutta.

Genus HALIASTUR, Selby.

(876) *H. Indus.*

Syn. Falco indus, Boddaert.
F. pondicerianus, Gmelin.
Milvus rotundicaudatus, Hodgson (young.)

Sankar Chil ('Shiva's kite'), *Dhobia Chil* ('Washerman's kite'), and *Ru-mabarik*, ('Lucky-faced,' *i. e.* propitious), Hind. *Khemankari*, Sanskrit. *Rutta Ookab*, Sind. (Burnes), also *Pilyo*: *Tswon-goung phyoo*, Arracan: *Lang-bondol*, Sumatra: *Ulang*, Java. Inhabits India and Malay countries: extremely common.

Genus MILVUS, Cuvier.

(877) *M. Ater.*

Syn. Falco ater et F. austriacus, Gmelin.
M. govinda, Sykes.
M. ætoleus, Lesson.
M. affinis, (?), Gould.

Chil (from the voice), or *Pariah Chil*, H. *Tswon bop*, Arracan. Inhabits India; Malayan peninsula (Penang); Australia? Rare in the eastern parts of Europe. An abundant summer visitant in Afghanistan.

Fam. VULTURIDÆ.

Subfam. VULTURINÆ.

Genus VULTUR, L.

Gidh, (Hind). *Shukuni*, Beng. *Gid Gerai*, Tickell.

(878) *V. monachus*, L.

Syn. V. cinereus, Gmelin.
V. arrianus Temminck.
V. imperialis, Tem. (p. c. 426), apud Jerdon (in epistolâ.)
Ægypius niger et vulgaris, Savigny.

Inhabits mountainous parts of Europe and Asia. Nepal, Assam.

Genus OTOGYPS, G. R. Gray.

(879) *O. calvus.*

Syn. Vultur calvus, Scopoli.
V. pondicerianus Daudin.

Molla-Gidh ('Priest Vulture'), H.: *Lal-mata Shukuni* ('Red-headed Vulture'), Beng. Inhabits India generally: common.

Subfam. GYPINÆ.

Genus GYPS, Savigny.

(880) *G. fulvus.*

Syn. Vultur fulvus, Gmelin.
V. Kolbii, Daudin (apud Dr. A. Smith and G. R. Gray).
V. percnopterus, Pallas (nec Linnæus).
V. leucocephalus, Meyer.
V. indicus apud Jerdon Catal.
Gyps vulgaris, Savigny.

Maha-dho of the Mahrattas. Inhabits Mountainous regions of the Old World: Nepal.

(881) *G. indicus* (Gray's *Ill. Gen. Birds*, pl.).

Syn. Vulture indicus, Scopoli and Latham.
V. bengalensis apud Temminck (Jerdon in epistolâ).
V. tenuiceps et tenuirostris, Hodgson.

Inhabits India and Malay countries: common.

(882) *G. bengalensis* (Hardwick's *Ill. Ind. Zool.*)

Syn. Vultur bengalensis, Gmelin, the young.
V. indicus apud Temminck (young, apud Jerdon in epistolâ).
V. chaguoun, Daudin. } Adult.
V. leuconotus, Gray. }

Lengta, Arracan. Inhabits India generally: very abundant. A summer visitant in Afghanistan.

Subfam. SARCORHAMPHINÆ.

Genus SARCORHAMPHUS, Dumeril.

(883) *S. papa, Pl. Enl.* 428).

Syn. Vultur papa, L.

Inhabits S. America.

Genus NEOPHRON, Savigny.

(884) *N. percnopterus*, *Pl. Enl.* 407, 429).

Syn. Vultur percnopterus Lin. (nec Pallas).
V. leucocephalus et V. fuscus Gmelin.
V. ginginianus et V. albus, Daudin.
V. meleagris, Pallas.
V. fulvus, Boddaert.
V. stercorarius, La Peyrouse.
Percnopterus ægyptiacus, Stephens.

Soongra, or *Soonda*, Scinde (Burnes). Inhabits warmer regions of Europe, Asia, and Africa: abundant on the plains of India; rare and accidental below the tideway of the rivers in Lower Bengal. A summer visitant in Afghanistan.

Subfam. GYPAETINÆ.

Genus GYPAETOS, Storr.

(885) *G. barbatus*, (Edwards, pl. 106).

Syn. Vultur barbatus et V. barbarus. Lin.
V. niger. Gmelin.
V. aureus. Brisson.
Falco magnus, S. Gmelin.
Phene ossifraga, Savigny.
Gypaetos grandis Storr.
G. alpinus, Daudin.
G. leucocephalus et G. melanocephalus Meyer.
G. meridionalis, Brehm.
G. barbatus. var. occidentalis et var. orientalis, Pr. Bonap.
G. hemachalanus. Hutton (with dark pectoral mark). J. A. S. III, 522.
Bearded Eagle, Latham.

'Golden Eagle' of English residents in the Himalaya. *Urgool*, Masuri (Hutton). *Cajeer*, or *Foomaee*, Kabul (Burnes). Inhabits Mountainous regions of Europe, Asia and, Africa.

Tribe II.—NOCTURNÆ.

Fam. STRIGIDÆ.

Subfam. BUBONINÆ.

Genus NYCTEA, Stephens.

(886) *N. nivea*, (Gould's *B. E.* pl. 43).

Syn. Strix nivea, Daudin.
Str nyctea. Lin.
S. candida. Latham.
N. erminea. Stephens.

Inhabits Arctic circle, migrating within the northern temperate zone.

Genus BUBO, Sibbald.

(887) *B. orientalis*, (*Pl. Col.* 174, 229).

Syn. Strix orientalis. Horsfield.
S. sumatrana, Raffles.
S. strepitans, Temminck.
B. et Huhua nipalensis, Hodgson.
H. pectoralis, Jerdon.

Inhabits Himalaya, S. India, and Malay countries.

(888) *B. maximus*, Sibbald (Gould's *B. E.* pl. 37),

Syn. Strix bubo, L.
B. atheniensis, Daudin.
B. europæus, Lesson.

(889) *B. bengalensis* (Gould's 'Century,' pl. 3).

Syn. Otus bengalensis Franklin.
Bubo cavearcus et Urrua cavearca. Hodgson.

Ghoogoo, H. (Jerdon). Inhabits India generally: Afghanistan: but not met with below the tideway of the rivers in Lower Bengal.

(890) *B. umbratus*.

Syn. Urrua umbrata. Blyth J. A. S. XIV, 180.
Strix coromander, coromandra, et coromandelica. auctorum ?
Str. coromanda. var., Latham.

Inhabits India generally.

Genus ASIO, Brisson.

(891) *A. otus* (*Pl. Enl.* 29).

Syn. Strix otus, L.
Str. soloniensis. Gm.
Otus europæus. Stephens.
O. communis. Lesson.
O. vulgaris, Fleming.

Inhabits Europe and N. Asia, Himalaya.

(892) *A brachyotus* (Gould's *B. E.* pl. 40).

Syn. Strix brachyotus, Gmelin.
Str. ulula, S. ægolius, et S. accipitrina, Pallas.
S. arctica, Sparrman.
S. tripennis. Schrank.
S. palustris, Smies.
S. brachyura Nilsson.
Brachyurus palustris, Gould.

Chota Ghooghoo, H. (Jerdon). Inhabits Europe, Asia, Africa, N. and S. America. Calcutta.

Genus SCOPS, Savigny.

(893) *Sc. aldrovandi*, Ray (Gould's *B. E.* pl. 48; Jerdon's *Ill. Ind. Orn.*, pl. 41, chesnut variety),

Syn. Strix scops, Linnæus.
Str. zorca et S. giu. Scopoli.
S. carniolica, Gmelin.
Sc. europæus Lesson.
Sc senegalensis, Swainson.
Sc. capensis. Smith.
Sc. sunia (chesnut variety), and S. pennata (grey variety). Hodgson.
Sc. malayanus. A. Hay.
Ephialtes spilocephalus, Blyth. J. A. S. XV, 8 (? Large specimen in immature plumage?
Otus Scops japonicus, Tem., apud G. R. Gray.
Strix bahkamæna (?), Pennant.

Chitta Gool, Telinga (Jerdon): *Chugad Kusial*, or *Sunya Kusial*, Nepal (H.) Inhabits Europe, Asia, and Africa. Himalaya, Pen: of India, Calcutta.

(894) *A. lempiji*, (*Pl. Col.* 99).

(Var. A. Malayan race, in general deeply tinged with fulvous.)

Syn. Strix lempiji, Horsfield.
Str noctula Reinwardt.
Scops javanicus, Lesson.

Lempiji, Java. (Var. B. Larger race, but seldom tinged with fulvous: inhabiting the Himalaya, Assam, Sylhet, and Arracan.) *Sc. lettia*, Hodgson. *Tharkavi Chugad*, or *Lattya Kudyal*,

resembling the last, but generally smaller and greyer in colour,—being, when slightly tinged fulvescent, the *Sc. lempiji* apud Jerdon of Malabar and Ceylon. *Sc. lettioides* et *griseus*, Jerdon Inhabits (in different varieties,) India, China (?), and the Malay countries. Malacca (the undoubted *lempiji*). Var. B.—N. W. Himalaya. Nepal. Arracan (Ramree.) Coromandel Coast (sent as *lettioides*, Jerdon): and two from Malabar (sent as *lempiji*.) T. C. Jerdon, Esq. (1844-6). Specimen (resembling last), from Ceylon. E. L. Layard, Esq. (1849).

Genus KETUPA, Lesson.

(895) *K. flavipes.*

Syn. Cultrunguis flavipes, Hodgson, J. A. S. XV. 364.

Inhabits Himalaya only (so far as hitherto observed).

(896) *K. ceylonensis.*

Syn. Strix ceylonensis, Gmelin.
Str. Leschenaultii Temminck.
S. Hardwickii, Gray.
S. dumeticola Tickell.
Cultrunguis nigripes, Hodgson.

Ulu (generic), H.: also *Amrai ka Ghooghoo*, H. (Jerdon): *Útúm*, Beng.: *Tee-dook*, Arracan. Inhabits India generally; Arracan; Tenasserim. Very common in Lower Bengal, near Calcutta.

(897) *K. javanensis*, Lesson.

Syn. Strix ketupa, Horsfield.
Str. ceylonensis apud Temminck.

Tamba, or *Ketombo Ratanapye*; *Hanta*; *Burong Pelow*; Malayan: *Blo-Ketupa*, Java. Inhabits Malayan peninsula and Archipelago: rare in Arracan. Specimen from Java.

Subfam. ATHENINÆ.

Genus NINOX, Hodgson.

(898) *N. scutulatus* (*Pl. Col.* 289).

Syn. Strix scutulata, Raffles.
Str. hirsuta, Temminck.
S. lugubris, Tickell.
Ninox nipalensis, Hodgson.
Athene malayensis, Eyton.

Kal Pancha, Beng.: *Choghud Besrah*, H. (Jerdon): *Kheng-boop*, Arracan: *Raja Wali*, Malayan. Inhabits India generally; Tenasserim provinces; Malayan peninsula; Sumatra: not rare in Lower Bengal. Madagascar (Dr. A. Smith, *Afr. Zool.* p. 163).

Genus ATHENE, Boie.

(899) *Ath. cuculoides* (Gould's 'Century,' pl. 4).

Syn. Noctua cuculoides, Vigors.
N. auribarbis, Hodgson.

D'zee-geet, Arracan. Inhabits Himalaya; Assam; Arracan; Tenasserim; China.

(900) *Ath. radiata.*

Syn. Strix radiata, Tickell, J. A. S. II. 572 (1833).
Athene erythropterus, Gould. P. Z. S. 1837, p 136
Noctua perlineata Hodgson.
N. cuculoides apud Jerdon, Catal.

Jungli Choghud, H. (Jerdon): *Chota Kalpancha*, Beng.: *Chugad*, Nepal (H.) Inhabits most parts of India; sub-Himalayan region: never on the alluvium of Lower Bengal, but appears immediately this is quitted in a westerly direction.

(901) *Ath. malabarica*, Blyth (J. A. S, XV, 280).

Syn. A. castanoptera apud Jerdon, Supp.

Inhabits Malabar.

(902) *Ath. castanotus*, Blyth.

Syn. Ath. castanoptera apud Blyth, J. A. S. XV, 280.

Inhabits Ceylon (where common).

(903) *Ath. brama* (*Pl. Col.* 68).

Syn. Strix brama, Temminck.
Str. persica? Nouv. Dict. d' Hist. Nat.
Noctua indica, Franklin.
N. tarayensis, Hodgson.

Katoria Pencha, Beng: *Chugad*, or *Chogpud*, H.: *Panglah*, Mahratta. Inhabits India generally to foot of Himalaya; extremely common in Lower Bengal: Persia (as about Erzeroum).

(904) *Ath. noctua* (Gould's *B. E.* pl. 48).

Syn. Strix noctua, Retzius.
Str. passerina apud Latham and Temminck.
S. nudipes, Nilsson.
Noctua veterum, Lichtenstein.
Athene gymnopus, (?), Hodgson.
Ath. bactrianus, Blyth, J. A. S. XVI 776.

Inhabits Europe; N. and W. Asia; Afghanistan; Himalaya (?); N. Africa.

(905) *Ath. passerina* (Gould's *B. E.* pl. 50).

Syn Strix passerina, Linnæus.
Str. pygmæa, Bechstein.
Str. acadica, Temminck.

Inhabits N. Europe and Asia.

(906) *Ath. Brodiei.*

Syn. Noctua Brodiei, Burton, P. Z. S. 1835 p. 152.
N. tubiger and Athene badia, Hodgson.

Inhabits Himalaya.

Subfam. SYRNIINÆ.

Genus SYRNIUM, Savigny.

(907) *S. Indrani* Gray's *Ill. Gen. Birds*, pl. 14.)

Syn. Strix indrani, Sykes (vide J. A. S. XVI, 463).
Ulula? et Bulaca newarensis, Hodgson.
B. monticola, Jerdon.

Newar, Nepal (H). Inhabits India generally, mountainous parts; Ceylon: Malayan peninsula.

(908) *S. sinense* (Hardw. *Ill. Ind. Zool.*)

Syn. Strix sinensis (?), Latham.
Str. orientalis, Shaw.

Inhabits most parts of India, to foot of Himalaya: not Lower Bengal (at least below the tideway of the rivers). China?

(909) *S. nivicolum*, Hodgson (J. A. S. XIV, 185; XV, 9; XVI, 464). [Remark. This is probably a Himalayan variety of S. aluco. Gould, distinguished by its generally larger size, darker colour, and the usually greater development of the transverse markings of the plumage.] Inhabits Himalaya.

Subfam. STRIGINÆ.

Genus PHODILUS, Is. Geoffroy.

(910) *Ph. badius* (Horsfield's *Zool. Res. in Java*, pl.).

Syn. Strix badia. Horsfield.

Wooo-wiwi, or *Kalong wiwi*, Jav. Inhabits Nepal; Sikim; Assam; Arracan; Malayan peninsula and archipelago.

Genus STRIX, L. (as restricted).

(911) *Str. flammea*, L.

Syn. S. javanica apud Sykes and Jerdon.

Lakkhi or *Jakkhi Pencha*, *B.*: *Kareya*, or *Kurail*, H., vulgo *Booree Chooree*, Jerdon. *Jilei*, Bhagulpore. Inhabits Europe and Asia: Africa? N. America? vicinity of Calcutta.

Genus GLAUX, Blyth.

(912) *Gl. javanica* (?), Jerdon's *Ill. Ind. Orn.* pl. 30).

Syn. Strix javanica de Wormb. apud Latham (vide J. A. S. XIV, 186).
S. treandida. Tickell, J. A. S. II 572.
S. longimembris. Jerdon.

Inhabits Plains of India: very rare on the mud-soil of Lower Bengal, within the reach of the tide. A specimen from S. India was presented by T. C. Jerdon, Esq. (1842).

Order III. INSESSORES. Suborder. PICÆ, L. (modified). Tribe. SYNDACTYLI, Cuv. (modified). Fam. BUCEROTIDÆ. Sub. fam. BUCEROTINÆ.

Genus BUCEROS, L. (*Dhan'es*, Beng., generic).

(913) *B. cavatus*, Shaw (*As. Res.* XVIII, pt. II, pl. Gould's *Century*, pl.).

Syn. B. bicornis (?). Lin.
B. homrai, Hodgson.

Ban Rao (Jungle King), Masuri: *Homrai*, Nepal: *Young-yeng*, Arracan: *Juggang Papan*, Sumatra: *Concan*, Malay. Inhabits extensive hill forests of all India; Assam; Arakan; Tenasserim; Malayan peninsula; Sumatra; Philippines?

(914) *B. rhinoceros*, (*Pl. Enl.* 934).

Syn. B. niger. Shaw (nec Vieillot).
B. sylvestris. Vieillot.
B. diadematus Drapiez.
} Young.

Juggang Danto, Malay: *Rangkok*, or *Jongrang*, Java. Inhabits Malayan peninsula and Archipelago.

(915) *B. hydrocorax*, L. (*Dict. Class.' Hist. Nat.*, *Atlas*, pl. 23, fig. 2.)

Syn. B. bicornis, var., Shaw.
B. cristatus. Vieillot.
B platyrhynchos, Pearson, J. A. S. X. 652.

Inhabits Moluccas.

(916) *B. pica*, Scopoli, (*Pl. Enl.* 813).

Syn. B. malabaricus. var. B. Latham.
B. monoceros, and probably B. violaceus, Shaw.

Bægma Dunnase, White, *As. Res.* IV, 119. Inhabits Indian peninsula; Ceylon? Goomsoor, Kuttack.

(917) *B. affinis*, Hutton, J. A. S. XVIII. Inhabits Deyra Doon.

(918) *B. albirostris*, Shaw, Vieillot, (Lev. *Ois. Rar.*, pl. 14).

Syn. B. malabaricus. Latham.
B. leucogaster. Blyth. J. A. S. X, 922 (the young).

Auk-khyeng, Arakan. Inhabits Mednapore district; Rajmahl; Monghyr; Nepal; Assam; Sylhet; Arakan; Tenasserim provinces: never in Malabar, or S. India: replaced by *B. affinis* in the Deyra Doon, which merely differs in being constantly of the larger size of *B. pica*.

(919) *B. intermedius*, Blyth (J. A. S. XVI, 994).

Syn. B. violaceus of Wagler. apud Lord A. Hay, Madr. Journ. XIII, 148.
Probably B. malabaricus of Sumatra, apud Raffles.

Inhabits Malayan peninsula (in latitude of Penang); Sumatra?

(920) *B. malayanus*, Raffles, (*Pl. Col.*).

Syn. B. anthracinus, Temminck.
B. bicolor Eyton.
B. Elliotti, A. Hay (vide J. A. S. XVI, 995).
B albirostris of Java (?). apud Horsfield.
Kiki (?). Malay: Angka Angka (?), Sum: Klinglingan (?), Java.

Inhabits Malayan peninsula; Sumatra; Java? Moluccas?

(921) *B. nigrirostris*, Blyth (J. A. S. XVI, 895).

Syn. B. malayanus apud Lord A. Hay, Madr. Journ. XIII. 151.

Inhabits Malayan peninsula.

(922) *B. birostris*, Scopoli, (Lev. *Ois. Rar.*, pl. 15).

Syn. B. ginginianus, Shaw.

Putteal Dunnase, *White*, *As. Res.* IV, 121. Inhabits India generally (nec Assam): never on the eastern side of the Bay of Bengal.

(923) *B. gingalensis*, Shaw (Lev. *Ois. Rar.*, pl. 23).

Syn. B. bengalensis, Gray.

Inhabits Malabar; Ceylon: never Bengal.

(924) *B. galeritus*, Temminck (*Pl. Col.*).

Syn. B. carinatus, Blyth, J. A. S. XV. 187.

Mati Sakawan, Malay. Inhabits Malayan peninsula.

(925) *B. comatus*, Raffles.

Syn. B. lugubris, Begbie, vide Ann. M.N. H. 1846, p. 405.

Inhabits Malayan peninsula; Sumatra.

(926) *B. exarrhætus*, Reinwardt (*Pl.Col.* 211). Inhabits Moluccas and Java.

(927) *B. panayensis*, Scopoli, (*Pl. Enl.* 780 781).

Inhabits Moluccas; Philippines.

(928) *B. nipalensis*, Hodgson (*As. Res.* XVIII, pt. 1, 2 figs. of female).

Inhabits S. E. Himalaya; hill ranges of Assam, and Munipur.

(929) *B. pasuran*, Raffles.

Syn. B. ruficollis apud Blyth, J. A. S. XII, 176.

Inhabits Cherra Punji; Arakan; Tenasserim provinces; Malayan peninsula; Sumatra.

(930) *B. plicatus*, Latham, Shaw (nec Drapiez).

Syn. B. obscurus, Gmelin.
B. subruficollis, Blyth, J.A. S. XII, 177.

Inhabits Arakan; Tenasserim provinces.

(931) *B. galeatus*, L. (*Pl. Enl.* 933).

Toko, and *Burong Gading*, Sum.: *Tibbang Mantooa*, Malay. Inhabits Malayan peninsula and archipelago.

Subfam. IRRISORINÆ.

Genus IRRISOR, Lesson.

(932) *I. erythrorhynchos.*

Syn. Upupa erythrorhynchos, Latham.
Inhabits S. Africa.

Fam. UPUPIDÆ.

Genus UPUPA, L.

(933) *U. epops*, L. (*Pl. Enl.* 52).

Inhabits Europe; Asia; N. Africa. Common in Bengal; also Nepal: generally replaced in S. India and Ceylon, as likewise in the Deyra Doon, by the next; though occurring in the Nilgiris.

(934) *U. senegalensis* (?), Swainson (vide J. A. S. XIV, 189).

Syn. U. minor apud Jerdon.

Inhabits S. India; Ceylon; Deyra Doon; W. Africa?

Fam. HALCYONIDÆ.

Genus DACELO, Leach.

(935) *D. monacha*, ——— ?

Syn. D. concreta, juv., Temminck.

Inhabits Celebes? Moluccas?

(936) *D. pulchella*, Horsfield (*Pl. Col.* 277; *Zool. Res. in Java*, pl.).

Tengki-watu. Jav. Inhabits Mergui; Malayan peninsula and archipelago.

Genus HALCYON, Swainson.

(937) *Match-ranga* (generic), or *Matchi-mar* (Masuri), H.: *Pin-ngyeng* (generic), Arakan, with the prefix of *Tsheng* for the larger species and *Glai* for the smaller: *Kaka*, Malayan.

(938) *H. leucocephalus*, L.

Syn. Alcedo capensis, L. (*Pl. Col.* 599).

Bang Kaka, Sumatra: *Tengke Buto*, Java. Malacca.

(939) *H. gurial*, Pearson (J. A. S X, 633.)

Syn. H. brunniceps, Jerdon, Madr. Journ. XIII, 143.
H. leucocephalus apud Horsfield, P. Z. S. 1839, p. 156.

Gurial, Beng.: *Malay Poymah*, Malabar (i. e. "Jungle King-fisher"), Jerdon. Inhabits India generally.

(940) *H. amauropterus*, Pearson (J. A. S. X, 635.)

Inhabits S. Bengal; Arakan; Tenasserim.

(941) *H. smyrnensis*, (*Pl. Col.* 232, 894).

Syn. Alcedo smyrnensis, L.
Ispida bengalensis minor, Brisson.

Sada-buk Match-ranga, Beng.: *Kilkila*, H. Jerdon: *Pilly kudua* (*loco*, or 'large'), Cingh. Inhabits India generally; Assam; Arakan; Tenasserim; Malayan peninsula; Ceylon; Syria.

(942) *H. gularis*, (*Pl. Col.* 135).

Syn. Alcedo gularis, Kuhl.
A. melanopterus, Temminck.
H. ruficollis, Swainson.
H. smyrnensis, var. albogularis, Blyth, J. A. S. XII, 928.

Tengke-arang, Java. Inhabits Java; Philippines: Madagascar (?) Vide. *Ann. M. N. H., n. s.*, 1848.

(943) *H. coromander.*

Syn. Alcedo coromander, Latham.
H. coromandelicus, Vigors.

Tengke-sambo, Java. Inhabits Nepal; Sikim; Bengal Sundarbans; Tenasserim; Coromandel?

(944) *H. atricapillus* (*Pl. Col.* 613).

Syn. Alcedo atricapilla, Latham.
A. albiventris, Scopoli (inapplicable).

Udang, Malay. Inhabits Eastern side of the Bay of Bengal; rare on the western: Bengal Sundarbans; Malayan peninsula and Archipelago; China.

Genus TODIRHAMPHUS, Lesson.

(945) *T. varius.*

Syn. Halcyon varia, Eyton, P. Z. S. 1839, p. 101.
Probably H. chlorocephalus (as distinguished from H. sacer), in Zool. Appendix to Lady Raffles's Memoirs of Sir St. Raffles, p. 655.

Tengke-cheger (?), Java. Inhabits Malayan peninsula; Sumatra; Java?

(946) *T. collaris.*

Syn. Alcedo collaris, Scopoli.
A. chlorocephala, Gmelin.
Malayan A. sacer (v. sanctus), Auct.
Var. T. occipitalis, Blyth, J. A. S. XV, 23, 51.

Tengke, Java. Inhabits Bay of Bengal, much more common on the eastern side; Tenasserim; Bengal Sundarbans; Sumatra; Java. Nicobar variety with broad white or rufous supercilium (*T. occipitalis*, Blyth). Ordinary variety, from the Nicobars. (Particularly bright.)

Genus CERYLE, Boie.

(947) *C. guttata* (Gould's 'Century,' pl. 5).

Syn. Alcedo guttatus, Vigors.
A. lugubris, Temminck.

Inhabits Himalaya.

(948) *C. rudis* (Edwards, pl. 9).

Syn. Alcedo rudis, L.
Ispida bitorquata, Swainson.

Phatka Match-ranga, B. Inhabits Asia and Africa; rare in the S. E. of Europe. Specimen from S. Africa, from Lower Bengal. Ordinary Asiatic variety (*C. varia*, Strickland) from the neighbourhood of Calcutta. Specimen from Greece.

Genus ALCEDO, Lin.

(949) *A. grandis*, Blyth (J. A. S. XIV, 190). Inhabits Sikim; Assam?

(950) *A. nigricans*, Blyth (J.A. S. XVI, 1180.)

Syn? A. curyzona, Temminck, Text de Pl. Col., and Kaup, Verhandlungen, &c., (1848), p. 77.

Inhabits Malacca.

(951) *A. ispida* L. (*Pl. Enl.* 77).

Inhabits Europe; W. Asia: Afghanistan?

(952) *A. bengalensis*, Gm. (Edwards, pl. 11). *Match-ranga*, B.: *Chota Kilkila*, H. (Jerdon). *Raja Whodan* (generic for all the small species), Malay: *Mal Pilli hudua (pinchi*, or 'small'), Cingh. Inhabits India generally; Burmah; Malacca; China.

(953) *A. moluccensis*, Blyth (J. A. S. XV, 11). Inhabits Celebes; Moluccas.

(954) *A. meningting*, Horsfield.

Syn. A. asiatica, Swainson, (Swainson's Zool. Ill., 1st series, pl. 50).

Binti, Sum.: *Meningting*, Jav. Inhabits Tenasserim provinces; Malayan peninsula and archipelago.

(955) *A. biru*, Horsfield (*Zool. Res. in Java*, pl.; Tem. *Pl. Col.* 239, f. 1).

Meningting Watu, or *Burong-Biru*, Jav. Inhabits Java.

Genus CEYX, Lacepede.

(956) *C. erythaca* (Jerdon's *Ill. Ind. Orn.*, pl. 25).

Syn. Alcedo erythaca et tridactyla, Pallas.
A. purpurea, Gmelin.
A. rubra, Boddaert.
C. microsoma, Burton.

Dein-ngyeen, Arracan; *Raja Whodan*, Malay. Inhabits India generally, but rare; Lower Bengal: more common on the eastern side of the Bay, southward to the Straits of Malacca.

(957) *C. rufidorsa*, Strickland (J. and S., *Ill. Orn.* pl. 552).

Syn. C. tridactyla apud Jardine and Selby.
A. madagascariensis, L., apud Latham.
A. purpurea, var., Shaw.

Binti Abang, Sum.: *Chuchack-wrang*, Jav. Inhabits Malayan peninsula; Java: never in India.

Fam. CORACIDÆ.

Genus CORACIAS, L.

(958) *C. pileata*, Reinwardt?

Syn. ? C. Temminckii, (Vieillot), (Vail. Ois. de Parad., t. 6).
C. papuensis, Quoy and Gaymard (Voy. de l' Astrolabe, Ois. t. 16).

Inhabits Celebes; Moluccas.

(959) *C. garrula*, L. (*Pl. Enl.* 486)

Inhabits Europe; N. Africa; W. Asia; N. W. India; Kashmir; Mooltan; Afghanistan.

(960) *C. indica Lin.* (*Pl. Enl.* 285; Edwards, pl. 326).

Syn. C. bengalensis, L.
Garrulus nævius, Vieillot.

Subzuk, and *Nil-kant*, H. (from the colours): *Tas*, *Mahr.* (from its call); *Karolowa*, Cingh. Inhabits India generally; replaced eastward by *C. affinis.*

(961) *C. affinis*, McClelland (Gray's 'Illustrated Genera of Birds,' pl.).

Nghet-kha, Arakan. Inhabits Assam; Arakan; Tenasserim provinces.

Genus EURYSTOMUS Vieillot.

(962) *Eu. orientalis* (*Pl. Enl.* 619).

Syn. Coracias orientalis, Lin.
Eu. fascicollis et cyanicollis, Vieillot.

Tiong Lampie, and *Tiong Batu*, Malayan. Inhabits India generally, China, and Malay countries; Ceylon.

(963) *Eu. pacificus* (Gould's B.A. Vol. II. pl. 17).

Syn. Coracias pacificus, Latham.
Eu. australis, Swainson.
Eu. orientalis apud Vigors and Horsfield. Lin. Tr. XV, 202.

Inhabits Australia.

Fam. MEROPIDÆ.

Genus ALCEMEROPS, Is. Geoffroy.

(964) *Alc. Athertonii* (Jardine and Selby, *Ill. Orn.* pl. 58).

Syn. Merops Athertonii, J. and S.
Bucia nipalensis, Hodgson, J. A. S. V. 360.
Merops cyanogularis, Jerdon.
Nyctiornis amherstiana, Royle.

Pya-too-ughet, Arakan. Inhabits Deyra Doon; Nepal; Assam; Arakan; Tenasserim; S. India.

(965) *M. amicta* (Swainson's *Zool. Ill.*, 2nd series, pl. 56; *Pl. Col.* 310).

Syn. Merops amictus, Temminck.

Inhabits Tenasserim Provinces; Malayan peninsula.

Genus MEROPS, L.

(966) *M. apiaster*, L. (*Pl. Enl.* 938).

Syn. M. galilæus, Hasselquist.
M. schæghagha, Forster.
M. chrysocephalus (?), Latham.

Inhabits Europe; W. Asia; Afghanistan.

(967) *M. persicus*, Pallas (Sav., Descript. de l'Egypt, tom. 1, pl. 4, f. 3).

Syn. M. ægyptius, Savigny.

Inhabits N. Africa; W. Asia; Sinde.

(968) *M. philippinus*, L. (*Pl. Enl.* 215.)

Syn. M. Leschenaultii, Levaillant.
M. javanicus, Horsfield.

Barai Barai, Malay. Inhabits India generally; Malay countries; Ceylon.

(969) *M. sumatranus*. Raffles (Griffith's *An. Kingdom*, VII, p. 422, pl.). Inhabits Malay countries.

(970) *M. erythrocephalus*, Latham (Swainson's *Zool. Ill.*, 1st series, pl. 8).

Syn. M. quinticolor, Vieillot.
M. urica, Horsfield.

Inhabits India generally (nec Lower Bengal); Malay countries; Ceylon.

(971) *M. viridis*, L. (Edwards, pl. 183; *Pl. Enl.* 749).

Syn. M. Lamarckii, Cuv.
M. orientalis, Latham.
M. indicus, Jerdon.
Var. M. coromandus, Latham.

Bans-pati. ('Bamboo leaf'), *H.*; *Hurrial, and Patringa*, H. (Jerdon). *Mo-na-gyee*, Arakan. Inhabits India generally; Arakan; Ceylon.

Tribe ZYGODACTYLI. Division I. (Devoid of cæca). Subdivision I. Climbers).

Fam. PICIDÆ.

Lukkurphor, Hind.: *Kat-tokra*, Beng.: *Kat-harya*, Masuri: *Theet-touk*, Burm.: *Glato*, Malay: *Tukki*, Sum.; *Peatuk*, Jav.: *Pilli hudua* (same name as for King-fishers), Cingh.

Subfam. CAMPEPHILENÆ.

Genus CAMPEPHILUS, G. R. Gray.

(972) *C. validus* (*Pl. Col.* 378, 402).

Syn. Picus validus, Reinwardt.

Inhabits Western Malasia. Malacca.

Genus HEMICERCUS, Swainson.

(973) *H. canente* (Lesson's *Cent. Zool.* pl. 73; Jerdon's *Ill. Ind. Orn.* pl. 40).

Syn. Picus canente, Lesson.
H. cordatus, Jerdon (rather smaller race).

Inhabits Burmese countries (Arakan, Tenasserim, Pegu): also S. India.

(974) *H. concretus*. (*Pl. Col.* 90, f. 1, 2).

Syn. Picus concretus, Reinwardt.

Inhabits W. Malasia; Malayan peninsula.

Genus HEMILOPHUS, Swainson.

(975) *H. pulverulentus* (*Pl. Col.* 389).

Syn. Picus pulverulentus, Tem.
P. javensis, fœm., apud Horsfield, *Lin. Tr.* XIII, 76.

Inhabits Burmese and Malay countries.

(976) *H. Hodgsonii*, Jerdon (*Ill. Ind. Orn.* pl. 5.),

Inhabits Neilgiris; Malabar.

(977) *H. javensis*.

Syn. Picus javensis, Horsfield.
P. leucogaster, Reinwardt.
'Great Malayan Woodpecker,' J. A. S. VI, 952.

Peatack cyam, Java. Inhabits Malay countries; Tenasserim.

(978) *H. funebris*.

Syn. Picus funebris, Valenciennes.
P. modestus, Vigors, P. Z. S.

Inhabits Philippines.

Genus CHRYSOCOLAPTES, Blyth.

(979) *Chr. sultaneus*.

Syn. Picus sultaneus, Hodgson, J. A. S. VI, 105.
P. strictus apud Jerdon, Catal.
P. strenus, Gould, mentioned P. Z. S. 1839, p. 165.

Inhabits India generally, chiefly the hill forests, rare in the plains: also Assam, Sylhet, Arakan, Tenasserim, and Malayan peninsula southward as far as Malacca.

(980) *Chr. goensis* (*Pl. Enl.* 696).

Syn. Picus goensis, Gmelin.
Dendrocopus Elliotti, Jerdon, Catal.
Chr. melanotus, Blyth, J.A.S. XII, 1005.

Inhabits Indian peninsula: rare in most parts; common in a few localities.

(981) *Chr. hæmatribon*.

Syn. Picus hæmatribon, Wagler.
P. spilolophus, Vigors, P. Z. S. 1830, p. 98 (the female).

Inhabits Philippines.

Genus BRACHYPTERNUS, Strickland.

(982) *Br. ceylonus (N. nat. Forsch.*, 13, *pl.* 4).

Syn. Picus ceylonus, Forster.
P. neglectus, Wagler.
P. erythronotus (?), et P. rubescens (?), Vieillot.

Inhabits Ceylon, where very common.

(983) *Br. aurantius* (Edwards, pl. 182; *Pl. Enl.* 695).

Syn. Picus aurantius, L.
P. bengalensis, Gmelin (nec Horsfield, Lin. Tr. XIII, 176).
P. nuchalis, Wagler.
P. tibetanus, Natterer.
P. psarodes, Lichtenstein.
P. hemipodius, Swainson.
Malacolophus? melanochrysos, Hodgson, J. A. S. VI, 109.
Br. micropus, Blyth, J. A. S. XIV, 194.
Var. P. chrysonotus, Lesson.

Inhabits India generally; Ceylon.

Genus TIGA, Kaup.

(984) *T. Shorei*, (Gould's 'Century,' pl. 49).

Syn. Picus Shorei, Vigors, P. Z. S. 1831, p. 175; J. A. S. XIV, 193.

Inhabits Himalaya, and hilly regions of S. India.

(985) *T. intermedia*, Blyth J .A. S .XIV, 193.

Inhabits Nepal; Assam; Sylhet; Arakan; Tenasserim; Penang; S. India

(986) *T. tridactyla*, (J. A.S. XIV, 163.)

Syn. Chrysonotus tridactylus, Swainson.
Picus tiga, Horsfield.

Tukki Besor of Malays, Sumatra. Inhabits Malay countries.

(987) *T. Rafflesii* (J.A. S. XV, 16).

Syn. Picus Rafflesii, Vigors.
T. labarum, Lesson.
T. amictus, Gray.

Inhabits Malayan peninsula; Sumatra.

Subfam. GECININÆ.

Genus GECINUS, Boie.

(988) *G. squamatus*(Gould's 'Century,' pl.48).

Syn. Picus squamatus, Vigors.
P. dimidiatus apud Hardwicke and Gray (nec Temminck).

Inhabits Himalaya.

(989) *G. striolatus*, Blyth, J. A. S. XII, 1000.

Syn. G. squamatus apud Jerdon, Catal.

Inhabits Himalaya, and hilly regions of S. India: occurs, though rare on the plains.

(990) *G. dimidiatus.*

Syn. Picus dimitatus, Temminck.
P. vitatus, Vieillot.
P. affinis, Raffles, apud Vigors, in Zool. App. to Lady Raffles's Memoir of Sir St. Raffles. p. 668.
G. viridanus, Blyth, J. A. S. XII, 1000.

Inhabits Arracan; Tenasserim provinces where common. Java.

(991) *G. occipitalis* (Gould's 'Century,' pl.47).

Syn. Picus occipitalis Vigors.
P. barbatus, Gray.
P. affinis (?), Raffles.

Inhabits Himalaya; Assam; Tippera; Tenasserim provinces; Sumatra?

Division III. (with crested nape.)

(992) *G. flavinucha.*

Syn. Picus flavinucha, Gould, P. Z. S. 1833, p. 120.
Dryotomus flavigula, Hodgson, J. A. S. V, 106.

Inhabits S. E. Himalaya; Assam; Arakan.

(993) *G. chloropus* (Hardw. *Ill. Ind. Zool.*)

Syn. Picus chloropus et chlorolophos, Vieillot.
P. nipalensis, Gray.
P. xanthoderus, Malherbe.

Inhabits Himalaya chiefly; N. India: rare on the plains.

(994) *G. chlorophanes* (J. A. S. XV, 16).

Syn. Picus chlorophanes, Vieillot.
P. chlorigaster, Jerdon, Madr. Journ. XIII, 139).
P. mentalis apud Jerdon, Catal.

Inhabits S. India; Ceylon.

(995) *G. malaccensis* (J. A. S. XIV, 192).

Syn. Picus malaccensis, Latham.
Le Pic de Malacca, Sonnerat.

Inhabits Malayan peninsula.

(996) *G. mentalis* (*Pl. Col.* 384).

Syn. Picus mentalis, Temminck.

Inhabits Tenasserim provinces: Malayan peninsula; Sumatra.

(997) *G. puniceus* (*Pl. Col.* 423).

Syn. Picus puniceus, Horsfield, Lin. Tr. XIII, 661.
Chrysonotus miniatus apud Eyton (?), P. Z. S. 1339, p. 106.

Tukki Bajukarap or *Belatu*, Malayan (Raffles). Inhabits Tenasserim; Malayan peninsula; Sumatra; Java.

Division IV.

(998) *G. pyrrhotis.*

Syn. Picus pyrrhotis, Hodgson, J. A. S. VI, 108.

Inhabits S. E. Himalaya.

(999) *G. rubiginosus.*

Syn. Picus rubiginosus, Eyton (nec Swainson, B. W. Afr. II. p. 150).
P. melanogaster, A. Hay, Madr. Journ, XIII, 153.

Inhabits Malayan peninsula.

Genus GECINULUS, Blyth.

(1000) *G. grantia* (J. A. S. XIV, 192).

Syn. Picus grantia, M'Clelland, P.Z. S. 1839, p. 165.

Inhabits Sikim; Assam.

Genus MEIGLYPTES, Swainson.

(1001) *M. pectoralis* (*Pl. Col.*)

Syn. Picus pectoralis, Latham.
P. marginatus, Reinwardt.
P. tukki, Lesson.
P. luridus, Nitzsch.
P. fasciolatus Lichtenstein.
Hemicercus brunneus, Eyto.n

Inhabits Malayan peninsula.

(1002) *M. tristis* (*Pl. Col* 197, f. 1).

Syn. Picus tristis, Horsfield.
P. poicilophus, Temminck.

Glato Bawan, Malacca: *Tukki Boreh* of Malays, Sumatra: *Platuk-watu*, Java. Inhabits Tenasserim; Malayan peninsula; Sumatra; Java.

(1003) *M. jugularis*, Blyth, J. A.S. XIV, 195. Inhabits Arracan; Tenasserim.

Genus MICROPTERNUS, Blyth.

(1004) *M. phaioceps*, Blyth, J. A. S. XIV, 195.

Syn. P. rufonotus, Malherbe.
P. rufus, Latham, apud Gray (nec Gmelin).
Rufous Indian Woodpecker, Latham.

Inhabits Bengal; Nepal; Assam; Sylhet; Arracan; Tenasserim provinces.

(1005) *M. gularis*, Jerdon, *Madr. Journ.* XIII, 139. Inhabits Indian peninsula.

Syn. Slight variety of preceding species?

(1006) *M. badius*.

Syn. Picus badius, Raffles.
P. brachyurus, Vicillot.

Tukki Kalabu of Malays (Raffles). Inhabits Malayan peninsula; Sumatra.

Subfam. PICINÆ.

Genus DRYOCOPUS, Boie.

(1007) *Dr. martius* (*Pl. Enl.* 596).

Syn. Picus martius, L.

Inhabits Europe; W. Asia.

Genus PICUS, L. (as restricted).

(1008) *P. leuconotus*, Bechstein (Naum. 35, t. 65),

Syn. P. cirris, Pallas (apud Gray).

Inbabits N. Europe.

(1009) *P. himalayanus*, Jardine and Selby (*Ill. Orn.* pl. 116).

Syn. P. assimilis, Natterer.

Inhabits N. W. Himalaya.

(1010) *P. darjellensis*, Blyth, J. A. S. XIV, 196.

Syn. P. majoroides, Hodgson.

Inhabits S. E. Himalaya.

(1011) *P. mahrattensis*, Latham (Gould's 'Century,' pl. 51).

Syn. P. hœmosomus, Wagler.

Inhabits India generally (but never on the alluvium of Lower Bengal).

(1012) *P. brunnifrons*, Vigors (Gould's 'Century,' pl. 52).

Syn. P. aurifrons, Vigors.

Inhabits Himalaya.

(1013) *P. Macei*, Vieillot (Hardw. *Ill. Ind. Zool.*)

Syn. P. medius from India, apud Latham.

Inhabits Bengal; Nepal; Assam; Tippera; Malayan peninsula.

(1014) *P. hyperythrus*, Vigors (Gould's 'Century,' pl. 50). Inhabits Himalaya.

(1015) *P. cathpharius*, Hodgson, J. A. S. XII, 1006. Inhabits S. E. Himalaya.

(1016) *P. rubricatus*, Blyth, (described as fine old male of No. 302 in J. A. S. XIV, 197). Inhabits Sikim.

(1017) *P. pygmæus*, Vigors, P. Z. S. 1831, p. 44.

Syn. P. trisulensis, Lichtenstein.

Inhabits N. W. Himalaya; Nepal.

(1018) *P. moluccensis*, Gmelin, (*Pl. Enl.* pl. 748, f. 2).

Syn. P. bicolor, Gmelin, apud Gray.
P. zizuki (?), Temminck.
Tripsursus auritus, Eyton.

Tukky lilit, Malayan; Sumatra. Inhabits Malayan peninsula; Java.

(1019) *P. canicapillus*, Blyth, J. A. S. XIV, 197.

Syn. Qu. Permanent variety of P. moluccensis.

Inhabits Arakan: Tenasserim Provinces.

(1020) *P. variegatus*, Wagler (nec Latham).

Syn. P. moluccensis, var. B, and Brown Woodpecker, Latham.
P. moluccensis, Hardw. and Gray Ill. Ind. Zool.
P. Hardwickii, Jerdon, Madr. Journ. XIII, 138.
Cawnpore Woodpecker, Latham.

Inhabits India, southward of the Himalaya.

(1021) *P. gymnopthalmos*, Blyth, J. A. S. XVIII. Inhabits Ceylon.

(1022) *P. validirostris*, Blyth (described and referred to *P. nanus*, Vigors, J. A. S. XIV, 197) Inhabits ——— ?

Subfam. PICUMNINÆ.

Genus PICUMNUS, Temminck.

(1023) *P. innominatus*, Burton, P. Z. S. 1835, p. 154.

Syn. Vivia nipalensis, Hodgson, J. A. S. VI, 107.

Wee-Wee, Nepal. Inhabits Himalaya.

Genus SASIA, Hodgson.

1024) *S. abnormis* (*Pl. Col.* 371, f. 3).
Syn. Picumnus abnormis, Temminck.
Inhabits Malay countries.

1025) *S. ochracea*, Hodgson, J. A. S. V, 778. Inhabits Nepal; Sikim; Assam; Sylhet; Aracan.

Subfam. YUNCINÆ.

Genus YUNX, Lin.

1026) *Y. torquilla*, L. (*Pl. Enl.* 998). Inhabits Europe and Asia: common in many parts of India, Calcutta, Ferozepore.

Subfam. INDICATORINÆ.

Genus INDICATOR, Vieillot.

1027) *I. xanthonotus*, Blyth, J. A. S. XI, 166, IV, 198 (Jerdon's *Ill. Ind. Orn. pl.—)*. Inhabits Sikim.

Subdivision II. (Perchers).

Fam. MEGALAIMIDÆ.

Genus MEGALAIMA, G. R. Gray.

1028) *M. virens* (Gould's 'Century,' pl. 46).
Syn. B. grandis, Gmelin.
Bucco virens, Boddaert.
Inhabits Himalaya; Assam; Cherra Punji: China.

1029) *M. lineata* (Tem. *Pl. Col.* 522).
Syn. B. lineatus, Vieillot.
B. corvinus, Tem.
Pho goung, Arakan. Inhabits Deyra Doon; Nepal; Assam; Sylhet; Tippera; Arakan; Tenasserim provinces; Sumatra (apud Vieillot).

1030) *M. caniceps* (Vail. *Barb.* t. 38, apud Gray).
Syn. B. lineatus apud Tickell. J. A. S. II, 579.
Bucco caniceps, Franklin,
Burra Bassunta, Central India: *Kootomra*, Tel.: *Kootoorya*, Mahr.: *Kootur-kasee*, Can.: *Kootooreal*, Cinghalese. Inhabits Indian peninsula, spreading northward to the Deyra Doon. Common in Meduapur jungles, and in Central India: replaced by a smaller and darker race in Ceylon. Specimens from the Nilgiris and specimens of rather smaller and darker-coloured race from Ceylon (*B. zeylanicus*? (Lin.)

1031) *M. viridis* (Jerdon's *Ill. Ind. Orn.*, pl. 26).
Syn. Bucco viridis, L.
Inhabits Nilgiris; Malabar.

1032) *M. flavifrons* (Vail. *Barb.* t. 55).
Syn. Bucco flavifrons, Cuv.
B. aurifrons, Temminck.
Inhabits Ceylon.

1033) *M. chrysopogon*, (*Pl. Col.* 285).
Syn. Bucco chrysopogon, Temminck.
Inhabits Malayan peninsula; Sumatra.

1034) *M. versicolor* (*Pl. Col.* 390).
Syn. Bucco versicolor, Raffles.
B. Rafflesii, Lesson.
Takoor, Malacca: *Takoo*, Sumatra (generic). Inhabits Malayan peninsula; Sumatra.

1035) *M. quadricolor.*
Syn Bucco quadricolor, Eyton, P. Z. S. 1839, p. 105.
B. malaccensis (?), Hartlaub, Rev. Zool. 1842, p. 337.
Inhabits Malayan peninsula.

1036) *M. armillaris* (*Pl. Col.* 89, f. 1).
Inhabits Malayan peninsula; Java?

1037) *M. asiatica* (Vieillot, *Gal. des Ois.*, t. 35).
Syn. Trogon asiaticus, Latham.
Capito cyanocollis, Vieillot.
Bucco cyanops, Cuv.
B. cæruleus, Dumeril.
Burra Bassunt-bairi, Bengal: *Koop-kha-loung*, Arakan. Inhabits Bengal; sub-Himalayan region to Deyra Doon, and valleys of the lower hills; Assam; Sylhet; Tipperah: rare in Arakan.

1038) *M. Franklinii.*
Syn. Bucco Franklinii, Blyth, J. A. S. XI, 167.
Inhabits S. E. Himalaya; Cherra Punji, Assam?

1039) *M. philippensis* (Tem. *Pl. Col.* 331).
Syn. Bucco philippensis, Brisson.
B. flavigula, Boddaert.
B. indicus, Latham.
B. flavicollis, Vieillot.
B. rubricollis, Cuv.
B. luteus, Lesson (albino variety, Jerdon.)
Chota Bassunt bairi, Bengal; *Kut-khora* and *Tambayut* ('Coppersmith'), H.: *Chanda*, Sumatra: *Engku*, Java. Inhabits India generally; nec Himalaya: Tippera; Chittagong; Ramree (Arakan); Tenasserim provinces; Penang; Sumatra; Java; Philippines; Ceylon.

1040) *M. rubricapilla* (Brown's *Zoology*, pl. 14)
Syn. Bucco rubricapillus, Gmelin.
Inhabits Ceylon.

1041) *M. trimaculata* (Tem. *Pl. Col.* 536, f. 1).
Syn. Bucco trimaculatus, Gray.
B. frontalis, Temminck.
B. Duvaucelei, Lesson.
B. australis apud Raffles (nec Horsfield).
B. cyanotis, Blyth (J. A. S. XIV, 465 (Arakan variety).
Ngel-pa-din, Arakan. Inhabits Malayan peninsula; Sumatra: with distinct variety in Arakan.

Genus MEGALORHYNCHUS, Eyton.

(1042) *M. Hayii*, Gray (apud G. R. Gray).

Syn. Micropogon fuliginosus, Temminck.
Calorhamphus sanguinolentus, Lesson.
Megalorhynchus spinosus, Eyton.

•*Ampis*, Sumatra: *Unkot Besea*, Penang. Inhabits Malayan paninsula; Sumatra.

Fam. CUCULIDÆ.

Subfam. CUCULINÆ.

Genus CUCULUS, L.

(1043) *C. sparverioides*, Vigors (Gould's 'Century,' pl. 53).

Syn. Ferruginous-necked Cuckoo (?), Latham.

Inhabits Himalaya; Nilgiris; Malayan peninsula.

(1044) *C. varius*, Vahl (Hardw. *Ill. Ind. Zool.*)

Syn. C. fugax, Horsfield.
C. Lathami, Gray.
C. tenuirostris, Lesson.
C. ejulans, Sundevall.
C. nisicolor, Hodgson, variety?
Bhrou and Bychan Cuckoo, and the young Sokagu, Cuckoo, Latham.

Chok-gallo, and *Popiya*, Beng.: *Kupuk*, or *Upuk*, H. (Jerdon). *Katti pitta* ('Sword bird'), Telugu. *Zuk-kat* (Custom-house bird), Dukhun. Inhabits India generally and Malay countries.

(1045) *C. striatus*, Drapiez.

Syn. C. micropterus, Gould.
C. optatus, Gould, 'Intr. to Birds of Australia.' (Doubtful.)
C. affinis, A. Hay, J. A. S. XV. 18 (large variety).
C. flaviventris apud Strickland (?), J. A. S. XIII, 390.

Bou-kotako, Beng.: *Kyphul-pucka* of hill-men, Masuri (Hutton). Inhabits India generally, and Malay countries: Australia? Rare in S. India.

(1046) *C. canorus*, Lin. (*Pl. Enl.* 811).

Syn. C. borealis, Pallas.
C. hepaticus, Sparrman, var.?

P'hu-p'hu, Deyra Doon. Inhabits Europe, Asia, and Africa, Darjiling, Calcutta.

(1047) *C. himalayanus*, Vigors (nec apud Gould's 'Century,' pl. 54).

Syn. S. saturatus, Hodgson, J. A. S. XII, 942. XV, 18.

Inhabits Himalaya generally: Tenasserim provinces.

(1048) *C. poliocephalus*, Latham (Gould's 'Century' pl. 54).

Syn. C. himalayanus apud Gould, Cent.

Inhabits Himalaya: S. India rarely.

(1049) *C. tenuirostris*, Gray (Hardw. *Ill. Ind. Zool.*).

Syn. C. flavus apud Lesson, et Jerdon, Madr. Journ. XI, 220: C. flavus, Ind. Var.?
C. lineatus (?), Lesson, Traité.
C. niger apud Blyth, J. A. S. XI, 908.
Pousya, Mahr. Inhabits India generally.

(1050) *C. merulinus*, Scopoli.

Syn. C. flavus, Gmelin.
C. pyrogaster, Drapiez.

Gedasse, Java. Inhabits Malay countries.

(1051) *C. Sonneratii*, Latham.

Syn. C. rufovittatus, Drapiez.
C. pravatus, Horsfield.

Inhabits S. India and Malay countries.

Subgenus SURNICULUS, Lesson.

(1052) *S. dicruroides*.

Syn. Pseudornis dicruroides, Hodgson, J. A. S. VIII, 136.
S. lugubris, Ind. Var.?

Inhabits India: Tenasserim provinces: Ceylon.

(1053) *S. lugubris*.

Syn. Cuculus lugubris, Horsfield.
C. albopunctatus, Drapiez.

Awon-Awon, Java. Inhabits Malayan peninsula and archipelago.

Subgenus CHRYSOCOCCYX, Boie.

(1054) *Chr. xanthorhynchos* (Horsfield's *Zool. Res. in Java*, pl.)

Syn. Cuculus xanthorhynchos, Horsfield.
Lampromorpha amethystina, Vigors, P. Z. S. 1831, p. 98.

Inhabits Tenasserim provinces: Malayan peninsula and archipelapo: Philippines: S. E. Himalaya (? Gray).

(1055) *Chr. chalcites* (?), Temminck (*Pl. Col.* 102, f. 2).

Syn. Cuculus malayanus (?), Raffles.
Chr. smaragdinus, Blyth, J. A. S. XV, 53 (nec Swainson).
Trogon maculatus, Gmelin, Brown's Ill. Zool. pl. XIII, fig. Sup. (but the specific name quite inapplicable).

Inhabits Hill regions of India generally; Arakan; Tenasserim.

(1056) *Chr. basalis*.

Syn. Cuculus basalis, Horsfield.

Inhabits Malayan peninsula and archipelago.

Genus EUDYNAMYS, Vigors and Horsfield.

(1057) *Eu. orientalis*.

Syn. Cuculus orientalis, Lin., the male.
C. punctatus, C. mindanensis, C. scolopaceus } Lin. } the female.
C. maculatus, Gmelin, }
Var.? C. indicus, Latham.
C. niger, Latham (Edwards, pl. 58).

Coël, H.: *Kokil*, Beng.: male—*Tuhu*; female *Chule*, Java: *Cowde-coha*, Cingh. Inhabits India, China, and Malay countries.

Genus OXYLOPHUS, Swainson.

(1058) *O. melanoleucos* (figured as the female *Edolio Cuckow* by Shaw).

Syn. Cuculus melanoleucos, Gmelin.
C. edolius, Cuvier.
Leptosomus afer apud Franklin and Sykes.

Popiya, Hind.: *Kolu Bubul*, Beng.: *Golli Kokila* ('Milkman Cuckoo),' Telugu. Inhabits India generally; Ceylon: rare on the eastern side of the Bay of Bengal, and never (?) in the Malay countries.

(1059) *O. coromandus* (*Pl. Enl.* 274, f. 2).

Syn. Cuculus coromandus, L.
C. collaris, Vieillot.

Inhabits India generally and Malay countries.

Subfam. PHŒNICOPHAINÆ.

Genus PHŒNICOPHAUS, Vieillot.

Cadow (generic), Malacca.

Subgenus DASYLOPHUS, Swainson.

(1060) *D. superciliosus.*

Syn. Ph. superciliosus, Cuv.

Inhabits Philippines.

Subgenus PHŒNICOPHAUS.

(1061) *Ph. pyrrhocephalus* (Pennant's 'Indian Zoology,' p. 5).

Syn. Cuculus pyrrocephalus, Forster.
Ph. leucogaster, Dumeril.

Malkoha, Ceylon (Pennant). Inhabits Ceylon.

(1062) *Ph. melanogaster* (*Pl. Col.* 349).

Syn. Cuc. melanogaster, Vieillot—the young?
Ph. calorhynchos, Temminck.

Inhabits Celebes: Moluccas.

(1063) *Ph. curvirostris* (Vail. *Ois. d' Afr.* t. 224).

Syn. Cuculus curvirostris, Shaw.
Ph. tricolor, Stephens.
Ph. viridis, Vieillot.
Cuculus melanognathus apud Raffles (nec Ph. melanognathus, Horsfield).

Inggang Balukar, Sumatra. Inhabits Malay countries.

Subgenus ZANCLOSTOMUS, Swainson.

(1064) *Z. diardi.*

Syn. Melias Diardi, Lesson.
Phœnicophaus tristis apud Blyth, J. A. S. XI, 928.

Cadow Kuchie, Malacca. Inhabits Malay countries.

(1065) *Z. sumatranus.*

Syn. Cuculus sumatranus, Raffles.
Phœnicophus Crawfurdii, Gray.

Sengdo, Sumatra. Inhabits Malay countries.

(1066) *Z. tristis* (Belanger, *Voy.* pl.).

Syn. Melias tristis, Lesson.
Phœnicophaus longicaudatus, Blyth.

Ban Kukil, Beng.: *Wa-pha-lai*, Arakan. Inhabits Bengal, Nepal, Assam, Arakan, Tenasserim provinces, Penang.

(1067) *Z. viridirostris*, Jerdon (*Ill. Ind. Orn.* pl. 3.)

Syn. Phœnicophaus Jerdoni, Blyth.

Kuppra Popya, Hind. *Wamaneh Kaki*, Telugu: *Handi Koota*, Ceylon (Daniell): *Mal candatta*, Do. (Layard). Inhabits Peninsular India; Ceylon.

(1068) *Z. javanicus* (Horsfield's '*Zool. Res. in Java*', pl.).

Syn. Phœnicophaus javanicus, Horsfield.
Coccyzus chrysogaster, Temminck.
C. rubrirostris, Drapiez.
Chalybeate Cuckoo, Latham.

Kaka Apie, Malacca: *Bubut Kembang*, Java Inhabits Malay countries; Tenasserim.

Genus RHINORTHA, Vigors.

(1069) *Rh. chlorophæa* (Belanger, *Voy.* pl. 1, the female).

Syn. Cuculus chlorophæus, Raffles.
C. sumatranus, Cuvier.
Phœnicophaus caniceps, Vigors.
Ph. viridirostris, Eyton.
Bubutus Isidorei et B. Davaucelei, Lesson.
Coccyzus badius, Gray.
Anadænus rufus et A. rufescens Swainson.

Slaya, *See-saya*, Malacca. *Búbút*, Sumatra. Inhabits Malay countries.

Genus TACCOCUA, Lesson.

(1070) *T. infuscata*, Blyth, J. A. S. XIV, 200.

Inhabits Tarai region bordering on Nepal and Sikim.

(1071) *T. affinis*, Blyth, J. A. S. XV, 19.

Inhabits Central India; Mednapur jungles; Rajmahl; Monghyr.

(1072) *T. sirkee* (Hardwicke's *Ill. Ind. Zool.*)

Syn. Centropus sirkee, Gray.
C. cuculoides, C. W. Smith, J. A. S. X. 658.

Coccyzus chrysogaster of Royle's list.

Inhabits vicinity of Cawnpore; Deyra Doon.

(1073) *T. Leschenaultii*, Lesson.

Syn. Zanclostomus sirkee apud Jerdon, Catal.

Inhabits S. India.

Genus CENTROPUS Illiger.

Mahúka, Hind.: *Kúka*, Beng.: *Atte Cuccula*, Cingh.: *Boop*, Arakan: *Búbút*, and *Kradok*, Malay.

(1074) *C. curycercus*, A. Hay (J. A. S. XIV, 551)

Syn. Cuculus bubutus apud Raffles (nec Centropus bubutus, Horsfield).

Inhabits Malayan peninsula; Sumatra.

(1075) *C. philippensis*, Cuvier (Horsfield's *Zool. Res. in Java*', pl.).

Syn. Cuculus ægyptius, var. γ, Latham.
Corydonyx pyrrhopterus, Vieillot.
Centropus bubutus, Horsfield.
C. castanopterus, Stephens.
C. fasciatus, C. W. Smith, J. A. S. X, 659.
Var. Polophilus sinensis, Stephens.

Inhabits S. E. Asia and its Archipelago.

(1076) *C. chlororhynchos*, Blyth, J. A. S. XVIII.

Inhabits Ceylon.

(1077) *C. viridis* (Brown's *Zoology*, pl. XIII, fig. *infra*).

Syn. Cuculus viridis, Scopoli.
C. bengalensis, Latham.
C. tolu apud Raffles.
C. lepidus et C. affinis, Horsfield.
C. pumilus, and probably C. melanops, Lesson.
C. dimidiatus, Blyth, J. A. S. XII, 915.
C. rectunguis, Strickland, Ann. Mag. N. H. XIX, 134.
Polophilus Lathami (?), Leach.

Inhabits India generally and Malay countries, more abundant in the latter.

(1078) *C. bicolor*, Lesson.

Syn. C. celebensis, Quoy and Gaymard, Voy. de l' Astrolabe.

Inhabits Celebes; Moluccas.

Fam. TROGONIDÆ.

Genus HARPACTES, Swainson.

(1079) *H. Hodgsonii*, Gould (*Mon. Trogonidæ*, pl. 34)

Htoo-ta-roo, Arakan. Inhabits Nepal; Assam; Sylhet; Arakan.

(1080) *H. kasumba* (Gould's *Mon. Trogonidæ* pl. 29).

Syn. Trogon kasumba, Raffles.
Tr. condea, Cuvier.
Tr. fasciatus, Tem. (nec Pennant).
Tr. Temminckii, Gould.

Kasumba, Sumatra. Inhabits Malayan peninsula; Sumatra.

(1081) *H. Diardi* (Gould's *Mon. Trogonidæ*, pl. 30).

Gumsoba, *Kuna somba* (*Kasumba ?*), Malacca. Inhabits Malayan peninsula; Sumatra.

(1082) *H. fasciatus* (Gould's *Mon. Trogonidæ*, pl. 31).

Syn. Trogon fasciatus, Pennant.
Tr. malabaricus, Gould.

Kúfni Churi of some, Hind.: *Kurna* Mahr.: *Kakurni Kukki*, Can. Inhabits peninsula of India; Ceylon.

(1083) *H. rutilus* (Gould's *Mon. Trogonidæ*, pl. 32).

Syn. Trogon rutilus, Vieillot.
Tr. cinnamomeus (?), Temminck.
T. Duvaucelei, Temminck.
T. fasciatus, var. B., Latham.

Ramguba, Malacca. Inhabits Malayan peninsula; Sumatra.

(1084) *H. oreskios* (Gould's *Mon. Trogonidæ* pl. 36).

Syn. Trogon oreskios, Temminck.

Inhabits Arakan; Tenasserim provinces.

Fam. CAPRIMULGIDÆ.

Subfam. PODARGINÆ.

Genus PODARGUS, Cuvier.

(1085) *P. Auritus*, Vigors (Gould's *Icones Avium*).

Syn. Bombycistoma Fullartonii, Hay, J. A. S, X, 573.

Inhabits Malayan peninsula.

(1086) *P. Javanensis*, Horsfield (Tem. *Pl. Col.* 159; Horsfield's *Zool. Res. in Java*).

Syn. ? P. cornutus, Tem. (the adult ?).

Inhabits Malayan peninsula, Java.

(1087) *P. affinis*, Blyth, J. A. S, XVI, 1180.

Inhabits Malayan peninsula.

Subfam. CAPRIMULGINÆ.

Chippuk, H. *Dub chooree*, also *Dubbuk chooree*, also *Undhee chooree*, H. *and* B: *Tukang*, Malayan. *Ugeet payeen*, Arakan; *Kuppo pitta* (Frog-bird), Telugu; also *As kappri gadu*, Tel.

Genus EUROSTOPODUS, Gould.

(1088) *Eu. cerviniceps* (Gould's *Icones Avium*).

Syn. Lyncornis cerviniceps, Gould.

Twun-dweng-nghat, Arakan. Inhabits Burmese countries.

(1089) *Eu. Temminckii* (Gould's *Icones Avium*).

Syn. Lyncornis Temminckii, Gould.
Caprimulgus imberbis, Temminck.
C. pulcher, A. Hay, Madr. Journ. XIII, 161.

Inhabits Malayan peninsula, Java.

Genus CAPRIMULGUS, Lin.

(1090) *C. indicus*, Latham (Jerdon's *Ill. Ind. Orn.* pl. 24).

Syn. C. cinerascens, Vieillot.
C. innotatus, Hodgson (juv.)

Inhabits India generally, Malayan peninsula.

(1091) *C. albonotatus*, Tickell, J. A. S, II, 580.

Syn. C. gangeticus, Blyth, mentioned Ann. Mag. N. H. 1843, pl. 95.
C. macrourus apud Blyth, J. A. S, XI, 586.
C. nipalensis, Hodgson, Gray, Zool. Misc.

Inhabits Northern and Central India: common in Lower Bengal.

(1092) *C. macrourus*, Horsfield (Gould's *B.* . Vol. II, pl. 9).

Inhabits Arakan, Tenasserim, Malacca, Java, . Australia; very rare in Lower Bengal.

(1093) *C. mahrattensis*, Sykes, P. Z. S. 1832, . 83.

Syn. C. atripennis, Jerdon, Ill. Ind. Orn., art. C. asiaticus.
C. asiaticus, var. C. (?), Latham.

Inhabits S. India, Ceylon.

(1094) *C. asiaticus*, Latham (Vaill. *Ois. d' fr.*, *t.*; Hardw. *Ill. Ind. Zool.*)

Syn. C. pectoralis, Cuv.
Bombay Goat sucker, Latham.

Bacca-meena, Cingh. Inhabits India generally.

(1095) *C. monticolus*, Franklin, P. Z. S. 831, p. 116.

Syn. Great Bombay Goat sucker, Latham.

Inhabits India generally, Arakan (Ramree).

(1096) *C. affinis*, Horsfield.

Inhabits Java. This is a diminutive of C. monicolus; wing 6½ Inches.

Fam. CYPSELIDÆ.

Subfam. CYPSELINÆ.

Genus ACANTHYLIS, Boie.

(1097) *Ac. caudacuta.*

Syn. Hirundo caudacuta, Latham.
Cypselus giganteus, Temminck.

Inhabits Nilgiris, Ceylon, Malayan peninsula, rarely Arakan.

(1098) *Ac. fusca* (Gould's B. A. Vol. II, pl. 10; Swainson's *Zool. Ill.*, *n. s.*, pl. 42; Delessert, *Souvenirs*, &c., pt. 2, pl. 9, and *Mag. de Zool.* 1840, *Ois.* pl. 20).

Syn. Hirundo fusca, Shaw.
Chætura australis, Stephens.
Ch. macroptera, Swainson, Zool. Ill.
Ch. nudipes, Hodgson, J. A. S, V, 779.
Cypselus leuconotus, Delessert.
Acanthylis caudacuta, (Lath.) apud Gould, loc. cit.

Inhabits S. E. Himalaya, and Australia (at least as figured by Mr. Swainson and by Mr. Gould).

(1099) *Ac. leucopygialis*, Blyth, J. A. S, XIII.

Inhabits Malayan peninsula.

Genus CYPSELUS, Illiger.

(1100) *C. melba* (Edwards, pl. 27)

Syn. Hirundo melba, Lin.
H. alpina, Scopoli.
Cypselus gutturalis, Vieillot.
C. gularis, Stephens.

Inhabits mountainous regions of the S. of Europe, Asia, and Africa. Rare in the British islands. Common in Central India, Nilgiris, &c.

(1101) *C. apus* (*Pl. Enl.* 542, fig. 1).

Syn. Hirundo apus, Lin.
Cypselus murarius, Tem.

Inhabits Europe and W. Asia: common in Afghanistan.

(1102) *C. rittatus*, Jardine and Selby (*Ill. Orn.* 2nd series, pl. 39),

Inhabits S. E. Asia, as China, and the Malayan peninsula and archipelago: common at Penang. N. W. Himalaya.

(1103) *C. leuconyx*, Blyth, J. A. S, XIV, 218.

Inhabits India generally: rare.

(1104) *C. subfurcatus*, Blyth, J. A. S. XVIII.

Syn. C. affinis, var., Strickland, P. Z. S. 1846, p. 99.

Inhabits Malayan peninsula.

(1105) *C. affinis*, Gray (Hardw. *Ill. Ind. Zool.*).

Syn. C. nipalensis, Hodgson, J. A. S, V, 780.
C. montanus, Jerdon, Madr. Journ. XIII, 144.

Ababil, Hind. Inhabits plains and lower hills of India generally; rare in the Dukhun; Ceylon.

(1106) *C. balasiensis*, Gray (Hardw. *Ill. Ind. Zool.*)

Syn. C. palmarum, Gray.

Inhabits most part of India: wherever the *Borassus* grows, to the fronds of which it affixes its nest. Arakan (Ramree). Common in Ceylon.

Genus COLLOCALIA, G. R. Gray.

(1107) *C. nidifica.*

Syn. Hirundo nidifica, Latham.
H. esculenta apud Horsfield.
H. fuciphaga apud Shaw.
H. brevirostris, McClelland, P. Z. S. 1839, p. 155.
H. unicolor, Jerdon, Madr. Journ. XI, 238; referred to Cypselus, ibid. XIII, 173; and termed C. concolor, J. A. S, XI, 886.

Wahalæna, Cingh. Inhabits Nilgiris, Ceylon, Sikim, Assam; and Malay countries.

(1108) *C. fuciphaga.*

Syn. Hirundo fuciphaga, Thunberg.

Inhabits rocky coasts bordering the Bay of Bengal, and of Malayan peninsula and archipelago.

Subfam. MACROPTERIGIINÆ.

Genus MACROPTERYX, Swainson.

(1109) *M. coronatus.*

Syn. Hirundo coronata, Tickell, J. A. S, II, 580; IV, 21.
M. klecho of India, Auctorum.

Inhabits jungles of Central and S. India, and of Ceylon.

(1110) *M. klecho* (Swainson's *Zool. Ill., n. s.*, pl. 74).

Syn. Hirundo klecho, Horsfield.
Cypselus longipennis, Temminck.

Inhabits Malayan peninsula, Java.

(1111) *M. comatus* (*Pl. Col.* 268).

Syn. Cypselus comatus, Temminck.

Inhabits Eastern Malasia; Sumatra?

Suborder PASSERES, L. modified. Fam. CORVIDÆ. Subfam. CORVINÆ (A.) Crows.

Genus CORVUS, Lin.

(1112) *C. culminatus*, Sykes (Hardwicke's *Ill. Ind. Zool.*)

Syn. C. orientalis, Eversmann.
C. corone, var., Franklin.
C. corax of Sumatra? Raffles.

Dand kag, Beng.: *Dhar kowa*, "*Dheri kowa* or *kurrial*"(Jerdon), Hind.: *Pahari kowa*, Deyra Doon: *Burong gaga-gaga*, Malayan. Inhabits India generally; Ceylon; Assam; Arakan; Tenasserim; Malayan peninsula; Sumatra?: also N. Asia (Eversmann). 'Raven' of Europeans in India.

(1113) *C. corone*, L. (*Pl. Enl.* 495).

Inhabits Europe; N. Asia? Japan? China?

(1114) *C. cornix*, L. (*Pl. Enl.* 76).

Inhabits N. Europe, and N. W. Asia: Japan (Temminck).

(1115) *C. splendens*, Vieillot (*Pl Col.* 425).

Kag or *Kak*, Beng.: *Kowa*, or *Path Kowa*, i. e. 'Common Crow'., Hind. *Dasi kowa*, Deyra Doon: *Cac-co*, Cingh. Inhabits India generally; Assam, Sylhet, Chittagong, and northernmost part only of Arakan, where its occurrence is of recent date.

(1116) *C. macrorhynchos*, Vieillot.

Syn.? Fregilus enea, Horsfield.

Inhabits vicinity of Straits of Malacca.

(1117) *C. frugilegus*, L. (*Pl. Enl.* 484.)

Inhabits Europe; Afghanistan; Kashmir; Japan (Temminck).

(1118) *C. monedula*, L, (*Pl. Enl.* 523).

Inhabits Europe; Middle Asia; Kashmir; N. Africa.

B. NUTCRACKERS.

Genus NUCIFRAGA, Brisson.

(1119) *N. hemispila*, Vigors (Gould's 'Century,' pl. 36., Inhabits Himalaya.

C. CHOUGHS.

Genus PYRRHOCORAX, Vieillot.

(1120) *P. alpinus*, Vieillot (*Pl. Enl.* 35).

Syn. Corvus pyrrhocorax, L.

Inhabits Alps, Himalaya, and other lofty mountain chains of Europe and Asia.

Genus FREGILUS, Cuv.

(1121) *Fr. graculus* (*Pl. Enl.* 255.)

Syn. Corvus graculus, L.
C. erythrorhamphus, Vieillot.
Fr. europœus, Lesson.
Fr. erythropus, Swainson.

Inhabits lofty mountain ranges of Europe and Asia: also high cliffs overhanging the sea.

Subfam. GARRULINÆ.

(A) MAGPIES.

Genus PICA, Brisson.

(1122) *P. bottanensis*, Ad. Delessert.

Syn. P. megaloptera, Blyth, J. A. S. XI, 193.

Inhabits Bootan.

(1123) *P. media* Blyth, J. A. S. XIII, 393, 1844.

Syn. P. sericea, Gould, P. Z. S. 1845, p. 2.

Inhabits China.

(1124) *P. caudata*, Ray (*Pl. Enl.* 488).

Syn. P. melanoleuca, Vieillot.

Inhabits Europe, N. Asia, and N. America west of the Rocky mountains range: variety common in Afghanistan.

Genus DENDRACITTA, Gould.

(1125) *D. leucogastra*, Gould, (*Trans. Zool. Soc.* Vol. I, pl. 12). Inhabits Nilgiris.

(1126) *D. rufa* (Vaill. *Ois. d' Afr.* pl. 59; Gould's 'Century,' pl. 42).

Syn. Corvus rufus, Scopoli.
Coracias vagabunda, Latham.
Pica rufiventris, Vieillot.

Hundi-chacha ('pan-scraper,' imitative of cry) and *Takka-chor* ('rupee-thief'), Beng.: *Maha, Lat*, H. (Jerdon).: *Mahtab*, and *Chand*, Sindee (Burnes). Inhabits India generally: plains and lower hills.

(1127) *D. sinensis* (Gould's 'Century,' pl. 43).

Syn. Corvus sinensis, Latham.

Kokiakak, Masuri. Inhabits Himalaya; China?

(1128) *D. altirostris*.

Syn. Crypsirina altirostris, Blyth. J. A. S. XII. 933, D. frontalis (?), McClelland, P. Z. S. 1839, p. 163.

Inhabits Sikim: Assam?

Genus CRYPSIRINA, Vieillot.

(1129) *Cr. varians* (Horsfield's *Zool. Res. in Java*: Lev. *Ois. d' Afr.* 56).

Syn. Corvus varians, Latham.
C. temia, Shaw,
Phrenotrix temia, Horsfield.

Chekitut, or *Benteot*, Java. Inhabits Tenasserim; Java.

Genus TEMNORUS, Lesson.

(1130) *T. leucopterus* (*Pl. Col.* 265).

Syn. Glaucopis leucopterus, Temminck.

Talong-gaga, or *Kolang-gaga*, Malayan. Inhabits Malayan peninsula and archipelago.

(B.) JAY-MAGPIES.

Genus CISSA, Boie.

(1131) *C. venatoria* (Hardw. *Ill. Ind. Zool.*).

Syn. Kitta venatoria, Gray.
Corvus sinensis (?), Boddaert.
C. speciosus (?), Shaw.
Corapica bengalensis, Lesson.

Inhabits S. E. Himalaya, Assam, Arakan, Tenasserim provinces.

(1132) *C. puella*, Blyth, J. A. S. XVIII.

Inhabits Ceylon.

Genus PSILORHINUS, Ruppell.

(1133) *Ps. magnirostris*, Blyth, J. A. S. XV, 27. Inhabits Ya-ma-dong mountains, separating Arakan from Pegu.

(1134) *Ps. occipitalis*, Blyth (J. A. S. XV, 27; Gould's 'Century,' pl. 41.)

Syn. Pica erythrorhyncha apud Vigors and Gould.
Corvus sinensis (?), Lin.
C. erythrorhynchos (?), Boddaert.
Coracias melanocephala (?), Latham.
Ps. albicapillus, Blyth (the young.)

Nil-khant, Masuri, Inhabits Himalaya: China?

(1135) *Ps. flavirostris*, Blyth (J.A.S. XV, 28.)

Inhabits Sikim; Kashmir (vide J. A. S. XV, 284).

Genus GARRULUS, Brisson.

(1136) *G. ornatus*, Gray (Hardw. *Ill. Ind. Zool.* Gould's 'Century,' pl. 38).

Syn. G. bispecularis, Vigors.

Inhabits Himalaya.

(1137) *G. gularis*. (Hardw. *Ill. Ind. Zool.* Gould's 'Century,' pl. 36, 40.)

Syn. G. lanceolatus, Vigors.
G. Vigorsii, Gray (the young).

Ban-sarra, of hill men (Hutton). Inhabits Himalaya.

Genus PERISOREUS. Fr. Bonap.

(1138) *P. infaustus* (Gould's 'Birds of Europe,' pl. 215).

Syn. Corvus infaustus, L.
C. sibiricus, Boddaert.
C. russicus. Gmelin.
C. mimus, Pallas.

Inhabits Northern regions of the Old Continent.

D. Insertæ sedis.

Genus LOPHOCITTA, G. R. Gray.

(1139) *L. galericulata* (Levaillant, *Ois. de Par.* pl. 42).

Syn. Corvus galericulatus, Cuv.
Lanius scapulatus. Licht.
L. coronatus. Raffles, (the female.)
Vanga cristata, Griffith's An. Kingd.

Burong Jeri, Malayan. Inhabits Malayan peninsula: Sumatra: Java.

Genus TURNAGRA (?,) Lesson.

(1140) *T. (?) striata* (Gould's 'Century,' pl. 37).

Syn. Garrulus striatus, Vigors.

Inhabits Himalaya.

Subfam. GARRULACINÆ.

Genus GARRULAX, Lesson.

(1141) *G. Belangeri*, Lesson (*Zoologie du Voy. de M. Belanger*).

Inhabits Tenasserim provinces; Pegu.

(1142) *G. leucolophos*, (Gould's 'Century,' pl. 18.)

Syn. Corvus leucolophos, Hardwicke.

Inhabits Himalaya; Assam; Sylhet; Arakan,

(1143) *G. chinensis.*

Syn. Lanius chinensis, Scopoli.
Corvus auritus, Daudin.
Turdus shanhu et T. melanopis, Gmelin.
Crateropus leucogenys, Blyth, J. A. S. XI, 180.

Inhabits China.

(1144) *G. albogularis.*

Syn. Ianthocincla albogularis, P. Z. S. 1835, p. 187.
Cinclosoma albigula, Hodgson, As. Res. XIX, 146.

Inhabits Himalaya.

(1145) *G. pectoralis.*

Syn. Ianthocincla pectoralis, Gould. P. Z. S. 1835, p. 186.
Cinclosoma grisa ire, Hodgson, As. Res. XIX, 146.
G. melanotis, Blyth, J. A. S. XII, 149. variety.

Inhabits Himalaya; Arakan; Tenasserim Provinces.

(1146) *G. moniliger.*

Syn. Cinclosoma moniliger, Hodgson, As. Res. XIX, 147.
Ianthocincla pectoralis (?) apud McClelland, P. Z. S 1839. p. 160,
G. McClellandii (?), Blyth, J. A. S. XII, 949.

Inhabits S. E. Himalaya; Assam: Tippera; Arakan; Tenasserim Provinces.

(1147) *G. cærulatus.*

Syn. Cinclosoma cœrulatum, Hodgson, As, Res XIX, 147,

Inhabits S. E. Himalaya.

1148) *G. ocellatus* (Gould's 'Century,' pl. 15).

Syn. Cinclosoma ocellatum, Vigors.

Inhabits Himalaya.

1149) *G. rufogularis.*

Syn. Ianthocincla rufogularis, Gould, P. Z. S. 1835, p. 187.
Cinclosoma rufimenta, Hodgson, As. Res. XIX, 148.

Inhabits S. E. Himalaya; Cherra Punji; Tipcra.

(1150) *G. squamatus* (Jardine and Selby's *Ill. Orn.*, 2nd series, pl. 4).

Syn. Ianthocincla squamata, Gould, P. Z. S. 1835, p. 47.
Cinclosoma melanura, Hodgson, As. Res. XIX, 147.

Inhabits S. E. Himalaya.

(1151) *G. subunicolor*, Hodgson (described J. A. S. XII, 952; XIV, 599).

Inhabits S. E. Himalaya.

(1152) *G. affinis*, Hodgson (described J. A. S. XII, 950).

Inhabits S. E. Himalaya.

(1153) *G. variegatus* (Gould's 'Century,' pl. 16).

Syn. Cinclosoma variegatum, Vigors.
G. Abeillei, Lesson.

Inhabits N. E. Himalaya.

(1154) *G. chrysopterus.*

Syn. Ianthocincla chrysoptera, Gould, P. Z. S. 1835, p. 48.

Inhabits S. E. Himalaya.

(1155) *G. erythrocephalus* (Gould's 'Century,' p. 17).

Syn. Cinclosoma erythrocephalum, Vigors.

Inhabits N. E. Himalaya.

(1156) *G. ruficollis* (Jardine and Selby's *Ill. Orn.* 2nd series, pl. 21).

Syn. Ianthocincla ruficollis, Jardine and Selby.
I. lunaris, McClelland, P. Z. S. 1839, p. 160.

Inhabits S. E. Himalaya; Assam; Sylhet; Tipperah.

(1157) *G. phœniceus* (Gould's *Icones Avium*).

Syn. Ianthocincla phœnicea, Gould.
Crateropus puniceus, Blyth, J. A. S. XI, 180.

Inhabits S. E. Himalaya.

(1158) *G. cachinnans* ('Madras Journal,' X, 255, pl. 7).

Syn. Crateropus cachinnans, Jerdon.
Cr. Lafresnayii, Ad. Delessert.
Cr. Delesserti, LaFresnaye (nec Cr. Delesserti, Jerdon).

Inhabits Nilgiris.

(1159) *G.* (?) *lineatus.*

Syn. Cinclosoma lineatum, Vigors.
C. setiferum, Hodgson, As. Res. XIX, 148.

Inhabits Himalaya.

(1160) *G.* (?) *imbricatus*, Blyth, J. A. S. XII, 951. Inhabits Bootan.

Genus ACTINODURA, Gould.

(1161) *Act. Egertoni*, Gould, P. Z. S. 1836, p. 18.

Syn. Leiocincla plumosa, Blyth, J. A. S. XII, 953

Inhabits S. E. Himalaya; Assam; Sylhet.

(1162) *Act. nipalensis.*

Syn. Cinclosoma nipalense, Hodgson, As. Rs. XIX, 145 (type of Ixops, Hodgson).

Inhabits S. E. Himalaya.

Genus SIBIA, Hodgson (*Sibya*, Nepal).

(1163) *S. picoides*, Hodgson (described J. A. S. VIII, 38).

Syn. Heterophasia cuculopsis, Blyth, J. A. S. XI, 187.

Inhabits S. E. Himalaya.

(1164) *S. capistrata.*

Syn. Cinclosoma capistratum, Vigors.
C. melanocephalum (?), Royle's list.
S. nigriceps, Hodgson.

Inhabits Himalaya.

Genus CUTIA, Hodgson.

(1165) *C. nipalensis*, Hodgson (J. A. S. XV, 772; XVI, 110).

Khatya, or *Khutya*, Nepal. Inhabits S. E. Himalaya.

Genus PTERUTHIUS, Swainson.

(1166) *Pt. rufiventer*, Blyth, J. A. S. XI, 183; XII, 954 (Gray's *Ill. Gen. Birds*).

Inhabits S. E. Himalaya.

(1167) *Pt. erythropterus* (Gould's 'Century,' pl. 11).

Syn. Lanius erythropterus, Vigors.

Inhabits Himalaya.

Subfam. LEIOTHRICANÆ.

Genus LEIOTHRIX, Swainson.

(1168) *L. argentauris.*

Syn. Mesia argentauris, Hodgson, Ind. Rev. 1838, p. 88.

Inhabits S. E. Himalaya.

(1169) *L. luteus.*

Syn. Sylvia lutea, Scopoli.
Tanagra sinensis, Gmelin.
Parus furcatus, Temminck.
Bahila calipyga, Hodgson. Ind. Rev. 1638, p. 88.

Inhabits Himalaya; China?

(1170) *L. strigula* (Ad. Delessert, *Souvenirs*, &c. pt. 2, pl. 8).

Syn. Siva strigula, Hodgson, Ind. Rev. 1838, p. 89.
Muscicapa variegata, Delessert, Mag. de Zool. 1840. Ois., t. 20.
L. chrysocephala Jameson.

Inhabits Himalaya.

(1171) *L. cyanouroptera.*

Syn. Siva cyanouroptera, Hodgson, Ind. Rev. 1838, p. 88.
Leiothrix lepida, McClelland, P. Z. S. 1839, p. 162.

Inhabits Himalaya ; Assam.

(1172) *L. ignitincta.*

Syn. Minla ignitincta, Hodgson, Ind. Rev. 1838, p. 32.
L. ornata, McClelland. P. Z. S. 1839, p. 162.

Inhabits S. E. Himalaya ; Assam.

(1173) *L. cinerea.*

Syn. Minla cinerea, Blyth, J. A. S. XVI, 449.

Inhabits S. E. Himalaya.

(1174) *L. castaniceps.*

Syn. Minla castaniceps, Hodgson, Ind. Rev. 1839, p. 33.

Inhabits Himalaya.

(1175) *L. vinipectus.*

Syn. Siva vinipectus, Hodgson, Ind. Rev. 1828, p. 89.

Inhabits S. E. Himalaya.

(1176) *L. chrysotis* (*chrysopterus ? seu leucotis ?*)

Syn. Preparus chrysotis, Hodgson, J. A. S. XIII, 938 ; XVI, 448.

Inhabits S. E. Himalaya.

Genus IXULUS. Hodgson.

(1177) *I. occipitalis*, J. A. S. XIV, 552.

Syn. Siva occipitalis, Blyth, J. A. S. XIII, 937.

Inhabits Sikim.

(1178) *I. flavicollis.*

Syn. Yuhina ? flavicollis, Hodgson, As. Res. XIX, 167.

Inhabits Himalaya (Masuri to Bootan).

Genus YUHINA, Hodgson.

(1179) *Y. gularis*. Hodgson (*As. Res.* XIX, 166.)

Inhabits S. E. Himalaya.

(1180) *Y. occipitalis*, Hodgson (*As. Res.* XIX, 166).

Inhabits S. E. Himalaya.

Genus MYZORNIS, Hodgson.

(1181) *M. pyrrhoura.* Hodgson, (J. A. S. XII, 984 ; XIV, 561).

Genus ERPORNIS, Hodgson.

(1182) *E. xanthlaema*, Hodgson J. A. S. XIII, 380.

Syn. E. xanthochlora, Hodgson, P. Z. S. 1845, p. 33.

Inhabits S. E. Himalaya ; Arakan ; Malayan peninsula.

Subfam. PARINÆ.

(A. *Paradoxornis* subseries.)

Genus CONOSTOMA, Hodgson.

(1183) *C. æmodius*. Hodgson (J. A. S, X, 856).

Inhabits Nepal.

Genus HETEROMORPHA, Hodgson.

(1184) *H. ruficeps* (J.A S. XII, 1010, pl.).

Syn. Paradoxornis ruficeps, Blyth, J. A. S. XI, 187.

Inhabits Sikim ; Bootan ; Arakan.

(1185) *H.* (? *Paradoxornis* ?) *caniceps*, Blyth, J. A. S. XVIII. Inhabits Sikim.

Genus SUTHORA, Hodgson.

(1186) *S. ruficeps.*

Syn. Chleuasicus, ruficeps. Blyth, J. A. S. XIV, 578.

Inhabits Sikim.

(1187) *S. nipalensis*, Hodgson (*Ind. Rev.* 1838, p. 32). Inhabits S. E. Himalaya.

(1188) *S. fulvifrons*, Hodgson (J. A. S. XIV, 579). Inhabits Nepal.

Genus FALCUNCULUS, Vieillot.

(1189) *F. frontatus* (Gould's B. A. Vol. II. pl. 79).

Syn. Lanius frontatus, Latham,

Inhabits E. and S. Australia.

Genus PARUS, Lin.

(1190) *P. flavocristatus*, Lafresnaye.

Syn. P. sultaneus, Hodgson, Ind. Rev. 1837, p 81. Melanochlora flavocristata et M. sumatrana, Lesson.

Inhabits Nepal ; Sikim ; Bootan ; Assam ; Malayan peninsula ; Sumatra.

(1191) *P. monticolus*, Vigors (Gould's 'Century,' pl. 29. f. 2.) Inhabits Himalaya.

(1192) *P. cinereus*, Vieillot (*Pl. Col.* 287, f. 2 ; Levaillant, *Ois. d' Afr.* pl. 139, f. 1).

Syn. P. atriceps, Horsfield, Lin. Tr. XIII, 160.
P. nipalensis. Hodgson. Ind. Rev. 1838, p. 31.

Inhabits Himalaya ; Assam ; Central and S. India ; Ceylon ; Java.

(1193) *P. xanthogenys*, Vigors (Gould's 'Century,' pl. 29, f. 1).

Syn. P. aplonotus, Blyth. J. A. S. XVI, 444.

Inhabits N. W. Himalaya ; Central and South India.

(1194) *P. spilonotus*, Blyth, J. A. S. XVIII.

Syn. P. xanthogenys apud Blyth, J. A. S. XVI, 445.

Inhabits Himalaya.

(1195) *P. rufonuchalis*, Blyth, J. A. S. XVIII.

Inhabits Tyne range, beyond Simla.

(1196) *P. melanolophos*, Vigors (Gould's 'Century,' pl. 30, f. 2). Inhabits N. W. Himalaya.

(1197) *P. rubidiventris*, Blyth, J. A. S. XVI, 445. Inhabits Nepal.

(1198) *P. dichrous*, Hodgson, J. A. S. XIII, 943. Inhabits Nepal.

(1199) *P. ionschistos*, Hodgson, J. A. S. XIII, 943. Inhabits Nepal.

Genus ORITES, Mœrrhing.

(1200) *O. erythrocephalus* (Gould's 'Century,' pl. 30, f. 1).

Syn. Parus erythrocephalus, Vigors.

Inhabits Himalaya.

Genus SYLVIPARUS, Burton.

(1201) *S. modestus*, Burton, P. Z. S. 1835, p. 154.

Syn. Parus sericophrys, Hodgson, J. A. S. XIII, 942; XVI, 446.

Inhabits Himalaya.

Genus ÆGITHALUS, Vigors.

(1202) *O. flammiceps*, Burton, P. Z. S., 1835, pl. 153.

Syn. Dicæum sanguinifrons, A. Hay, J. A. S. XV, 44.

Inhabits N. W. Himalaya.

Subfam. PARADISEINÆ.

B. Subseries with bills of medium length.

Genus PARADISEA, L.

(1203) *P. apoda*, Lin. (*Pl. Enl.* 254; Vieillot, *Ois. de Par.* t. 1.)

Syn. P. major, Shaw.

Inhabits N. Guinea.

(1204) *P. minor*, Shaw (Vieillot, *Ois. de Par.* pl. 2). Inhabits N. Guinea.

(1205) *P. rubra*, Cuvier (Vaill. *Ois. de Par.* t. 3).

Syn. P. sanguinea, Shaw.

Inhabits N. Guinea.

Genus CICINNURUS, Vieillot.

(1206) *C. regius* (*Pl. Enl.* 496; Vaill. *Ois. de Par.* t. 7).

Syn. Paradisea regia, L.
C. spinturnix, Lesson.

Inhabits N. Guinea.

Subfam. GRACULINÆ.

A. Maina and Starling subseries. Inhabiting Europe, Asia, and N. Africa.

a. Of more bulky form; gait saltatory.

Genus GRACULA, L.

(1207) *Gr. javanensis*, Osbeck (Edwards, pl. 17, lower figure).

Syn. Mainatus major, Brisson: described J. A. S., XV, 31.
M. sumatranus (?), Lesson.
Gr. religiosa, L., var. B., Latham.

Inhabits Malayan peninsula and archipelago; Nicobar Islands.

(1208) *Gr. intermedia*, A. Hay (J. A. S. XV. 32). *Paharia Maina*, Hind.: *Thale-gu*, Arakan, Inhabits Nepal; Assam; Arakan; Tenasserim Provinces.

(1209) *Gr. religiosa*, L. (Edward's pl. 17, upper figure).

Syn. Eulabes indica, Cuvier.
Pastor musicus, Daudin.
Mainatus javanus, Lesson, apud Jerdon, J. A. S. XII, 178 (bis).

Inhabits S. India; Ceylon.

(1210) *Gr. ptilogenys*, Blyth, J. A. S., XV, 285. Inhabits Ceylon.

Genus AMPELICEPS, Blyth.

(1211) *A. coronatus*, Blyth, J. A. S., XI, 194; XV, 32.

b. Of less bulky form; the gait ambulatory.

Genus ACRIDOTHERES, Vieillot.

(1212) *Acr. tristis* (*Pl. Enl.* 219).

Syn. Paradisea tristis, L.
Gracula gryllivora, Daudin.

Bhat Salik, Beng.: *Maina*, H.: *Bunnee*, or *Saloo* (Tickell): *Saloonku*, Mahr: *Gorwuntra*, Can. (Jerdon). *Dza-ret-mouk*, Arakan.

(1213) *Acr. ginginianus* (Vaill. *Ois. d'Afr.* t. 95, f. 2).

Syn. Turdus ginginianus, Latham.
Gracula grisea, Daudin (t. 95 f. 2).

Gang Salik, Beng.: *Ganga Maina*, H.: *Lali*, Sinde (Burnes.) Inhabits Bengal, Upper India, Scinde; Tenasserim Provinces.

(1214) *Acr. cristatellus*, (Edwards, pl. 19).

Syn. A cristatellus L.
Acr. fuliginosus Blyth, J. A. S. XIII, 362 (the young)

Inhabits China.

(1215) *Acr. griseus*.

Syn. Pastor griseus, Horsfield.
Maina cristalloides, Hodgson.
P. fuscus (?), Wagler.
P. mahrattensis (?), Sykes.

Jhont Salik (i. e. 'Cresta Maina'), Beng.; *Dza-ret-mouk-teng*, Arakan: *Jallak Sungu*, Java. Inhabits India generally (?); Bengal; Nepal; Arakan; Tenasserim; Penang; Sumatra; Java.

Genus STURNUS, Lin.

(1216) *St. temporalis*.

Syn. Pastor temporalis, Tem.

Inhabits China.

(1217) *St. contra*, L. (*Pl. Enl.* 280; Edwards pl. 187).

Syn. St. capensis, L.
Pastor auricularis, Drapiez.
P. jalla, Horsfield.

Ablaka, H.: *Guia-leggra*, Beng.: *Qwyai-dza-ret*, Arakan: *Jallak*, or *Jallak-uring*, Java. Inhabits India; Sumatra; Java.

(1218) *St. vulgaris*, L.

Syn. St. indicus, Hodgson.

Telia Maina, Hind.: *Saruk*, Kabul. Inhabits Europe; Asia: common in Himalaya. Upper Bengal?

(1219) *St. unicolor*, Marmora.

Inhabits N. Africa; Sardinia: and a more brilliantly glossed variety in Afghanistan.

Genus PSAROGLOSSA, Hodgson.

(1220) *Ps. spiloptera* (Gould's 'Century,' pl. 34).

Syn. Lamprotornis spilopterus, Vigors.

Puli, Masuri. Inhabits Himalaya.

Genus STURNIA, Lesson.

(1221) *St. sericea* (Brown's 'Zoology,' pl. 21).

Syn. Sturnus sericeus Latham

Inhabits China.

(1222) *St.* ? Inhabits Ceylon.

(1223) *St. erythropygia*, Blyth, J. A. S. XV, 34.

Inhabits Nicobar islands.

(1224) *St. Blythii* (Jerdon's *Ill. Ind. Orn.* pl. 22).

Syn. P malabaricus apud Jerdon, Madr. Journ. XI, 22.
Pastor Blythii, Jerdon.
St. dominicana (?), apud Blyth. J. A. S. XIII, 363

Inhabits India; Malabar.

(1225) *St. malabarica.*

Syn. Turdus malabaricus, Gmelin (No. 51, nec No. 125).
Pastor malabaricus, var., apud Jerdon, Madr. Journ XI, 23.
P. nanus (?) et Gracula cinerea (?), Lesson.

Pawi, Hind. Inhabits India generally (but somewhat local), Assam; Arakan; Tenasserim.

(1226) *St. Pagodarum.*

Syn. Turdus pagodarum, Gm.
T. melanocephalus, Vahl.
Sturnus subroseus, Shaw (apud G. R. Gray)

Monghyr Pawi, Beng. Inhabits India generally; Assam; Arakan (Ramree). Non-resident in Lower Bengal, but common in the jungles westward.

(1227) *St. cana*, Blyth, J. A. S. XIII, 365.

N. B. This is the young of a species nearly allied to, but distinct from, the next, some of whose reputed synonymes perhaps belong to it.

Inhabits China (Macao).

(1228) *St. daurica* (*Pl. Enl.* 627, f. 2).

Syn. Turdus dauricus et T. sturninus, Pallas.
T. dominicanus, Gmelin.
Pastor malayensis, Eyton.

Inhabits Malayan peninsula; China (?).

Genus CALORNIS, G. R. Gray.

(1229) *C. affinis*, A. Hay, J. A. S. XV, 36, 369.

Inhabits Tipperah; Arakan; Nicobar islands; Tenasserim (?)

(1230) *C. cantor* (*Pl. Col.* 199, f. 1, 2).

Syn. Turdus cantor, Gmelin.
T. chalybeus et T. strigatus, Horsfield.

Biang, *Kala loyang*, and *Burong Kling*, Malay: *Sling*, Java. Inhabits Malayan peninsula; Sumatra; Java.

Genus PASTOR, Temminck.

(1231) *P. roseus* (Edwards, 20; *Pl. Enl.* 250).

Syn. Turdus roseus, L.
T. suratensis, Latham.

Tillyer, H. (Jerdon). *Golabi Maina*, H. Beng.: *Bya*, Sinde (Burnes). Inhabits Europe, Asia and N. Africa; very common in Hindustan.

Genus ENODES, Temminck.

(1232) *E. erythrophrys* (Tem. *Pl. Col.* 267).

Syn. Lamprotornis erythrophrys. Tem.

Inhabits Moluccas, Java.

Genus MINO, Lesson.

(1233) *M. calvus* (*Pl. Enl.* 200).

Syn. Gracula calva, L.

Inhabits Moluccas; Philippines.

Fam. FRINGILLIDÆ.

Subfam. PLOCEINÆ.

Genus PLOCEUS, Cuvier.

(1234) *Pl. hypoxanthus ?* (*Pl. Col.*).

Syn. Loxia hypoxantha (?), Daudin.
Pl. philippinus apud Horsfield (Lin. Tr. XIII, 160.) et Temminck; nec apud Strickland, J. A. S. XII, 945.

Inhabits Java; Philippines.

(1235) *Pl. philippinus* (*Pl. Enl.* 135, f. 2).

Syn. Loxia philippina, T. (apud Strickland).
Pl. baya, Blyth J. A. S. XII. 249.

Baya, H.: *Chindora*, and *Tal Babie*, Beng. Inhabits India generally; Burmese countries; Malayan peninsula; Sumatra?

(1236) *Pl. manyar.*

Syn. Fringilla manyar, Horsfield, Lin. Tr. XIII, 160.
Euplectes flaviceps, Swainson.
Eu. striatus, Blyth, J. A. S. XI, 873, and XII, 181 (bis).
Eu. bengalensis (?) apud Jerdon, Catal.
Ploceus flaviceps (?), Cuv.

Inhabits Bengal; Nepal; Assam; Scinde; S. India; Java.

(1237) *Pl. bengalensis* (Edwards, pl. 189).

Syn. Loxia bengalensis, L.
L. regina, Boddaert.
Coccothraustes chrysocephala, Vieillot.
Euplectes albirostris, Swainson.

Sarbo Baya, Hind. Inhabits Bengal.

Subfam. ESTRELDINÆ.

Genus MUNIA, Hodgson.

(1238) *M. maja* (Edwards pl. 306, f. 1).

Syn. Loxia maja, L.
L. leucocephala, Raffles.
Maia sinensis, Brisson.

Inhabits Malayan peninsula; Sumatra.

(1239) *M. ferruginosa.*

Syn. Loxia ferruginosa, Latham.
La Maina, Buffon.

Inhabits Java.

(1240) *M. rubronigra*, Hodgson, *As. Res.* XIX, 153.

Syn. Lonchura melanocephala, M'Clelland, P. Z. S. 1839, p. 163.
Loxia malacca, Var, Lath.
L. indica, Lath.—Young?

Pora Munia: *Nukroul*, Masuri. Inhabits Bengal; Nepal; Assam; Arakan; Tenasserim. Nec *Chinese Sparrow*, Edwards, pl. 43, on which is founded *Coccothraustes sinensis*, Brisson, *Loxia malacca*, 3, Lin., *Malacca Grosbeak*, var. *A*, Latham, and which is also *Loxia atricapilla*, Vieillot, *Dict. Class. d'Hist. Nat.*

(1241) *M. malacca* (Edwards pl. 355).

Syn. Loxia malacca, L.
Coccothraustes javensis, Brisson.
Amadina sinensis apud Blyth, P. Z. S. XV, 36.

Nukl-nore, H. (Jerdon). Inhabits Indian peninsula; Ceylon; rare in Lower Bengal.

(1242) *M. undulata* (Edwards, pl. 40).

Syn. Loxia undulata and
L. punctulata, var. A, Latham.
L. bicolor, Latham, the young.
Munia lineoventer, Hodgson.

Tela Munia, H.: *Simbaz*, Masuri: *Sing baz* or *Sheen baz* (Jerdon). Inhabits India generally; Arakan; Tenasserim.

(1243) *M. punctularia.*

Syn. Loxia punctularia, L.
Fringilla nisoria, Temminck.

Inhabits Malayan peninsula and archipelago.

(1244) *M. molucca*? (*Pl. Enl.* 139, f. 2).

Syn. Loxia molucca, (?) L.
Munia acuticauda, Hodgson.

Inhabits Nepal; Malayan peninsula.

(1245) *M. pectoralis.*

Syn. Amadina pectoralis, Jerdon, J. A. S. XIII, 949, described in Madras Journ. XIII, 171.

Inhabits S. India.

(1246) *M. striata.*

Syn. Loxia striata, Latham.
Fringilla leuconota, Temminck.

Inhabits Indian peninsula; Ceylon; Arakan; not common in lower Bengal.

(1247) *M. melanictera*?

Syn. Fringilla melanictera (?), Gmelin.
Amadina leucogastra, Blyth, J. A. S. XV, 286.

Inhabits Malayan peninsula.

(1248) *M. malabarica.*

Syn. Loxia malabarica, L.
Lonchura cheet, Sykes.
Loxia bicolor, Tickell (nec Latham).

Sar Munia; *Piduri*, B.: *Chorga*, H. Inhabits India generally; Ceylon.

Genus ERYTHRINA.

(1249) *E. prasina* (Tem. *Pl. Col.* 96).

Syn. Fringilla prasina, Sparrman (nec Latham).
Fr. sphecura, Temminck.
Emberiza quadricolor, Gmelin.
E. viridis, Swainson.
Emberiza cyanopis (?), Gmelin.

Inhabits Indian archipelago.

Genus AMADINA, Swainson.

(1250) *A.* (?) *oryzivora* (*Pl. Enl.* 388; Edwards, pl. 41, 42).

Syn. Loxia oryzivora, L.

Inhabits Indian archipelago.

Genus ESTRELDA.

(1251) *E. amandava* (*Pl. Enl.* 115, f. 2, 3; Edwards, pl. 355, f. 1).

Syn. Fringilla amandava, L.
Fr. punicea, Horsfield, Lin. Tr. XIII, 160.
Fr. senegalensis, Vieillot (vide Dict. Class).

Lal or *Lal Munia*, H: *Lal* (male), *Munia* (female), Masuri. Inhabits India generally and Malay countries.

(1252) *E. formosa.*

Syn. Fringilla formosa, Latham.

Inhabits Central India.

Genus SCISSIROSTRUM, Guerin.

(1253) *Sc. Pagei.* Guerin (*Mag. de Zool*).

Inhabits Moluccas.

Subfam. PASSERINÆ.

Genus PASSER, Ray.

(1254) *P. indicus*, Jardine and Selby (*Ill. Orn.* pl. 115).

Charia, or *Chata*, B.: *Gourya*, H. Inhabits India generally; Ceylon; Arakan.

(1255) *P. pyrrhonotus*, Blyth, J. A. S. XIII, 946. Inhabits Scinde.

(1256) *P. salicaria* (Savigny, *Desc. Egypt. Nat. Hist.*, I, pl. f. 7).

Syn. Fringilla salicaria,
Fr. hispaniolensis, Temminck.

Inhabits N. Africa; Sardinia; Sicily; Syria; Afghanistan.

(1257) *P. cinnamomeus.*

Syn. Pyrgita cinnamomea, Gould, P. Z. S. 1835, p. 85.

Inhabits N. W. Himalaya.

(1258) *P. flaveolus*, Blyth, J. A. S. XIII, 946. Inhabits Arakan; Tenasserim.

(1259) *P. montanus* (*Pl. Enl.* 267, f. 1).

Syn. Fringilla montana, L.

Inhabits Temperate parts of Europe and Asia; China; Burmah; Malayan peninsula; Java.

Genus PETRONIA, Pr. Bonap.

(1260) *P. stulta* (*Pl. Enl.* 225).

Syn. Fringilla stulta et Fr. bononiensis, Gmelin.
Fr. petronia, L.
Petronia rupestris, Bonap.

Inhabits Afghanistan; W. Asia; S. Europe; N. Africa.

(1261) *P. flavicollis.*

Syn. Fringilla flavicollis, Franklin, P. Z. S. 1831, p. 120.

Raji, or *Jungli Churia*. H. Inhabits India generally, but not on the alluvium of Lower Bengal.

Subfam. FRINGILLINÆ.

Genus MONTIFRINGILLA (?), Brehm.

(1262) *M. (?) nemoricola.*

Syn. Fringillauda nemoricola, Hodgson, As. Res XIX, 158.

Inhabits Himalaya.

Genus FRINGILLA, L.

(1263) *Fr. montifringilla*, L. (*Pl. Enl.* 54, f. 2).

Syn. Loxia hamburghia, Gmelin.

Inhabits Northern and temperate parts of Europe and Asia; Afghanistan; N. W. Himalaya.

Genus PYRRHOSPIZA, Hodgson.

(1264) *P. punicea*, Hodgson, J. A. S. XIII, 953.

Syn. Propyrrhula rubeculoides, Hodgson, P. Z. S. 1845, p. 36.

Inhabits Himalaya; Tibet.

Genus PROCARDUELIS, Hodgson.

(1265) *Pr. nipalensis*, Hodgson.

Syn. Carduelis nipalensis, Hodgson, As. Res. XIX, 157.
Linota saturata et L. fusca, (?), Blyth, J. A. S. XI, 92-3.

Inhabits S. E. Himalaya.

Genus CARPODACUS.

(1266) *C. rodopepla* (Gould's Century, pl. 31, f. 1).

Syn. Fringilla rodopepla, Vigors.

Inhabits S. E. Himalaya.

(1267) *C. rodochrous* (Gould's 'Century,' pl. 31, fig. 2).

Syn. Fringilla rodochroa, Vigors.

Inhabits Himalaya.

(1268) *C. erythrinus?* (Vieillot, *Ois. Chant.* pl. 65).

Syn. Fringilla erythrina (?), Meyer.
Coccothraustes rosea, Vieillot.
Loxia madagascariensis, L.
Pyrrhulinota roseata, Hodgson, P. Z. S. 1845, p. 36.

Tuti, or *Eurkhar Tuti*, H. Inhabits India generally; Arakan.

Genus HÆMATOSPIZA, Hodgson.

(1269) *H. boetonensis?*

Syn. Loxia boetonensis? Latham.
L. indica? Gmelin, nec Latham.
Corythus sepahi, Hodgson, As. Res. XIX, 151.

Inhabits Himalaya.

Genus PYRRHULA, Mœrhing.

(1270) *P. nipalensis*, Hodgson, J. A. S. XIX, 155. Inhabits S. E. Himalaya.

(1271) *P. erythrocephalus*, Vigors (Gould's 'Century,' pl. 32). Inhabits Himalaya.

Genus PROPYRRHULA, Hodgson.

(1272) *Pr. subhimachala*, Hodgson.

Syn. Corythus subhimachalus, Hodgson, As. Res. XIX, 152.

Inhabits N. E. Himalaya.

Genus LOXIA, L.

(1273) *L. curvirostris*, L. (*Pl. Enl.* 218). Inhabits Europe; Afghanistan.

(1274) *L. himalayensis*, Hodgson, J. A. S. XIII, 952.

Syn. L. himalayana, Hodgson, P. Z. S. 1845, p. 35.

Inhabits Himalaya.

Genus CHRYSOMITRIS, Boie.

(1275) *Chr. spinoides* (Gould's Century, pl. 33, f. 2).

Syn. Carduelis spinoides, Vigors.

Inhabits Himalaya.

Genus CARDUELIS, Stephens.

(1276) *C. caniceps*, Vigors (Gould's Century, pl. 33, f. 1; Royle's *Ill. Him. Bot.* pl. 8, f. 2).

Syn. Fringilla orientalis, Eversmann, Shira. H.

Inhabits Middle Asia; Afghanistan; Kashmir, &c.

Genus LIGURINUS, Brisson

(1277) *L. sinicus* (*Pl. Enl.* 257, f. 3).

Syn. Fringilla sinica, L.
Loxia sinensis, Gmelin.
Lig. xanthogramma? apud Blyth, J. A. S. XIII, 956; vide XVI, 470.

Inhabits China.

Genus SERINUS (?), Brehm.

(1278) *S. (?) aurifrons.*

Syn. Emberiza aurifrons, Blyth, J. A. S. XVI, 476

Inhabits Tyne range, beyond Simla.

Genus COCCOTHRAUSTES, Brisson.

(1279) *C. melanoxanthus*, Hodgson, *As. Res.* XIX, 150. Inhabits S. E. Himalaya.

(1280) *C. carnipes*, Hodgson, *As. Res.* XIX, 151.

Syn. C. speculigerus (?), Brandt.

Inhabits Himalaya.

(1281) *C. icterioides*, Vigors (Gould's 'Century,' pl. 45). Inhabits N. E. Himalaya.

Subfam. EMBERIZINÆ.

Genus EMBERIZA, L. (*Gundam*, H).

(1882) *E. albida*, Blyth, J. A. S, XVIII. Inhabits Tyne range, beyond Simla.

Genus EUSPIZA, Bonap.

(1283) *Eu. simillima*, Blyth, J. A. S. XVIII.

Syn. Emberiza melanocephala of India, Auctorum.
Tanagra rudies (Mus Carls.), Lath.,—the female?

Inhabits S. India. (*N. B.* Differs from Eu. melanocephalus in its much smaller size; the closed wing measuring $3\frac{1}{4}$ in. instead of 4 in., &c.)

(1284) *Eu. luteola* (G. R. Gray, *Ill. Gen. Birds*, pl.).

Syn. Emberiza luteola (Mus. Carls, fasc. IV, t. 93). Latham,—the female.
E. icterica, Eversmann.
E. bruniceps, Brandt.
Loxia flavicans, var. A. Latham.

Inhabits Plains of India; Afganistan, &c.

(1285) *Eu. flavogularis*, Blyth, J. A. S. XVIII.

Syn. Emberiza aureola of India, Auctorum.

Inhabits Nepal; Tippera; Arakan.

(1286) *Eu. Lathami* (Jardine and Selby, *Ill. Orn.* pl. 132).

Syn. Emberiza Lathami Gray.
E. cristata, Vigors.
E. suberistata, Sykes (the female).
E. erythroptera Jardine and Selby.
E. nipalensis, Hodgson.
Fringilla melanictera, Gmelin.

Inhabits Plains and lower hills of India, China, &c.

(1287) *Eu. hortulana* (*Pl. Enl.* 247, f. 1).

Syn. Emberiza hortulana, L.
E. Buchanani, Blyth, J. A. S. XIII, 957.
E. chlorocephala apud Hodgson?

Inhabits Europe and Asia; India.

(1288) *Eu. melanops.*

Syn. Emberiza melanops, Blyth, J. A. S. XIV, 554.
E. chlorocephala of Nepal apud Hodgson (?), vide J. A. S. XV, 39.

Inhabits Tippera.

(1289) *Eu. fucata.*

Syn. Emberiza fucata, Pallas.
E. lesbia apud Temminck (nec Gmelin).
E. cia apud Jerdon, Catal.

Putthur Chirta, (H. Jerdon). Inhabits Bengal; Deyra Doon; S. India?

(1290) *Eu. pusilla?*

Syn. Emberiza pusilla(?), Pallas.
E. sordida, Hodgson, J. A. S. XIII, 958 (the female); male described, J. A. S. XV, p. 40.
E. (Oeyris) oinops, Hodgson, P. Z. S. 1845, p. 35.

Inhabits S. E. Himalaya.

(1291) *Eu. cia* (*Pl. Enl.* 30, f. 2; 511, f. 1).

Syn. Emberiza cia, L.
E. barbata, Scopoli.
E. lotharingica, Gmelin.

Inhabits Europe and Asia. Specimens from near Masuri. Capt. Hutton (1848).

Subfam. ACCENTORINÆ.

Genus ACCENTOR, Bechstein.

(1292) *A. nipalensis*, Hodgson, J. A. S. XII, 958; P. Z. S. 1845. p. 34.

Syn. A. immaculatus, Hodgson (in abraded plumage).
A. cacharensis, Hodgson (in first plumage).

From Nepal. B.

(1293) *A. variegatus*, Blyth, J. A. S. XII, 958 (described XI, 187). Inhabits Sikim.

(1294) *A. strophiatus*, Hodgson, J. A. S. XII, 959; P. Z. S. 1845, p. 34. Inhabits Himalaya generally.

(1295) *A. atrogularis*, Hutton, J. A. S. XVIII. Inhabits Tyne range, beyond Simla.

(1296) *A. mollis*, Blyth, J. A. S. XVI, 581. Inhabits Sikim.

Subfam. ALAUDINÆ.

Genus ALAUDA, L.

(1297) *A. arvensis*, L. (*Pl. Enl.* 363, f. 1).

Syn. A. cœlipeta, Pallas,
A. italica, Gmelin.
A. longipes, Latham,
A. dulcivox, Hodgson.
} apud G. R. Gray.

Inhabits Europe and Asia: Sub-Himalaya.

(1298) *A. gulgula*, Franklin.

Syn. A. gangetica, Blyth.
A. gracilis, Blyth, var.
A. leiopus, Hodgson, var.

Inhabits India generally.

(1299) *A. malabarica*, Scopoli.

Syn. A. deva, Sykes.

Inhabits S. India.

Subgenus CALANDRELLA, Kaup.

(1300) *C. brachydactyla.*

Syn. Alauda brachydactyla, Temminck.
A. calandrella, Bonelli.
A. arenaria, Stephens.
A. dukhunensis, Sykes.
Emberiza baghaira, Franklin.
E. olivacea, Tickell, J. A. S. II, 578.
Baay-geyra Lark, Latham.

Baghairi, H. *Ortolan* of Europeans in India. Inhabits Europe, Asia, and N. Africa. Common in India.

(1301) *C. raytal*, Blyth.

Syn. Alauda raytal, Buchanan Hamilton, J. A. S. XIII, 962, XV, 40.

Inhabits Dry sand-dunes of Ganges, Indus, &c.

Genus CALERIDA, Boie.

(1302) *G. chendoola.*

Syn. Alauda chendoola, Franklin.
A. gulgula apud Sykes.
Crested Calandre Lark, Latham.

Chendul, H. Inhabits Sandy plains of India.

(1303) *G. Boysii*, Blyth.

Syn. Certhilauda Boysii, Blyth, J. A. S. XV, 41.

Inhabits Bengal.

Genus MIRAFRA, Horsfield.

(1304) *M. Hayii*, Jerdon, J. A. S. XIII, 959. Inhabits Coromandel Coast.

(1305) *M. affinis*, Jerdon, J. A. S. XIII, 959. Inhabits Middle and S. India; Ceylon.

(1306) *M. erythroptera*, Jerdon, J. A. S. XIII, 958 (*Ill. Ind. Orn.*, pl. 38). Inhabits S. India.

(1307) *M. cantillans*, Jerdon, J. A. S. XIII, 960. Inhabits India generally; rare in Lower Bengal.

(1308) *M. assamensis*, McClelland, P. Z. S. 1839, pl. 162.

Syn. Alauda mirafra. Temminck (apud Jerdon, nec apud G. R. Gray).
Finch Lark. Latham.

Inhabits Bengal: Nepal; Assam.

(1309) *M. phœnicura*, Franklin, P. Z. S. 1831, p. 119. Inhabits S. India.

Genus PYRRHULAUDA, A. Smith.

(1310) *P. grisea* (*Pl. Col.* 269, f. 2).

Syn. Alauda grisea, Scopoli.
A. gingica Gmelin.
Fringilla crucigera. Temminck.

Chak Bharái; *Dhulo Cháta*, Beng; *Decora*, H., vulgo; *Dubhuk Chari* ('Squat Sparrow') H. (Jerdon). Inhabits India generally.

Fam. MOTACILLIDÆ.

Genus HETERURA, Hodgson.

(1311) *H. sylvana*, Hodgson, J. A. S. XIV, 556; P. Z. S. 1845, p. 33 (Jardine's *Contrib. Orn.* 1848, pl.). Inhabits Himalaya.

Genus ANTHUS, Bechstein.

Subgenus DENDRONANTHUS, Blyth.

(1312) *D. trivialis* (*Pl. Enl.* 660, f. 1).

Syn. Alauda trivialis, L.
A. minor, Bewick.
Anthus arboreus. Temminck.

Inhabits Europe and N. Asia; Himalaya.

(1313) *D. maculatus*.

Syn. Anthus maculatus et A. brevirostris, Hodgson.

Musaricki, H. (Jerdon). Inhabits India generally.

Subgenus ANTHUS, Auct.

(1314) *A. similis*, Jerdon (*Ill. Ind. Orn.* pl. 45).

Syn. Agrodoma similis, Jerdon. Madr. Journ. XI, 35.

Inhabits Nilgiris: N. W. Himalaya.

(1315) *A. Richardi*, Vieillot (*Zool. Journ.* Vol. I, pl. 14). Inhabits Europe, Asia, and N. Africa. Specimens from the vicinity of Calcutta.

(1316) *A. rufulus*, Vieillot.

Syn. A. agilis apud Jerdon (nec Sykes).
A. malayensis, Eyton.
A. pallescens apud Sundevall.
A. pratensis of Sumatra, Raffles.
Slender Lark, Latham.

Rugail, H. (Jerdon): *Lancha-lancha*, or *Hamba Puyu*, Sum. Inhabits India generally and Malay countries.

(1317) *A. striolatus*, Blyth, J. A. S. XVI, 435.

Syn. A. pelopus (?). Hodgson, G. R. Gray, Brit. Mus. Catal.

Inhabits Himalaya, S. India.

(1318) *A. montanus*, Jerdon, J. A. S. XVI, 435.

Syn. A. rufescens apud Jerdon, Catal.

Inhabits Nilgiris.

(1319) *A. campestris* (*Pl. Enl.* 661).

Syn. Alauda campestris, L.
A. rufescens. Bechstein. Temminck.
A. rufulus apud Jerdon, Catal.

Chilla, H. (Jerdon). Inhabits Europe, Asia, N. Africa. Specimens from near Mednapur.

(1320) *A. pratensis* (*Pl. Enl.* 661, f. 2).

Syn. Alauda pratensis, L.

Inhabits Europe, Asia, N. Africa.

(1321) *A. cervinus* (Denon's Egypt, *Hist. Nat.* pl.).

Syn. Motacilla cervina, Pallas.
Anthus rufogularis, Brehm.
A. aquaticus? apud Blyth, J. A. S. XVI, 437.

Inhabits S. E. Himalaya; N. Europe; N. Africa.

Genus NEMORICOLA, Blyth.

(1322) *N. indica* (Vaill. *Ois. d' Afr*, t. 179).

Syn. Motacilla indica Gmelin
M. variegata, Vieillot (nec Stephens),

Mhamula, H. (Jerdon). *Nyet Rahat*, Arakan. Inhabits India generally; Burmah; Malayan peninsula; Sumatra. Vicinity of Calcutta at all seasons.

Genus MOTACILLA, L. (as restricted).

(1323) *M. maderaspatana*, Brisson (nec Linnæus; Vaill. *Ois. d'Afr.* t. 184).

Syn. M. maderaspatensis, Gmelin.
M. maderas et M. variegata, Stephens (nec Vieillot).
M. picata. Franklin.
Pied Wagtail Latham.

Inhabits Hindustan generally; Rajmahl; Darjiling: never in Lower Bengal.

(1324) *M. alba*, L. (*Pl. Enl.* 652).

Syn. M. albida et M. cinerea. Gmelin.

Inhabits Europe and W. Asia; Afganistan? Very rare in the British Islands.

(1325) *M. dukhunensis*, Sykes, P. Z. S. 1832, p. 91.

Syn. M. alba apud Jerdon.

Dhobin, H. (Jerdon). Inhabits N. W., Central, and S. India. Afghanistan?

(1326) *M. luzoniensis*, Scopoli.

Syn. M. alba, var. γ, Latham.
M. leucopsis, Gould, P. Z. S. 1837, p. 78.
M. alboides, Hodgson, As. Res. XIX, 190.

Khanjan, H. Inhabits Bengal; Nepal; Philippines.

(1327) *M. hoarula*, L. (*Pl. Enl.* 18, f. 1; Edwards, pl. 259).

Syn. M. Sulphurea, Bechstein.

Inhabits Europe, Asia and its archipelago, Africa, and Australia. Specimen in summer dress, from Masuri.

Genus BUDYTES, Cuvier.

(1328) *B. citreola*.

Syn. Motacilla citreola, L.
M. scheltobriusk, Lepech.
B. calcaratus, Hodgson, As. Res. XIX, 190.

Zurcha, Kabul. Inhabits Asia generally, and E. Europe: Calcutta and Himalaya.

(1329) *B. viridis* (Brown's 'Illustrations,' pl. 33,—).

Syn. Motacilla viridis, Scopoli.
M. bistrigata, Raffles.
B. beema Sykes.
B. flava (? et neglecta apud Jerdon.
Wagtail Lark, Latham (young female.)

Pilkya, H.; *Bessit*, Java. Inhabits India generally and Malay countries; S. Europe? N. Africa?

(1330) *B. melanocephala*, Sykes, P. Z. S. 1823, p. 90; also of Lichtenstein? Inhabits S. E. Europe; W. and Middle Asia; Hindustan.

Fam. SPHENURIDÆ.

Genus MEGALURUS, Horsfield.

(1331) *M. palustris*, Horsfield (P. C. 65, f. 2); J. A. S. XIII, 372.

Syn. Malurus marginalis, Reinwardt.

Larri-angon, Jav. Inhabits Bengal; Tippera; Arakan; Java.

Genus SPHENURA, Lichtenstein.

(1332) *Sph. striata* (J. A. S. XIII, 373).

Syn. Megalurus? striatus, Jerdon, Madr. Journ. XIII, 169 (the female).
Dasyornis locustelloides, Blyth, J. A. S. XI, 602.

Inhabits Bengal; S. India.

Genus SPHENÆACUS (?), Strickland.

(1333) *Sph. (?) Burnesii*,

Syn. Eurycercus Burnesii, Blyth, J. A. S. XII, 374.

Inhabits Sindh.

Genus DUMETIA, Blyth.

(1334) *D. hyperythra*.

Syn. Timalia hyperythra, Franklin.

Inhabits Central India.

(1335) *D. albogularis*.

Syn. Malacocercus (?) albogularis, Blyth, J. A. S. XVI. 453.
Timalia hyperythra apud Jerdon, Catal.
Shah Dumri, H.? (Jerdon).

Inhabits S. India; Ceylon.

Genus MALACOCERCUS, Swainson.

(1336) *M. nipalensis*.

Syn. Timalia nipalensis vel. leucotis, et T. pellotis, Hodgson, As. Res. XIX, 182.

Inhabits Nepal.

(1337) *M. bengalensis* (Edwards, pl. 184, badly coloured).

Syn. Merula bengalensis, Brisson.
Turdus canorus, L.
Pastor terricolor, Hodgson, J. A. S. V, 771.

Sat Bhai ('seven brothers'), H.: *Chatarrhea*, B. Inhabits Bengal; Nepal; Assam; Deyra Doon; Ceylon.

(1338) *M. malabaricus*, Jerdon (*Ill. Ind. Orn.*, art. M. *griseus*).

Syn. M. Somervillei apud Jerdon, Catal.

Jungli Kur or *Kayr*, H. (Jerdon). Inhabits Malabar; sides of Nilgiris.

(1339) *M. griseus* (Jerdon's *Ill. Ind. Orn.*, pl. 19.)

Syn. Turdus griseus, Latham.

Keyr, H.: *Chinda*, or *Sida*, Telugu: *Kullu Koorari* ('Hedge-bird'), Tamool: *Kuliyan*, Malayalum (Jerdon). Inhabits Carnatic, and its immediate vicinity.

(1340) *M. rufescens*, Blyth, J. A. S. XVI, 453. Inhabits Ceylon.

(1341) *M. Malcolmi* (Hardwicke's *Ill. Ind. Zool*)

Syn. Timalia Malcolmi, Sykes.
Garrulus albifrons, (Gray and Hardw.)
Pale-eared Thrush, Latham.

Ghoghoye, H.; *Gongya*, Can.; *Kokutti*; Mahr. (Jerdon). Inhabits S. India: Cawnpore district.

(1342) *M. subrufus*, Jerdon.

Syn. Timalia subrufa, Jerdon, Catal.
T. pœcilorhyncha, de la Fresnaye.

Inhabits S. India: Wynaad, and along the margins of the W. Ghats.

(1343) *M. Earlei*, Blyth, J. A. S. XIII, 369.

Syn. M geochrous, Hodgson.

Inhabits Bengal; Nepal; Tippera.

(1344) *M. caudatus*.

Syn. Cossyphus caudatus, Dumeril.
Megalurus isabellinus, Swainson, 2¼ Cent.
Timalia chatarrhœa, Franklin.

Dumri, H.; *Huni*, Tam.? (Jerdon); *Hedo*, and *Laila*, Sindh. Inhabits India generally.

Genus DRYMOICA, Swainson.

(1345) *Dr. criniger.*

Syn. Suga criniger, Hodgson, As. Res. XIX 183.

Inhabits Himalaya.

(1346) *Dr. sylvatica.*

Syn. Prinia sylvatica, Jerdon, Madr. Journ. XI. 4.

Inhabits Nilgiris.

(1347) *Dr. robusta*, Blyth, J. A. S. XVIII. Inhabits Ceylon. Specimen presented by E. L. Layard, Esq. differs from *Dr. sylvatica* in its darker shade of colour above, and larger and stronger bill and legs, which last appear to have been of a deep reddish brown colour: the flanks and sides of the breast are duskyish.

(1348) *Dr. neglecta.*

Syn. Prinia neglecta, Jerdon. Madr. Journ. XIII, pt. II, 130.
Dr. sylvatica of Mednapur apud Blyth, J. A. S. XVI, note to p. 459

Inhabits Central India. Specimen procured near Mednapur differs from *Dr. sylvatica* in its more rufescent tinge throughout, the wingfeathers being margined with dull rufous; and the flanks are largely and deeply tinged with brown, extending up the sides of the breast.

(1349) *Dr.* ——— *?* Inhabits Java. *A.* Specimen presented by the Batavian Society (1845). is very like *Dr. sylvatica*, but smaller, with more conspicuously whitish lores and throat. Vide J. A. S. XVI, 459.

(1350) *Dr. Jerdoni*, Blyth, J. A. S. XVI, 459. Inhabits S. India.

(1351) *Dr. inornata.*

Syn. Prinia inornata, Sykes. P. Z. S. 1832, p. 89.

Inhabits Hindustan generally; S. India; Ceylon. This Ceylon race is darker above, especially on the crown, the lores and throat conspicuously whitish, as in Dr. robusta.

(1352) *Dr. Franklinii.*

Syn. Prinia Franklinii, Blyth. J. A. S. XIII, 376.
Pr macroura, Franklin, P. Z. S. 1831, p. 118.
Pr. fusca, Hodgson, P. Z. S. 1845, p. 29.
Sylvia longicaudata (?), Tickell, J. A. S. II. 576.

Inhabits Bengal; Nepal; Arakan.

(1353) *Dr. Buchanani*, Blyth, J. A. S. XIII, 376.

Syn. Prinia rufifrons, Franklin (nec Ruppell).
Pr. brunnifrons, Hodgson, An. Mag. N. H. 1845, p. 29.
Sylvia longicauda, var. A (?) Latham.

Inhabits Nepal; Upper Bengal; S. India.

(1354) *Dr. lepida*, Blyth, J. A. S. XIII, 376; XVI, 460. Inhabits margins of sand-deposits of rivers in Bengal: also Sindh.

Genus PRINIA, Horsfield.

(1355) *Pr. Hodgsonii*, Blyth, J. A. S. XIII, 376.

Syn. Pr. gracilis apud Jerdon (nec Franklin, nec Malurus gracilis, Ruppell).

Inhabits Nepal; S. India.

(1356) *Pr. gracilis*, Franklin, P. Z. S. 1831, p. 119. Inhabits Central India.

(1357) *Pr. rufescens*, Blyth, J. A. S. XVI, 456. Inhabits Arakan.

(1358) *Pr. socialis*, Sykes, P. Z. S. 1832, p. 89.

Syn. Foodkey Warbler, Latham

Inhabits S. India.

(1359) *Pr. Stewarti*, Blyth, J. A. S. XVI, 455.

Syn. Sylvia kalaphutki, B. Ham. MS.
Flaxen Warbler, var A., Latham.

Inhabits Upper Provinces of Bengal Presidency.

(1360) *Pr. flaviventris.*

Syn. Orthotomus flaviventris, Ad. Delessert.

Inhabits Nilgiris? Bengal Sundarbuns; Tenasserim; Malacca.

Genus NEORNIS, Hodgson.

(1361) *N. flavolivacea*, Hodgson, J. A. S. XIV, 590 (the young).

Syn. Drymoica brevicaudata, Blyth J. A. S. XVI, 459 (the adult).

Inhabits Nepal; Darjiling.

Genus ORTHOTOMUS, Horsfield.

(1362) *O. longicauda.*

Syn. Motacilla longicauda et M. sutoria, Gmelin.
Sylvia guzuratta, Latham.
S. ruficapilla, Hutton, J. A. S.
Orthotomus Bennettii, et O. lingoo, Sykes.
O. sphenurus, Swainson, 2¼ Cent.
O. sutoria and O. patia, Hodgson, P. Z. S. 1845, p. 29.

Tuntuni, Beng. Inhabits India generally; Ceylon; Burmese countries; Malayan peninsula.

(1363) *O. edela*, Temminck.

Syn. Edela ruficeps, Lesson.
Motacilla sepium apud Raffles.

Kuchichi, Malay. Inhabits Malayan peninsula; Sumatra.

(1364) *O. cineraceus*, Blyth, J. A. S. XIV, 589. Inhabits Malayan peninsula.

Genus HORIETES, Hodgson.

(1365) *H. brunnifrons*, Hodgson, J. A. S. XIV, 585.

Syn. H. schistilatus, Hodgson, J. A. S. 1845, p. 30.
Nivicola schistilata, Hodgson, J. A. S. XIV, 586.

Inhabits S. E. Himalaya, near the snow region.

Genus CISTICOLA, Lesson.

(1366) *C. cursitans* (Jerdon's *Ill. Ind. Orn.*, pl. 6).

Syn. Prinia cursitans, Franklin.

Inhabits India generally. Not satisfactorily distinct from B. schœnicola.

(1367) *C. omalura*, Blyth, J. A. S. XVIII, Inhabits Ceylon.

Genus PELLORNIUM, Swainson.

(1368) *P. ruficeps*, Swainson.

Syn. P. olivaceum, Jerdon.
Cinclidia punctata, Gould.
Megalurus ruficeps, Sykes.

Inhabits Nepal; S. India; Tenasserim provinces.

Genus TURDIROSTRIS, A. Hay.

(1369) *T. superciliaris*, A. Hay, *Madr. Journ.* XIII, pt. 2, 193. Inhabits Malayan peninsula.

Genus POMATORHINUS, Horsfield.

(1370) *P. hypoleucos*, Blyth, J. A. S. XIV. 599.

Syn. Orthorhinus hypoleucos, Blyth the young), J. A. S. XIII, 371.

Inhabits Arakan.

(1371) *P erythrogenys*, Vigors (Gould's 'Century.' pl. 55). Inhabits Himalaya.

(1372) *P. schisticeps*, Hodgson, *As. Res.* XIX, pt. 1, p. 181. Inhabits S. E. Himalaya; Sylhet; Tippera; Arakan.

(1373) *P. leucogaster*, Gould, P. Z. S. 1837, p. 137.

Syn. P. olivaceus, Blyth, J. A. S. XVI, 451.
P. montanus of Assam apud Horsfield, P. Z. S. 1839, p. 166.

Inhabits Deyra Doon; Nepal; Assam; Tenasserim provinces.

(1374) *P. melanurus*, Blyth, J. A. S. XVI, 451. Inhabits Ceylon.

(1375) *P. Horsfieldi*, Sykes, P. Z. S. 1832, p. 89. Inhabits Peninsula of India.

(1376) *P Phayrei*, Blyth J. A. S. XVI, 452. Inhabits Arakan.

(1377) *P. ferruginosus*, Blyth, J. A. S. XIV, 597. Inhabits Sikim.

(1378) *P. ruficollis*, Hodgson, *As. Res.* XIX, pt. 1, 182. Inhabits S. E. Himalaya.

(1379) *P. montanus*, Horsfield (*Zool. Res. in Java*, pl.). *Bokkrek*, Java. Inhabits Java.

Genus XIPHORHAMPHUS, Blyth.

(1380) *X. superciliaris*, Blyth, J. A. S. XII, 947.

Syn. Xiphorhynchus superciliaris, ibid, J. A. S. XI 175.

Inhabits Sikim.

Genus TURDINUS, Blyth.

(1381) *T. macrodactylus*, J. A. S. XIII, 382.

Syn. Malacopteron macrodactylum, Strickland.
Brachypteryx albogularis, Hartland.

Tana, Malay. Inhabits Malayan peninsula.

Genus TRICHASTOMA, Blyth.

(1382) *Tr. Abbotti.*

Syn. Malacocincla Abbotti, Blyth, J. A. S. XIV, 601.

Inhabits Arakan.

(1383) *Tr. olivaceum.*

Syn. Megalopteron olivaceum, Strickland, Ann. Mag. N. H. 1847, p. 132.

Tr. Abbotti, var? Inhabits Malayan peninsula.

(1384) *Tr. bicolor.*

Syn. Brachypteryx bicolor, Lesson.
Malacopteron ferruginosum, Blyth, J. A. S. XIII, 383.

Inhabits Malayan peninsula; Sumatra.

(1385) *Tr. rostratum*, Blyth, J. A. S. XI, 795. Inhabits Malayan peninsula.

Genus MALACOPTERON, Eyton.

(1386) *M. majus*, Blyth, J. A. S. XVI, 461. Inhabits Malayan peninsula.

(1387) *M. magnum*, Eyton, P. Z. S. 1849, p. 103. Inhabits Malayan peninsula.

Genus ALCIPPE, Blyth.

(1388) *A. albogularis.*

Syn. Setaria albogularis, Blyth, J. A. S. XIII, 385.

Inhabits Malayan peninsula.

(1389) *A. affinis* (J.A. S. XIII, 384.)

Syn. Trichastoma affine, Blyth, J. A. S. XI. 795.

Inhabits Malayan peninsula.

(1390) *A. cinerea*, Eyton.

Syn. Malacopteron cinereum, Eyton, P. Z. S. 1839, p. 103; J. A. S. XIII, 384.

Inhabits Malayan peninsula.

(1391) *A. Phayrei*, Blyth, J. A. S. XIV, 601. Inhabits Arakan.

(1392) *A. nipalensis.*

Syn. Siva nipalensis, Hodgson, Ind. Rev. 1838, p. 80.

Inhabits S. E. Himalaya; Arakan.

(1393) *A. sepiaria.*

Syn. Brachypterix sepiaria, Horsfield, Lin. Tr. XIII, 156.

Chichohan, Jav. Inhabits Java.

(1394) *A. poiocephala.*

Syn. Timalia poiocephala, Jerdon, Madr. Journ. XIII, 169.

Inhabits S. India.

(1395) *A. atriceps.*

Syn. Brachypteryx atriceps, Jerdon, Madr. Journ. X, 250.

Inhabits S. India.

(1396) *A.* (?) ***striata.***

Syn. Timalia striata, Blyth, J. A. S. XI, 783.

Inhabits Malayan peninsula.

Genus MACRONOUS, Jardine and Selby.

(1397) *M. ptilosus*, J. and S. *(Ill. Orn.* pl. 150).

Syn. Timalia trichorros, Temminck,

Burong taal-uban, Malay. Inhabits Malayan peninsula.

Genus MIXORNIS, Hodgson.

(1398) *M. gularis* (*Horsf. Zool. Res. in Java*, pl.).

Syn. Timalia gularis, Horsfield.
Prinia pileata, Blyth, J. A. S. XI, 204.

Burong Puding, Malay. Inhabits Tenasserim provinces; Malayan peninsula; Java.

(1399) *M. chloris*, Hodgson, J. A. S. XI, 794,

Syn. M. ruficeps, Hodgson, P. Z. S. 1845. p. 23.
Motacilla rubicapilla (?), Tickell, J. A. S. II, 576.

Inhabits Sub-himalayan region; Central India? Tenasserim provinces.

Genus TIMALIA, Horsfield.

(1400) *T. pileata*, Horsfield (*Zool. Res. in Java*, pl.). *Dawit*, or *Gogo-stile*, Jav. Inhabits Bengal; Nepal; Assam; Arakan; Java.

(1401) *T. nigricollis*, Temminck.

Syn. T. erythronotus, Blyth, J. A. S. XI, 793.
Brachypteryx nigrogularis, Eyton.

Burong Tanah, Malay. Inhabits Malayan peninsula.

(1402) *T. pectoralis*, Blyth, J. A. S. XI, 793.

Syn. Malacopteron squamatum, Eyton.

Pampang, Malay. Inhabits Malayan peninsula.

(1403) *T. erythroptera*, Blyth, J. A. S. XI, 794.

Syn. T. pyrrhophæa, Hartlaub.
Brachypteryx acutirostris, Eyton.

Inhabits Malayan peninsula.

Genus CHRYSOMMA, Hodgson.

(1404) *Chr. sinense* (Jardine and Selby, *Ill. Orn.* pl. 119).

Syn. Parus sinensis, also Gotah Finch, and Emberiza calfat, Var. A, Latham.
Timalia hypoleuca, Franklin.
T. Horsfieldi, Jardine and Selby.
Pyctoris rufifrons, Hodgson, P. Z. S. 1845, p. 24.
Timalia bicolor, Lafresnaye.

Gulchasm; also *Shukar Dumri*, H. ? (Jerdon). Inhabits India generally; China ?

Genus STACHYRIS, Hodgson.

(1405) *St. nigriceps*, Hodgson, J. A. S. XIII, 378; P. Z. S. 1845, p. 22. Inhabits S. E. Himalaya.

(1406) *St. pyrrhops*, Hodgson, J. A. S. XIII, 379; P. Z. S. 1845, p. 23 (there spelt *pyrops*). Inhabits Nepal.

(1407) *St. ruficeps*, Blyth, J. A. S. XVI, 452. Inhabits Sikim.

(1408) *St. chrysæa*, Hodgson, J. A. S. XIII, 379; P. Z. S. 1845, p. 23. Inhabits S. E. Himalaya; Arakan.

Fam. LANIADÆ.

Genus GAMPSORHYNCHUS, Blyth.

(1409) *G. rufulus*, Blyth, J. A. S. XIII, 370. Inhabits Terai region of the S.E. Himalaya, Arakan, &c.

Genus THAMNOCATAPHUS, Tickell.

(1410) *Th. picatus*, Tickell, J. A. S. XVIII, Inhabits Darjiling.

Genus LANIUS, L.

(1411) *L. lahtora* (Hardwicke's *Ill. Ind. Zool*).

Syn. Collurio lahtora, Sykes.
Lanius excubitor, var C., Latham.
L. burra, Gray, Hardw, Ill. Ind. Zool.

Dudia lahtora, ('Milky Shrike'), H. Inhabits India generally (nec Lower Bengal).

(1412) *L. schach, L.*

Syn. L. bentet, Horsfield.

Burong Papa, or Terip api, Malay.; *Bentet*, Java. Inhabits China; Philippines; Java.

(1413) *L. erythronotus* (Gould's Century, pl. 12, f. 2).

Syn. Collurio erythronotus, Vigors.

Inhabits N. W. Himalaya.

(1414) *L. caniceps*, Blyth J. A. S. XV, 302.

Syn. C. erythronotus of S. India, Auct.

Inhabits Indian peninsula; Sindh; Upper Bengal.

(1415) *L. nigriceps.*

Syn. Collurio nigriceps, Franklin.
Lanius nasutus, Scopoli.
L. antiguanus, Latham.
L. tricolor, Hodgson, Ind. Rev. 1837.
Indian Shrike, Latham.

Inhabits Bengal; Kutak; Nepal; Assam; Arakan.

(1416) *L. tephronotus.*

Syn. Collurio tephronotus, Vigors, P. Z. S. 1831, p. 43.
Lanius nipalensis, Hodgson, Ind. Rev. 1837, p. 445.
Grey-backed Shrike, Latham.

Inhabits Bengal; Nepal; Assam; Arakan.

(1417) *L. superciliosus*, L. (Vaill. *Ois. d' Afr.* pl. 66, f. 2.)

Syn. L. collurioides, Lesson.

Bengal variety—

L. cristatus, L.
L. phœnicurus, Pallas.
L. rutilus, var A, and L. superciliosus, var A, Latham.
L. melanotis, Valenciennes.
L. ferrugiceps, Hodgson, Ind. Rev. 1837. p. 446.

Sindh variety.

L. arenarius, Blyth, J. A. S. XV, 304.

Philippine variety?

L. lucionensis, Kátkáti. Beng.

Inhabits all S. E. Asia and its islands, except on elevated land.

(1418) *L. tigrinus*, Drapiez, *Dict. Class. d' Hist. Nat.*

Syn. L. magnirostris, Lesson, in Belanger's Voyage.
L. strigatus, Eyton, P. Z. S. 1839, p. 103.

Serara, Malay. Inhabits Malay countries.

(1419) *L. Hardwickii*, Vigors (Gould's 'Century,' pl. 12, f. 1).

Syn. Collurio Hardwickii, Vigors.
Bay-backed Shrike, Latham.

Pichanuk, H. Inhabits India generally (nec Bengal alluvium).

(1420) *L. hypoleucos*, Blyth, J. A. S. XVII, 249. Inhabits Tenasserim provinces.

Genus TEPHRODORNIS, Swainson.

(1421) *T. sylvicola*, Jerdon, *Madr. Journ.* X, 236. *Phari latora*, H. Inhabits S. India.

(1422) *T. pelvica.*

Syn. Tenthaca pelvica, Hodgson, Ind. Rev. 1837, p. 447.

Inhabits Nepal; Arakan.

(1423) *T. gularis.* (Tem. *Pl. Col.* 256. f. 1.)

Syn. L. virgatus, Temminck.
Lanius gularis, Raffles.

Baron Baron, Malay. Inhabits Malay countries.

(1424) *T. pondiceriana.* (Hardw. *Ill. Ind. Zool.*)

Syn. Muscicapa pondiceriana, Gmelin.
M. philippensis of India, Latham.
Lanius keroula, Gray.
L. muscipetoides, Franklin.
L. griseus, Tickell, J. A. S II, 573.
L. sordidus, Lesson.
T. superciliosus, Swainson.
Tenthaca leucurus, Hodgson, Ind. Rev. 1837, p. 447.

Inhabits India generally.

(1425) *T. affinis*, Blyth, J. A. S. XVI, 473. Inhabits Ceylon.

(1426) *T. grisola*, Blyth, J. A. S. XII, 180. Inhabits Penang; Java; Arakan; very rare in Lower Bengal.

Genus HEMIPUS, Hodgson.

(1427) *H. obscurus* (Horsfield's *Zool. Res. in Java.* pl.).

Syn. Muscicapa obscura, Horsfield.
M. hirundinaceus, Reinhardt.
Tephrodornis hirundinaceus, Swainson.

Inhabits Malay countries; Tenasserim.

(1428) *H. picata.*

Syn. Muscicapa picata, Sykes.
M. tyrannides, Tickell, J. A. S. II, 574.
M. hyrundinacea, apud Jerdon, Catal.
M. variegata (?), Linnæus.

Inhabits Arakan; Central and S India; Ceylon.

(1429) *H. capitalis.*

Syn. Muscicapa? capitalis, McClelland, P. Z. S. 1839, p. 159.
H. piceicolor, Hodgson, P. Z. S. 1845, p. 33.

Inhabits Himalaya; Assam.

Genus XANTHOPYGIA, Blyth.

(1430) *X. leucophrys*, Blyth, J. A. S. XVI, 123.

Syn. Muscicapa xanthopygia, A. Hay, Madr. Journ. XI, 162 (the female).

Inhabits Malayan peninsula.

(1431) *X. narcissina* (Tem., *Pl. Col.* 577, f. 1).

Syn. Muscicapa narcissina, Temminck.
Z. carysophrys, Blyth, J. A. S. XVI, 124.

Inhabits China; Japan.

Fam. BRACHYURIDÆ.

Genus PITTA, Vieillot.

(1432) *P. cærulea* (Tem. *Pl. Col.* 217).

Syn. Myiothera cærulea, Raffles.
Pitta gigas, Temminck.

Inhabits Malayan peninsula: Sumatra.

(1433) *P. nipalensis.*

Syn. Paludicola nipalensis, Hodgson, J. A. S. VI, 103.
Pitta nuchalis, Blyth, J. A. S. XI, 188.

Inhabits Himalaya; Arakan.

(1434) *P. cucullata*, Hartlaub (*Ann. Mag. N. H.* XIII, pl. 20.)

Syn. P. nigricollis, Blyth, J A. S. XII, 960.
P. rodogaster, Hodgson, J. A. S. XII, 961 (the young).

Inhabits Nepal; Assam; Malayan peninsula.

(1435) *P. cyanoptera*, Temminck (*Pl. Col.* 218).

Syn. P. malaccensis apud Blyth. J. A. S. XII, 960.

Inhabits Arakan; Tenasserim provinces; Malayan peninsula.

(1436) *P. triostegus* (Gould's 'Century,' pl. 23.)

Syn. Turdus triostegus, Sparrman.
T. malaccensis, Scopoli.
P. supercilliaris et abdominalis, Wagler.
P. bengalensis, Stephens.
P. brachyura of India, auctorum.

Inhabits India generally, from the sub-Himalayan region to Ceylon inclusive: never on the eastern side of the Bay of Bengal.

(1437) *P. erythrogastra*, Tem. (*Pl. Col*, 212.) Inhabits Philippines.

(1438) *P. granatina*, Tem. (*Pl. Col.* 506.)

Syn. P. coccinea, Eyton, P. Z. S. 1839, p. 104.

Inhabits Malayan peninsula.

(1439) *P. cyanea*, Blyth, J. A. S. XII, 1008; XVI, 153. Inhabits Arakan; Tenasserim provinces.

(1440) *P. cyanura* (*Pl. Enl.* 355).

Syn. Corvus cyanurus, Gmelin.
Myiothera affinis, Raffles.

Sintar, Sum.: *Punglor*, Jav. Inhabits Malayan peninsula; Sumatra.

Genus HYDROBATA, Vieillot.

(1441) *H. asiatica* (Gould's 'Century,' p. 24).

Syn. Cinclus asiaticus, Swainson.
C. Pallasii apud Gould.

Inhabits Himalaya.

Genus TROGLODYTES, Cuvier.

(1442) *Tr. nipalensis*, Hodgson, J. A. S. XIV, 589.

Syn. Tr. subhemalayanus, Hodgson, Gray.

Inhabits N. W. Himalaya; Nepal.

(1443) *Tr. punctatus*, J. A. S. XIV, 589.

Inhabits Sikim.

Genus EUPETES, Temminck.

(1444) *Eu. macrocercus*, Tem. (*Pl. Col.* 516). Inhabits Malayan peninsula.

Genus ENICURUS, Temminck.

(1445) *E. ruficapillus*, Tem. (*Pl. Col.*). Inhabits Java.

(1446) *E. maculatus*, Vigors, (Gould's 'Century,' pl. 27).

Syn. E. fuliginosus, Hodgson (the young).

Inhabits Himalaya.

(1447) *E. schistaceus*, Hodgson, *As. Res.* XIX, 191. Inhabits S. E. Himalaya; Tenasserim provinces.

(1448) *E. immaculatus*, Hodgson, *As. Res.* XIX, 190, J. A. S. XVI, 157. Inhabits Arakan. Rare in Nepal.

(1449) *E. frontalis*, Blyth, J. A. S. XVI. 156. Inhabits Malayan peninsula.

(1450) *E. scouleri*, Vigors (Gould's 'Century,' pl. 28). Inhabits Himalaya; rare to the N. W.

Fam. MERULIDÆ.

Subfam. MERULINÆ.

Genus MYIOPHONUS, Temminck.

(1451) *M. Temminckii*, Vigors (Gould's 'Century,' pl. 21).

Syn. M. nitidus, Gray.

Inhabits Himalaya; Assam; Arakan.

(1452) *M. Horsfieldi*. Vigors (Gould's 'Century,' pl. 20). Inhabits Nilgiris (nec Himalaya).

Genus TURDUS, L.

Subgenus ZOOTHERA, Vigors.

(1453) *Z. monticola*, Vigors (Gould's 'Century,' pl. 22). Inhabits Himalaya.

(1454) *Z. marginata*, Blyth, J. A. S. XVI, 141. Inhabits Arakan.

Subgenus OREOCINCLA, Gould.

(1455) *O. nilgiriensis*, Blyth, J. A. S. XVI, 181. Inhabits Nilgiris.

(1456) *O. mollissima*, Blyth, J. A. S. XI, 188; XVI, 141

Syn. O. rostrata, Hodgson, Ann. Mag. N. H. 1845, f. 326.

Inhabits Himalaya.

(1457) *O. dauma* (Gould's *B. E.* pl.).

Syn. Turdus dauma, Latham.
T. Whitei, Eyton.
T. doratus?
O. parvirostris, Gould, P. Z. S. 1837, p 136.

Inhabits Himalaya, Nilgiris: migrating to the plains in winter. Rare in Europe.

(1458) *O. spiloptera*, Blyth, J. A. S. XVI, 142. Inhabits Ceylon.

Subgenus TURDUS.

(1459) *T. viscivorus*, L. (*Pl. Enl.* 439; Gould's *B. E.* pl. 77).

Syn. T. major, Brisson.

Inhabits Europe; N. W. Himalaya.

(1460) *T. Naumanni* (?), Temminck (Gould's *B. E.* pl. 9).

Syn. T. dubius, Naumann.

Inhabits E. Europe; N. Asia; very rare in the Himalaya.

(1461) *T. atrogularis*, Natterer (Gould's *B. E.* pl. 75).

Syn. T. Bechsteini, Naumann.
T. dubius, Bechstein.

Inhabits N. Asia; Himalaya; Tippera.

(1462) *T. ruficollis*, Pallas.

Syn. (Perhaps a variety of Galerida cristata of which some specimens are partially rufous-tailed).

Inhabits N. Asia; Himalaya.

(1463) *T. javanicus* (?), Horsfield, *Lin. Tr.* XIII, 184.

Syn. T. concolor, (?) Temminck (Pl. Col.)
T. rufulus, Drapiez, Dict. Class.
T. modestus, Eyton, P. Z. S. 1839, p. 103.

Inhabits Arakan ; Malayan peninsula ; Java ?

Subgenus MERULA.

(1464) *M. vulgaris*, Ray, Leach (Gould's *B. E.* pl. 72).

Syn. Turdus merula, L.

Inhabits Europe ; N. Africa ; Madeira ; W. Asia ; Afghanistan ; China (Chusan).

(1465) *M. boulboul* (Gould's 'Century,' pl. 14).

Syn. Lanius boulboul et Turdus persicus (?), Latham.
T. pæcilopterus, Vigors.

Inhabits Himalaya.

(1466) *M. simillima.*

Syn. Turdus simillimus, Jerdon, Madr. Journ., X, 253.

Inhabits Nilgris.

(1467) *M. nigropileus.*

Syn. Turdus nigropileus, de la Fresnaye ; Ad. Delessert Voyage dans l'Inde.

Inhabits S. India.

(1468) *M. albocincta* (Royle's *Ill. Him. Bot.* pl. 8. f. 3).

Syn. Turdus albocinctus et T. albicollis, Royle.
T. collaris, Sorel.

Inhabits Himalaya.

(1469) *M. castanea*, Gould P. Z. S. 1835, p. 185. Inhabits Himalaya.

(1470) *M. Wardii* (Jerdon's *Ill. Ind. Orn.* pl. 8).

Syn. Zoothera melanoleuca. Hartlaub.
Oreocincla ? micropus, Hodgson (female).

Inhabits Himalaya ; S. India.

Subgenus GEOCICHLA, Kuhl.

(1471) *G. unicolor.*

Syn. Turdus unicolor, Tickell, Gould.

Inhabits Himalaya.

(1472) *G. dissimilis*, Blyth, J. A. S. XVI, 144.

Syn. Calcutta Thrush, Latham.

Inhabits Bengal (during cold season.)

(1473) *G. citrina* (Tem. *Pl. Col.* 445).

Syn. Turdus citrinus, Latham.
T. Macei, Vieillot.
T. lividus, Tickell, J. A. S. II, 577.
T. rubeculus apud Horsfield, P. Z. S. 1839, p. 161.

Inhabits Bengal ; Napal ; Assam ; Arakan ; S. India.

(1474) *G. cyanotus* (J. and S., *Ill. Orn.*., 1st series, pl. 46).

Syn. Turdus cyanotus, Jardine and Selby.

Inhabits Indian peninsula.

(1475) *G. innotata*, Blyth, J. A. S. XVI, 146. Inhabits Malayan peninsula ; Nicobars.

Subgenus PETROCINCLA, Vigors.

(1476) *P. erythrogastra* (Gould's 'Century,' pl. 13 ; J. and S. *Ill. Orn*, 1st series, pl. 129).

Syn. Turdus erythrogaster, Vigors.
Petrocincla rufiventris, Jardine and Selby.
Petrocossyphus ferrugineoventris, Lesson.

Inhabits Himalaya.

(1477) *P. cyaneus* (*Pl. Enl.* 250 ; Edwards, pl. 18).

Syn. Turdus cyaneus, L.
T. solitarius, Gmelin.
Merula cærulea, Brisson.
P. longirostris, Blyth, J. A. S. XVI,150.

Inhabits Europe ; N. Africa ; W. Asia ; Kashmir ; Punjab ; Sindh. The Indian variety *P. pandoo* (the male), and *P. maal* (the female), Sykes : *Turdus solitarius*, var. *A*, Latham. is merely somewhat deeper-coloured, the females especially, which are somewhat differently marked on the under-parts. The bill also is generally smaller. Inhabits Hindustan ; S. India.

(1478) *P. affinis*, Blyth, J. A. S. XII, 177. Inhabits Sikim ; Butan ; Assam ; Sylhet ; Tippera ; Arakan ; Tenasserim.

(1479) *P. manillensis* (*Pl. Enl.* 636).

Syn. Turdus manillensis, Gmelin.
T. olivaceus (?), Boddaert.

Inhabits Philippines ; China.

Subgenus MONTICOLA, Brehm.

(1480) *M. cinclorhyncha* (Gould's 'Century, pl. 19).

Syn. Petrocincla cinclorhyncha, Vigors.
Petrophila cyanocephala, Swainson.
Black-collared Thrush, var. A, Latham.

Inhabits Hilly parts of India generally, keeping to the forests : very rare in Lower Bengal in the seasons of passage.

Genus LUSCINIA, (Antiq.) L. (1735), G. R. Gray.

(1481) *L. philomela*, Bonap (*Pl. Enl.* 615, f. 2).

Syn. Motacilla luscinia, L.
Sylvia luscinia, Lath. Tem. (nec S. philomela, Tem.)

Bulbul hosta, H. : *Bulbul-i-hazar dastan*, Pers. Inhabits Europe ; N. Africa ; W. Asia ; common in Persia, but only known as a cage bird in Afghanistan.

Subfam. SAXICOLINÆ.

Genus THAMNOBIA, Swainson.

(1482) *Th. cambaiensis.*

Syn. Sylvia cambaiensis, Latham.
Saxicoloides erythrurus, Lesson (the female).

Inhabits Upper and Central India.

(1483) *Th. fulicata* (*Pl. Enl.* 185, f. 1).

Syn. Motacilla fulicata, L.
Ænanthe ptygmatura, Vieillot.
Th. leucoptera, Swainson.
Rusty-vented Thrush, and the female.—Sylvia fulicata, var. a, Latham.

Kulchuri, H. (Jerdon). Inhabits S. India; Ceylon; Philippines?

Genus KITTACINCLA, Gould.

(1484) *K. macrourus* (Vaillant, pl. 114).

Syn. Turdus macrourus, Gmelin.
T. tricolor, Vieillot.
Gryllivora longicauda, Swainson.

Shama, H.; *Abbeka*, H. (Jerdon): *Larwa*, Jav. Inhabits India generally (nec Lower Bengal); Ceylon; Burmese and Malay countries.

Genus COPSYCHUS, Wagler.

(1485) *C. mindanensis*.

Syn. Turdus mindanensis, Gmelin.
Lanius musicus, Raffles (nec Turdus amœnus, Horsfield).
Gryllivora magnirostra et Gr. rosea, Swainson (vide J. A. S. XVI, 139).

Choche, Malay; *Moorai*, or *Moorai Kichou*, Sum. Inhabits Malay countries.

(1486) *C. saularis* (Edwards, pl. 181).

Syn. Gracula saularis, L.
Gryllivora intermedia, Swainson.
Dahila docilis, Hodgson, As. Res. XIX, 189.

Dayal, B.; *Dayyur* or *Deyr*, H. (Jerdon): *Polichia*, Cingh: *Thabeitgyee*, Arakan. Inhabits Bengal; Nepal; India generally; Arakan; Tenasserim. The Head and back of female invariably ashy.

Var. Gr. brevirostra (?), Swainson.

Inhabits Ceylon. The Head and back of shining black, nearly as in the male.

Genus NOTODELA (?), Lesson.

(1487) *N.* (?) *leucura*, J. A. S. XVI, 138.

Syn. Muscisylvia leucura, Hodgson, P. Z. S. 1845, p. 27.

Inhabits Masuri; Nepal.

Genus GRANDALA, Hodgson.

(1488) *Gr. cœlicolor*, Hodgson, J. A. S. XII, 447. Inhabits Simla; Nepal: near snowy region.

Genus SAXICOLA, Bechstein (*Jerka*, Sindh).

(1489) *S. opistholeuca*, Strickland.

Syn. S. leucura apud Blyth, J. A. S. XVI, 137.

Inhabits Upper Hindustan; Sindh.

(1490) *S. picata*, Blyth, J. A. S. XVI, 131. Inhabits Upper Hindustan; Sindh.

(1491) *S. leucomela* (*Pl. Col.* 257, f. 3).

Syn. Muscicapa leucomela et M. melanoleuca, Stephens.

Inhabits S. Europe; N. Africa; W. Asia; Upper Hindustan; Sindh.

(1492) *S. atrogularis*, Blyth, J. A. S. XVI, 130-1.) Inhabits Upper-Hindustan; Sindh.

(1493) *S. œnanthe* (*Pl. Enl.* 554).

Syn. Motacilla ænanthe, L.

Inhabits Europe; W. Asia; Upper Hindustan.

Genus CYANECULA, Brehm.

(1494) *C. suecica* (*Pl. Enl.* 361, f. 2, and 610, f. 1, 2, 3).

Syn. Motacilla suecica, L.
Sylvia cæruligula, Pallas.
S. sperata, var. A, Latham (the female).
Blue-necked Warbler, Latham.

Husaini Pidda, H.: *Dumbuk*, Kabul. Inhabits N. Europe; India generally: very abundant in Lower Bengal.

Genus RUTICILLA, Brehm.

(1495) *R. frontalis* (Gould's *Century*, pl. 26. f. 2).

Syn. Phœnicura frontalis, Vigors.

Inhabits Himalaya generally.

(1496) *R. erythrogastra*.

Syn. Sylvia erythrogastra, Guldenstadt.
Muscicapa aurorea, Pallas.
Phœnicura Reevesii, Gray.

Inhabits N. and M. Asia, from the Caucasus to Japan; Nepal; Assam.

(1497) *R. phœnicurus* (*Pl. Enl.* 351, f. 2).

Syn. Motacilla phœnicura, L.
Phœnicura ruticilla, Swainson.
R. tythys of Afghanistan, apud Hutton, J. A. S. XV, 780.

Inhabits Europe; W. Asia; and variety in Afghanistan and Sindh.

(1498) *R. leucoptera*, Blyth, J. A. S. XII, 962; XVI, 134. Inhabits Malayan peninsula: Java.

(1499) *R. indica*, Blyth (Jardine and Selby, *Ill. Orn.* pl. 86, f. 3).

Syn. Phœnicura atrata apud Jardine and Selby.

Thirt bira (i. e. 'Shaker'). H. (Jerdon). Inhabits India generally.

(1500) *R. cæruleocephala* (Gould's *Century*, pl. 26, f. 2).

Syn. Phœnicura cæruleocephala, Vigors.

Inhabits Himalaya.

(1501) *R. fuliginosa*.

Syn. Phœnicura fuliginosa, Vigors, P. Z. S. 1831, p. 35.
Ph. plumbea, Gould, P. Z. S. 1835, p. 185.

Inhabits Himalaya.

(1502) *R. leucocephala* (Gould's *Century*. pl. 26, f. 2).

Syn. Phœnicura leucocephala, Vigors.
Sylvia erythrogastra, var. *a*, Latham.

Inhabits Himalaya.

Genus CALLIOPE, Gould.

(1503) *C. pectoralis*, Gould (*Icones Avium*). Inhabits Himalaya.

(1504) *C. camtschatkensis* (Lath. *Supp.*, pl. in frontispiece).

Syn. Sylvia camtschatkensis, Gmelin.
Motacilla calliope, Pallas.
Calliope Lathami, Gould.

Gangula, Nepal. Inhabits Asia. Common in Lower Bengal during the cold season; rare in C. India.

(1505) *C. cyana*.

Syn. Larvivora cyana, et L. brunnea (?), Hodgson, J. A. S. VI, 102.
Phœnicura superciliaris, Jerdon, Madr. Journ. XIII, 170.

Inhabits Himalaya chiefly: rare in Nilgiris: very rare and accidental in Lower Bengal during the seasons of passage.

Genus TARSIGER, Hodgson.

(1506) *T. chrysæus*, Hodgson, *Ann. Mag. N. H.* 1845, p. 198. Inhabits S. E. Himalaya.

Genus PRATINCOLA, Koch.

(1507) *Pr. caprata* (*Pl. Enl.* 235, f. 1. 2).

Syn. Motacilla caprata, L.
M. luctuosis, var. *A*, Latham.
M. sylvatica (?), Tickell, J. A. S. II, 575.
Saxicola fruticola, Horsfield.
S. bicolor et S. erythropygia, Sykes.

Pidah, or *Kala Pidah*, H.; *Lay khya*, Arakan; *Dechu*, Jav. Inhabits India generally (nec Lower Bengal); Arakan; Java.

(1508) *Pr. rubicola* (*Pl. Enl.* 678, f. 1).

Syn. Motacilla rubicola, L.

Inhabits Europe; N. Africa.

(1509) *Pr. indica*, Blyth J. A. S. XVI, 129.

Syn. P. rubicola of India, auctorum.

Inhabits India generally.

(1510) *Pr. leucura*, Blyth, J. A. S. XVI, 474. Inhabits Sindh.

(1511) *Pr. ferrea*, Hodgson, J. A. S. XVI, 129. Inhabits Himalaya generally.

Genus IANTHIA, Blyth.

(1512) *I. hyperythra*, Blyth, J. A. S. XVI, 132. Inhabits Sikim.

(1513) *I. rufilatus*, J. A. S. XVI, 132.

Syn. Nemura rufilatus, and the female—N. cyanura, Hodgson, P. Z. S. 1845, p. 27.
Erythaca Tytlerii (?), Jameson, Trans, Wern. Soc. (not described).
Motacilla cyanura (?), Pallas, the female.

Inhabits Himalaya generally; more numerous to the N. W.?

Genus ERYTHACA, (Antiq.) Cuv., G. R. Gray.

(1514) *E. flavolivacea*.

Syn. Ianthia flavolivacea, (Hodgson), J. A. S. XVI, 133. 774.
Nemura flavolivacea, Hodgson, P. Z. S. 1845, p. 27.

Inhabits Sikim.

(1515) *E. rubecula* (*Pl. Enl.* 361, f. 1).

Syn. Motacilla rubecula, L.

Inhabits Europe; W. Asia (Trebizond).

Genus ERYTHROSTERNA, Bonap.

(1516) *E. leucura* (vide J. A. S. XVI, 474).

Syn. Muscicapa leucura, Gmelin.
M. parva of India, auctorum.
Saxicola rubeculoides, Sykes.
Synornis joulainus, Hodgson, P. Z. S. 1845, p. 27.
White tailed Red breast, and the young—probably Maculate Flycatcher, Latham.

Turra, H. Inhabits India generally; rarer to the S.: extremely common in L. Bengal.

(1517) *E. acornaus*, (Hodgson).

Syn. Muscicapula acornaus of Nepal, J. A. S. XVI, 127.

Inhabits Himalaya.

(1518) *E. pusilla*, Blyth, J. A. S. XVIII.

Syn. Muscicapula acornaus of Central India, apud Blyth, J. A. S. XVI, 127.
Muscicapa poonensis apud Blyth, J. A. S. XI, 458.

Inhabits Central India.

Genus SIPHIA, Hodgson.

(1519) *S. strophiata*, Hodgson, *Ind. Rev.* 1837, p. 651. Inhabits Himalaya.

(1520) *S. superciliaris*.

Syn. Dimorpha superciliaris, Blyth, J. A. S. XI, 190 (altered to Muscicapula hyperythra, J. A. S. 885, and again by an oversight to M rubecula, J. A. S. XII, 940).
D. (?) rubrocyanea, Hodgson, P. Z. S. 1845, p. 26.

Inhabits S. E. Himalaya.

(1521) *S. (?) tricolor*.

Syn. Digenea tricolor, Hodgson, P. Z. S. 1845, p. 46; J. A. S. XVI, 126.

Inhabits Himalaya.

(1522) *S. (?) leucomelanura*.

Syn. Digenea leucomelanura, Hodgson, P. Z. S. 1845, p. 26; J. A. S. 1845, XVI, 126.

Inhabits S. E. Himalaya.

Genus ANTHIPES, Blyth.

(1523) *A. moniliger*.

Syn. Dimorpha? moniliger, Hodgson, P. Z. S. 1845, p. 26.
Niltava McGregoriæ, fœm (?), apud Hodgson, Ind. Rev. 1837, p. 650.
A. gularis, Blyth, J. A. S. XVI, 122.

Inhabits S. E. Himalaya; Arakan.

Genus MUSCICAPULA, Blyth.

(1524) *M. melanoleuca*, vide J. A. S. XVI, 137.

Syn. Muscicapa maculata apud Tickell, J. A. S. II, 574.

Inhabits S. E. Himalaya; C. India; Arakan; Tenasserim provinces; Java.

(1525) *M. superciliaris* (Jardine's *Contrib. Orn.* 1848, pl.).

Syn. Muscicapa superciliaris, Jerdon, Madr. Journ. XI, 16.
Dimorpha albogularis, Blyth, J. A. S. XI, 190.
Muscicapa hemileucura, Hodgson, G. R. Gray.
Lucknow Flycatcher and Azure Warbler, Latham.

Inhabits Himalaya chiefly; C. and S. India.

(1526) *M. sapphira* (Tickell) Blyth, J. A. S. XII, 939; XVI, 473. (Jerdon's *Ill. Ind. Orn.* pl. 32). Inhabits Sikim.

Genus CYORNIS, Blyth.

(1527) *C. unicolor*, Blyth, J. A. S. XII, 1067; XVI, 128. Inhabits Sikim.

(1528) *C. rubeculoides* (Gould's 'Century,' pl, 25).

Syn. Phœnicura rubeculoides, Vigors.
Niltava brevipes, Hodgson, Ind. Rev. 1837, p. 651.
Muscicapa rubecula, Swainson (the female).
Ætherial Warbler, Latham (and the female agrees with the supposed female of his Blue Indian Warbler).

Inhabits Himalaya; visiting the plains in the cold season, when not rare, in the vicinity of Calcutta: Arakan; Tenasserim.

(1529) *C. banyumas* (Horsfield's *Zool. Res. in Java*, pl.).

Syn. Muscicapa banyumas, Horsfield.
M. cantatrix, Temminck.

Inhabits Java: very rare in Nilgiris.

(1530) *C. elegans.*

Syn. Muscicapa elegans, Tem. (apud Strickland).
M. hyacintha apud Tickell, J. A. S. II, 574.
C. Tickelliæ, Blyth, J. A. S. XII, 941.
Blue Indian Warbler? Latham (vide J. A. S. XVI, 128).

Inhabits Central (and W?) India.

(1531) *C.* ? (Allied to *Muscicapa pallipes*, Jerdon) *Madr. Journ.* XI, 15. Inhabits Sikim.

Genus OCHROMELA, Blyth.

(1532) *Ochr. nigrorufa*. J. A. S. XVI, 129.

Syn. Saxicola nigrorufa, Jerdon, Madr. Journ. X, p. 266.
Muscicapa rufula, la Fresnaye.

Inhabits summit of Nilgiris.

Genus NILTAVA, Hodgson. (*Niltouw*, Nepal).

(1533) *N. grandis.*

Syn. Chaitaris grandis Blyth, J. A. S. XI, 189.
Bainopus irenoides, Hodgson, G. R. Gray.

Inhabits Sikim.

(1534) *N. sundara*, Hodgson, *Ind. Rev.* 1837, p. 650. Inhabits Himalaya; rare to the N. W.

(1535) *N. McGregoriæ.*

Syn. Phœnicura McGregoriæ, Burton, P. Z. S, 1835, f. 152.
N. fuligiventer, Hodgson, Ind. Rev. 1837, p. 650 (the male only).
Dimorpha auricularis, Hodgson, J. A. S XII, 240.
Leiothrix signata, McClelland, P. Z. S, 1839, p. 168. } The female.

Inhabits Himalaya; Assam.

Genus CYANOPTILA, Blyth.

(1536) *C. cyanomelanura*, J. A. S. XVI, 125 (*Pl. Col.*).

Syn. Muscicapa cynomelanura, Temminck.

Inhabits Java.

Genus STOPAROLA, Blyth.

(1537) *St. melanops* (Gould's 'Century,' pl. 6).

Syn. Muscicapa melanops, Vigors.
M. lapis, Lesson, Rev. Zool. &c. 1839, p. 104.
M. thalassina, Swainson (the female).
Verditer Flycatcher, Latham.

Nil Kutkutea, Beng. Inhabits India generally; visiting the plains in the cold season.

(1538) *St.*———? (Vide J. A. S. XVI, 125). Inhabits Java.

(1539) *St. indigo.*

Syn. Muscicapa indigo, Horsfield.

Inhabits Java.

(1540) *St. albicaudata*, Jerdon (*Ill. Ind. Orn.* pl. 14).

Syn. Muscicapa albicaudata, Jerdon, Madr. Journ, XI, 16.

Inhabits Nilgiris.

Genus MUSCICAPA, L.

Subgenus BUTALIS, Boie.

(1541) *B. terricolor*, Hodgson, J. A. S. XVI, 120. Inhabits Nepal.

Subgenus HEMICHELEDON, Hodgson.

(1542) *H. latirostris.*

Syn. Muscicapa latirostris, Raffles, Swainson, M. poonensis, Sykes.

Zukki, H. (Jerdon). Inhabits India generally; common in Ceylon; rare in L. Bengal: Malayan peninsula; Sumatra.

(1543) *H. fuliginosa*, Hodgson, P. Z. S. 1845, p. 31, J. A. S, XVI, 119. Inhabits Himalaya.

(1544) *H. ferruginea*, Hodgson, P. Z. S. 1845, p. 32. Inhabits S. E. Himalaya.

Genus ACANTHIZA, Vigors and Horsfield.

(1545) *A.*——*?* Inhabits Java?

BRACHYPTERYX series.

Genus SYLVANIA, Blyth.

(1546) *S. phœnicuroides*, J. A. S. XVI, 135.

Syn. Brachypterus phœnicuroides, Hodgson, Gray's Catal.

Inhabits Himalaya.

Genus CALLENE, Blyth.

(1547) *C. frontalis*, Blyth J. A. S. XII, 1010. pl.), *ibid.* XVI, 136. Inhabits Sikim.

Genus BRACHYPTERYX, Horsfield.

(1548) *Br. major.*

Syn. Phœnicura major, Jerdon, Madr. Journ. XIII, 170.

Inhabits Nilgiris.

(1549) *Br. montana*, Horsfield (*Zool. Res. in Java*, pl.). Inhabits Java.

(1550) *Br. cruralis.*

Syn. Calliope (?) cruralis, Blyth, J. A. S. XII, 933; XVI, 136.

Inhabits Sikim.

(1551) *Br.* (?) *nigrocapitata*, Eyton, P. Z. S. 1839, p. 137. Inhabits Malayan peninsula.

Genus TESIA, Hodgson.

(1552) *T. cyaniventer*, Hodgson, J. A. S. VI, 101.

Syn. T. auriceps, Hodgson, J. A. S. XVI, 137, 474.
Saxicola? olivea, McClelland, P. Z. S. 1839, 161.

Inhabits Nepal; Sikim; Assam.

(1553) *T. castaneo-coronata.*

Syn. Sylvia castaneo-coronata, Burton, P. Z. S. 1835, p. 152.
T. flaviventer, Hodgson, J. A. S. VI, 102.

Inhabits Himalaya.

Genus PNOEPYGA, Hodgson.

(1554) *Pn. squamata* (Gould's *Icones Avium*).

Syn. Microura squamata, Gould.
Tesia rufiventer, T. albiventer, and T. concolor, Hodgson (varieties of colouring.

Inhabits Nepal; Sikim.

(1555) *Pn. pusilla.*

Syn. T. pusilla, Hodgson, J. A. S. XIV, 588.
T. squamata, small variety?

Inhabits Nepal.

(1556) *Pn. caudata.*

Syn Tesia caudata, Blyth, J. A. S. XIV. 588.

Inhabits Sikim.

Genus ARUNDINAX, Blyth.

(1557) *A. olivaceus*, Blyth, J. A. S. XIV, 595.

Syn. Phragmaticola olivacea, Blyth, M. S. Jerdon, Madr. Journ. XIII, pt. II, p. 129.

Inhabits Bengal; Arakan; S. India.

Genus ACROCEPHALUS, Naum.

(1558) *Acr. brunnescens*, J. A. S. XV, 288.

Syn. Acrobates brunnescens, Jerdon, Madr. Journ. X, 269.
Acroceph. arundinaceus v. turdoides of India, auctorum.

Inhabits India generally; Arakan.

(1559) *Acr. montanus.*

Syn. Sylvia montana, Horsfield, Lin. Tr. XIII, 156.

Inhabits India generally; Java.

Genus LOCUSTELLA, (Ray) Gould.

(1560) *L. rubescens*, Blyth, J. A. S. XIV, 582. Inhabits Lower Bengal (in the cold season).

Genus PSEUDOLUSCINIA (?), Sasi.

(1561) *Ps. luteoventris.*

Syn. Tribura luteoventris, Hodgson, P. Z. S. 1845, p. 30; J. A. S. XVI, 583.

Inhabits Kachar region of Nepal.

Genus DUMETICOLA. Blyth.

(1562) *D. thoracica*, Blyth, J. A. S. XIV, 584.

Syn. Salicaria affinis, Hodgson, G. R. Gray.

Inhabits Nepal.

Genus PHYLLOPNEUSTE, Meyer.

(1563) *Ph. rama.*

Syn. Sylvia rama, Sykes, P. Z. S. 1832, p. 89; J. A. S. XVI, 440.

Inhabits India generally.

(1564) *Ph. indicus*, Blyth, J. A. S. XIV, 593. Inhabits Nepal; S. India; China (Chusan).

(1565) *Ph. occipitalis*, Jerdon, J. A. S. XIV, 593. Inhabits S. India.

Subgenus ABRORNIS, Hodgson.

(1566) *Abr. pulcher*, Hodgson J. A. S. XVI, 592. Inhabits Nepal; Sikim.

(1567) *Abr. cantator.*

Syn. Motacilla cantator, Tickell, J. A. S. II, 576; XVI, 440.
Culicipeta schisticeps, Hodgson, apud G. R. Gray.

Inhabits Nepal; C. India; rare in Lower Bengal.

(1568) *Abr. schisticeps*, Hodgson, J. A. S. XIV, 592.

Syn. Phyllopneuste xanthoschistos, Hodgson, G. R. Gray.

Inhabits Himalaya generally; Arakan.

(1569) *Abr. poliogenys*, Blyth, J. A. S. XVI, 441. Inhabits Sikim.

Subgenus CULICIPETA, Blyth.

(1570) *C. Burkii*, J. A. S. XII, 968.

Syn. Sylvia Burkii, Burton, P. Z. S. 1835, p. 153.
Cryptolopha auricapilla, Swainson, 2nd Centen.
Muscicapa bilineata, Lesson, Rev. Zool. par la Soc. Cuv. 1839, p. 104.

Inhabits India generally; rare to the south.

Subgenus REGULOIDES, Blyth.

(1571) *R. trochiloides*.

Syn. Acanthiza trochiloides, Sundevall.
Phyllopneuste reguloides, Blyth, J. A. S. XI, 191; XII, 963.

Inhabits Himalaya; migrating southward in cold season.

(1572) *R. modestus* (Gould's *B. E.* pl.) J. A. S. XIV, 963.

Syn. Regulus modestus, Gould.
R. inornatus, Blyth, J. A. S. XI, 19— (abraded plumage).
Phyllopneuste nitida, G. R. Gray.

Inhabits N. India, common in L. Bengal: very rare in Europe.

(1573) *R. chloronotus*, Hodgson, G. R. Gray. Inhabits Himalaya.

Subgenus PHYLLOSCOPUS, Boie.

(1574) *Ph. nitidus*, Blyth, J. A. S. XII, 965.

Syn. Muscicapa nitida (?) Latham, Franklin.
Sylvia hippolais apud Jerdon, Madr. Journ. XI, 6.
Hippolais Swainsoni, G. R. Gray.

Inhabits India generally; Ceylon.

(1575) *Ph. trochilus* (*Pl. Enl.* 651, f. 1).

Syn. Motacilla trochilus, L.

Inhabits Europe; N. Africa: W. Asia; W. India (apud Gould); Japan.

(1576) *Ph. tristis*, Blyth, A. J. S. XII, 966.

Syn. "Sylvia trochilus?" apud Jerdon, Madr. Journ. XI, 6.

Inhabits India generally.

(1577) *Ph. montanus*, Blyth, J. A. S. XVIII. Inhabits Himalaya.

(1578) *P. viridanus*, Blyth, J. A. S, XII. 967. Inhabits India generally; Arakan; very common in Lower Bengal.

(1579) *Ph. affinis*, J. A. S. XVI, 442.

Syn. Motacilla affinis, Tickell, J. A. S. II, 576.

Inhabits Bengal (common).

(1580) *Ph. lugubris*, Blyth, J. A. S. XII, 968. Inhabits India generally: common in Lower Bengal.

(1581) *Ph. javanicus?*

Syn. Sylvia javanica (?), Horsfield, Lin. Tr. XIII, 156.
Ph. magnirostris, Blyth, J. A. S. XII, 966.

Opior Opior, Java. Inhabits Nepal; Bengal; Arakan; Java?

(1582) *Ph. brunneus*, Blyth, J. A. S. XIV, 591 (described from a small specimen).

Syn. Ph. fuscatus, var., Blyth, J. A. S. XVI, 443-4.

Inhabits Bengal: common in Arakan.

(1583) *Ph. fuscatus*, Blyth, J. A. S. XI, 113; XII, 965. Inhabits Bengal; Arakan.

Genus REGULUS, (Antiq.) Cuvier.

(1584) *R. ignicapillus*, Temminck. Inhabits Europe and Asia N. W. Himalaya?

(1585) *R. cristatus*, Ray (*Pl. Enl.* 651, f. 3).

Syn. Motacilla regulus, L.
R. auricapillus, Selby.
R. flavicapillus, Naum.

Inhabits Europe and Asia: N. W. Himalaya.

Subfam. SYLVIANÆ (frugivorous Warblers).

Genus SYLVIA, Latham (*Phularia*, H., *i. e.* 'Flower pecker').

(1586) *S. Jerdoni*.

Syn. Curruca Jerdoni, Blyth, J. A. S. XVI, 439.
Philomela orphea apud Jerdon, Madr. Journ. X, 267.

Inhabits S. India.

(1587) *S. affinis*.

Syn. Curruca affinis, Blyth, J. A. S. XIV, note to p. 564.

Inhabits S. India; Ceylon.

(1588) *S. curruca* (*Pl. Enl.* 380, f. 3).

Syn. Motacilla curruca, M. sylviella, et M. dumetorum, Gmelin.
Curruca garrula, Brisson.

Inhabits Europe; Asia; Africa: India generally (nec Lower Bengal below the tideway).

Fam. CERTHIADÆ.

Subfam. CERTHINÆ.

Genus CERTHIA, L.

(1589) *C. nipalensis*, Hodgson (Blyth, *Mon. Indian Certhiadæ*).

Syn. C. himalayana apud Blyth, J. A. S. XIV, 581.

Inhabits Nepal.

(1590) *C. discolor*, Blyth, J. A. S. XIV, 580. Inhabits Sikim.

(1591) *C. himalayana*, Vigors, P. Z. S. 1831, p. 174.

Syn. C. asiatica, Swainson, 2½ Cent.

Inhabits Deyra Doon.

Subfam. SITTINÆ.

Genus TICHODROMA, Illiger.

(1592) *T. muraria* (*Pl. Enl.* 372.)

Syn. Certhia muraria, L.
T. phœnicoptera, Temminck.
T. europæa, Stephens.

Inhabits S. Europe; W. Asia; Afghanistan; Himalaya.

Genus SITTA, L.

(1593) *S. formosa*, Blyth (J. A. S. XII, 938, 1007). Inhabits Sikim.

(1594) *S. cinnamoventris*, Blyth, J. A. S. XI, 459. Inhabits Himalaya.

(1595) *S. castaneoventris*, Franklin (J. and S., *Ill. Orn.*, 1st series, pl. 165). Inhabits Hill regions of India.

(1596) *S. himalayana*, Jardine and Selby (*Ill. Orn.* 1st series, pl. 164).

Syn. S. nipalensis, Hodgson, J. A. S. V, 779.

Subgenus DENDROPHILA, Swainson.

(1597) *D. frontalis* (Swainson's *Zool. Ill.*, 1st series, pl. 2).

Syn. Sitta frontalis, Horsfield.
S. velata, Temminck.
S. corallina, Hodgson, J. A. S. V, 779.

Inhabits India, Burmah, and Malay countries.

Fam. GRAUCALIDÆ.

Genus GRAUCALUS, Cuvier.

(1598) *Gr. Macei*, Lesson.

Syn. Gr. papuensis of India, auctorum.
Gr. nipalensis, Hodgson, Ind. Rev. 1837, p. 327.
Ceblepyris javensis (?), Horsfield, vide J. A. S. XV, 306.

Kepodang-sungu, Jav. Inhabits India generally; Ceylon; Arakan; Tenasserim.

Genus CAMPEPHAGA, Vieillot.

(1599) *C. fimbriata* apud Strickland (*Pl. C.* 247, 250).

Syn. Ceblepyris fimbriatus, Temminck.
Lanius silens, Tickell, J. A. S. II, 573.
Volvocivora melaschistos, Hodgson, Ind. Rev. 1837, 328.
Graucalus maculosus, McClelland, P. Z. S. 1839, p. 159.
Ceblepyris lugubris, Sundevall.
Blue-grey Thrush, Latham.

Inhabits India generally; commoner to the N., and breeding in the Himalaya: Java?

(1600) *C. melanoptera*, Blyth, J. A. S. XV, 307. Inhabits Arakan, where common.

(1601) *C. Sykesi*, Strickland, *Ann. Mag. N. H.* 1844, p. 36.

Syn. Ceblepyris fimbriatus apud Jerdon, Catal.
C. canus, Sykes,—the young?
Eastern Thrush, Latham.

Inhabits India generally; Ceylon: nec Himalaya.

(1602) *C. cærulescens*.

Syn. Ceblepyris cærulescens, Blyth, J. A. S. XI, 463; XV, 308.

Inhabits Luçon.

Genus LALAGE, Boie.

(1603) *L. orientalis* (*Pl. Enl.* 273, f. 2).

Syn. Lanius orientalis, Gmelin.
Turdus striga, Raffles.
Sylvia leucophæa, Vieillot nec Latham.

Kras, Malay; *Lenjettan*, Jav. Inhabits Malayan peninsula and Archipelago.

Fam. — —?

Genus PERICROCOTUS, Boie.

(1604) *P. speciosus* (Gould's Century, pl. 7).

Syn. Turdus speciosus, Latham.
Muscipeta princeps, Vigors and Gould.

Nget-meng-thu, i. e. 'Prince bird,' Arakan. Inhabits Himalaya; C. India: rare in S. India and in L. Bengal: Assam, Sylhet, Arakan, Tenasserim, Malayan peninsula (Penang).

(1605) *P. flammeus* (Swainson's *Zool. Ill.* 2nd series, pl. 52; Jerdon's *Ill. Ind. Orn.* pl. 11).

Syn. Muscicapa flammea, Forster, Pennant's Ind. Zool.
M. subflava, Vieillot.
Phœnicornis elegans, McClelland, P. Z. S. 1839, p. 156.
August Flycatcher, Latham (but the preceding species also referred to).

Phari Bulal Chasa, H. (Jerdon); Inhabits S. India: Ceylon. Assam? (vide J. A. S. XV, 309).

(1606) *P. brevirostris* (Gould's 'Century,' pl. 8).

Syn. Muscipeta brevirostris, Vigors and Gould.
Phœnicornis miniatus apud Swainson, Class. Birds.

Inhabits Himalaya; Assam; Sylhet; Arakan: rare in C. and S. India.

(1607) *P. igneus*, Blyth, J. A. S. XV, 309.

Syn. Malayan P. flammeus, Auctorum.

Uwis, or *Semuttan*, Java. Inhabits Malay countries.

(1608) *P. solaris*, Blyth, J. A. S. XV, 310. Inhabits Sikim.

(1609) *P. roseus.*

Syn. Muscicapa rosea, Vieillot.
Phœnicornis affinis, McClelland, P. Z. S. 1839, p. 157.

Nget-meng-tha-mee (*i.e.* 'Princess-bird'), Arakan. Inhabits India generally; Arakan.

(1610) *P. peregrinus* (Gould's 'Century.' pl. 9).

Syn. Parus peregrinus et Motacilla cinnamomea, L.
P. coccineus et malabaricus, Gmelin.

Bulal Chusm, H. (Jerdon). Inhabits India generally; Ceylon; Arakan.

(1611) *P.* (?) *erythropygius* (Latham's *Gen. Hist.* Vol. VI, p. 178, pl. 98); Jardine's *Contrib. Orn.*, pl. 1).

Syn. Muscicapa erythropygia, Jerdon, Madr. Journ. XI, 17.
Turdus speciosus, var. β. and Cawnpore Flycatcher, Latham.

Inhabits Hindustan (nec L. Bengal).

Fam. AMPELIDÆ.

Genus COCHOA, Hodgson (*Cocho*, Nepal).

(1612) *C. purpurea*, Hodgson, J. A. S. V, 359 (J. A. S. No. 139, pl.). Inhabits Nepal; Sikim.

Fam. PITTIDÆ.

Subfam. EURYLAIMINÆ.

Genus EURYLAIMUS, Horsfield.

Subgenus CORYDON, Lesson.

(1613) *C. sumatranus* (*Pl. Col.* 297).

Syn. Eurylaimus sumatranus, Raffles.
Eu. corydon, Temminck.
Eu. Temminckii, Lesson.
Eurylaimus? Hay, J. A. S. X, 575.

Kungquait, Malay. Inhabits Tenasserim provinces; Malayan peninsula; Sumatra.

Subgenus EURYLAIMUS.

(1614) *Eu. javanicus*, Horsfield, (*Pl. Col.* 130, 131; *Zool. Res. in Java*, pl.)

Syn. Eu. Horsfieldi, Temminck.
Tamplana Lilin, Malay.

Inhabits Arakan; Tenasserim; Malayan peninsula and Archipelago.

(1615) *Eu. ochromalus*, Raffles (*Pl. Col.* 261).

Syn. Eu. cucullatus, Temminck.
Tamplana Qilin, Malay.

Inhabits Tenasserim provinces; Malayan peninsula and Archipelago.

(1616) *C. nasutus* (*Pl. Col.* 154).

Syn. Todus nasutus, Latham.
T. macrorhynchus, Gmelin.

Ujun and *Tudak Whogan*, Malay; *Palano*, or *Tampalano*, Sum. Inhabits Tenasserim provinces; Malayan peninsula and Archipelago.

(1617) *C. affinis*, Blyth, J. A. S. XV, 312. Inhabits Arakan.

Subgenus PSARISOMUS, Swainson.

(1618) *Ps. Dalhousiæ* (Gould's *Icones Avium*; Royle's *Ill. Him. Bot.* pl. 7).

Syn. Eurylaimus Dalhousiæ, Jameson.
Eu. psittacinus, Muller.
Raya sericeogula, Hodgson, J. A. S. VIII, 36.

Inhabits Himalaya; Assam; Sylhet; Arakan.

Subgenus SERILOPHUS, Swainson.

(1619) *S. lunatus* (*Trans. Zool. Soc.*, pl. 25).

Syn. Eurylaimus lunatus, Gould.
S. lunulatus, Swainson.

Inhabits Tenasserim provinces.

(1620) *S. rubropygia*, J. A. S. XV, 311.

Syn. Raya rubropygia, Hodgson, J. A. S. VIII, 36.
Eu. lunatus apud Horsfield, P. Z. S. 1839, p. 156.

Inhabits S. E. Himalaya; Assam; Sylhet; Arakan.

Subfam. PIPRINÆ.

Genus CALYPTOMENA, Raffles.

(1621) *C. viridis*, Raffles. (*Pl. Col.* 316; Horsfield's *Zool. Res. in Java*, pl.)

Syn. C. Rafflesii et C. caudacuta (the young), Swainson.

Sehoo, *Pachat*, *Sampo Penang*, Malay. Inhabits Malayan peninsula; Sumatra.

Fam. HIRUNDINIDÆ.

Genus HIRUNDO, L.

Chatok, H.; *Mo-tswai-nghet*, or *Pgan-hlwa*, Arakan; *Layang Layang*, Malay.

(1622) *H. filifera*, Stephens.

Syn. H. ruficeps (?), Lichtenstein.
H. filicaudata, Franklin, P. Z. S. 1831, p. 115.
H. indica et H. erythrocephala (?), Gmelin.

Inhabits C. India chiefly; rare in S. India; Deyra Doon; Katak.

(1623) *H. rustica*, L. (*Pl. Enl.* 543, f. 1).

Syn. H. gutturalis, Scopoli.
H. javanica, Sparrman.
H. panayana, Latham.
H. jewan, Sykes, P. Z. S. 1832, p. 83.

Inhabits Europe, Asia, and Africa; visiting India during the cold seasoa.

(1624) *H. domicola*, Jerdon, *Madr. Journ.* XIII, 173.

Syn. H. javanica apud Latham and Shaw.
Bungalow Swallow of residents in the Nilgiris.

Inhabits Malay countries; Nilgiris.

(1625) *H. daurica*, L.

Syn. H. alpestris, Pallas.
H. erythropygia, Sykes, P. Z. S. 1832, p. 83.
H. nipalensis, Hodgson, J. A. S. V, 780.

Inhabits E. Asia: common during the winter months in India, China, and Malasia.

(1626) *H. hyperythra*, Blyth, J. A. S. XVIII; *Mon. Ind. Hirundinidæ*. Inhabits Ceylon (resident).

(1627) *H. urbica*, L. (*Pl. Enl.* 542, f. 2). Inhabits Europe; N. Africa; rare in India.

(1628) *H. rupestris*, Scopoli (Gould's *B. E.* pl. 56).

Syn. H. montana, Gmelin.
H. rupicola, Hodgson, J. A. S. V, 781.
H. inornata, Jerdon, Madr. Journ. XIII, 173.

Inhabits S. Europe; N. Africa; W. Asia; Himalaya; Nilgiris.

1629. *H. concolor*, Sykes, P. Z. S. 1832, p. 83. Inhabits C. India.

1630) *H. riparia*, L. (*Pl. Enl.* 543, f. 2). Inhabits Northern regions; Africa; N. India (banks of Sutlej); C. India (rare).

(1631) *H. sinensis*, Hardwicke's *Ill. Ind. Zool.*,

Syn. H. brevicaudata, McClelland, P. Z. S. 1839, p. 156.

Inhabits river banks of all India; Burmah, and China (?).

Fam. ARTAMIDÆ.

Genus ARTAMUS, Vieillot.

(1632) *A. fuscus*, Vieillot (*Mem. Mus.* Tom. VI, fig.).

Syn. Oecypterus rufiventer, Valenciennes.
A. leucorhynchos, (L.) apud McClelland P. Z. S. 1839, p. 158, et Jerdon, Catal.
Murasiny Chatterer and Brown-coloured Swallow, var. A. Latham.

Tal-chatok Beng. Inhabits India generally; Assam; Arakan.

Fam. DICRURIDÆ.

Genus DICRURUS, Vieillot (*Chibya*, Nepal; *Chayon* or *Chagon*, Malay).

Subgenus CHIBIA, Hodgson.

(1633) *Ch. hottentota*.

Syn. Corvus hottentotus, L.
Edolius barbatus, Gray.
E. crishna, Gould, P. Z. S. 1836, p. 5.
Criniger splendens, Tickell, J. A. S. II, 514.
Chibia casia, Hodgson, Ind. Rev. 1837, p. 324.
Krishna Crow, Latham.

Kesh-raj, B.; *Kesya*, Nepal. Inhabits Bengal; Nepal; Assam; C India; rare in the peninsula of India (vide *Madr. Journ.* XIII, pt. 2. 121.

Subgenus CHAPTIA, Hodgson.

(1634) *Ch. ænea* (Vaill. *Ois. d' Afr.* 176).

Syn. Dicrurus æneus, Vieillot.
D. æratus, Stephens.
Ch. muscipetoides, Hodgson, Ind. Rev. 1837, p. 327.

Butchanga, Beng.; *Chaptya* (i. e. 'flat-billed'), Nepal. Inhabits Nepal; Bengal: Assam.

(1635) *Ch. malayensis*, A. Hay, J. A. S. XV, 294. Inhabits Malayan peninsula.

Subgenus BHRINGA, Hodgson.

(1636) *Bh. remifer*, (*Pl. Col.* 178).

Syn. Edolius remifer, Temminck.
E. rangonensis apud Horsfield, P. Z. S. 1839, p. 325.
Bh. tectirostris, Hodgson, Ind. Rev. 1837, p. 325.

Nghet-dan; Arakan. Inhabits Himalaya; Assam.

Subgenus EDOLIUS, Cuvier.

(1637) *E. paradiseus*.

Syn. Cuculus paradiseus, L.

Bherm or *Bhring raj*, H.; *Kate-ongal*, Mahr.; *Kalgia*, Nepal; *Nghet-dan*, Arakan; *Barong Saweh*, and *Chawi*, Malayan. Inhabits India and Malasia.

Var. A. Syn. Chibia malabaroides, Hodgson, Ind. Rev. 1837, p. 325.
Lanius malabaricus as figured by Latham and Shaw (but not L. malabaricus as described by Latham from Sonnerat).
E. grandis apud Blyth, J. A. S. XI, 170; Ann. Mag. N. H. XIV, 46.

Inhabits Nepal; Tippera; Tenasserim provinces.

Var. B. Syn. E, grandis, Gould, P. Z. S. 1836, p. 5.
E. dentirostris and E. orissæ (?), Jerdon, Madr. Journ. XIII, pt. 2, p. 121.
Dicrurus platurus, Vieillot, apud G. R. Gray.

Inhabits India; Bengal Sundarbuns; Assam; Arakan; Tenasserim provinces.

Var. C. Syn. Cuculus paradiseus, L.
E. rangonensis, Gould, P. Z. S. 1836, p. 5.
E. intermedius, Lesson, apud G. R. Gray.
E. cristatellus, Blyth, J. A. S. XI, 171.

Inhabits Malay countries.

Subgenus DICRURUS, Vieillot.

(1638) *D. edoliformis*, Blyth, J. A. S. XV, 297. Inhabits Ceylon.

(1639) *D. viridescens*, Gould (vide J. A. S. XI, 173, and 802, figs. 10 and 11). Inhabits Burmah.

(1640) *D. balicassius* (*Pl. Enl.* 603).

Syn. Corvus balicassius, L.
Oriolus furcatus, Gmelin.
Bhuchanga annectans, Hodgson, Ind. Rev. 1837, p. 326.
Dicrurus affinis, Blyth, J. A. S. XI, 147.
Corvus afer, Licht., and
C. assimilis, Bechstein, apud G. R. Gray.

Inhabits Malay countries; Nepal.

(1641) *D. macrocercus*, Vieillot (*As. Res.* XVIII, pt. 2. pl.).

Syn. Muscicapa biloba, Lichtenstein.
D. indicus, Stephens, Hodgson.
Bhuchanga albirictus, Hodgson, Ind. Rev. 1837, p. 326.
Edolius forficatus, Horsfield, in Lin. Tr. XIII, 144 (apud Strickland).
E. longus, Vaill., apud Horsfield.

Finga, Beng.; *Kalsa*, or *Bajunga*, sometimes also *Kotical*, H. (Jerdon); *Gyga-mgee-tshwai*, Arakan; *Sri Ganting*, Jav. Inhabits India generally; Arakan; Java?

(1642) *D. longicaudatus*, A. Hay described in *Ann. Mag. N. H.* 1844, p. 461; Jerdon, *Madr. Journ.* XIII, pt. 2, p. 121; J. A. S. XV, 298.

Syn. D. macrocercus apud Jerdon, Catal.
D. cinereaceus apud Gray, Hodg. Catal.

Nil Finga, and *Dhouh*, Beng. Inhabits India generally; Ceylon.

(1643) *D. interedius*, Blyth, J. A. S. XV, 298. Inhabits Tenasserim provinces; Penang.

(1644) *D. caerulescens* (Edwards, pl. 56), vide *Ann. Mag. N. H.* 1844, p. 47.

Syn. Lanius caerulescens, L.
L. fingah, Shaw.

Phari Bajunga H. (Jerdon). Inhabits India generally; not common in L. Bengal.

(1645) *D. leucopygialis*, Blyth, J. A. S. XV, 298. Inhabits Ceylon.

(1646) *D. cinereaceus*.

Syn. Edolius cinereaceus, Horsfield, Lin. Tr. XIII, 145.
D. leucopæus (?), Vieillot.
D. ceylonensis (?), Stephens.

Chenta, Jav. Inhabits Malay countries.

Fam. TCHITREADÆ.

Genus TCHITREA, Lesson.

(1647) *Tch. paradisi* (Vaill., *Ois. d' Afr.*, pl. 44, 45, 46; Jerdon's *Ill. Ind. Orn.* pl. 7).

Syn. Muscicapa paradisi, L.
M. indica, Stephens. } the rufous
M. castanea, Temminck. } plumage.
M. mutata of India, Latham.
Muscipeta leucogaster, Swainson, Nat. Libr., Muscicapidæ.

Shah Bulbul, and *Hosseini Bulbul*, H.; *Kaddehoora*, Cingh; (the white bird;) and *Sultana Bulbul*, H.; *Ginihoora*, Cingh.; (the chesnut bird;) *Tonka Peegeelee-pitta* (*i. e.* 'long-tailed Bulbul'), Telugu; *Walkordalatee*, Tamul. Inhabits India generally; Bengal; Deyra Doon.

(1648) *Tch. affinis*, A. Hay, J. A. S. XV, 292; XVII, 1179.

Syn. Malayan Tch. paradisi, Auctorum.
M. castanea (?), Temminck.

Ahtap, and *Mira Jabone*, Malayan. Inhabits Malay countries; Tenasserim; Arakan; Sikim; Nepal?

(1649) *Tch. atrocaudata* (?), Eyton, vide J. A. S. XV, 298.

Syn. Muscipeta atriceps, Blyth, J. A. S. XI, 203, 790.

Inhabits Malayan peninsula.

Genus MYIAGRA, Swainson.

(1650) *M. caerulea* (Vaill. *Ois. d'Afr.*, 158).

Syn. Muscicapa caerulea, Vieillot.
M. occipitalis, Vigors.
M. caeruleocephala, Sykes (the female).
Azure-headed Flycatcher, Latham.

Kala-mata Kutkutia, B. Inhabits India generally; Burmese and Malay countries; Philippines.

Genus PHILENTOMA, Eyton.

(1651) *Ph. velatum* (*Pl. Col.*).

Syn. Muscicapa velata, Temminck.
M. pectoralis, A. Hay, Madr. Journ. XIII, pt. 2. p. 161, Strickland, Ann. Mag. N. H. XIX, (1847), p. 131.

Inhabits Malayan peninsula and Archipelago.

(1652) *Ph. pyrrhopteron* (*Pl. Col.* 596, f. 2).

Syn. Muscicapa pyrrhoptera, Temminck.
Muscipeta plumosa, Blyth J. A. S. XI, 79.
Ph. castaneum, Eyton, Ann. M. N. H. XVI, (1845), p. 229

Inhabits Malayan peninsula and Archipelago.

Genus CRYPTOLOPHA, Swainson.

(1653) *Cr. cinereocapilla* (Swainson's *Zool. Ill.* pl. 13; *Nat. Libr.* Vol. on Flycatchers, pl. 23).

Syn. Muscicapa cinereocapilla, Vieillot.
Platyrhynchus ceylonensis et
Cr. poiocephala, Swainson.
Muscicapa nitida, var. A, Latham.

Inhabits India generally; Assam; Arakan; Tenasserim.

Genus RHIPIDURA, Vigors and Horsfield.

(1654) ***Rh. hypoxantha***, Blyth, J. A. S. XII, 935.

Syn. Chelidorhynx chrysoschistos, Hodgson, P. Z. S. 1845, p. 32.

Inhabits Nepal; Sikim.

Genus LEUCOCERCA, Swainson.

(1655) *L. fuscoventris*, Franklin, P. Z. S. 1831, p. 117.

Syn. Muscicapa sannio, Sundevall.
M. (Muscylva) albogularis (?), Lesson, the young?
Broad-tailed Flycatcher, Latham.

Chok Doyal, Beng. Inhabits L. Bengal; C. India.

(1656) *L. albofrontata* (Jerdon's *Ill. Ind. Orn.* pl. 2). *Rhipidura albofrontata*, Franklin, P. Z. S. 1831, p. 117. Inhabits India generally (nec alluvium of L. Bengal.)

(1657) *L. pectoralis*, Jerdon. J. A. S. XII, 953; Jerdon's *Ill. Ind. Orn.*, Art. *Rh. albofrontata*. Inhabits Nilgiris.

(1658) *L. javanica*.

Syn. Muscicapa javanica, Sparrman.
Platyrhynchus perspicillatus, Vieillot.

Murai-Kandang, Sum.; *Sikattan*, Jav. Inhabits Malay countries.

Fam. PYCNONOTIDÆ.

Genus HYPSIPETES, Vigors. (*Bulbul*, H.: *Boot Boot*, Arakan).

(1659) *H. olivacea*, Jardine and Selby, *Ill. Orn.* 2nd series (figured erroneously as *H. ganeesa*, Sykes, in 1st series, pl. 168).

Syn. Ixocincla olivacea, Bl., described J. A. S. XIV, 575.

Inhabits Mauritius.

(1660) *H. psaroides*, Vigors (Gould's 'Century,' pl. 10). *Ban Bukra* ('Jungle Goat,' from voice), Masuri (Hutton). Inhabits Himalaya; Assam; Arakan.

(1661) *H. nilgiriensis*, Jerdon, *Madr. Journ.* X, 245. Inhabits Nilgiris; Ceylon.

(1662) *H. concolor*, Blyth, J. A. S. XVIII, Inhabits Tenasserim provinces.

(1663) *H. McClellandii*, Horsfield, P. Z. S. 1839, p. 159. Inhabits Himalaya; Assam; Arakan.

(1664) *H. malaccensis*, Blyth, J. A. S. XIV, 574. *Chtap*, Malay. Inhabits Malayan peninsula.

(1665) *H. virescens*, Blyth, J. A. S. XV, 51.

Syn. Ixocincla virescens, Blyth, J. A. S. XIV, 579.

Inhabits Nicobars.

Genus IOLE, Blyth.

(1666) *I. olivacea*, Blyth, J. A. S. XIII, 386; XIV, 573. Inhabits Malay countries.

(1667) *I. virescens*, Blyth, J. A. S. XIV, 573. Inhabits Arakan.

Genus HEMIXOS, Hodgson.

(1668) H. *flavala*, Hodgson, J. A. S. XIV. 572. Inhabits Himalaya; Assam; Arakan; Tenasserim.

(1669) *H. icterica*.

Syn. Criniger? ictericus, Strickland, An. Mag. N. H. 1844, p. 411.
Turdus indicus (?), Gmelin, apud Jerdon.

Inhabits S. India; Ceylon.

Genus CRINIGER, Temminck.

(1670) *Cr. striatus*.

Syn. Trichophorus striatus, Blyth J. A. S. XI, 184.
Alcurus striatus, Hodgson, J. A. S. XII, 985.

Inhabits Himalaya.

(1671) *Cr. flaveolus*.

Syn. Trichophorus flaveolus, Gould, P. Z. S. 1836, p. 6.

Inhabits Himalaya; Arakan.

(1672) *Cr. gularis*.

Syn. Turdus gularis, Horsfield, Lin. Tr. XIII, 150.
Ixos phaiocephalus, Hartlaub.
Trichophorus caniceps, Lafresnaye.
Pycnonotus rufocaudatus, Eyton, Ann. Mag. N. H. 1845, p. 228.

Marba-rimba, Malay; *Bres*, Jav. Inhabits Malay countries.

(1673) *Cr. ochrocephalus*.

Syn. Turdus ochrocephalus, Gmelin.
Trichophorus crispiceps, Blyth, J. A. S. XI, 204.

Baron Baron (same as No. 883), Malay; *Chuchakrawa*, Jav. Inhabits Malay countries.

Genus PYCNONOTUS, Kuhl.

(1674) *P. jocosus*.

Syn. Lanius jocosus, L.
L. emeria, Shaw.
Gracula cristata, Scopoli.
Sitta chinensis, Osbeck, apud G. R. Gray.

Karra Bulbul, *Sepayi Bulbul*, Beng. Inhabits India generally; Arakan; variety (?) in the Tenasserim provinces and Penang.

(1675) *P. bengalensis*, Blyth, J. A. S. XVI, 567.

Syn. P. cafer of India, Auctorum.

Kala Bulbul, Beng. Inhabits Sub-Himalayan region; Assam; Bengal; Mednapur District.

(1676) *P. hæmorrhous*.

Syn. Turdus hæmorrhous, Gmelin.
Hæmatornis pusillus et pseudocafer, Blyth, J. A. S. X, 841.
H. cafer apud Jerdon, Catal.

Inhabits Hindustan generally; S. India; Ceylon; Arakan.

(1677) *P. nigropileus*, Blyth, J. A. S. XVI, 472. Inhabits Tenasserim provinces.

(1678) *P. leucotis*.

Syn. Ixos leucotis, Gould, P. Z. S. 1836, p. 6.

Bhooroo, Sindh. Inhabits Sindh.

(1679) *P. leucogenys*, (Hardw. *Ill. Ind. Zool.*)

Syn. Brachypus leucogenys, Gray.
Ixos plumigerus, Lafresnaye.
Hæmatornis cristatus, Burn.

Inhabits Himalaya; Kashmir.

(1680) *P. xantholaimus* Jerdon (*Ill. Ind. Orn.* pl. 35), J. A. S. XIV, 568. Inhabits E. Ghats of peninsular India.

(1681) *P. goiavier* (Sonn. *Voy.* t. 28.)

Syn. Muscicapa goiavier, Scopoli.
M. psidii, Gmelin.
Turdus analis, Horsfield.

Beribba, Malay; *Chuchack*, Jav. Inhabits Malay countries.

(1682) *P. flavescens*, Blyth, J. A. S. XIV, 568. Inhabits Arakan.

(1683) *P. flavirictus*, Strickland, *Ann. Mag. N. H.* 1844, p. 413.

Syn. Trichophorus virescens, Tem., apud Jerdon. Catal.
Ixos virescens, Tem., apud Tickell, J. A. S. II, 571.
Criniger Tickelli, Blyth, J. A. S. XIV, 571.

Inhabits Peninsula of India; Ceylon; Mednapur jungles, and W. border of the Gangetic delta.

(1684) *P. plumosus*, Blyth, J. A. S. XIV, 567. Inhabits Malayan peninsula.

(1685) *P. brunneus*, Blyth, J. A. S. XIV, 568. *Merlia*, Malay. Inhabits Malayan peninsula.

(1686) *P. Finlaysoni*, Strickland, *Ann. Mag.* N. H. 1844, p. 411. Inhabits Burmese countries. Common in Arakan, Tenasserim, &c.

(1687) *P. sinensis* (Eydoux and Gervais, *Voy. de la Favorite*, pl 14).

Syn. Muscicapa sinensis, Gmelin.
Turdus occipitalis, Temminck.

Inhabits China; Philippines.

(1688) *P. melanocephalus* (Hardw. *Ill. Ind. Zool*).

Syn. Brachypus melanocephalus, Gray.
Br. plumifer (?), Gould, P. Z. S. 1837, p. 137.
Vanga flaviventris, Tickell, J. A. S. II, 537.

Inhabits Himalaya; C. India; Asám, Sylhet, Tippera, Arakan, Tenasserim provinces.

(1689) *P. atricapillus* (Levaillant, *Ois. d' Afr.*, pl. 140; much too dully coloured).

Syn. Ægithina atricapilla, Vieillot—nec P. atricapillus, (Vieillot), apud Lord A. Hay, described J. A. S. XIV, 569.
Rubigula aberrans, Blyth, J. A. S. XV, 287; XVI, 472.

Inhabits Ceylon.

(1690) *P. gularis* (Jerdon's *Ill. Ind. Orn.*, pl. 37).

Syn. Brachypus gularis, Gould, P. Z. S. 1835, p. 186.
Br. rubineus, Jerdon, Madr. Journ. X, 246.

Inhabits S. India.

(1691) *P.* (?) *cyaniventris*, Blyth, J. A. S. XI, 792.

Syn. Ixodia (afterwards changed to Ixidia) cyaniventris, Blyth, J. A. S. XIV, 578.
Malacopteron aureum, Eyton, Ann. Mag. N. H. 1845, p. 228.
Turdus No. 6, Raffles, Lin. Tr. XIII, 311.

Inhabits Malayan peninsula; Sumatra.

Genus MICROTORSUS, Eyton (*Macrocelis* ? Swainson).

(1692) *M. melanoleucos*, Eyton, P. Z. S. 139, p. 102.

Syn. Brachypodius tristis, Blyth, J. A. S. XIV, 576,—the young.

Labau, and *Mirba Tando*, Malay. Inhabits Malayan peninsula.

Genus BRACHYPODIUS, Blyth.

(1693) *Br. cinereoventris*, Blyth, J. A. S. XIV, 576. Inhabits Tippera.

(1694) *Br. poiocephalus*, Jerdon (*Ill. Ind. Orn.* pl. 31)); *Madr. Journ.* X, 246. Inhabits S. India.

Genus SETORNIS (?), Lesson.

(1695) *S.* (?) *criniger*.

Syn. Brachypus (?) criniger, A. Hay, J. A. S. XIV, 577.

Inhabits Malayan peninsula.

Subfam. PHYLLORNINÆ.

Genus PHYLLORNIS, Boie (*Hariwa*, Beng.)

(1696) *Ph. Hardwickii* (Ad. Delessert, *Voy. dans. l'Inde*, pt. 2, pl. 7).

Syn. Chloropsis Hardwickii, Jardine and Selby, Monag.
Chl. curvirostris, Swainson, 2½ Centen. .
Chl. cyanopterus, Hodgson.
Chl. chrysogaster, McClelland, P. Z. S. 1839, p. 167.
Chl. auriventris, Guérin.

Boing-dan-thay, Arakan. Inhabits Himalaya; Assam; Sylhet; Arakan.

(1697) *Ph. aurifrons* (Jardine and Selby, *Orn. Ill.* pl. 5).

Syn. Chloropsis aurifrons, Jardine and Selby, Monog.
Chl. malabaricus, ibid. (tab. cit.)

Subz Harica, Nepal; *Nget-tsin*, Arakan. Inhabits S. India; Himalaya; Assam; Sylhet; Arakan.

(1698) *Ph. malabaricus*.

Syn. Turdus malabaricus, Gmelin, No. 125.
Chloropsis aurifrons apud Jerdon, Catal.

Inhabits Indian peninsula; Ceylon?

(1699) *Ph. Jerdoni*, Blyth, J. A. S. XIV, 566 Jerdon's *Ill. Ind. Orn.* pl. 43).

Syn. Chloropsis gamsorhynchus (mispelt cæsmarhynchos, v. casmarhynchus apud Gray, Griffith's Transl. An. Kingd. VI, 391), apud Tickell, J. A. S. II, 577.
Chl. cochinchinensis apud Jerdon, Catal.
Blue chinned Thrush, Latham.

(1700) *Ph. cochinchinensis* (*Pl. Cl.* 414, f. 2, apud Strickland).

Syn. Turdus cochinchinensis, Lath., Gm., the adult; and
T. malabaricus apud Latham—the young.
Chloropsis malabaricus apud Eyton, P. Z. S. 1836, p. 102; and Blyth, J. A. S. XII, 967, (nec form).
Philemon nigricollis (?), Vieillot.
Meliphaga javensis, Horsfield.
Phyllornis moluccensis, Gray.

Nget-tsin (same as No. 1283), Arakan; *Chuchakija*, Jav. Inhabits Burmese and Malay countries generally; Arakan.

(1701) *Ph. Sonneratii* (Jardine and Selby, *Orn. Ill.* pl. 100).

Syn. Chloropsis Sonneratii, Jardine and Selby.
Phyllornis Mulleri, Temminck.
Chl. gampsorhynchus, Jardine and Selby. } young.
Chl. zosterops, Vigors. } young.
Turdus viridis, Horsfield. } young.

Daon, or *Dawoan*, Malay. Inhabits Malay countries generally.

(1702) *Ph. cyanopogon*, Temminck, (*Pl. Col.* 512, f. 1).

Syn. Chloropsis mysticalis, Swainson, 2¼ Centen.; the young; described as that of and was referred erroneously to Ph. malabaricus, J. A. S. XII, 957.

Inhabits Malay countries generally.

Genus IORA, Horsfield.

(1703) *I. innotata*, Blyth, J. A. S. XVI, 472. Inhabits Arakan.

(1704) *I. zeylanica* (Brown's *Ill.*; pl. 15, 32; Lev. *Ois. d' Afr.*, pl. 141).

Syn. Motacilla zeylanica, cingalensis, et melanitera, Gmelin.
Fringilla multicolor, Latham.
Iora melaceps, Swainson.

Show Bhugah, or *Show Bheegee*, H. (Jerdon). Inhabits S. India; Ceylon; Deyra Doon (?).

(1705) *I. typhia* (Edwards, pl. 79).

Syn. Motacilla typhia, L.
Ficedula bengalensis, Brisson.

Fatikja, and *Toufik*, Beng. Inhabits Bengal; Nepal; Assam; Arakan; Tenasserim provinces; Malayan peninsula. The exceedingly common *Iora typhia* of Bengal very rarely exhibits any black about the cap and back at any season of the year; and those of the whole eastern side of the Bay of Bengal appear to be similiar: but occasionally specimens are met with, which have assumed less or more of this colouring, and which are perhaps hybrids, like those between *Coracias indica* and *C. affinis*, *Treron phœnicoptera* and *Tr. Jerdoni*, and a few other analogously affined races).

(1706) *I. scapularis*, Horsfield (*Zool. Res. in Java*, pl. —the female), J. A. S. XIII, 381.

Durong Capas, Malay; *Cheetoo*, Jav. Inhabits Malay countries.

Genus IRENA, Horsfield.

(1707) *I. puella* (Horsfield's *Zool. Res. in Java*, pl.).

Syn. Coracias puella, Latham.

Nget-pya-zah, Arakan; *Quayang*, and *Biang Kapoor*, Malay; *Bressi*, Jav. Inhabits C. and S. India; Assam; Burmah; Malay countries. *Malayan race* with lower tail-coverts reaching nearly to end of tail.

Fam. MELIPHAGIDÆ.

Subfam. ORIOLINÆ.

Genus ORIOLUS, L. (*Huldikaka*, Beng.)

(1708) *O. Traillii* (Gould's 'Century,' pl. 35; J. and S., *Orn. Ind.*, *2nd* series, pl. 26).

Syn. Pastor Traillii, Vigors.

Inhabits Himalaya; Assam; Burmah (Arakan, Tenasserim).

(1709) *O. melanocephalus*, L.

Syn. O. maderaspatanus, Franklin. } the young.
O. McCoshii, Tickell, J. A. S. II, 577. } the young.
O. Hodgsonii (?), Swainson.

Bania-bhou, Beng.; *Nghet-wa*, Arakan. Inhabits Bengal; Kutak; C India; Nepal; Assam; Arakan; Tenasserim;—distinct race in Ceylon, and Malabar (?).

(1710) *O. larvatus*, Lichtenstein (Lev., *Ois. d' Afr*, pl. 261, 262).

Syn. O. radiatus (?), Gmelin.
O. condonguar, Temminck.
O. capensis, Swainson.
O. monachus (Gm.), apud Wagler.
O. chloris, Cuvier.

Inhabits S. Africa.

(1711) *O. xanthonotus*, Horsfield (*Zool. Res. in Java*, pl. ; *Pl. Col.* 214).

Syn. O. leucogaster, Reinwardt.
O. castanopterus, Blyth, J. A. S. XI, 795 (the young).

Sepong Rayate, Malay. Inhabits Malay countries.

(1712) *O. chinensis*, L.

Syn. O. cochinchinensis, Brisson.
O. acrorhynchos, Vigors, P. Z. S. 1831, p. 97.

Inhabits China.

(1713) *O. macrourus*, Blyth, J. A. S. XV, 46. Inhabits Nicobar Islands.

(1714) *O. indicus*, Brisson (Jerdon's *Ill. Ind. Orn.*, pl. 15).

Syn. O. chinensis et cochinchinensis of India, Auctorum.
O. coronatus (?), Swainson, vel hippocrepis (?), Wagler.
Le Loriot des Indes, Buffon.

Inhabits Peninsular India; rare in Bengal; common in Burmese and Malay countries; also China.

(1715) *O. tenuirostris*, Blyth, J. A. S. XV, 48. Inhabits ——————?

(1716) *O. kundoo*, Sykes (the young).

Syn. O. galbula apud Franklin and Sykes (the adult).
O. aureus, Jerdon's Catal.
O. galbuloides, Gould.

Peebeck, H. (Jerdon). Inhabits Hindustan generally; nec L. Bengal.

(1717) *O. galbula*, L. (*Pl. Enl.* 26).

Syn. Coracias oriolus, Scopoli.

Inhabits Europe; W. Asia; N. Africa.

(1718) *O. viridis* (Gould's B. A. Vol. IV, pl. 13).

Syn. Gracula viridis and Coracias sagittata, Latham.
O. variegatus, Vieillot.
Mimeta viridis, King.
M. meruloides, Vigors and Horsfield.

Inhabits N. S. Wales.

Genus SPHECOTHERES, Vieillot.

(1719) *Sph. viridis*, Vieillot (Gould's B. A. Vol. IV, pl. 15).

Syn. Sph. virescens, Jardine and Selby.
Sph. australis et canicollis, Swainson.
Turdus maxillaris (?,) Latham.

Inhabits Australia.

Subfam. MELIPHAGINÆ.

Genus ENTOMYZA, Swainson.

(1720) *E. cyanotis* (Gould's B. A. Vol. IV, pl. 68).

Syn. Gracula cyanotis, Turdus cyaneus, et Merops cyanops, Latham.

Inhabits N. S. Wales.

Genus ZOSTEROPS, Vigors and Horsfield.

(1721) *Z. palpebrosus* (*Pl. Col.* 292, f. 3).

Syn. Sylvia palpebrosa, Temminck.
S. annulosa, var. a, Swainson.
Z. maderaspatana (v. madagascariensis of India), auctorum (vide J. A. S. XIV, 562).

Inhabits India generally (nec L. Bengal), from the Himalaya to Ceylon; Assam; Arakan; Tenasserim provinces; Nicobar Islands.

Fam. NECTARINIIDÆ.

Shakar-Khora (i. e. 'Sugar-sucker;') H.; *Mor-chang*, Beng.; *Tutika*, Cingh.; *Pan-bweng-tsot* (*i. e.* 'Flower-pecker'), Arakan.

Genus ARACHNOTHERA, Temminck.

(1722) *A. magna*.

Syn. Cinnyris magna, Hodgson, Ind. Rev. 1837, p. 272; J. A. S. XII, 951.
A. inornata of Assam apud Horsfield P. Z. S. 1839, p. 167; vide J. A. S. XII, 981.

Inhabits Nepal; Sikim; Assam; Sylhet; Arakan.

(1723) *A. flavigaster*.

Syn. Anthreptes flavigaster, Eyton, P. Z. S. 1839, p. 105, J. A. S XIV, 557.

Chechap Rimba, or *Kolechap Pangone*, Malay. Inhabits Malayan peninsula.

(1724) *A. chrysogenys*, Temminck, (*Pl. Col.* 338, f. 1); J. A. S. XII. 981; XV, 43.

Syn. Certhia longirostra apud Raffles, Lin. Tr. XIII. 299, (nec Latham).

Siap jantung, Malay. Inhabits Malayan peninsula; Sumatra.

(1725) *A. inornata*, Temminck (*Pl. Col.* 84).

Syn. Cinnyris affinis, Horsfield, Lin. Tr. XIII, 66.

Chess, Jav. Inhabits Java.

(1726) *A. modesta*.

Syn. Anthreptes? modesta, Eyton, P. Z. S. 1839, p. 105.
Ar. latirostris, Blyth, J. A. S. XII, 982.

Chichap Nio, Malay. Inhabits Malayan peninsula.

(1727) *A. robusta*, Muller (*Zool. Ind. Arch.*, t. 2, f. 1); described J. A. S. XV, 43, No. 6. Inhabits Sumatra.

(1728) *A. longirostra* (Griffith's *Transl. An. Kingd.* VII, 391, pl.)

Syn. Certhia longirostra, Latham (nec Raffles).

Prit Andun, Jav. Inhabits Java.

(1729) *A. affinis*, Blyth, J. A. S. XV, 43.

Syn. A. inornata apud Blyth, J. A. S. XII 982.
Cinnyris longirostris, Jerdon, Madr. Journ. XIII, 172.

Inhabits Arakan; Tenasserim provinces; Malayan peninsula; very rare in S. India.

Genus NECTARINIA, Illiger.

(*A.* With elongated middle tail-feather in the males).

(1730) *N. goalpariensis* (Royle's *Ill. Him. Bot.*, pl. 7), J. A. S. XII, 969.

Syn. Certhia goalpariensis, Latham.
Cinnyris Vigorsii (the male), and C. concolor (the female), Sykes, P. Z. S. 1832, pp. 98, 99.
C. miles, Hodgson, Ind. Rev. 1837, p. 273.
C. labecula, McClelland, P. Z. S. 1839, p. 167.
N. seheriæ, Tickell, J. A. S. II, 577.
N. Lathami, Jardine, Nat. Libr.

Inhabits Sub-Himalaya region; C. and S. India; Assam; Sylhet; Arakan; Tenasserim provinces.

(1731) *N. siparaja* (*Pl. Col.* 126, f. 3).

Syn. Certhia siparaja, Raffles, Lin. Tr. XIII, 299.
N. mysticalis, Temminck.

Sipa Raja, Malay. Inhabits Malayan peninsula and archipelago.

(1732) *N. Gouldiæ* (Gould's 'Century,' pl. 56), J. A. S. XII, 974.

Syn. Cinnyris Gouldiæ, Vigors, P. Z. S. 1831, p. 44.

Inhabits Sikim; Sylhet; Arakan.

(1733) *N. ignicauda* (*Nat. Libr., Nectariniidæ*, pl. 29); J. A. S. XII, 972.

Syn. Cinnyris ignicauda, Hodgson, Ind. Rev. 1837, p. 972.
C. rubricaudata, Blyth, mentioned J. A. S. XI, 192.
N. phœnicura, Jardine, Nat. Libr.

Inhabits Nepal; Assam; Sylhet.

(1734) *N. nipalensis* (*Nat. Libr., Nectariniidæ*, pl. 27); J. A. S. XII, 974.

Syn. Cinnyris nipalensis, Hodgson, Ind. Rev. 1837, p. 273.

Inhabits S. E. Himalaya.

(1735) *N. Horsfieldi*, Blyth, J. A. S. 975. Inhabits N. W. Himalaya.

(1736) *N. saturata* (*Nat. Libr., Nectariniidæ*, pl. 29): J. A. S. XII, 976.

Syn. Cinnyris saturata, Hodgson, Ind. Rev. 1837, p. 273.
C. assamensis, McClelland, P. Z. S. 1839, p. 167.
C. Hodgsonis, Jardine, Nat. Libr.

Inhabits S. E. Himalaya; Assam.

(1737) *N. lotenia* (*Nat. Libr., Nectariniidæ*, pl. 23—not good).

Syn. Certhia lotenia, L.
C. polita, Latham.
C. purpurata, Shaw.

Inhabits S. India; Ceylon.

(1738) *N. asiatica* (*Nat. Libr., Nectariniidæ*, pl. 24); J. A. S. XII, 978.

Syn. Certhia asiatica, L.
C. mahrattensis, C. chrysoptera, C. cirrhata, et C. currucaria, Latham.
C. saccharina, Shaw.
Cinnyris orientalis, Franklin, P. Z. S. 1831, p. 122.
C. epauletta et C. strigula, Hodgson, Ind Rev. 1837, p. 272.
C. cyaneus, Encl., Method.

Inhabits India generally; Arakan; Sindh.

(1739) *N. malaccensis* (Swainson's *Zool. Ill.*, 1st series, pl. 121).

Syn. Certhia malaccensis, Scopoli.
C. lepida, Latham.
N. javanica, Horsfield.

Prit-gantil, Jav. Inhabits Burmese and Malay countries (Arakan, Tenasserim).

(1740) *N. simplex*, Muller (*Zool. Ind. Arch.*, t. 8, f. 4).

Syn. N. frontalis, Blyth, J. A. S. XIV, 558.

Inhabits Malayan peninsula; Sumatra.

(1741) *N. phœnicotis*, Temminck (*Pl. Col.* 108, f. 1; 338, f. 2); J. A. S. XII, 979. Inhabits Burmese and Malay countries (Tippera, Arakan, Tenasserim).

(1742) *N. hypogrammica*, Muller (*Zool. Ind. Arch.* t. 8, f. 3).

Syn. N. nuchalis, Blyth, J. A. S. XII, 980, and the female termed Anthreptes macularia, J. A. S. XI, 107.

Inhabits Malayan peninsula; Sumatra; Borneo.

(1743) *N. solaris*, Temminck (*Pl. Col.* 347, f. 3). Inhabits Moluccas.

(1744) *N. pectoralis*, Horsfield (*Pl. Col.* 138).

Syn. N. eximia, Temminck.
Certhia philippensis olivacea, Brisson.

Sri-ganti, Jav. Inhabits Malayan peninsula and archipelago; Nicobar Islands.

(1745) *N. flammaxillaris*, Blyth, J. A. S. XIV, 557.

Syn. N. jugularis apud Blyth J. A. S. XII, 979.

Inhabits Arakan; Tenasserim.

(1746) *N. zeylonica* (*Nat. Libr., Nectariniidæ*, pl. 20,—not good).

Syn. Certhia zeylonica, L.
Cinnyris sola, Vieillot.
C. lepida apud Sykes (female.)

Inhabits Bengal: S. India; Ceylon.

(1747) *N. minima* (*Nat. Libr., Nectaraniidæ*, frontispiece.)

Syn. Cinnyris minima, Sykes, P. Z. S. 1832, p. 98.

Inhabits S. India.

(1748) *N. Hasseltii*, Temminck (*Pl. Col.* 376, f. 3).

Syn. N. Phayrei, Blyth, J. A. S. XI, 1008.
Certhia speeta, var., Raffles.
C. braziliana, Shaw.

Inhabits Burmese and Malay countries (Arakan, Tenasserim).

Genus DICÆUM, Cuvier.

(1749) *D. cruentatum* (Edwards, pl. 81).

Syn. Certhia cruentata, L. (nec apud Horsfield, Lin. Tr. XIII, 168, which = D. rubrocanum, (Tem.), Vaill.Ois. d' Afr. pl. 136).
C. coccinea, Scopoli.
C. erythronotus, Latham.

Inhabits Bengal; Assam; Arakan: Tenasserim; Malayan peninsula.

(1750) *D. trigonostigma* (Sonnerat, *Voy. aux Indes*, pl. 117.)

Syn. Certhia trigonostigma, Scopoli.
C. cantillans, Latham.
D. croceoventre, Vigors.

Beong Nalow, Malay. Inhabits Arakan, Tenasserim; Malayan peninsula; Sumatra.

(1751) *D. chrysorrhœum*, Temminck (*Pl. Col.* 478).

Syn. D. chrysochlorum, Blyth, J. A. S. XI, 1009.

Inhabits Arakan; Tenasserim; Malacca.

(1752) *D. concolor*, Jerdon (*Ill. Ind. Orn.*, pl. 89). Inhabits Nilgiris; Malabar.

(1753) *D. minimum*.

Syn. Nectarinia minima, Tickell, J. A. S. II, 577.
Certhia erythrorhyncha, Latham (founded on the drawing of a young specimen, with colour of bill exaggerated).
D. Tickelliæ, Blyth, J. A. S. XII, 983.
Myzanthe inornata, Hodgson, Gray's Catal.

Inhabits India generally; Ceylon; Arakan. Common in L. Bengal.

Genus MYZANTHE, Hodgson.

(1754) *M. ignipectus*, Hodgson, J. A. S. XII, 983. Inhabits Nepal; Sikim; Butan.

Genus PRIONOCHILUS, Strickland.

(1755) *Pr. thoracicus* (*Pl. Col.* 600, f. 1), J. A. S. XIV, 559.

Syn. Pipra thoracica, Temminck.
P. maculata (?), Temminck (female or young?).

Inhabits Malayan peninsula.

(1756) *Pr. percussus* (*Pl. Col.* 394, f. 2), J. A. S. XIV, 559.

Syn. Pipra percussa, Temminck.
Dicæum ignicapillum, Eyton, P. Z. S. 1839, p. 105.

Nalloo, or *Nalow*, Malayan. Inhabits Malayan peninsula; Sumatra.

Genus PIPRISOMA, Blyth (*Smicrornis*?, Gould).

(1757) *P. agile*, J. A. S. XIII, 314.

Syn. Fringilla agilis, Tickell, J, A S. II, 578.
Pipra squalida, Burton, P. Z. S. 1836, p. 113.
Parisoma (?) vireoides, Jerdon, Madr. Journ. XI, 9.

Inhabits C. India; Himalaya? (Deyra Doon?)

Order IV. GEMITORES.

Fam. COLUMBIDÆ.

Subfam. TRERONINÆ.

Genus TRERON, Vieillot. (*Hurrial*, H.; *Hurtel*, Beng.; *N'goo*, Arakan; *Battagoya*, Cingh.; *Poonai*, Sum.)

Subgenus TORIA, Hodgson.

(1758) *T. aromatica* (*Pl. Enl.* 163).

Syn. Columba aromatica, C. curvirostris, and (the female)
C. tannensis, Gmelin.
Poonai ubar, Sum. (Raffles).

Inhabits Eastern Archipelago.

(1759) Var. *T. nipalensis*, Hodgson, *As. Res.* XIX, 164; J. A. S. XIV, 847. *T'horia* (*i. e.*, 'beaked'), Nepal; *Krocha*, Malay. Inhabits Nepal; Assam; Arakan; Tenasserim provinces; Malayan peninsula; rare in L. Bengal.

(1760) *T. Capellei* (*Pl. Col.* 143).

Syn. Columba Capellei, Temminck.
Vinago giganteus, Vigors, Zool. App. to Lady Raffles's Biog. of Sir St. Raffles, p. 674.
Tr. magnirostris, Strickland, Ann. Mag. N. H. 1844, p. 115.

Inhabits Malayan peninsula; Sumatra.

Subgenus TRERON, Vieillot.

(1761) *Tr. viridifrons*, Blyth, J. A. S. XIV, 849. Inhabits Tenasserim provinces.

(1762) *Tr. phœnicoptera* (Gould's 'Century,' pl. 18; but the feet should have been coloured brilliant yellow); J. A. S. XIV, 849.

Syn. Col. phœnicoptera, Latham.
C. militaris, Temminck.
C. Hardwickii, Gray.

Inhabits Bengal, Assam, Sylhet, Nepal, and all Upper India, southward to C. India, where mingled much with the next race.

(1763) *Tr. chlorigaster*, Blyth, J. A. S. XII, 167; XIV, 850.

Syn. Tr. Jerdoni, Strickland, Ann. Mag. N. H. 1844, p. 167.
Tr. phœnicoptera v. militaris of S. India, Auctorum.

Inhabits Peninsula of India; rare in L. Bengal.

(1764) *Tr. bicincta* (Jerdon's *Ill. Ind. Orn.* pl. 21); J. A. S. XIV, 851.

Syn. Vinago bicincta (the male). and V. unicolor (the female), Jerdon, Madr. Journ. XII, 13, 14.
V. vernans, var., Lesson's Traité.

Inhabits India generally; Ceylon, Nepal, Assam, Sylhet, Arakan, Tenasserim.

(1765) *Tr. viridis* (*Pl. Enl.* 138; J. A. S. XIV, 851.

Syn. Columba viridis, Scopoli.
C. vernans, Gmelin.
C. purpurea, Latham.

Pouye, Malay. Inhabits Malayan peninsula and Archipelago.

(1766) *Tr. chloroptera*, Blyth, J. A. S. XIV, 852. Inhabits Nicobar Islands.

(1767) *Tr. malabarica* (*Nat. Libr. Columbidæ*, pl. 1); Jerdon's *Ill. Ind. Orn.*, Art. *Tr. bicincta*; J. A. S. XIV, 852.

Syn. Vinago aromatica (the male), and V. affinis (the female), Jerdon, Madr. Journ. XII, 13.
Columba pompadora? Gmelin (founded on Brown's 'Illustrations,' pl. 19, 20).

Inhabits S. India; Ceylon? rare in L. Bengal; common in Assam, Sylhet, Arakan, and Tenasserim.

(1768) *Tr. olax* (*Pl. Col.* 241).

Syn. Columba olax, Temminck.

Sembooan, Malay. Inhabits Malay countries.

Subgenus SPHENOCERCUS, G. R. Gray.

(1769) *Sph. cantillans* (Gould's 'Century,' pl. 57).

Syn. Vinago cantillans, Blyth, J. A. S. XII, 166 (cage variety).
V. sphenura, Vigors, P. Z. S. 1841, p. 173
Columba aromatica, var. *A*, Latham (cage variety).

Kokla, or *Kokhela*, H. Inhabits Himalaya.

(1770) *Sph. apicauda*.

Syn. Treron apicauda, Hodgson, Gray's Catal; J. A. S. XIV. 854.

Inhabits S. E. Himalaya; Assam.

(1771) *Sph. oxyura* (*Pl. Col.* 240).

Syn. Columba oxyura, Temminck.
Sphenurus semitorquatus, Swainson.

Inhabits Malay conntries.

Genus PTILINOPUS, Swainson.

(1772) *Pt. melanocephalus* (*Pl. Enl.* 214).

Syn. Columba melanocephala, Pennant.

Jowan Bondol, Jav. Inhabits Java.

(1773) *Pt. jambu* (Tem. *Pigeons*, *t.* 27, 28).

Syn. Columba jambu, Gmelin.

Paonag Gadang, Malay; *Poonai Jambu*, Sum. Inhabits Malayan peninsula; Sumatra.

(1774) *Pt. purpuratus* (Temminck, *Pigeons*, *t.* 24); vide J. A. S. XII, 178 (*bis*).

Syn. Columba purpurata, Latham.
C. Forsteri, Desmarest.
C. kurukuru, Bonnaterre.

Inhabits Ladrones, &c.

(1775) *Pt.* ? Inhabits Navigators' Islands.

Genus CARPOPHAGA, Selby. (*Dukul*, or *Dunkul*, H.)

(1776) *C. sylvatica*; vide J. A. S. XIV, 856.

Syn. Columba sylvatica, Tickell, J. A. S. II, 581.
Carp. ænea of India, Auctorum.

Dunkul, H.; *Soona Kubutra*, Uria; *Pyoonmadee*, Arakan; *Pagam*, Sumatra. Inhabits C. and S. India; Assam; Sylhet; Arakan; Tenasserim; Malayan peninsula; Sumatra; Java? Variety in Nicobar Islands.

(1777) *C. pusilla*, Blyth, J. A. S. XVIII, Inhabits Nilgiris.

(1778) *C. perspicillata* (*Pl. Col.* 246).

Syn. Columba perspicillata, Temminck.

Inhabits Java; Moluccas.

(1779) *C. insignis*, vide J. A. S. XIV, 855.

Syn. Ducula insignis, Hodgson, As. Res. XVIII, 162.
C. cuprea, Jerdon Madr. Journ. XII. p. 12 (subsequently referred to Col. badia, Raffles, ibid. XIII, 164).

Inhabits S. E. Himalaya; Assam; Arakan; Nilgiris.

(1780) *C. bicolor* (Sonn. *Voy. t.* 103).

Syn. Columba bicolor, Scopoli.
C. alba, Gmelin.
C. littoralis, Temminck.

Barung dara lahut, Jav. Inhabits Malayan peninsula and Archipelago; Nicobar Islands.

Subfam. COLUMBINÆ.

Subgenus ALSOCOMUS, Tickell.

(1781) *A. Hodgsonii*.

Syn. Columba Hodgsonii, Vigors, P. Z. S. 1839, p. 16.
C. nipalensis, Hodgson, J. A. S, V, 122; XIV, 867.

Inhabits Himalaya.

(1782) *A. puniceus*, Tickell, J. A. S, XI, 462; XII, 867, 878. Inhabits C. India; Assam; Arakan; Tenasserim.

(1783) *P. torquatus* (*Pl. Enl.* 316).

Syn. Columba palumbus, L.

Inhabits Europe: variety in N. W. Himalaya.

(1784) *P. pulchricollis*.

Syn. Columba pulchricollis, Hodgson, vide J. A. S, XIV, 866.

Inhabits S. E. Himalaya.

(1785) *P. Elphinstonei* (Jerdon's *Ill. Ind. Orn.*, pl. 48).

Syn. Ptilinopus Elphinstonei, Sykes, P. Z. S. 1832, p. 149.

Inhabits Nilgiris.

Subgenus COLUMBA (as restricted).

(1786) *C. livia*, Brisson (*Pl. Enl.* 510). *Jalalaya*, H.; *Parwi*, Mahr.; *Gola* of the dealers. Inhabits Europe; and variety in C. and S. Asia.

(1787) *C leuconota*, Vigors (Gould's 'Century,' pl. 59), J. A. S. XIV, 864. Inhabits Himalaya, near snow region.

Genus MACROPYGIA, Swainson.

(1788) *M. Reinwardtii* (*Pl. Col.* 248).

Syn. Columba Reinwardtii, Temminck.

Inhabits Moluccas, &c.

(1789) *M. rufipennis*, Blyth, J. A. S. XV, 871. Inhabits Nicobar Islands.

(1790) *M. amboinensis*.

Syn. Columba amboinensis, L.

Derkuku-sopa, Jav. Inhabits Tenasserim provinces; Java; Moluccas.

(1791) *M. leptogrammica* (*Pl. Col.* 248); J. A. S. XIV, 869.

Syn. Columba leptogrammica, Temminck.
Coccyzura tusalia, Hodgson, J. A. S. XIII, 936.

Inhabits S. E. Himalaya.

Genus GEOPELIA, Swainson.

(1792) *G. albiventris*, Blyth (*Report on Australian Vertebrata in Mus. As. Soc.*)

Syn. Columba Maugei (?), Temminck.

Inhabits Timor.

(1793) *G. striata* (Temminck, *Pigeons*, *t.* 47).

Syn. Columba striata et C. sinica, L.
C. malaccensis, Gmelin.
C. fowat, Bonnaterre.
C. bantamensis, Sparrman.

Katitiran, Sum.; *Berkutut*, Jav. Inhabits Malayan peninsula and archipelago.

Genus TURTUR, Selby. *G'hugu*, Beng.; *Fachta*, H.; *Cobeya*, Cingh.; *Gya*, Arakan; *Palam, or Terkuku*, Mal., Sum.; *Puter*, Jav.

(1794) *T. risoria* (Temminck, *Pigeons*, *t.* 44); vide J. A. S. XIV, 870.

Syn. Columba risoria, L.
T. erythrophrys, Swainson, apud Strickland.

Dhor Factah, H.; *Kalhak, Kahalak, Kahalaki*, or *Paur Ghughu*, Beng. Inhabits N. Africa; S. E. Europe?; S. Asia.

(1795) *T. bitorquatus* (Temminck, *Pigeons*, *t.* 47).

Syn. Columba bitorquata, Temminck.

Puter-genui, Jav. Inhabits Java; Moluccas; Timor.

(1796) *T. humilis* (*Pl. Col.* 258, 259).

Syn. Columba humilis, Temminck.
C. risoria (minor), Franklin—the female.
Asiatic Pigeon, Latham.

Seroti Fachtah, H.; *Golabi* (or 'rose-coloured'), *Tamakhuri* (or 'copper cup'), and *Itkuiya* (or 'brick coloured'), *Ghughu*, Beng.; *Gyo-lengbya*, Arakan. Inhabits India generally; Arakan.

(1797) *T. chinensis* (Sonnerat's *Voy. aux Indes*, *t.* 102); vide J. A. S. XIV, 875.

Syn. Columba chinensis, Scopoli.
C. risoria, var B, Latham.

Inhabits China.

(1798) *T. suratensis* (Temminck, *Pigeons*, *t.* 43); J. A. S. XIV, 874.

Syn. Columba suratensis, Latham.
C. tigrina, Temminck.
C. turtur, L., var., figured in Griffiths' Trans. Ann. Kingd., VIII, 290.

Chitla, Upper Provinces; *Chitroka Fachtah*, H.; *Chañral Ghughu*, or *Telia Ghughu*, B; *Kangskiri*, Bhagulpur; *Cobeya*, Cingh.; *Laybiouk*, Arakan. Inhabits India generally, Burmese and Malay countries.

(1799) *T. orientalis* (*Pl. Col.* 550); J. A. S. XIV, 875.

Syn. Columba orientalis, Latham.
C. meena, Sykes, P. Z. S. 1832, p. 149.
C. gelastis, Temminck.
C. agricola, Tickell, J. A. S. II, 581.
C. ferrago, Eversmann.
C. turtur, var., Raffles?

Balam, or *Terkuku*, Sum., Raffles; *Kulla Fachtah*, H.; *Sun Ghughu*, Beng.; *H'hulga*, Mahratta; *Gyo-pein-doo-ma*, Arakan. Inhabits India generally; Burmah; E. Malasia; N. Asia in summer.

(1800) *T. senegalensis* (Temminck, *Pigeons*, *t.* 45); J. A. S. XIV, 873.

Syn Columba senegalensis, L.
C. cambaiensis, Gmelin.
C. maculicollis, Wagler.

Tortru Fachtah, H. Inhabits India generally (nec alluvium of L. Bengal); W. Asia; Turkey; N. Africa.

Genus CHALCOPHAPS, Gould.

(1801) *Ch. indicus* (Edwards, pl. 14); J. A. S. XIV, 859.

Syn. Columba indica, L.
C. pileata, Scopoli.
C. javanica (?), cyanocephala, et albicapilla, Gmelin.
C. cyanopileata, et griseocapilla, Bonnaterre.
C. superciliaris, Wagler.

Ram Ghughu and *Rhaj Ghughu*, Beng.; *Nil Cobaya*, or *Nillo Cobaya* (*i. e.* 'blue dove') Cingh.; *Gyo-ngyo*, Arakan; *Takoat*, and *Poona*

Tanna, Malay; *Limoo-an*, Sum.; *Delimu*, or *Glimukan*, Jav. Inhabits India; Burmese and Malay countries.

Subfam. GOURINÆ.

Genus CALÆNAS, G. R. Gray.

(1802) *C. nicobarica* (Edwards, pl. 339; *Pl. Enl.* 491).

Syn. Columba nicobarica, L.
C. gallus, Wagler.

Inhabits Andaman and Nicobar Islands; Mergui archipelago; Malayan peninsula.

Order RASORES.

Fam. MEGAPODIIDÆ.

Genus MEGAPODIUS, Quoy and Gaymard.

(1803) *M. nicobariensis*, Blyth, J. A. S. XV, 52, 372. Inhabits Nicobar Islands.

Fam. PHASIANIDÆ.

Subfam. PAVONINÆ.

Genus PAVO, L.

(1804) *P. cristatus*, L. (*Pl. Enl.* 433, 434).

Syn. P. assamensis. McClelland, Ind. Rev. 1838, p. 513.

Mayura, *B.*; *Maur*, H.; *Mra*, or *Marak*, Sum. (Raffles). Inhabits India generally; Assam; Chittagong; Burmah? Sumatra.

(1805) *P. muticus*, L. Vieillot, (*Gal. des Ois.*, *t.* 202).

Syn. P. spiciferus, Vieillot.
P. Aldrovandi, Wilson.
P. javanicus, Horsfield.
P. japonensis, Brisson.

Oo-doung, Arakan; *Pegu Mayura*, B.; *Merak*, Java. Inhabits Burmese and Malay countries; northward to Arakan.

Genus MELEAGRIS, L.

(1806) *M. gallopavo*, L. (Wilson's *Am. Orn.*, Bonap. *Cont.* p. 9).

Syn. M. sylvestris, Vieillot.
Gallopavo sylvestris, Catesby.

Peru, B., H. Inhabits N. America. *A.* Indian domestic variety, male.

Subfam. POLYPLECTRONINÆ.

Genus CERIORNIS, Swainson.

(1807) *C. melanocephala* (Gould's '*Century*,' pl. 63, 64, 65).

Syn. Satyra melanocephala et Phasianus nipalensis, Gray.
Tragopan Hastingsii, Vigors.

Jewar, *Jewari*, Simla. Inhabits N. W. Himalaya.

(1808) *C. satyra* (Gould's '*Century*,' pl. 62).

Syn. Meleagris satyra, L.
Satyra Lathami et Pennantii, Gray.
S. cornuta, G. R. Gray.

Dafia, Beng. (Bhotea?) Inhabits S. E. Himalaya (Nipal, Sikim).

(1809) *C. Temminckii* (Hardwicke's *Ill. Ind. Zool*).

Syn. Satyra Temminckii, Gray.

Inhabits China.

Genus ITHAGINIS, Wagler.

(1810) *I. cruentus* (Hardwicke's *Ill. Ind. Zool.* Tem. *Pl. Col.* 332).

Syn. Phasianus cruentus, Wagler.
Ph. Gardnerii, Hardwicke (female).

Inhabits Nepal.

Genus GALLOPERDIX, Blyth. (Spur-fowl of sportsmen.)

(1811) *G. zeylonensis* (Pennant's *Ind. Zool.* pl. 7).

Syn. Tetrao zeylonensis, Gmelin.
T. bicalcaratus, Pennant.

Aban or *Saban Cuccula*, Cingh. Inhabits Ceylon.

(1812) *G. lunulosa* (Hardwicke's *Ill. Ind. Zool.*; Delessert, *Voy. aux. Indes*, pl. 10; Jerdon, *Ill. Ind. Orn.*, pl. 42, the female).

Syn. Perdix lunulosa, Valenciennes.
P. et Plectrophorus Hardwickii, Gray.
Francolinus nivosus Delessert.

Jitta Kodi. Telugu. Inhabits Rajmahl; C. W.; and S. India.

(1813) *G. spadiceus* (Hardwicke's *Ill. Ind. Zool.*, the female).

Syn. Tetrao spadiceus, Gmelin.
T. madagascariensis. Scopoli.
Polyplectron Northiæ, Gray (the female).

Inhabits C. and S. India.

Genus POLYPLECTRON, Temminck.

(1814) *P. chinquis*, Temminck (*Pl. Col.* 539), apud G. R. Gray.

Syn. P. albo-ocellatum, Cuvier.
P. lineatum, Gray, the female.
Pavo tibetanus, L.
Peacock Pheasant from China (?), Edward's, pl. 67, 69.

Doung-kula, Arakan: *Mo-nuwur*, and *Day-o-da-huk*. Inhabits Assam, Sylhet, Arakan, Tenasserim.

(1815) *P. bicalcaratum* (Hardwicke's *Ill. Ind. Zool*).

Syn. Pavo bicalcaratus, L.
P. malaccensis, Scopoli.
P. Hardwickii Gray.

Kuaow Charman, Malay, Sum. Inhabits Malayan peninsula; Sumatra.

Genus ARGUS, Temminck.

(1816) *A. giganteus*, Temminck (Vieillot, *Gal. des Ois.*, *t.* 203; Jardine and Selby, *Ill. Orn.*, *n. s.*, pl. 6).

Syn. Phasianus argus, L.
A. pavoninus, Vieillot.
Malay Peacock, Latham.

Kuaow, Malay; Sum. Inhabits Malayan peninsula; Sumatra. (Nec Sylhet, as stated by Hardwicke, *MS.* in Brit. Mus.)

Subfam. PHASIANINÆ.

Genus GALLUS, L. (apud G. R. Gray). *Murgh*, female *Murghi*, H.: *Ayam*, Malay.

(1817) *G. ferrugineus.*

Syn. Tetrao ferrugineus, Gmelin.
G. bankiva, Temminck.
Phasianus gallus, L.,—Domestic varieties (among which are G. giganteus, morio, crispus, ecaudatus, pumilus, plumipes, cristatus, pentadactylus, pusillus, lanatus, &c.).
Hackled Partridge, Latham—the hen.

Ban Murgh, or *Jungli Murgh*, H.; *Ban Kokra*, of Santals; *Ayam utan*, Malay; *Brooga*, Sum.; *Bengkiwo*, or *Bekikko*, Java. Inhabits Jungly districts of all N. India, from valleys of sub-Himalayan region southward to the Vindhyian range and the N. Circars; Assam: Burmese and Malay countries: Turkestan? (Vide J. A. S. VIII, 1007). A. Indian race, with white ear-lappet in living specimens (vide *Ann. Mag. N. H.* XX, 389). B. Pale sub-Himalayan race (vide *Ann. M. N. H.*, XX, 289). C. Deep-coloured Malayan race. D. Domestic varieties.

(1818) *G. Stanleyi*, Gray, (Hardwicke's *Ill. Ind. Zool.*,—the hen).

Syn. G. Lafayettei, Lesson.
G. lineatus, Blyth, mentioned J. A. S. XVI, 387.

Welle Cuccula, Cingh. Inhabits Ceylon.

(1819) *G. Sonneratii*, Tem. (*Pl. Col.* 232, 233).

Syn. Phasianus gallus apud Sonnerat.
Ph. indicus, Leach.

Jungli Murgh, S. India. Inhabits peninsula of India.

Genus EUPLOCOMUS, Temminck.

(1820 *Eu. ignitus* (Macartney's *Emb. to China*, pl. 13).

Syn. Phasianus ignitus, Shaw.
Gallus Macartneyi, Temminck.
Ph. rufus, Raffles (the female).

Jugang, Sum. Inhabits Malayan peninsula; Sumatra.

(1821) *Eu. nycthemerus* (*Pl. Enl.* 123, 124).

Syn. Phasianus nycthemerus, L.
Nycthemerus argentatus, Swainson.

Inhabits China.

(1822) *Eu. lineatus* (Belanger, *Voy. Ind. Orient., Zool.*, *pl.* 8, 9).

Syn. Phasianus lineatus, Latham.
Ph. Reynaudii, Lesson.
Ph. fasciatus, McClelland, Calc. Journ. N. H. II, 146.

Yeet, Arakan. Inhabits Burmese countries. (Arakan, Tenasserim. Pegu).

(1823) *Eu. Horsfieldi* (Gray's *Ill. Gen. Birds*, pl.).

Syn. Gallophasis Horsfieldi, G. R. Gray.

Mut'hura; *Purple Pheasant* of Europeans. Inhabits Assam; Sylhet.

(1824) *Eu. melanotus*, Blyth, (noticed J. A. S. XVII, 694). *Kalij Pheasant* of Darjiling. Inhabits Sikim.

(1825) *Eu. albocristatus*, (Gould's '*Century*,' pl. 66, 67).

Syn. Phasianus albocristatus, Vigors.
Ph. Hamiltonii, Gray (Hardw. Ill. Ind. Zool.)

Kalij of Simla, Masuri, &c.; also *Murgh-Kalij*, and *Kukera*. Inhabits N. W. Himalaya.

(1826) *Eu. erythropthalmos* (Hardw. *Ill. Ind. Zool.*—the female).

Syn. Phasianus erythropthalmos, Raffles.
Ph. purpureus, Gray (the female).

Pagar, Malay; *Mira Mata*, Sum. Inhabits Malayan peninsula; Sumatra.

Genus PHASIANUS, L.

Subgenus PUCRASIA, G. R. Gray.

(1827) *P. macrolopha* (Gould's '*Century*,' pl. 69, 70).

Syn. Satyra macrolopha, Lesson.
Ph. pucrasia, Vigors, J. E. Gray.
Ph. pucrasse, Gray.
Tragopan Duvaucelei, Temminck.

Plas, *Pukras*, *Koklas*. Inhabits N. W. Himalaya (rare in Nepal).

Subgenus PHASIANUS, as restricted.

(1828) *Ph. Wallichii* (Gould's '*Century*,' pl. 68).

Syn. Lophophorus Wallichii. Hardwicke.
Phasianus Stacei, Vigors.

Chir, or *Cheor*, *Banchil*, *Herril*. Inhabits N. W. Himalaya.

(1829) *Ph. torquatus*, Gmelin (Hardw. *Ill. Ind. Zool*).

Syn. Ph. albotorquatus, Bonnaterre.

Inhabits China.

(1830) *Ph. colchicus*, L. (*Pl. Enl.* 121, 122). *Kurgkuol*, Pushtu. Inhabits W. Asia (Abundant—though somewhat different from the European bird—on the Elburz Chain, N. of Persia). Now common in Europe.

Subgenus THAUMALEA, Wagler.

(1831) *Th. Amherstiæ* (G. R. Gray, *Ill. Gen. Birds*, pl. 125).

Syn. Phasianus Amherstiæ, Leadbeater.

Inhabits bordering regions of China and Tibet.

Genus LOPHOPHORUS, Temminck.

(1832) *L. impeyanus* (Gould's '*Century*,' pl. 60, 61).

Syn. Phasianus Impeyanus, Latham.
Ph. curvirostris, Shaw.
Lophophorus rufulgens, Temminck.

Monal, or *Ghur Monal*; *Murgh i zari* ('Golden Fowl'); *Murgh Muhshor*: male, *Ratkap*; female, *Monali*. Inhabits Himalya generally: Kaffiristan (Burnes).

Subfam. TETRAONINÆ.

Genus TETRAOGALLUS, Gray.

(1833) *T. himalayensis*, G. R. Gray (Hardw. *Ill. Ind. Zool.*; Jardine and Selby, *Orn. Ill.* pl. 141, nec pl. 76, nec G. R. Gray, *Ill. Gen. Birds*). These have since been united by Mr. G. R. Gray; but of some dozens of specimens from Afghanistan eastward to Sikim, all were quite similar, and corresponded neither with the Persian species (*T. caucasica*, v. *Nigelli*), nor with the Altai species (*T. altaica*) as described, nor very decidedly with the figure published by Messrs. Mitchell and G. R. Gray, which should represent a fourth species.

Syn. T. Nigelli of Himalaya, Auctorum.

Inhabits Himalaya; Hindu Kosh; Afghanistan.

Genus LERVA, Hodgson.

(1834) *L. nivicola*, Hodgson.

Syn. Perdix lerva, Hodgson, P. Z. S. 1833, p. 107.

Quoir Monal. *Snow Partridge* of sportsmen. Inhabits Snow-region of Himalaya.

Subfam. PTEROCLINÆ.

Genus PTEROCLES, Temminck. (*Bur-titur*, H. *Whistling Grouse*, or *Rock Pigeons* of sportsmen in India.)

(1835) *Pt. arenarius* (*Pl. Col.* 52, 53).

Syn. Tetrao arenarius, Pallas.
Perdix aragonica, Latham.
Bonasa pyrenaica, Brisson.

Buklit, H.; *Khyrgut*, or *Sya-rim*; also *Tutuk* (expressive of cry), and *Bovra Kurra* ('black breast'), Afghanistan. *Sand Grouse* of sportsmen. Inhabits desert regions of Asia, S. Europe, and N. Africa.

(1836) *Pt. fasciatus* (Jerdon's *Ill. Ind. Orn.*, pl. 10, 36).

Syn. Tringa fasciata, Scopoli.
Tetrao indicus, Gmelin.
Perdix indica, Latham.
Œnas indicus et bicinctus, Vieillot.
Pterocles quadricinctus, Temminck.

Hundsgri, H.; *Polunkar*, Telugu; *Kelkudari* (Rock Partridge), Tamul. *Painted Grouse* of sportsmen. Inhabits Hindustan generally.

(1837) *Pt. alchata* (*Pl. Enl.* 105, 106).

Syn. Tetrao alchata, L.
T. caudacutus, Gmelin.
T. chata, Pallas.
Œnas cata, Vieillot.
Pt. caspius, Menetries.

Inhabits Middle Asia; Afghanistan; Syria; Spain; N. Africa.

(1838) *Pt. exustus*, Temminck (*Pl. Col.* 354, 360).

Syn. Pt. senegalensis, Lichtenstein.

Bur Tetur and *Kumar Tetur*, H.; *Buttator*, Sindh; *Sassinia*, Afghanistan. Inhabits Hindustan; M. and W. Asia; S. Europe; N. Africa.

Subfam. PERDICINÆ.

Titr or *Tetur* (root of *Tetrao*), H.; *Kha*, Arakan.

A. Guinea-fowl.

Genus NUMIDA, L.

(1839) *N. meleagris*, L.

Syn. N. galeata, Pallas.

Inhabits Africa. The domestic adults are typically coloured.

Genus FRANCOLINUS, Brisson, Stephens.

Div. 1. With stouter bills.

(1840) *Fr. pintadeus*.

Syn. Tetrao pintadeus, Scopoli.
T. madagascariensis, Gmelin, (nec Scopoli).

Pintado Partridge, Mauritius. Inhabits Mauritius.

(1841) *Fr. sinensis*.

Syn. Tetrao sinensis, Osbeck.
T. perlatus, Gmelin.
Perdix Phayrei, Blyth, mentioned J. A. S. XII, 1011.

Inhabits Indo-China; China.

Div. 2. With less robust bills.

(1842) *Fr. vulgaris*, Stephens (*Pl. Enl.* 147, 148).

Syn. Tetrao francolinus, L.

Kala Tetur, H.; *Mushki Tetur*, Urdu: *Durraz* (Burnes). *Black Partridge* of sportsmen. Inhabits N. India; Afghanistan; Persia; Syria; Cyprus; Sicily.

(1843) *Fr. pictus*, (Jardine and Selby, *Orn. Ill.* pl. 50).

Syn. Perdix picta, Jardine and Selby.
P. Hepburnii, Gray, Hardw. Ill. Ind. Zool.

Painted Partridge of sportsmen. Inhabits peninsula of India, where replacing Fr. vulgaris.

D. Rock Partridges.

Genus CACCABIS, Boie.

(1844) *C. chukar* (Gould's '*Century*', pl. 71).

Syn. Perdix chukar, Gray.
Chacura pugnax, Hodgson, Madr. Journ. 1337, p. 305.

Chukor, H. (from voice); *Kulk*, or *Zirk*, Pushtu. Inhabits Himalaya; Afghanistan.

E. Ordinary Partridges.

Genus PERDIX, Brisson.

(1845) *P. gularis*, Tem. (Hardw. *Ill. Ind. Zool*). *Jungli Titr*, H. *Wood Partridge*, and *Bengal Chikor* of sportsmen. Inhabits Banks of Ganges.

(1846) *P. pondiceriana* (*Pl. Col.* 213; Hardw. *Ill. Ind. Zool*).

SYN. Tetrao pondicerianus, Gmelin.
Perdix orientalis, Gray.

Gora Titur, H. *Grey, Common*, or *Scavenger Partridge* of sportsmen. Inhabits India generally; Ceylon, never on the E. side of the Bay of Bengal.

Genus RHIZOTHERA, G. R. Gray.

(1847) *Rh. curvirostris* (Hardw. *Ill. Ind. Zool.* —the female).

SYN. Tetrao curvirostris, Raffles.
Perdix longirostris, Temminck.

Janting, Sum. Inhabits Malayan peninsula; Sumatra.

F. Wood Partridges.

Genus ARBORICOLA, Hodgson.

(1848) *A. torqueola* (*Pl. Col.* 462, 463; Hardw. *Ill. Ind. Zool.*—male.

SYN. Perdix torqueola, Valenciennes.
P. megapodia, Temminck.
P. olivacea, Gray.

Peura, *Ban Tetra*, N. W. Himalaya. *Green* or *Hill Partridge* of sportsmen. Inhabits Himalaya.

(1849) *A. rufogularis*, Blyth, J. A. S XVIII, Inhabits Sikim at a lower altitude than the preceding race.

(1850) *A. atrogularis*, Blyth, J. A. S. XVIII, Inhabits Hill regions of Assam, Sylhet, and Arakan.

(1851) *A.* (?) *Charltoni*.

SYN. Perdix Charltoni, Eyton, Ann. Mag. N. H. XVI, 230.

Inhabits Penang.

Genus ROLLULUS, Bonnaterre.

(1852) *R.* (?) *ocellatus* (Hardw. *Ill. Ind. Zool.*)

SYN. Tetrao ocellatus, Raffles. Lin. Tr. XIII, 322.
Perdix oculea, Temminck.

Troong, Sum. Inhabits Tenasserim provinces; Malayan peninsula; Sumatra.

(1853) *R. cristatus* (*Pl. Col.* 350, 351).

SYN. Columba cristata, Gmelin.
Phasianus roulroul, Scopoli.
Perdix coronata, Lathaм.
Tetrao porphyrio, Shaw.
T. viridis, Gmelin—female.

Soal, *Bestum*, Malay; *Bentol*, Sum. Inhabits Tenasserim provinces; Malayan peninsula; Sumatra.

(1854) *R. niger* (Belanger's *Voyage*, *t.* 7, male,—Hardw. *Ill. Ind. Zool.*,—female).

SYN. Cryptonyx niger, Vigors, Zool. Journ. IV. 349. } Male.
C. Dussumieri, Lesson. }
C. ferrugineus, Leadbeater, Lin. Tr. XVI. 349. } Female.
Perdix æruginosa, Eyton, P. Z. S 1839, p. 106. }

Hole, Malay. Inhabits Malayan peninsula; Sumatra.

G. Dwarf Partridges.

Genus PERDICULA, Hodgson. *Bush Quails* of Sportsmen.

(1855) *P. asiatica* (*Trans. Zool. Soc.* II, pl 3, —not good).

SYN. Coturnix pentah, Sykes.
Perdix asiatica et cambaiensis (?), Latham.

Lowa, H. *Common Bush Quail* of sportsmen: *Rock Quail*, S. India. Inhabits India generally.

(1856) *P. argoondah* (*Trans. Zool. Soc.* II, pl. 2,—not good).

SYN. Coturnix argoondah, Sykes.
Perdix rubiginosa (?), Valenciennes.

Geerza, H. *Forest Quail*. Inhabits S. India.

I. Quails. *Battair*, H.

Genus COTURNIX, Mœrrhing.

Subgenus COTURNIX, Gould.

(1857) *C. communis*, Bonnaterre (*Pl. Enl.* 170).

SYN. Tetrao coturnix, L.
C. major, Brisson.
C. dactylisonans, Temminck.
C. europæus, Swainson.
C. vulgaris, Jardine.

Ghaghus, H. (Jerdon). *Common Quail* of sportsmen. Inhabits Europe, Asia, Africa: common in India (nec Malasia).

(1858) *C. coromandelica* (*Pl. Col.* 35.)

SYN. Tetrao coromandelicus, Gmelin.
C. textilis, Temminck.

Rain Quail of sportsmen. Inhabits India generally.

(1859) *C. chinensis* (Gould's *B. A.* Vol. V, 92).

SYN. Tetrao chinensis, L.
T. manillensis, Gmelin.
Coturnix philippensis, Brisson.
O. excalfatoria, Temminck.
C. flavipes, Blyth, J. A. S. XI, 808,—the female.

Pikau, Malay; *Chaun-chan*, China; *Painted Quail* of sportsmen. Inhabits S. E. Asia and its islands; Australia. Common in the Malay countries; less so in Bengal; rare in S. India; Ceylon.

(1860) *C. (?) erythrorhyncha*, Sykes, (*Zool. Trans.* Vol. II, pl. 1). *Kokui Loosa*, H. (Jerdon). *Red-billed* or *Black Quail* of Nilgiris. Inhabits Nilgiris; Malabar.

Fam. TINAMIDÆ (?)

Subfam. TURNICINÆ.

Genus TURNIX, Bonnaterre. *Button Quails* of sportsmen.

(1861) *T. ocellatus* (Sonn. *Voy. t.* 23).

Syn. Oriolus ocellatus, Scopoli,
Tetrao luzoniensis, Gmelin.
Hemipodius thoracicus, Temminck.
H. atrogularis, Eyton, (the female), and H. taigoor apud Eyton (the female), P. Z. S. 1839, p. 107.
H. pugnax (?), Temminck (Pl. Col. 60, 2), apud G. R. Gray, Brit. Mus. Catal., and Strickland, Ann. Mag. N. H. XX, 135.

Pochio, Malay; *Puyu*, Sum.; *Drigul*, male, *Tomma*, female, Java. Inhabits Himalaya (Almorah, Nepal, Sikim); Burmese and Malay countries; Philippines. *N. B.* Himalayan, Burmese and Malayan examples are perfectly similar.

Rufous variety from S. India and Ceylon *Zool. Trans.* Vol. II, pl. 4).

Syn. Hemipodius taigoor, Sykes,—the male, and H. pugnax apud Sykes and Jerdon,—the female.

Small pale variety common in L. Bengal. *T. bengalensis*, Blyth). *Salni gundru*, Muttra.

(1862) *T. Dussumieri* (*Pl. Col.* 454, f. 2).

Syn. Hemipodius Dussumieri, Temminck.
H. maculosus (?) Temminck, apud G. R. Gray, Brit. Mus. Catal.
T. tanki, Buch. Hamilton, described J. A. S. XII, 181, (bis).

Bustard Quail of sportsmen. Inhabits India generally; Arakan.

(1863) *T. Sykesi*, A. Smith, *Zool. Africa*, art. *T. lipurana*.

Syn. Ortygis Dussumieri apud Jerdon, Catal., and J. A. S, XI, 804.

Chimnaj? H. (Muttra); *Tattu Buttera*, Sindh. Inhabits India generally: (L. Bengal?); Sindh.

Order V. CURSORES.

Fam. CASUARIDÆ.

Genus CASUARIUS, L.

(1864) *C. galeatus*, Vieillot (*Pl. Enl.* 313; *Menagerie du Museum*, pl.).

Syn. Struthio casuarius, L.
C. emu, Latham.

Inhabits Moluccas.

Genus DROMAIUS, Vieillot.

(1865) *Dr. novæ Hollandiæ* (Gould's B. A. Vol. VI, pl. 1).

Syn. Casuarius novæ hollandiæ, Latham.
Dr. ater, Vieillot.
Dromicus australis, Swainson.
Dr. emu, Stephens.

Inhabits Australia.

Fam. STRUTHIONIDÆ.

Genus STRUTHIO, L.

(1866) *Str. camelus*, L. (*Pl. Enl.* 547; *Menagerie du Museum*, pl.). *Shutur-murgh* ('Camel-fowl'), H. Inhabits Africa; Arabia?

Order VI. GRALLATORES.

Tribe PRESSIROSTRES.

Fam. OTIDÆ.

Genus OTIS, L.

Subgenus HOUBARA, Bonap.

(1867) *H. Macqueenii* (Hardwicke's *Ill. Ind. Zool.*), J. A. S. XVI, 786.

Syn. Otis Macqueenii, Gray.

Tilaor, H.; *Dugdaur*, Pushtu, *Hurriana Floriken* of sportsmen. Inhabits C. and W. deserts of India; Afghanistan.

Subgenus EUPODOTIS, Lesson.

(1868) *Eu. Edwardii* (Hardwicke's *Ill. Ind. Zool.*; Gould's *Century*, pl. 72).

Syn. O. Edwardii, Gray.
O. nigriceps, Vigors.
O. luconiensis, Vieillot (apud G. R. Gray).

Tokdar, H. Inhabits Hindustan; Luzon?

Subgenus. SYPHEOTIDES, Lesson.

(1869) *S. bengalensis* (Gould's *Century*, pl. 73, 74, 75).

Syn. Otis bengalensis, Gmelin.
O. himalayana, Vigors.
O. deliciosa, Gray.

Charj, or *Ablak Charj*, H. *Floriken* of N. India. Inhabits Bengal, Assam, Nipal; N. India generally.

(1870) *S. auritus* (Jardine and Selby, *Orn. Ill.* pl. 40, 92; Jerdon's *Ill. Ind. Orn.*, pl. 33).

Syn. Otis aurita, Latham.
O. fulva, Sykes, male in non-breeding dress.
O. atriceps, Gray.
O. indica, Shaw.

Charj, H. (S. India); *Tun-mor*, Mahr.; *Kunnoul*, Can. *Floriken* of S. India: *Likh* of Bengal. Inhabits India generally.

INCERTÆ SEDIS.

Fam. GLAREOLIDÆ.

Genus GLAREOLA, Brisson.

(1871) *Gl. orientalis*, Leach (apud G. R. Gray, *Lin. Tr.* XIII, pl. 132; pl. ; Gould's B. A. Vol. VI, pl. 23;—figures and descriptions bad, if the species be correctly assigned).

Syn. Gl. pratincola vel torquata of India, auctorum.

Inhabits India, Burmese and Malay countries.

(1872) *Gl. luctea*, Temminck (*Pl. Col.* 399; Griffiths' *Trans. An. Kingd.*, VIII, 543, pl.—very bad).

Syn. Gl. orientalis apud Jerdon, Madr. Journ. XII, 215.

Utteran, Sindh. Inhabits India generally (very abundant).

Fam. CHARADRIADÆ.

Subfam. CURSORIINÆ.

Genus CURSORIUS, Latham.

(1873) *C. coromandelicus.*

Syn. Charadrius coromandelicus, Gmelin.
Cursorius asiaticus, Latham.
C. frenatus. Illiger.
Tachydromus orientalis, Swainson.

Nukri, H. Inhabits India generally (nec Lower Bengal).

Genus MACROTARSIUS, Blyth.

(1874) *M. bitorquatus*, Jerdon, Blyth, J. A. S. XVII, 254. Inhabits E. Ghâts of peninsular India.

Subfam. ESACINÆ.

Genus ESACUS, Lesson.

(1875) *E. recurvirostris.*

Syn. Œdicnemus recurvirostris, Cuvier.
Carvanica grisea, Hodgson, J. A. S. V, 796.

Kawanak, H.: *Tuloor*, Sindh. *Bastard Floriken* of sportsmen. Inhabits India generally; Ceylon; Sindh; Arakan.

Genus ŒDICNEMUS, Cuvier.

(1876) *Œd. crepitans* (*Pl. Enl.* 919).

Syn. Charadrius œdicnemus, L.

Bursiri, or *Lámbi*, H.; *Khurma*, Beng.; *Gadang Kapala*, Sum. (Raffles). *Bastard Floriken* of some. Inhabits Europe, Asia, Africa. Very common in parts of India.

Subfam. VANELLINÆ.

Titi, Beng.

Genus HOPLOPTERUS, Bonaparte.

(1877) *H. ventralis* (Hardw. *Ill. Ind. Zool.*)

Syn. Charadrius ventralis, Wagler.
Ch. Duvaucelei, Lesson.

Nghet Taloing, Arakan. Inhabits India generally (on sand-flats). Common in Arakan.

Genus SARCIOPHORUS, Strickland.

(1878) *S. bilobus* (*Pl. Enl.* 880).

Syn. Charadrius bilobus, Gmelin.

Zirdi, H. Inhabits India generally on arable land.

Genus LOBIVANELLUS, Strickland.

(1879) *L. goensis* (Gould's *Century*, pl. 78).

Syn. Parra goensis, Gmelin.
Charadrius atrogularis, Wagler.

Tititui (expressive of cry), H.; *Titori*, Sindh. *Kibullo*, Cingh.; *Teeteedoo*, Arakan. Inhabits India generally and Malay countries (very abundant).

(1880) *L. cinereus.*

Syn. Pluvianus cinereus, Blyth, J. A. S. XI, 587.

Inhabits Bengal not uncommon in cold season.

(1881) *L. leucurus* (Denon's Egypt, *Zool.*, pl. 6, f. 2).

Syn. Charadrius leucurus, Lichtenstein.

Chizi, Kabul. Inhabits Middle Asia; N. Africa. Very rare in India.

Genus VANELLUS, L.

(1882) *V. cristatus*, Meyer (*Pl. Enl.* 242).

Syn. Tringa vanellus, L.
V. gavia, Leach.

Alatye, or *Mekhdao*, Kabul. Inhabits Europe and Asia; N. Africa (in winter): Upper India; never in S. India, or L. Bengal.

Subfam. CHARADRINÆ.

Genus SQUATAROLA, Cuvier.

(1883) *Sq. helvetica* (*Pl. Enl.* 854, 858).

Syn. Tringa helvetica, Gmelin.
Tr. squatarola, L.
Charadrius hypomelas Pallas.
Vanellus griseus, Brisson.
V. melanogaster, Bechstein.

Bara Batan, B.; *Chibugan*, Java. This is of nearly general distribution. Europe, Asia, Africa, Australia, N. America. Not rare in L. Bengal.

Genus CHARADRIUS, L.

(1884) *Ch. pluvialis*, L. (*Pl. Enl.* 904). Inhabits Europe; W. Asia; N. Africa.

(1885) *Ch. virginicus*, Bechstein (Wilson's *Am. Orn.* pl. 59, f. 5).

Syn. Ch. pluvialis apud Wilson, also Horsfield, and Jerdon. Catal.
Ch. pluvialis, var., Raffles.
Ch. marmoratus, Temminck.
Ch. pectoralis, Vieillot.
Ch. xanthocheilus (?), Wagler (Gould's B. A. Vol. VI, pl. 13).

Chota Batan, B.; *Berkay*, Malay; *Cheruling*, Sum.; *Trull*, Jav. Inhabits S. E. Asia and its islands; Australia?; N. and S. America. Very common in India.

Subgenus EUDROMIAS, Boie.

(1886) *Eu. morinellus* (*Pl. Enl.* 832).

Syn. Charadrius morinellus, L.

Inhabits Europe; W. Asia.

Subgenus HIATICULA, G. R. Gray.

(1887) *H. Geoffroyi*, vide J. A. S. XII, 180.

Syn. Charadrius Geoffroyi, Wagler.
H. rufinus, Blyth, Ann. Mag. N. H. 1843.

Inhabits India generally; not common; Java.

(1888) *H. Leschenaultii* (?), vide, J. A. S. H, 181.

Syn. Charadrius Leschenaultii (?), Lesson.
Ch. cirripedesmos, Wagler, apud Sundevall.
Ch. rufinellus, Blyth, Ann. Mag. N. H. 1833.

Inhabits India generally; extremely common L. Bengal.

(1889) *H. cantiana.*

Syn. Charadrius cantianus, Latham.
Ch. alexandrinus, Hasselquist.
Ch. littoralis, Bechstein.
Ch. albifrons, Meyer.

Inhabits Europe; Asia; N. Africa.

(1890) *H. philippina* (Sonnerat, *Voy. aux Indes*, pl. 46).

Syn. Charadrius philippinus, Scopoli.
Ch. dubius, Gmelin.
Ch. curonicus, Beseke.
Ch. minor, Meyer,
Ch. fluviatilis, Bechst.
Ch. intermedius, Menetries.
Ch. hiaticuloides, Franklin.
Ch. zonatus, Swainson.
Ch. hiaticula apud Pallas.
Ch. hiaticula. var. (?), Raffles.

Zirria, H.; *Tilla Chusmuk*, Kabul; *Bui*, Sum. Inhabits Asia; Africa; rare in N. W. Europe. Extremely common in India.

(1891) *H. pusilla.*

Syn. Charadrius pusillus, Horsfield.
Ch. minor ? Wagler, apud Jerdon, Catal.

Inhabits India and Malay countries. Rare in India.

(1892) *H. nigrifrons* (Gould's *B. A.* Vol. VI, pl. 20).

Syn. Charadrius nigrifrons, Cuvier.
Ch. melanops, Vieillot.
Ch. russatus, Jerdon. Catal.

Inhabits Australia (between 28° and 37°, S. lat.). Extremely rare in India.

Fam. CHIONIDÆ.

Genus HÆMATOPUS, L.

(1893) *H. ostralegus*, L. (*Pl. Enl.* 939). *Duriya Guzpoun* (i. e. 'Sea Longshanks' or *Himantopus*); H.; *Tetawuk*, Kabul. Inhabits Europe; Asia; N. Africa. Adult, in summer dress (bill 4 in. long). From Arakan.

Fam. RECURVIROSTRIDÆ.

Genus HIMANTOPUS, Brisson. *Lal Theng* ('Red-shank'), Beng.; *Guz-poun*, ('Yard-leg'), H.; *Chaha Bara*, Muttra; *Gusling*, Sindh: *Gagang-bayem*, Jav.

(1894) *H. candidus*, Bonnaterre (*Pl. Enl.* 878).

Syn. Charadrius himantopus, L.
Ch. autumnalis, Hasselquist.
H. vulgaris et H. rufipes, Bechstein.
H. albicollis, Vieillot.
H. atropterus, Meyer.
H. melanopterus, Temminck.
H. asiaticus, Lesson.

Inhabits Europe, Asia, Africa. Very common in India.

(1895) *H. intermedius*, Blyth, J. A. S. XVIII, p. . Inhabits India where much less common than H. candidus, and Malay countries.

Genus RECURVIROSTRA, L.

(1896) *R. avocetta*, L. (*Pl. Enl.* 353). Inhabits Europe, Asia, Africa. Not rare in Lower Bengal.

Fam. SCOLOPACIDÆ,

Kada-khoncha ('Clay-pecker'), B.; *Kutra*, H.; *Yeng-yan*, Arakan; *Trinil*, Jav.; *Chanchali*, Kabul.

Genus IBIDORHYNCHUS, Vigors.

(1897) *I. Struthersii*, Vigors (Gould's *Century*, pl. 79).

Syn. Erolia (red-billed) Hodgson, J. A. S. IV, 459.

Inhabits Himalaya.

Genus TOTANUS, Ray, Bechstein.

(1898) *T. glottis* (Gould's *Century*, pl. 75; *B. A.* Vol. VI, pl. 36;—winter plumage).

Syn. Scolopax glottis, L.
Sc. canescens, Gmelin.
Totanus chloropus, Meyer.
T. fistulans, Bechstein.
T. glottoides, Vigors.
Limosa grisea, Brisson.
L. totanus et L. glottis, Pallas.
Glottis natans, Koch.
Gl. Vigorsii, G. R. Gray.

Timtimma, H.; *Benonchung*, Jav. Inhabits Old World generally; Australia. Very common in India.

(1899) *T. stagnatilis*, Bechstein (Gould's *B. E.* pl. 314; *B. A.* Vol. VI, pl. 37; *Century*, pl. 76;—winter plumage).

Syn. Scolopax totanus, L.
T. Horsfieldi, Sykes.
T. Lathami, Gray (Hardw. Ill. Ind. Zool).
T. tenuirostris, Horsfield.

Chota Timtimma, H.; *Kiyo*, Java; *Kurruh-i-abi*, Kabul. Inhabits Old World generally; Australia. Very common in India.

(1900) *T. fuscus* (*Pl. Enl.* 875).

Syn. Scolopax fusca, L.
Sc. nigra et Tringa atra, Gmelin.
Sc. curonica, Beseke.
Limosa fusca, Brisson.
T. natans et T. maculatus, Bechstein.

Butan, H. Inhabits Europe and Asia. Common in India.

(1901) *T. calidris* (*Pl. Enl.* 845).

Syn. Scolopax calidris, L.
Tringa gambetta, Gmelin.
Tot. variegatus, Bruunich.
T. striatus et T. nævius, Brisson.

Chota Butan, H. Inhabits Europe and Asia. Very common in India.

Genus ACTITIS, Illiger.

(1902) *Act. glareola.*

Syn. Tringa glareola, Gmelin.
Totanus affinis, Horsfield.

Ola-Watua, Cingh.; *Kodidi*, Malay. Inhabits Europe and Asia. Extremely common in India.

(1903) *Act. ochropus* (*Pl. Enl.* 843).

Syn. Tringa ochropus, L.
Tonatus leucurus, Gray (Hardw. Ill. Ind. Zool.)

Tita. Sindh. Inhabits Europe and Asia. Rare in N. Africa. Common in India.

(1904) *Act. hipoleucos* (*Pl. Enl.* 850).

Syn. Tringa hipoleuca, L.

Tiha, and *Musda*, Sindh.; *Trinil batu*, Java. Inhabits Europe and Asia. Extremely common in L. Bengal.

Genus TEREKIA, Bonaparte.

(1905) *T. cinerea* (Gould's B. E. pl. 807; B. A. Vol. VI, pl. 34).

Syn. Scolopax cinerea, Gmelin.
Sc. terek, Latham.
Sc. sumatrana, Raffles.
Limosa recurvirostra, Pallas.
Fedoa terekensis, Stephens.
Tonatus javanicus, Horsfield.
Xenus cinereus, Kaup.

Kuning kaki, Sum.; *Bedaran*, or *Choweyan*, Jav. Inhabits Asia and its archipelago; rare in Europe and in Australia. Common in India.

Genus LIMOSA, Brisson.

(1906) *L. lapponica* (*Pl. Enl.* 900).

Syn. Scolopax lapponica, L.
Sc. leucophæa, Latham.
L. rufa, Brisson.
L. ferruginea, Pallas.
Totanus gregarius, Bechstein.

Inhabits Europe; Africa; never (?) India.

(1907) *L. ægocephala* (Gould's B. A. Vol. VI, pl. 28).

Syn. Scolopax ægocephala et Sc. limosa, L.
Sc. belgica, Gmelin.
Sc. melanura, Leisler.
L. leucophæa, Jerdon.
L. melanuroides, Gould.

Chaha, and *Jángral*, H.; *Susling*, Sindh; *Biru Lahut*, Jav. Inhabits Europe, Asia and its islands, and N. Australia. Very common in India.

N. B. Individuals of the same flock of this species vary excessively in size, and are frequently small as the pair represented by Mr. Gould. The bill varies in length from 2¾ to 4¼ in., and the closed wing from 7 to 8⅛ in.

Genus NUMENIUS, L.

(1908) *N. arquata*, L. (*Pl. Enl.* 818). *Sáda Kastachura* ('*White* Curve-bill,' as opposed to Ps. crepitans, Beng.; *Goar*, or *Goungh*, H.; *Terok*, Sum. Inhabits Europe, Asia, Africa. Common in India.

(1909) *N. phæopus* L. (*Pl. Enl.* 842).

Syn. Phæopus vulgaris, Flemming.

Chota Goungh, H.; *Gajahan*, Java. Inhabits Europe, Asia, Africa. Common on the sea-coasts of India, rare inland.

Genus TRINGA, L.

(1910) *Tr. canutus*, L. (*Pl. Enl.* 365, 366; Gould's B. E. pl. 324).

Syn. Tr. cinerea, Brunnich.
Tr islandica, nævia, grisea, et australis, Gmelin.
Tr. glareola, Pallas.
Tr. ferruginea, Meyer.
Tr. rufa, Wilson (Am. Orn. pl. 57, f. 2, 5).

Inhabits Europe, Africa, N. Asia. Very rare in India.

(1911) *Tr. subarquata*, Gmelin (*Pl. Enl.* 851; Gould, *B. E.* pl. 328; *B. A.*, Vol. VI, pl. 32).

Syn. Tringa ferruginea, Brunnich.
Tr. islandica, Retzius.
Tr. falcinella, Pallas.
Tr. chinensis, Gray.
Scolopax africana et pygmæa, Gmelin.
Sc. caffra, Forster.
Numenius pygmæus, Latham.
Erolia varia, Vieillot.
Falcinellus Cuvieri, Bonap.

Mayatan. Jav. Inhabits Europe, Asia, Africa, Australia. N. America. Very common in India.

(1912) *Tr. cinclus*, L. (*Pl. Enl.* 852; Gould, *B. E.* pl. 329).

Syn. Tringa alpina, L.
Tr. ruficollis et Scolopax pusilla, Gmelin.
Sc. salina, Pallas.
Numenius variabilis, Bechstein.

Inhabits Northern hemisphere. Not common in L. Bengal, nor in S. India.

(1913) *Tr. platyrhyncha* (Gould's *B. E.* pl. 331).

Syn. Tr. eloroides, Vieillot.
Limicola pygmæa, Kaup.

Inhabits Asia; rare in Europe: tolerably common in India.

(1914) *Tr. minuta*, Leisler (Gould, *B. E.* pl. 332).

Syn. Tr. pusilla, Meyer and Wolff.
Tr. cinclus Pallas, apud G. R. Gray.
Tr. damacensis, Horsfield.
Tr. pusilla ? apud Jerdon, Catal.

Chota Pun-loha, H. (Jerdon). Inhabits Europe and Asia. Very common in India.

(1915) *Tr. Temminckii*, Leisler (Gould. *B. E.* pl. 333).

Syn. Tr. pusilla, Bechstein.

Inhabits Europe and Asia. Common in India.

Genus EURINORHYNCHUS, Nilsson.

(1916) *Eu. pygmæus* (G. R. Gray, *Ill. Gen. Birds*, pl. 152, f. 1).

Syn. Platalea pygmæa, L.
Eu. griseus, Nilsson.
Eu. orientalis, Blyth, Ann. Mag. N. H. 1843.

Inhabits Europe and Asia. Extremely rare. ost numerous on the eastern coast of the Bay Bengal, a few mingled in flocks of No. 1911 -16).

Genus CALIDRIS, Illiger.

(1917) *C. arenaria* (Gould, *B. E.* pl. 335).

Syn. Charadrius calidris, L
Ch. rubidus, Gmelin.
Arenaria grisea, Bechstein.
A. vulgaris, Leisler
Tringa tridactyla, Pallas.
C. tringoides, Vieillot.

Inhabits Sea-coasts of Northern hemisphere. ery rare (?) in India.

Genus PHILOMACHUS, Mœrrhing.

(1918) *Ph. pugnax* (*Pl. Enl.* 300, 305, 306, 44; Gould *B. E.* pl. 328).

Syn. Tringa pugnax. L.
Tr. variegata, Brunnich.
Tr. equestris et grenovicensis, Latham.
Tr. rufescens, Bechstein.
Tr. littorea, Gmelin.
Limosa Hardwickii,—male } Hardw. Ill. Ind.
Totanus indicus,—female } Zool.

Gehwala, H.; *Chouchili*, Sindh. Inhabits Europe and Asia. Common in India in winter dress; onstantly leaving L. Bengal before the ruff of he male is put forth; though specimens with growing ruffs have been obtained at Rajmahl.

Genus STREPSILAS, Illiger.

(1919) *Str. interpres* (*Pl. Enl.* 856; Gould's *B. A.* Vol. VI, pl. 39).

Syn. Tringa interpres, L.
Str. collaris, Temminck.

This is if universal distribution, on all sea-oasts; rare inland.

Genus PHALAROPUS, Brisson.

(1920) *Ph. fulicarius* (Edwards, pl. 142).

Syn. Tringa fulicaria, L.
Ph. platyrhynchus, Temminck.
Ph. rufus. Bechstein.

Inhabits Northern regions. Exceedingly rare in India.

Genus MACRORHAMPHUS, Leach.

(1921) *M. semipalmatus*, Jerdon, Blyth, J. A. S. XVII, 252. Inhabits India, rare (?), or more probably confined to sea-coasts.

Genus SCOLOPAX, L.

(1922) *Sc. rusticola*, L. (*Pl. Enl.* 885).

Syn. Sc. indicus, Hodgson, J. A. S. VI, 490.

Inhabits Europe and Asia. Common in the Himalaya, and Nilgiris during the cold season. Very rare in L. Bengal, and in Ceylon.

Genus GALLINAGO, Ray, Stephens.

(1923) *G. nemoricola*, Hodgson (Jerdon's *Ill. Ind. Orn.* pl. 9), J. A. S. VI, 490. *Wood-Snipe*, Himalaya: *Solitary Snipe*, Nilgiris. Inhabits Himalaya; C. India; Nilgiris.

(1924) *G. solitaria*, Hodgson, J. A. S. VI, 491.

Syn. Sc. nemoricola, var.?

Inhabits Himalaya.

(1925) *G. stenura*.

Syn. Scolopax stenura, Temminck.
Sc. gallinago apud Raffles and Horsfield.
Sc. heterura et biclavus. Hodgson.

Kas Watua, Cingh.; *Boorkat Gadung*, Malay; *Sekadidi*, Sum.; *Burchet*. Jav. Inhabits India and Malay countries. Common in India.

(1926) *G. scolopacinus*, Bonaparte (*Pl. Enl.* 883).

Syn. Scolopax gallinago, L
G. uniclavus, Hodgson, J. A. S. VI 492.

Bharka, or *Bhuruk*, H. Inhabits Old World generally (nec Malay countries?)

(1927) *G. gallinula* (*Pl. Enl.* 884).

Syn. Scolopax gallinula, L,
Sc. minima, Ray.

Inhabits Old World generally (nec Malay countries?). Common in India.

Genus RHYNCHEA, Cuvier.

(1928) *Rh. bengalensis* (Hardw. *Ill. Ind. Zool*).

Syn. Scolopax bengalensis, L.
Sc. capensis, Gmelin, apud Raffles.
Rh. orientalis, Horsfield.
Rh. varia, Temminck.
Rh. capensis apud Gray.

Raja Kas Watua, Cingh.; *Pengung*, Jav. Inhabits India and Malay countries. Common in India.

Fam. PALAMEDEIDÆ.

Subfam. PARRINÆ.

Piho, H.

Genus METOPIDIUS, Wagler.

(1929) *M. indicus* (*Vieillot, Gal. des. Ois.* pl. 264; Hardw, *Ill. Ind. Zool.*)

Syn. Parra indica, Latham.
P. cuprea, Vahl.
P. melanochloris, Vieillot.
P. ænea, Cuvier.
P. superciliosa, Horsfield.
P. atrata, Tickell. J. A. S. II, 582. } Young.
Gallinula viridis, Gmelin. }

Dal-pipi, Beng; *Pichisan*, Java. Inhabits S. E. Asia and its islands. Very common in India.

Genus HYDROPHASIANUS, Wagler.

(1930) *H. chirurgus* (Gould's *Century*, pl. 77, Hardw. *Ill. Ind. Zool.*)

Syn Tringa chirurgus, Scopoli (Sonn. Voy. aux Indes, pl. 45,—non-breeding plumage).
Parra sinensis et lazoniensis, Gmelin.

Dal-kukra, H,; *Bhepi*, or *Bhenpi*, Beng. Inhabits India; China; Philippines. Common.

Fam. GRUIDÆ.

Genus GRUS, Mœrrhing.

(1931) *Gr. antigone* (Edwards, pl. 45; *Pl. Enl.* 865).

Syn. Ardea autigone, L.
Grus torquatus, Vieillot.
Gr. orientalis (?), Pallas.

Saras, or *Surhuns*, H.; *Gyo-gya*, Arakan. Inhabits India generally, rare to the southward.

(1932) *Gr. cinerea*, Bechstein (*Pl. Enl.* 769; Gould's *B. E.* pl. 270).

Syn. Ardea grus, L.
Grus vulgaris, Pallas.

Kulung, H.; *Kunj*, Persian. Inhabits Europe; Asia; N. Africa. Common in India.

Subgenus ANTHROPOIDES, Vigors.

(1933) *Anthr. virgo* (*Pl. Enl.* 241; Edwards, pl. 134.)

Syn. Ardea virgo, L.
Grus numidica, Brisson.

Karkarra, H.; also *Kurrounch* (Jerdon); *Kurkoncha*, Can.; *Shukdurruk*, Kabul. (All imitative of cry.) Inhabits Asia and Africa. Rare in S. Europe. Common in S. India.

Tribe CULTRIROSTRES.

Fam. ARDEADÆ.

Subfam. TANTALINÆ.

Genus FALCINELLUS. Ray, Bechstein.

(1934) *F. igneus* (Gould's *B. A.* Vol. VI, pl. 47).

Syn. Tantalus falcinellus, L.
T. igneus et viridis, Gmelin.
Ibis sacra, Temminck.

Kowari, H.; *Kala Kustechora*, B.; *Buzak*, Kabul. *Black Curlew* of sportsmen. Inhabits Old World generally; Australia. Common in India.

Genus GERONTICUS, Wagler.

(1935) *G. papillosus* (*Pl. Col.* 340).

Syn. Ibis papillosa, Temminck.

Buza or *Kala Buza*, H.; *Karunkul*, C. India. *King Curlew* of sportsmen. Inhabits India generally (nec L. Bengal).

Genus THRESKIORNIS, G. R. Gray.

(1936) *Thr. melanocephalus*, (Jardine and Selby, *Orn. Ill.*, pl. 120).

Syn. Tantalus melanocephalus, L.,—the young.
Ibis Macei et I. leucon (apud G. R. Gray), Temminck.
I. bengala, Cuvier.
I. religiosa apud Sykes.

Munda, H.; *Safed Buza* of some: *Sada Kastechora* (*i. e.* 'White Curlew') of some, B.; *Kula-gouk*, Arakan. *White Curlew* of sportsmen. Inhabits India generally; scarce in Arakan.

Genus TANTALUS, L.

(1937) *T. leucocephalus*, Gmelin (Pennant's *Ind. Zool.* pl. 11).

Syn. T. gangeticus, Shaw.
T. indicus, Cuvier.

Dokh, H.; *Jaunghal*, in Hindustan (Jerdon); *Kat Sarunga*, H., B.; *Lamjang*, and *Lumduk*, Sindh. Inhabits India generally; Ceylon; Assam; Arakan.

(1938) *T. lacteus*, Temminck (*Pl. Col.* 352).

Syn. T. ibis, var., and the young—
T. cinereus, Raffles, Lin. Tr. XIII, 327.

Inhabits Malay countries.

Genus PLATALEA, L.

(1939) *Pl. leucorodia*, L. (*Pl. Enl.* 405).

Chammach Buza (*i. e*, 'Spoon Ibis'), H.; *Chimta*, B. Inhabits Europe and Asia. Common in India.

Genus ANASTOMUS, Bonnaterre.

(1940) *A. oscitans*, (*Pl. Enl.* 932; Sonnerat, *Voy. aux Indes*, pl. 122).

Syn. Ardea oscitans, Boddaert.
A. ponticeriana et coromandelica, Gmelin.
An. typus, Temminck.
A. albus et cinereus, Vieillot.
Mycteria asiatica (?), Latham.

Gungla or *Gunglu*, H. (Jerdon); also *Ghongal*, H.; *Samuk-khol*, B.; *Tont'h Bhunga* (Tickell); *Kha-yoo-tsoot*, Arakan. Inhabits India generally. Common.

INCERTÆ SEDIS.

Genus DROMAS, Payk.

(1941) *D. ardeola*, Payk. (*Pl. Col.* 362; Salt, 'Travels in Abyssinia,' pl. 31).

Syn. Erodia amphilensis, Stanley.
Ammoptila charadroides? apud Jerdon, Catal.

Inhabits Sea-coast of S. India and Ceylon; also of E. Africa.

Subfam. CICONINÆ.

Genus MYCTERIA, L.

(1942) *M. australis*, Shaw (Gould's *B. A.* Vol. VI, pl. 51).

Syn. Ardea oscitans, Latham.
Ciconia leucoptera, Wagler.

Bunarus, and *Lohajung*, H.; *Ram Salik*, B. Inhabits India generally, Malay countries, and Australia.

Genus CICONIA, L.

(1943) *C. alba*, Belon (*Pl. Enl.* 866).

Syn. Ardea ciconia, L.

Lag-lag, or *Ujli*; also *Haji Lag-lag*, H. (Jerdon); *Dhek*, Muttra. Inhabits Europe; Asia; N. Africa; India generally; very common in parts of Bengal, during the cold season.

(1944) *C. nigra*, L. (*Pl. Enl.* 399).

Syn. Ardea nigra, L.
A. chrysopelargus, Lichtenstein.
A. fusca, Brisson,—the young.
White-bellied Jabiru, Latham.

Súrmai, H. (Jerdon). Inhabits Europe; Asia; N. Africa: common in N. India; very rare in L. Bengal.

(1945) *C. leucocephala* (*Pl. Enl.* 906).

SYN. Ardea leucocephala, Gmelin.
C. umbellata, Wagler.

Manikjor, H., B.; *Khyee-kheng-tswop*, Arakan; *Sandang-lawe*, Java. Inhabits India generally; Burmese and Malay countries. Common.

Genus LEPTOPTILOS, Lesson.

(1946) *L. argala* (*Pl. Enl.* 300).

SYN. Ardea argala, L.
A. dubia, Gmelin.
Ciconia mirabou, Temminck.
C. nudifrons, Jerdon, Catal.,—young.
Argala migratoria, Hodgson, Ind. Rev. 1838, p. 563.

Hargila, B.; *Dusta*, H. (Jerdon); *Chaniari Dhauk*, H. (Hodgson); *Garar*, Muttra. 'Adjutant' of Europeans. Inhabits N. Asia? Visiting India during the rains, when common in L. Bengal.

(1947) *L. javanica* (*Pt. Col.* 312).

SYN. Ciconia javanica, Horsfield.
C. capillata, Temminck.
C. calva, Jerdon, Catal.
C. nudifrons, and the young—C. cristata, McClelland, Ind. Rev. 1838, pl. 512.
Argala immigratoria, Hodgson, ibid., p. 563.
Ardea dubia of Sumatra, apud Raffles.

Madanchur, B.; *Chinjara*, H. (Jerdon); *Tontsap* and *Nghet-gyee*, Arakan; *Bangou Sula*, *Burong Kambing*, and *Burong Gaja* of Malays (Raffles); *Bangu*, Java. Inhabits India and Malay countries; never frequenting towns, like L. argala.

Subfam ARDEINÆ.

Genus ARDEA, L. *Bog*, or *Bogla*, H.; *Barado*, Sindh; *Nga-heet* and *Nghet-nga-nwa*, Arakan.

(1948) *A. goliath*, Ruppell (Atlas pl. , the adult).

SYN. A. typhon (?), Temminck (Pl. Col. 475)?
A. nobilis, Blyth, Ann. Mag. N. H. XIII, 175,—young bird.

Inhabits Bengal (in cold season); Nepal: also Africa. Several specimens of this immense heron have been procured in the vicinity of Calcutta, but all hitherto in the plumage of the first year.

(1949) *A. sumatrana*, Raffles Gould's B. A. Vol. VI, pl. 54,—the second plumage.

SYN. A. fusca, Blyth, Ann. Mag. N. H. XIII, 176.
A. rectirostris, Gould.

San Barado, Sindh. Inhabits Sindh; Sikim (tarai?); Assam; Arakan; Sumatra; Australia.

(1950) *A. cinerea*, L. (*Pl. Enl.* 755, 787).

SYN. A. major, L.
A. bruh (?), Jacquemont, Atlas, pl.

Kabud, H. (Jerdon). *Sada Kánk*, and *Anjun*, B.; *Saa*, Sindh; *Changa Awu*, Jav. Inhabits Europe; Asia; Africa. Common in India.

(1951) *A. purpurea*, L. (*Pl. Enl.* 783).

SYN. A. caspica, purpurata, rubiginosa (?), et botaurus aut rufa, Gmelin.
A. variegata, Scopoli.
A. monticola, LaPey.

Nari, H. (Jerdon); *Lál Kank*, B.; *Khyonhyoing*, Arakan; *Changa-ulu*, Java. Inhabits Europe, Asia, Africa.

Subgenus HERODIAS, Boie.

Koka, Cingh.; *Kantal*, Jav.; *Ooker*, and *Kumole*, Kabul; *Byoing Phyoo*, Arakan.

(1952) *H. alba* (*Pl. Enl.* 886; Goulds B. A. Vol. VI, pl. 56).

SYN. Ardea alba, L.
A. egretta, Temminck.
A. nivea, Lesson.
A. modesta, Gray.
A. flavirostris et melanorhynchos, Wagler.
A. torra, Buchanan Hamilton and Franklin.
A. syrmatophorus, Gould.

Mallang Bagla, *Turra Bagla*, and *Patoka Bagla*, H. (Jerdon); *Dhar Bagla*, B.; *Bacho Barado*, Sindh. Inhabits S. E. Europe; Africa; Asia and its islands; Australia. Common in India.

(1953) *H. intermedia* (Gould's B. A. Vol. VI. pl. 57).

SYN. Ardea intermedia, Wagler, Isis, 1829.
A. egrettoides, Temminck.
A. flavirostris, Bonnaterre, nec Wagler.
A. putea, Buchanan Hamilton.
A. nigrirostris, Gray,
H. plumifera, Gould.

Inhabits as last. The most abundant species of Egret in the Malay countries. Common also in India.

(1954) *H. garzetta* (*Pl. Enl.* 901).

SYN. Ardea garzetta, L.
A. xanthodactyla et A. nivea, Gmelin.
A. orientalis, Gray.
A. melanopus, Wagler, } Variety.
A. nigripes, Temminck, }
H. immaculata (?), Gould.

Kirchia (or *Kilchia*) *Bagla*, H. (Jerdon). Inhabits as last. Very common in India. Australia?

(1955) *H. bubulcus* (*Pl. Enl.* 910: Denon's Egypt, *Zool.* t. 1, pl. 8, f. 1).

SYN. Ardea bubulcus, Savigny.
A. lucida, Raffinesque.
A. æquinoctialis, Montagu.
A. coromandelensis, Stephens.
A. bicolor and A. ruficapilla, Vieillot.
A. russata, Temminck.
A. affinis, Horsfield.
A. coromandelica, Lichtenstein.
A. Veranii, Roux.
A. leucocephala, Cuvier.
A. caboga, Franklin.
A. ibis, Hasselquist.

Durrea and *Surkhia Bogla*, H.; *Gai Bagla*, B.; *Sudu Koka*, Cingh.; *Kantal Chilik*, Jav. Inhabits as last, associating much with cattle. Nec Australia?

(1956) *H. asha*.

SYN. Ardea asha, Sykes.
Herodias pannosa (?), Gould (B. A. Vol. VI, pl. 59).

Kala Bugla, H. (Jerdon). Inhabits Peninsula of India; Sindh. Nec (?) L. Bengal. Australia?

(1957) *H. jugularis* (Gould's B. A. Vol. VI, pl. 60).

Syn. Ardea jugularis, Forster.
A. cærulea, var., Latham.
A. matook, Vieillot.
Demigretta concolor, Blyth. J. A.S. XV, 372.
H. Greyi,—Gray (Gould's B. A Vol. VI, pl. 61),—permanent white variety.

Inhabits Arakan; Nicobar Islands; N. Zealand; Africa (Senegal)?

Subgenus BUTORIDES, Blyth.

(1958) *B. javanica.*

Syn. Ardea javanica, Horsfield.

Kancha Bagla, H.; *Kuno Bag*, B.; *Puchong*, Malay; *Upi upian*, Jav. Inhabits India and Malay countries. Common.

Subgenus ARDEOLA, Boie.

(1959) *A. leucoptera* (Hardw. *Ill. Ind. Zool*).

Syn. A. leucoptera, Boddaert,
A. Grayi, Sykes—breeding dress,
A. malaccensis, Gmelin—non-breeding dress.

Undki Bogli. H. (Jerdon); *Kuro Bog*, B.; *Kana koka*, Cingh. Inhabits India generally; Burmese countries; Malayan peninsula. Exceedingly common.

Subgenus NYCTICORAX, Brisson, Stephens.

(1960) *N. griseus* (*Pl. Enl.* 758).

Syn. Ardea nycticorax et grisea, L.
N. europæus, Stephens.

Wok (from voice), and *Batchka*, Beng., H.; *Gadri*, Sindh; *Leng-wet*, Arakan; *Guwo*, Jav. Inhabits Europe; Asia; Africa. Common in India.

Subgenus TIGRISOMA, Swainson.

(1961) *T. melanolopha.*

Syn. Ardea melanolopha. Raffles, Lin. Tr. XIII, 316.

Inhabits Ceylon; Arakan; Malayan peninsula; Sumatra.

Subgenus BOTAURUS, Brisson, Stephens.

(1962) *B. stellaris* (*Pl. Enl.* 789).

Syn. Ardea stellaris, L.

Nir goung, H. Inhabits Europe; Asia; Africa. Common in Bengal.

Subgenus ARDETTA, G. R. Gray.

(1963) *A. flavicollis* (Jerdon's *Ill. Ind. Orn.* pl. 16; Gould's *B. A.* Vol. VI, pl. 65,—not good, if the Australian be truly identical with the Indian species.

Syn. Ardea flavicollis, Latham.
A. nigra, Vieillot.
A. picta, Raffles,—the young figured in Hardwicke's Ill. Ind. Zool.

Kala and *Nol Bogla*, B.; *Tototan* or *Tomtomman*. Jav. Inhabits India generally: not common, nor rare in L. Bengal: Ceylon; Tippera; Arakan; Tenasserim; Malayan peninsula; Sumatra; China; Australia.

(1964) *A. cinnamomea* (Hardw. *Ill. Ind. Zool*).

Syn. Ardea cinnamomea, Gmelin.

Lal Bogla, H.; *Nati*, *korawaka*, Cingh.; *Ayam-Ayaman*, Jav. Inhabits India and Malay countries. Common.

(1965) *A. sinensis* (young figured as No. 1651, Hardw. *Ill. Ind. Zool.*,—not good).

Syn. Ardea sinensis, Gmelin.
A. lepida et A. nebulosa, Horsfield.

Bambangan, Jav. Inhabits India generally; Ceylon; Arakan; Jav; China. Generally observed on high reeds.

(1966) *A. minuta* (*Pl. Enl.* 323).

Syn. Ardea minuta, L.
A. danubialis et soloniensis, Gmelin.

Inhabits Europe, Africa, C. Asia; Nepal.

Tribe MACRODACTYLI.

Fam. RALLIDÆ.

Genus PORPHYRIO, Brisson.

(1967) *P. poliocephalus*, Latham. *Kaim*, or *Kayem*, Beng.: *Keima*, H.; *Kogh*, Sindh. Inhabits India generally; Arakan; Tenasserim. Replaced in the Malayan peninsula and archipelago by *P. smaragdinus*, Temminck, v. *indicus*, Horsfield; *Tedone* of the Malays; *Pellung*, Jav.

Genus GALLICREX, Blyth.

(1968) *G. cristatus.*

Syn. Gallinula cristata, Latham.
G. plumbea, Vieillot.
G. lugubris (male), and G. gularis (female), Horsfield.
Rallus rufescens apud Jerdon, Madr. Journ. XII, 205 (female).
Fulica cinerea, Gmelin,

Kora, or *Kongra*, Beng.; *Bontod*, and *Bureng*, Jav. Inhabits India generally, and Malay countries. Common in Bengal.

Genus PORZANA, Vieillot.

(1969) *P. phœnicura* (*Pl. Enl.* 896; Horsfield, *Zool. Res. in Java*, pl.).

Syn. Rallus phœnicurus, Pennant.
Gallinula javanica, Horsfield.
G. erythrina, Bechstein.
Fulica chinensis, Boddaert.

Daouk, or *Dehuk*, Beng.; *Dawuk*, H. (Jerdon); *Korawaka*, Cingh.; *Kurai*, Sindh; *Kaloo-gwet*, Arakan; *Roa-Roa*, Malay; *Sri-bomba*, Jav. Inhabits S. E. Asia and its archipelago. Extremely common.

(1970) *P. akool.*

Syn. Gallinula akool, Sykes (nec Jerdon).
G. modesta, Swainson 2½ Cent., p. 348.

Inhabits India generally. Rare in L. Bengal.

(1971) *P. maruetta* (*Pl. Enl.* 751).

Syn. Rallus porzana, L.
R. maruetta, Brisson.

Khairi, Beng. (generic); *Teerteeruk*, Kabul. Inhabits Europe, Asia, and Africa. Common in India.

(1972) *P. pygmæa* (J. and S., *Ill. Orn.*, pl. 15).

Syn. Crex pygmæa, Naumann
Gallinula Baillonii, Vieillot.

Inhabits Europe, Asia, and N. Africa. Very common in India.

(1973) *P. quadristrigata*.

Syn. Rallus quadristrigatus, Horsfield.
Gallinula superciliosa, Temminck.
G. leucosoma, Swainson, 2½ Cent, p. 348.

Inhabits Malay countries.

(1974) *P. fusca* (*Pl. Enl.* 773; *Pl. Col.* 387).

Syn. Rallus fuscus, L.
Gallinula rubiginosa, Tem.

Inhabits S. E. Asia and its islands. Common in India.

(1975) *P. fasciata* (*Pl. Col.* 417), J. A. S. XI, 797.

Syn. Rallus fasciatus, Raffles.
Gallinula euryzona, Tem.
Rallus ruficeps, Cuv.

Sintar, Malay (generic). Inhabits Malayan peninsula and archipelago.

(1976) *P. ceylonica* (Brown's *Ill.*, pl. 37.)

Syn. Rallus ceylonicus, Gmelin.

Inhabits Peninsular India; Ceylon.

Genus ORTYGOMETRA, Ray.

(1977) *O. crex* (*Pl. Enl.* 750).

Syn. Gallinula crex, L.
Crex pratensis, Bechstein.

Inhabits Europe and W. Asia: common in Afghanistan.

(1978) *R. striatus*, L.

Syn. R. gularis, Horsfield.

Ayam-aym, Sum.; *Tikussan*, Jav. Inhabits S. E. Asia and its islands. Common in India.

(1979) *R. indicus*, Blyth, J. A. S. XVII, p.

Syn. R. aquaticus of Indian auctorum.

Inhabits India generally. Common.

Genus. GALLINULA, Brisson.

(1980) *G. chloropus* (*Pl. Enl.* 877).

Syn. Fulica chloropus et F. fusca, L.
G. parvifrons, Blyth.
G. akool apud Jerdon, Catal.

Pan Paira, *Dahuk Paira*, B.; *Kushkul*, Cabul. Inhabits Europe, Asia, and N. Africa. Common in India.

Genus FULICA, L.

(1981) *F. atra*, L. (*Pl. Enl.* 197).

Syn. F. aterrima, L.
F. æthiops et F. leucoryx, Sparrman.
F. pullata et atrata, Pallas.

Dasri, or *Dasarni*. H.; *Kushkul*, Cabul; *Ari*, Sindh. Inhabits Europe, Asia, and N. Africa. Common in India.

Order VIII. NATATORES.

Tribe LONGIPENNES.

Fam. LARIDÆ.

Subfam. LARINÆ.

Genus CATARRACTA, Brunnich.

(1982) *C. cephus*, Brunnich (Gould's *B. E.* pl. 442).

Syn. Lestris parasiticus, Swainson.
L. crepidatus, Temminck
L. Buffonii, Boie.

Inhabits Northern seas.

Genus LARUS, L. *Gang Chil* (*i. e.* 'Ganges Kite,' B.): *Badkhor*, Cabul.

(1983) *L. fuscus*, L. (Gould, *B. E.*, pl. 431).

Syn. L. flavipes, Meyer.
L. argentatus apud Montagu.

Inhabits Atlantic; Mediterranean; Red Sea; Indian Ocean; C. G. Hope; N. Zealand. Cabul (Burnes).

(1984) *L. icthyaetus*, Pallas (Ruppell, *Atlas*, pl. 17).

Syn. L. kroikocephalus, Jameson, J. A. S. VIII, 242.
Icthyaetus Pallasi, Kaup.

Inhabits Asia; Indian Ocean; common in Bay of Bengal.

(1985) *L. ridibundus*, L. (*Pl. Enl.* 960, 970; Gould, B. E. pl. 425).

Syn. L. cinerarius et L. erythropus, Gmelin.
L. atricilla et L. nævia, Pallas.
L. canescens, Bechstein.
L. capistratus, Temminck.
Sterna obscura, Latham.

Inhabits Europe; Asia; N. Africa: much less common in L. Bengal than L. fuscus.

(1986) *L. brunnicephalus*, Jerdon, *Madr. Journ.* XIII, 225.

Syn. L. ridibundus, var., Sundevall.

Inhabits India generally. Common.

Subfamily. STERNINÆ.

Gáng Chil, B; *Tikári*, H.

Div. 1. Skimmers.

Genus RHYNCHOPS, L.

(1987) *Rh. albicollis*, Swainson (Gray's *Ill. Gen. Birds*, pl. 180). Inhabits India generally.

Div. 2. Marsh Terns.

Genus SYLOCHELIDON, Brehm.

(1988) *S. caspius* (Savigny, *Ois. d'Ægypt*, pl. 9, f. 1; Gould's B. A. Vol. VII, pl. 22).

Syn. Sterna caspia, Latham.
S. strenuus, Gould.
Thalassites, Catal., No. 405, Jerdon.

Inhabits India generally (nec L. Bengal), and the warmer regions of the Old World; Australia; rare in N. W. Europe.

Genus GELOCHELIDON, Brehm.

(1989) *G. anglicus* (Wilson's *Am. Orn.* pl. 72, f. 6).

Syn. Sterna anglica, Montagu.
St. aranea, Wilson (apud Audubon, Selby, and de Kay).
St. risoria et St. meridionalis, Brehm.
St. nilotica, Gmelin.
St. affinis, Horsfield (nec Ruppell).

Inhabits warmer regions of the Old World, extending also to America. Common in India.

Genus HYDROCHELIDON, Boie.

(1990) *H. indica.*

Syn. Viralva indica, Stephens.
Sterna hybrida, Pallas.
St. leucopareia, Natterer,
St. grisea, Horsfield,
St. cantiaca (?) apud Raffles.
St. similis, Gray (Hardw. Ill. Ind. Zool.)

Samar Saut ?, Sum.; *Puter-lahut*, Jav. Inhabits Europe; Asia; Africa; Malay countries: rare in N. W. Europe: very common in India. *N. B. H. fluviatilis*, (Gould's *B. A.* Vol. VII, pl. 31,) of Australia, would seem to differ only in having the entire throat white when in summer dress.

(1991) *H. nigra* (*Pl. Enl.* 333).

Syn. Sterna nigra, nævia, et L. hybrida (?), L. St. fissipes, Pallas. St. leucoptera, Temminck. } apud G. R. Gray.

Inhabits S. Europe; Africa; W. Asia. Rare in N. and C. Europe.

Genus THALASSEUS, Boie.

(1992) *Th. bengalensis* (Gould's B. A. Vol. VII, pl. 25).

Syn. Sterna bengalensis, Lesson,
St. media (?), Horsfield.
Th. Torressi, Gould
Sterna, Jerdon's Catal., No. 402.

Toyang kacher (?), Java. Inhabits Indian and Malayan seas; N. Australia.

Genus STERNA, L.

Subgenus SEENA, Blyth.

(1993) *Seena aurantia* (Hardw. *Ill. Ind. Zool.*

Syn. Sterna seena, Sykes.
St. aurantia, et St. brevirostris, Gray.

Inhabits India generally. Common along the rivers.

Subgenus STERNA.

(1994) *St. paradisea*, Brunnich (Vieillot, *Gal. des Ois.*, pl. 290).

Syn. St. Dougalli, Montagu.

Inhabits Europe; Asia; Africa; America; coasts of India.

(1995) *St. hirundo*, L. (*Pl. Enl.* 987).

Syn. St. fluviatilis, Naumann.

Inhabits Europe; Asia; Africa; Nilgiris; Ceylon.

(1996) *St. javanica*, Horsfield (Hardw. *Ill Ind. Zool*).

Syn. St. melanogaster, Temminck.
St. acuticauda, Gray.

Inhabits India and Malay countries. Common along the rivers.

Subgenus STERNULA, Boie.

(1997) *St. minuta* (*Pl. Enl.* 996; Wilson's *Am. Orn.* pl. 60, f. 2).

Syn. Sterna minuta, L.
St. sumatrana (?), Raffles.
St. sinensis (?), Gmelin,—young.

Toyang, Jav. Inhabits Northern hemisphere: represented in S. America and in Australia by closely allied species. Common on W. coast of India.

Div. 4. Oceanic Terns.

Genus ONYCHOPRION, Wagler.

(1998) *On. melanauchen* (Gould's *B. A.* Vol. VII, pl. 28).

Syn. Sterna melanauchen, Temminck.
St. minuta, Horsfield (apud G. R. Gray).

Inhabits Indian Ocean; Malayan seas: N. Australia. Breeds numerously on Nicobar Islands.

(1999) *On. anasthætus* (Sonnerat, *Voy. a la Nouv. Guinée*, pl. 84).

Syn. Sterna anasthætus, Scopoli.
St. panayana, Latham (nec apud Gould? B. A. Vol. VII, pl 33).
St. infuscata, Lichtenstein (from E. Indies).
St. antarctica, Mus de Paris, Lesson (Calcutta).

Inhabits Indian Ocean; Bay of Bengal; Malayan Seas.

Genus ANOUS, Leach.

(2000) *A. stolidus* (Gould's *B. A.* Vol. VII, pl. 34).

Syn. Sterna stolida, L,
A. niger, Stephens.
Gaira fusca, Brisson.
St. philippina (?), Latham.

Chamar, Malay (generic). This is of very general distribution, over the temperate and warmer parts of the ocean. Common in the Indian seas.

(2001) *A. tenuirostris* (Gould's *B. A.* Vol. VII, pl. 36).

Syn. Sterna tenuirostris, Temminck.
A. leucocapillus, Gould.

Inhabits coasts of Africa; Indian Ocean; Australian seas.

Fam. PROCELLARIDÆ.

Genus DIOMEDEA, L.

(2002) *D. exulans*, L. (Gould's *B. A.* Vol. VII, pl. 38).

Syn. Plautus albatrus, Klein.

Inhabits S. Ocean.

(2003) *D. melanophrys*, Temminck (Gould's *A.* Vol. VII, pl. 43). Inhabits S. Ocean.

(2004) *D. chlororhynchos*, Latham (Gould's *A.* Vol. VII, pl. 42).

Syn. D. chrysostoma, Forster.

Inhabits S. Ocean.

(2005) *D. fuliginosa*, Gmelin (Gould, *B. A.* ol. VII, pl. 44).

Syn. D. palpebrata, Forster.
D. antarctica, Banks.
D. fusca, Audubon.

Inhabits Southern Ocean.

Genus PROCELLARIA, L.

(2006) *Pr. gigantea*, Gmelin (Gould's *B. A.* ol. VII, pl. 45). Inhabits Southern Ocean.

(2007) *Pr. glacialoides*, A. Smith (Gould's *B. A.* Vol. VII, pl. 48).

Syn. Pr. tenuirostris, Audubon.

Inhabits S. Ocean.

(2008) *Pr. Cookii*, G. R. Gray (Gould's *B. A.* Vol. VII, pl. 51).

Syn. Pr. velox, Solander, MS.
Pr. leucoptera, Gould.

Inhabits Southern Ocean.

(2009) *Pr. turtur*, Solander (Gould's *B. A.* Vol. VII, pl. 54). Inhabits S. Ocean.

Genus PRION, Lacepede.

(2010) *Pr. vittatus* (Gould's *B. A.* Vol. VII, pl. 55).

Syn. Procellaria vittata, Forster.
Pr. Forsteri, Latham.

Inhabits Southern Ocean.

Genus PELICANOIDES, Lacepede.

(2011) *P. urinatrix*, (Gould's *B. A.* Vol. VII, pl. 60).

Syn. Procellaria urinatrix, Latham.
Pr. tridactyla, Forster.
Puffinaria Garnottii, Lesson.

Inhabits S. Ocean: Bay of Bengal (apud Sundevall).

Genus PUFFINUS, Brisson.

(2012) *P. major*, Faber (*Pl. Enl.* 962; A. Smith, *S. Afr. Zool.*, Aves, pl. 56).

Syn. Procellaria puffinus, L.
Pr. grisea, Gmelin.
P. fuliginosus, Strickland.
P. cinereus, A. Smith.

Inhabits Atlantic; Mediterranean; S. Ocean.

Genus THALASSIDROMA, Vigors.

(2013) *Th. oceanica*, Kuhl (Gould's *B. A.* Vol. VII, pl. 65).

Syn. Th. Wilsonii, Bonaparte.
Procellaria pelagica, apud Wilson.

Inhabits N. and S. Oceans.

Tribe TOTIPALMATI.

Fam. PELICANIDÆ.

Genus PHAETON, L.

(2014) *Ph. æthereus*, L. (the young; Gould's *B. A.* Vol. VII, pl. 73).

Syn. Ph. phœnicurus, Gmelin (the adult).

Inhabits Bay of Bengal; Indian Ocean; S. Seas, &c.

(2015) *Ph. candidus* (*Pl. Enl.* 369; Edwards, pl. 149, f. 2).

Syn. Lepturus candidus, Brisson.
Ph. melanorhynchos, Gmelin (the young).

Inhabits Bay of Bengal; Indian Ocean; S. Seas, &c.

Genus SULA, Brisson.

(2016) *S. fiber* (Gould's *B. A.* Vol. VII, pl. 78).

Syn. Pelicanus fiber et P. sula, L.
S. australis, Stephens.
S. braziliensis, Spix.

Inhabits Tropical Seas. Common in Bay of Bengal.

(2017) *S. piscator* (Gould's *B. A.* Vol. VII, pl. 79).

Syn. Pelicanus piscator, L.
S. candida, Stephens.
S. erythrorhyncha, Brandt.
S. rubripes, Gould.

Inhabits Tropical Seas. Common in Bay of Bengal, &c.

Genus PELICANUS, L.

(2018) *P. onocrotalus*, L. (Edwards, pl. 93).

Syn. P. roseus, Eversmann, } G.R. Gray.
Onocrotalus phœnix, Lesson, }

Inhabits S. Europe; W. Asia; Africa. *A.* stuffed head and neck, copious pendent crest 5 in. long, and with the rest of the feathers very unlike those of either Indian Pelican.

(2019) *P. javanicus*, Horsfield (Stephens, in Shaw's Zoology, XIII, 109, pl. 12).

Syn. P. onocrotalus of India, auctorum (also of Pallas?).
P. crispus (?), Bruch.

Hawasil, and *Gaganbher*, H.; *Gara Polo*, Beng. (generic); *Lampipi*, Malay; *Bukhul*, Java. Inhabits S. E. Asia and its islands. Common in India.

(2020) *P. philippensis*, Gmelin (*Pl. Enl.* 965).

Syn. P. roseus et P. manillensis, Gmelin.

Won-bo, Arakan; *Walang kadda*, Jav. Inhabits S. E. Asia and its islands. More common in L. Bengal than the preceding species.

Genus GRACULUS, L.

(2021) *Gr. carbo*, L. (*Pl. Enl.* 927).

Syn. Carbo cormoranus, Meyer.
C. albiventris, Tickell, J. A. S. XI, 463,—the young.

Gho-ghur, H.; *Khambo*, Sindh. Inhabits Northern hemisphere. Not common in most parts of India and never in L. Bengal. Most numerous towards the Himalaya.

(2022) *Gr. sinensis* (*Atlas* to Macartney's Embassy to *China*, pl.).

Syn. Pelicanus sinensis, Shaw.
Phalacrocorax fuscicollis, Stephens.
Ph. leucotis, Blyth.
Carbo leucogaster, Meyer.
C. nudigula, Brandt.

Inhabits Asia, chiefly to the eastward. In India, commonest towards the Himalaya, rare in the peninsula, and never seen in L. Bengal.

(2023) *Gr. Linnæi*, G. R. Gray (*Pl. Col.* 322).

Syn. Pelicanus graculus, L., apud G. R. Gray (nec apud Temminck).
P. leucogaster, Vieillot.
Carbo cristatus, Temminck.

Inhabits Europe; Africa to C. G. Hope.

(2024) *Gr. pygmæus* (Hardw. *Ill. Ind. Zool.*).

Syn. Pelicanus pygmæus, Pallas.
Carbo javanicus, Horsfield.
C. melanognathus, Brandt.
Phalacrocorax niger, Vieillot.
Halieus africanus apud Sundevall.

Jograbki, *Pan-koul*, H.; *Pan-Kowa* (i. e. 'Water Crow'), *Pan-Kowri*, and *Pan-kouti*, B.; *Kaben*, Sindh; *Tong-gyee*, Arakan; *Pechuch*, Jav. Inhabits Asia and its archipelago. Extremely common throughout India.

Genus PLOTUS, L.

(2025) *Pl. melanogaster*, Gmelin.

Syn. Pl. Vaillantii of India, auctorum.

Banwa, and *Pan Dubbi*, H.; *Goyar*, B.; *Teng-gyee*, Arakan; *Dandang Ayer*, Sum. Inhabits S. E. Asia and its archipelago. Common throughout India.

Tribe LAMELLIROSTRES.

Fam. ANATIDÆ.

Hans (root of *Anser*, &c.), H.

Subfam. PHŒNICOPTERINÆ.

Genus PHŒNICOPTERUS, L.

([illegible] Pallas.

Syn. [illegible] Temminck.

Bog-hans ('Heron Goose'), H.; *Kaan T'hunti*, B. Inhabits warmer regions of the old continent. Common in parts of India. It is the smaller Indian Flamingo.

Subfam. ANSERINÆ.

Div. 1. Swans.

Genus CYGNUS, L.

(2027) *C. olor* (*Pl. Enl.* 913).

Syn. Anas olor, L.
C. sibilus, Pallas.
C. mansuetus, Ray.
C. gibbus, Bechstein.

Inhabits N. Asia and of E. Europe, chiefly.

(2028) *C. atrata* (Gould's B. A. Vol. VII, pl. 6).

Syn. Anas atrata, Latham.
A. plutonia, Shaw.
Anas novæ hollandiæ, Bonnaterre.

Inhabits Australia.

Div. 2. Ordinary Geese.

Raj Hans, H.

Genus ANSER, Brisson.

(2029) *A. cygnoides*, (*Pl. Enl.* 347).

Syn. Anas cygnoides, L.

Inhabits China, where domesticated. Unknown in the wild state. The domestic Geese of India are a hybrid race between this and the next species.

(2030) *A. cinereus*, Meyer (Gould's *B. E.* pl. 347,—very bad; Yarrell's *Br. Birds*, III, 53).

Syn. Anas anser, L.
Anser ferus, Gesner.
A. vulgaris, Pallas.
A. palustris, Fleming.

Inhabits Northern hemisphere. Common in India; somewhat rare in W. Europe.

(2031) *A. brachyrhynchus*, Baillion (Yarrell's *Br. Birds*, III, 64).

Syn. A. phœnicopus, Bartlett.
A. brevirostris, Thienem.
A. rufescens (?), Brehm.

Inhabits N. hemisphere. Punjab.

Subgenus BERNICLA, Stephens.

(2032) *B. indica* (Gould's *Century*, pl. 80.

Syn Anas indica, Gmelin.
Anser undulatus, Brandt.

Inhabits India generally, common in the cold season.

Div. 3. Perching Geese.

Genus DENDROCYGNA, Swainson. *Silli* H.; *Saral*, B.

(2033) *D. major*, Jerdon (*Ill. Ind. Orn.*, pl. 23). Inhabits India generally; Not rare in L. Bengal.

(2034) *D. arcuata* (Horsfield, *Zool. Res. in Java*, pl.

Syn. Anas arcuata, Cuvier.
A. javanica, Horsfield.
Marecca awsuree, Sykes.

Butunth, Sindh; *Tseet-tsa-lee*, Arakan; *Bilibi*, Sum.; *Meliris*, Jav. Inhabits India and Malay countries. Extremely common. *N. B.* The Australian species referred to this by Mr. Gould (*B. A.* Vol. VII, pl. 14), is obviously distinct and new.

Genus SARCIDIORNIS, Eyton.

(2035) *S. melanotus* (*Pl. Enl.* 937; Pennant's *Ind. Zool.*, pl. 11).

Syn. Anser melanotus, Pennant.

Nukta, H.; *Tau-bai*, Arakan. Inhabits India and Burmah. Not common in L. Bengal.

(2036) *S.* (?) *leucoptera*, Blyth, J. A. S. XVIII. Inhabits Burmah; Tenasserim provinces.

Genus NETTAPUS, Brandt.

(2037) *N. coromandelianus* (*Pl. Enl.* 949, 950; Hardw. *Ill. Ind. Zool*).

Syn. Anas coromandeliana, Gmelin.
Berniela girra, Gray.
Dendrocygna affinis, Jerdon—winter dress.

Girja and *Girri*, H.; *Ghangerel*, B.; *Karagat*, Arakan. Inhabits India and Malay countries. Extremely common.

Div. 4. Shieldrakes.

Genus CASARCA, Bonap.

(2038) *C. rutila* (Gould's B. E. pl. 358).

Syn. Anas rutila, Pallas.
A. casarca, L.
A. rubra, Gmelin.

Surkhab and *Chukwa*, male, *Chukwi*, female, H. Inhabits Asia generally; N. Africa: rare in Europe: common in India.

Genus TADORNA, Leach.

(2039) *T. vulpanser*, Fleming (*Pl. Enl.* 53; Gould's B. E. pl. 357).

Syn. Anas tadorna, L.
A. cornuta, Gmelin.
T. familiaris, Boie.
T. Bellonii, Stephens.

Mekez (male), *Alikaz* (female), Cabul; *Shah Murghabi*, *Ali-jur gub*, and *Niraji*, Sindh. Inhabits Europe; Asia; N. Africa. Not common in L. Bengal; more so on the Indus.

Subfam. ANATINÆ.

Hans, H.; *Bigri*, B.

Genus ANAS, L.

Subgenus SPATULA, Boie.

(2040) *Sp. clypeata* (*Pl. Enl.* 971, 972).

Syn. Anas clypeata, L.
A. rubens, Gmelin.
A. mexicana, Latham.
A. platalea, Vieillot.

Tridari, H.: *Alipat*, and *Kachuk Mal*, Sindh. Inhabits Europe; Asia; Africa; N. America. Common in India.

Subgenus ANAS.

(2041) *A. boschas*, L (*Pl Enl.* 776, 777).

Syn. A. fera, Brisson.
A. domestica et A. aduncа, L. } Varieties.
A. curvirostra, Pallas.
A. purpureo-viridis, Schinz,
A. Breweri, Audubon.

Subz-gurdan ('green-neck'), Persian; *Niroji*, Sindh. Inhabits N. Hemisphere: in India, confined to the Upper Provinces; never L. Bengal, nor S. India.

(2042) *A. pœcilorhyncha*, Pennant (*Ind. Zool.* pl. 13; Hardw. *Ill. Ind. Zool*). Inhabits India generally (not migratory); Burmah; not very common in L. Bengal.

(2043) A. (?) *caryophyllacea*, Latham (Jerdon's *Ill. Ind. Orn.*, pl. 34; G. R. Gray, *Ill. Gen. Birds*, pl. ,—bill and feet coloured erroneously).

Syn. A. erythrocephala, Bonnaterre.

Inhabits India generally; Burmah. Not common in L. Bengal.

Subgenus DAFILA, Leach.

(2044) *D. acuta* (*Pl. Enl.* 954; Gould's B. E. pl. 365).

Syn. Anas acuta, L.
A. caudacuta, Ray.
A. longicauda, Brisson.
A. tsitzihoa, Vieillot.

Kokarali, Sindh; *Sink-dum*, (*i. e.* 'Pin-tail'), Cabul. Inhabits N. Hemisphere. Extremely common throughout India.

Subgenus CHAULELASMUS, G. R. Gray.

(2045) *Ch. streperus Pl. Enl.* 958).

Syn. Anas strepera, L.
A. platyrhynchus, Ray.
A. kekuscha, Gmelin.
Chauliodus capensis, Swainson.

Sya-dum, Cabul. Inhabits N. Hemisphere; S. Africa. Rather common in India.

Subgenus MARECA, Stephens.

(2046) *M. penelope* (*Pl. Enl.* 825: Gould's B. E. pl. 366).

Syn. Anas penelope, L.
A. fistularis, Brisson.

Chea Nepal. Inhabits Europe; Asia; N. Africa. Moderately common in India.

Subgenus QUERQUERDULA, Stephens.

(2047) *Qu.* (?) *glocitans*.

Syn. Anas glocitans, Pallas (nec Gmelin).
A. picta, Steller.
A. torquata, Mess.
A. formosa, Georgi.
A. baikal, Bonnaterre.

Inhabits N. E. Asia. Extremely rare in L. Bengal.

(2048) *Qu. crecca* (*Pl. Enl.* 947).

Syn. Anas crecca, L.

Tulsia Bigri, *B.*; *Juruku*, or *Churuku*, Cabul. Inhabits Europe; Asia; N. Africa. Common in India.

(2049) *Qu. circia* (*Pl. Enl.* 946).

Syn. Anas querquerdula et A. circia, L.

Inhabits Europe; Asia; N. Africa. Extremely common in India.

Subfam. FULIGULINÆ.

Ghotye, Kabul.

Genus FULIGULA, Stephens.

Subgenus BRANTA, Boie.

(2050) *Br. rufina* (*Pl. Enl.* 928).

Syn. Anas rufina, Pallas.
A. erythrocephala et A. cinerea, Gmelin—young.
Callichen ruficeps, Brehm.

Nul Gulnar, Cabul. Inhabits Europe; and Asia; rare in W. Europe. Not rare in L. Bengal, in December and January.

Subgenus FULIGULA.

(2051) *F. ferina* (*Pl. Enl.* 803).

Syn. Anas ferina, L.
A. rufa, Gmelin.
A. ruficollis, Scopoli.

Lal Muriya, B. Inhabits N. hemisphere. Moderately common in L. Bengal.

(2052) *F. marila* (*Pl. Enl.* 1002).

Syn. Anas marila, L.
A. frænata, Sparrman.
A. subterranea, Scopoli.

Inhabits N. Hemisphere; Nepal.

(2053) *F. cristata*, *Ray* (*Pl. Enl.* 1001, 1007).

Syn. Anas fuligula, L.
A. colymbis, Pallas.
A. scandiaca, Gmelin.
A. latirostris, Brunnich.
A. notata, Boddaert.

Dubaru, B.; *Ablak*, Cabul. Inhabits N. Hemisphere. Moderately common in India.

(2054) *F. nyroca* (*Pl. Enl.* 1000).

Syn. Anas nyroca, Guldenstadt.
A. peregrina et A. africana, Gm.
A. Gmelini, Latham.
A. glaucion, Pallas.

Lal Bigri, B. Inhabits Europe; Asia; N. Africa. Tolerably common in India: exceedingly so in some seasons.

Subfam. MERGINÆ.

Genus MERGUS, L.

(2055) *M. castor*, *L.* (*Pl. Enl.* 951).

Syn. M. merganser, L.
M. Raii, Stephens.
M. orientalis, Gould, P. Z. S. 1845, p. 2.

Khoruk, Cabul. Inhabits N. Hemisphere. Very rare in India, except towards the Himalaya.

Fam. PODICIPIDÆ.

Genus PODICEPS, L.

(2056) *P. cristatus* (*Pl. Enl.* 400, 941, 944).

Syn. Colymbus cristatus, L.
C. cornutus, Brisson.
C. urinator, Scopoli.

Inhabits Old and New continents; Australia?

(2057) *P. philippensis*, Gm. (*Pl. Enl.* 905, 945).

Syn. Colymbus minor, et C. hebridicus. Gmelin.
C. fluviatilis, Brisson.

Durbari, B.; *Puudub*, Bhagulpore. Inhabits Old continent. Very common in India.

APPENDIX, No. 1.

Genus PSITTACUS, subgenus CHRYSOTIS, p. 2.

(2058) *Chr. leucocephalus*, No. 8 (A).

Genus LORICULUS, p, 9.

(2059) *L. asiaticus*, No. 46 (A).

Psittacus philippensis and Psittacula rubrifrons, refer to a nearly allied species.

Genus CORIPHILUS, p. 13.

(2060) *C. notatus*, No. 90 (A).

Genus HALCYON, p. 46.

(2061) *H. amauropterus*, *Pearson*, J. A. S. X. 635. Inhabits L. Bengal (Sundarbans especially); Arakan; Tenasserim provinces; very abundant along the eastern coast of the Bay of Bengal, not yet observed on the western. Not rare in the vincinity of Calcutta.

Genus PICUS, p. 62.

(2062) *P. atratus*, *Blyth*, *J. A. S.* XVIII, p. Inhabits Tenasserim Provinces.

LEIOTHRICANÆ? p. 99.

Genus MUSCITREA, Blyth.

(2063) *M. cinerea*, *Blyth*, *J. A. S.* XVI, 122. Inhabits Arakan.

(2064) BISCUITS.

Skibstvebak, Dan.	Biscotto, Galetta, It.
Scheepsbeschuit, Dut.	Biscoito, Port.
Biscuit, Fr.	Bort, Saucher, Rus.
Zweibach, Ger.	Bizcocho, Galletta, Sp.
Biscoot, Hind.	Faulkner.

Biscuit, from the two Latin words bis coctus, twice baked, is an unfermented bread, which, if properly prepared, can be kept a great length of time, and hence its use as a common form of bread at sea. That supplied to the Royal Navy,

om England, is now all made by machinery, but n India, and in England, ordinarily, it is made y hand. The good quality of biscuits depends n the thorough kneading of the dough, and its ubsequent division into portions of equal size nd thickness.—*Tomlinson.*

(2065) BISHOPS WEED. ANETHUM SOWA.

Omum, TAM. | Ajowan, HIND.
Ajooma, DUK. | Aymaudum, CAN.

Bishops weed seed. Sison Ammi, Lin.—*Ainslie's Mat. Med. p.* 269. These well known arminative seeds yield by distillation a very useful oil which is given medicinally, as a stomachic. The distilled water is used as a carminative in every nursery of Madras under the name of Omum Water.

(2066) BISMUTH. Mr. Piddington, the Mineralogical Curator of the Bengal Asiatic Society's Museum, mentions in his reports, that he found bismuth in one of the ores sent him from the antimony mines near Maulmein; and it is found in connection with silver in Burmah.—*Mason.* Bismuth is a metal that was unknown to the ancients. It was referred to by Agricola in his work on mining in 1829, and was subsequently described by Stahl and Dufay. The minerals in which this metal constitutes the principal ingredient are comparatively few in number; and of these only two species are of any importance in a commercial point of view, namely, the native bismuth, and its sulphurets. These minerals are all of them soluble in strong nitric acid, the solution yielding a white precipitate on being dropped into water. They are known and described by mineralogists under the following names:—*Native* or *Octahedral Bismuth, Bismuth-Ochre, Prismatic Bismuth-Glance, Needle-Ore* or *Acicular Bismuth Glance* called by Phillips *Plumbo-Cupriferous Sulphuret of Bismuth, Tellur-bismuth,* formerly known by the name of *Molybdan Silver.—Engl. Cyc, p.* 481.

(2067) BISON, the name of a genus of Ruminant Animals belonging to the family *Bovidæ.* The genus *Bison* comprehends two living species, one of them European, now become very scarce and verging towards extinction; the other American, and, notwithstanding the advances of man, still multitudinous.—*Engl. Cyc. page* 482.

(2068) BIT-LABAN, BIT NOBEN.

Sunchul. GUZ. | Kala-nemek, Sochul, HIND.

A medicinal salt prepared by melting together for about 6 or 7 hours, in an earthen pot, an impure muriate of soda, called *samur,* and emblic myrobolans (*Hind. Guz.* Aoonla, Anvelcutty), in the proportion of fifty-six ounces of the muriate, to twenty ounces of the dried myrobolans. It is met with in most Indian bazars, and is used by native practitioners as a tonic in dyspepsia and gout, as a stimulant in chronic rheumatism, &c.—*Faulkner.*

(2069) BITTERS.—*Pure Bitters.* In all parts of the world bitter substances appear to be regarded by the common people as febrifuges. The beautiful Menyanthes trifoliata and the Tormentil are as popular, in northern regions, as the Chiretta and its various substitutes in tropical countries of the East. Such remedies were in great repute in regular practice before the discovery of Quinine. Although, however, they act as tonics and improvers of digestion, and are admirable adjuvants of the true antiperiodics, it is doubtful whether they possess any strictly antiperiodic virtues of themselves. In this respect they bear very much the same relation to true febrifuges, as salicine does to quinine. Most of them will be found enumerated under their respective heads, and it is only necessary to mention here that of the *Mucilaginous Bitters,* the chief is the Goluncha, and two others are the Baobab, and Cetraria. *Aromatic Bitters* were formerly in high repute, but have latterly fallen into disuse as febrifuges. India does not appear to be particularly rich in them, and it is a curious fact connected with them that the species of Galipia yielding Angustura bark, is more esteemed by the natives of the Cinchona countries than the true bark. Dr. Hancock gave very strong evidence in its favor. *Bitters containing Alkaloids or Tannin* are a class containing all the most important antiperiodics, and the most valuable of them all is quinine. No Indian tree comes so near the Cinchonas in its botanical affinities as the Hymenodictyon excelsum. As one of its chief habitats is the pestilential jungles of Goomsoor, this would be an exemplification, if its virtues were found to be really considerable, of a favourite notion with some, that along with the bane, nature always supplies the antidote. *Astringent Bitters* and substances containing much tannin, have long been used in Europe as febrifuges.—*Ind. Ann. Med, Sci. for April.* 1856, p. 381.

(2070) BITUMEN, ASPHALTUM, MINERAL PITCH.

Jodenlym, DUT. | Nift-i-roomie, PERS.
Judenpech, GER. | Asphalto, PORT.
Nift-roomie, HIND. | Asfalt, RUS.
Isfalto, IT. | Asfalto, SP.
Asphaltum, LAT. | FAULKNER.

Bitumen itself is a Latin word used by Tacitus, Pliny, and other Roman writers. A considerable number of combustible mineral substances, as Naptha, Petroleum, Maltha, or Sea-wax, are sometimes arranged under the head of Bitumens; but their properties vary greatly in some respects, as, for example, with regard to solidity, fluidity, and colour. The term Bitumen is however usually applied to two varieties, namely, *Asphaltum* already described and Elastic Bitumen. This is sometimes called Fossil Caoutchouc, and is a rare mineral product, which has hitherto been found in three places only; 1st, in the Odin mine, near Castleton in Derbyshire, in a Secondary Limestone, accompanied by asphaltum, calcareous spar, fluor, blende, galena, and pyrites; 2nd,

in a coal-mine of Montrelais, a few leagues from Angers in France, it occurs among quartz and calcareous crystals, in the veins of grit of the Coal Formation; 3rd, in a coal-mine near South Bury in Massachussets, United States.—*Eng. Cyc. p.* 494.

(2071) BIXA. This is a genus of plants belonging to the natural order *Flacourtiaceæ*. It produces the substance called Arnotto. The only species of any general interest in the genus is the *Bixa orellana*, a native of the Malayan Archipelago, but now extremely common in the W Indies, where it is cultivated in rich moist soil by the sides of rivers.—*Eng. Cyc. page* 495.

(2072) BIXA ORELLANA, Willd.

Kistee, DUK, Latkan, HIND. and BEN. Thee-dew, BURM.	Kuppa Manhala, CAN, Mungi natie marum & Sapprah marum,	TAM.

This plant forms a small tree with deep-green shining heart-shaped leaves, and clusters of purplish flowers, which are succeeded by capsules of a heart-shaped form, covered with stiffish bristles, and opening into two valves which contain, attached to their middle, a number of seeds covered with a soft, sticky, vermilion-coloured rind. It is the latter which furnishes the arnotto of commerce already described under its proper head. According to Feé, this substance is obtained by heaping up the seeds in water for several weeks or months, and afterwards pressing them, when the colouring matter separates and is afterwards precipitated in the water. Or the pulp is separated by washing and maceration, and the colouring matter precipitated by the aid of an acid, and caught upon fine sieves. Independently of the use of arnotto for staining cheese and butter, the Indians paint their persons with it, and thus, it is said, destroy the subcutaneous vermin with which they are infested. It acts as a purgative taken internally; but its reputed powers as an antidote to the poison of the cassava are imaginary.—*Eng. Cyc. page* 495. Dr. Roxburgh remarked that this plant appears to be a native of India, but in the indigenous plant, the flowers are white and the immature capsule, green; while in the plants from West Indian seed the flowers are rose coloured, and the immature seed vessel red: and the Eastern plants do not furnish so much nor so good a colour.—*Roxburgh*. Dr. McClelland mentions that *Bixa orellana* (*Thee-dew*), or *Arnotto*, is cultivated all over Pegu for the red and yellow dyeing properties of its capsule. This is found in all the bazars, and in those of Bengal under the name of *Lat-kan*. It is a favorite dye with the Burmese, and might become a production of some importance.—*McClelland*. It is this species of Bixa which is now so largely grown for its dye. Some account of this has already been given under its proper head, Arnotto, which is used to impart a bright orange colour to silk goods and to give a deeper shade to simple yellows. The dry hard paste is also found to be the best of all ingredients for imparting a golden tint to cheese and butter. The Spanish Americans mix it with their chocolate, to which it gives a beautiful rich hue. The dye is usually prepared by macerating the pods in boiling water for a week or longer. When they begin to ferment, the seeds ought to be strongly stirred and bruised with wooden pestles to promote the separation of the red skins. This process is repeated several times, till the seeds are left white. The liquor, passed through close cane sieves, pretty thick, of a deep red color, and a very bad smell, is received into coppers. In boiling, it throws up its coloring matter to the surface in the form of scum, which is taken off, saved in large pans, and afterwards boiled down to a due consistence, and then made up, when soft, into balls or cakes of two or three pounds weight. The imports into Great Britain of Arnotto for home consumption are from 200,000 to 300,000 lbs. per annum. The plant is grown in Dacca and other parts of India in the Malay Peninsula and the Eastern Archipelago. At the Hawaiian Islands, Tongataboo, Rio Janeiro, Peru and Zanzibar, the Arnotto is now an indigenous shrub which rises to the height of seven or eight feet, producing oblong heavy pods, somewhat resembling those of a chesnut. Within this there are generally thirty or forty irregularly formed seeds, which are enveloped in a pulp of a bright red colour, and a fragrant smell.—*Simmond's Commercial Products, p.* 448.

(2073) BOEHMERIA, a genus of plants belonging to the natural order *Urticaceæ*. The species were formerly comprehended under the genus *Urtica*. One of the species *Boehmeria nivea*, formerly *Urtica nivea*, is the Rheea of Assam, which yields fibres of remarkable fineness and tenacity. It appears from the investigations of Dr. Falconer, that the plant which yields the celebrated grass-cloth of China is identical with the Assam plant. Several specimens of these fibres manufactured into light articles of dress were exhibited in the Indian collection at the Great Exhibtion of 1851.

(2074) BOEHMERIA FRUTESCENS (*Urticeæ*). POOAH FIBRE. 'Pooah' by the Parbuttias; 'Kienki' by the Lepchas; and 'Yenki' by the Limboos. The plant grows to the height of six or eight feet, and varies in the thickness of the stem from the size of a quill to that of the thumb. The leaf is serrated, of a dark green colour above, silvery white below, not hairy or stinging; and has a reddish pedicle of about three inches long. The seed forms in small currant-like clusters along the top of the plant, and on alternate sides about an inch apart. Two small leaves spring from the stem at the centre of and above each cluster of seed. Dr. Falconer recognized the "Pooah" as the "*Boehmeria frutescens*" of

botanists, common at lower elevations on the Himalayas from Gurhwal to the Sikkim hills, ranges to Burrampooter. In the outer hills of Gurhwal and Kumaon it is called 'Poee,' and the tough fibre is used there for making nets. In Darjeeling, *B. frutescens* goes by a similar name, 'Pooah,' and the fibre is used for similar purposes. It was first described by Thunberg, who distinguishes it from the textile species, *Boehmeria* (or *Urtica*) *nivea*, which grows there in abundance." The 'Pooah' is not cultivated but grows wild and abundantly in the valleys throughout the mountains of Eastern Nipal and Sikkim, at the foot of the Hills skirting the Tarai to the elevation of 1000 or 1200 feet; and within the mountains up to 3000 feet. It is considered a hill plant, and not suited to the plains or found in them. It does not grow in the forest, but is chiefly found in open clear places, and in some situations overruns the abandoned fields of the Hill people within the elevations which suit it. It sheds its leaves in the winter, throws them out in April and May, and flowers and seeds in August and September. The exact period altering of necessity with the elevation. "When used as a fibrous material, it is cut down for use when the seed is formed; this is the case with the common Flax, in Europe. At this time the bark is most easily removed and the produce is best. After the seed is ripe it is not fit for use, at least it is deteriorated. As soon as the plant is cut, the bark or skin is removed. This is very easily done. It is then dried in the sun for a few days; when quite dry it is boiled with wood-ashes for four or five hours; when cold, it is beaten with a mallet on a flat stone until it becomes rather pulpy, and all the woody portion of the bark has disappeared; then it is well washed in pure spring water and spread out to dry. After exposure for a day or two to a bright sun it is ready for use. When the finest description of fibre is wanted, the stuff, after being boiled and beaten, is daubed over with wet clay, and spread out to dry. When thoroughly dry the clay is rubbed and beaten out; the fibre is then ready for spinning into thread, which is done with the common distaff. The 'Pooah' is principally used for fishing nets, for which it is admirably adapted on account of its great strength of fibre and its extraordinary power of long resisting the effects of water. It is also used for making game-bags, twine, and ropes. It is considered well adapted for making cloth, but is not much used in this way." Captain Thompson, to whom the specimens of Pooah fibre were sent, says that, "when properly dressed, it is quite equal to the best Europe Flax, and will produce better sailcloth than any other substance he has seen in India. Dr. Campbell's communication shows that mud is used in the preparation, which clogs it too much, and Mr. W. Rownee mentions that if potash were used in the preparation (which is invariably done with Russian Hemp and Flax) instead of clay or mud, the colour would be improved, the substance rendered easy to dress, and not liable to so much waste in manufacturing." Sergeant Crutcher thought that this fibre might be supplied for four rupees a maund, when large quantities were prepared. Captain Thompson thought that it would be worth twelve rupees a maund in Calcutta.—*Royle, p.* 368.

(2075) BOEHMERIA GOGLADO. This nettle is common in Gurhwal and near Simla, and probably abounds in fibre. *Royle, p.* 372.

(2076) BOEHMERIA MACROSTACHYA, is common in Gurhwal and near Simla. It probably abounds in fibre.—*Royle, p.* 372.

(2077) BOEHMERIA NIVEA, GAUDICHAUD. *Urtica nivea*, Lin. CHINA GRASS.

Chu or Tchou ma, CHIN.	Kunkhoora and kunkoora, in RUNGPORE.
Tejo karao, JAPANESE.	Rheea, in ASSAM.
Caloee, SUMATRA.	Pan, in SHAW.
Ramee, MALAY.	Rheea grass, ENGLISH.
Inan, in BONOA.	Goun, BURM
Gambe, in East CELEBES.	

The *Boehmeria nivea* is a herbaceous plant, with broad ovate leaves which are downy and white beneath, hence its specific name. It bears no sting.—*Eng. Cyc. p.* 528. This species of Boehmeria is the most famous among these nettles for its fibres, it being now satisfactorily ascertained that the well known *China grass* of commerce, the China-flax, or Dom Rheea or Ramee fibre, is the product of this plant, the Boehmeria (formerly Urtica) nivea. The caloee or Ramee fibre, the Urtica tenacissima of Roxburgh, and the Bon Rheea or Jungle Rheea, will perhaps be found other species. And the plants called B. candicans and B. utilis by Mr. Weber of Java, are supposed identical with B. nivea. Of all the Nettle Tribe, this plant is the most famous for its fibre. Dr. Royle considers it to be one of the most valuable products of India, as its strength far exceeds the best hemp, while its fineness rivals superior kinds of flax, and as four to five crops of fibre can be obtained from the same plants within the year, if any machine could be invented for facilitating the separation of the fibre, from the woody part of the stalks, the Rheea would speedily undersell all the other fibres. It is carefully cultivated by some nations, the Chinese and the Assamese, but it grows spontaneously in the islands of the Eastern Archipelago, along the base of the hills from Cochin-China to the Yellow River, and from Chusan to the farthest west that researches have extended, also in Japan, the Celebes, in Borneo and in Siam; it is indigenous all over the Malayan Peninsula: it grows freely at Singapore though not planted or cultivated to any extent. It grows also in Burmah, Assam and Rungapore; in all which the people make use of it as a cordage material, and know it by the various names

given above. The fibres can be had at Ningpo, for about 6 dollars a picul of 133 lbs., but in England they have fetched the high prices of £60, £80 and even £120 a ton. These high prices have prevented this fibre from coming into general use for the manufactures of England, but it has also been impossible to use it for fine purposes owing to the occasional occurrence of a small black, almost invisible spot. The lowest price at which the Rheea fibre of Assam is procurable, is 6 annas a seer or about £42 a ton; but Capt. Dalton considers it might be reduced to £28 a ton, if easier means of preparing it could be discovered. Notwithstanding these various localities, it is satisfactory to know that the manufacturers in England, Messrs. Sangster and Marshall of Leeds, have reported the fibres from China and from Assam to be identical for all practical purposes. In England, of late years, China-grass has attracted considerable attention, and no less than three prize medals were given, at the Exhibition of 1851, for finely prepared specimens of this fibre. On one of these, that of Messrs. Wright & Co., the Jury reported that the process of preparation consists, essentially, in a very ingenious arrangement for boiling the stems in an alkaline solution, after they have been previously steeped for twenty-four hours in water of a temperature of 90°. The fibre is then thoroughly washed with pure water, and finally subjected to the action of a current of high pressure steam till nearly dry. The Rheea grows with such readiness that, if left alone, the plant would soon produce a complete jungle; though thriving anywhere, it springs up most luxuriantly in the shade, where there is much moisture, growing to the height of eight or ten feet, when its shoots flower. It can then be cut down, and other shoots spring up, which are also soon fit to cut, and so on successively for nearly any period, yielding generally four or five cuttings in the year. In Burmah, the name "Goon," is applied to this plant, the term *Betya* being given to another nettle the U. heterophylla. In Sumatra it is known as "Caloee," but the Malays call it "Ramee." In Assam, Rungpore and Dinagepoor, it is grown in the districts, along the foot of the hills, and is cut down four or five times during the year, thus yielding a series of crops. The aggregate produce of an acre of ground is about twelve maunds, and there, the expense seems to be about 15 Rs. a maund. The different crops vary in strength and fineness. In the cultivation of this plant manure is useful; moisture is essential for quick growth, as well as shade and protection from storms, to allow it to grow to the height of eight feet, from which a six feet fibre may be extracted. In China, where the finest fibre is produced, it is cultivated with considerable care; it may be grown from seed, but more quickly by parting the roots, as it throws up numerous shoots which, when cut down, are succeeded by fresh ones, so that three several crops are obtained in the season. There are however two modes of cultivating and clearing it, the Chinese method and the Indo Chinese. In the former, the plant when grown for the first time in a new site, is raised from seeds, but the roots of the seedling plants give off new shoots, by which they may be propagated; but the plan adopted with mulberry trees of placing down layers, is a quick mode. The first crop may be gathered in six weeks or two months, and every six weeks thereafter. When the stems are cut, they are split longitudinally, the bark is removed and the inner fibre which then come into view are removed and softened in boiling water. For its Commercial relations, *see* CHINA GRASS.—*Royle, Fib. Plants*.

(2078) BOEHMERIA SALICIFOLIA, a stinging nettle, common near Simla and in Gurhwal, and probably abounds in fibre.—*Royle*, *p.* 377.

(2079) BOEHMERIA UTILIS. Syn. Bon or Bun Rheea, Wild or Jungle Rheea; Leepeah, Nepa. There is no proof that the *Bon* or *Bun Rheea* that is, Jungle Rheea, is the Dom Rheea or China Nettle in a wild state, but considerable probability that it is a distinct species, possessed of many of the same properties as the Ramee or Rheea Nettle. Indeed, Major Hannay, who has chiefly brought it into notice, says of Bon or Jungle Rheea (*Boehmeriæ* species) that it is a Jungle plant, common in the Assam forests, and thriving best in the vicinity of water or of running streams. When unmolested it grows to a tree, but, by proper management, any quantity of young shoots can be obtained; and as the divided roots afford numerous shoots, the plant can be propagated by slips as well as by the seed. Its cultivation for its fibre might be carried on as with the willow in Europe. By the Chinese in Assam it is said to be exported into Southern from Northern China. It is cultivated largely by the Hill tribes, north-west of Yeunan, and by the Singpoos and Dhoanncas of the northeastern frontier of India, to a small extent only for a coarse cloth, but chiefly for nets. The Nepaulese recognize it as the *Leepeeah* of Nepaul. ('Journ. Agri-Hortic. Soc.,' vii, p. 222.) This fibre is well adapted for rope-making. It is about five feet in length, brown in colour, strong, and flexible. Capt. W. Thompson, of the house of Messrs. Thompson, rope-makers, of Calcutta, says of it: "It is all that can be desired either for canvas or lines, and only requires to be known to be generally used for such purposes." It was the kind which was made into a five inch rope by Messrs. Huddart along with the Dom Rheea or China-grass, and broke with a weight of about nine tons, or precisely 21,025 lb. Since then, it has been made up into ropes of various sizes, which have been carefully tested, and found in every case greatly to exceed in tenacity those made of Russian Hemp of the same size.

has also been made up into lines and cords, some of them almost fine enough for fishing lines: in all which it displays its fitness for all such purposes, from the union of strength and flexibility. There is no doubt that it would command a market as soon as its good qualities become known. It would be desirable to ascertain whether, by pressing it between grooved rollers, or something of that kind, it could not be sent in a still cleaner state, and command a still higher price. It was valued at £35 a ton.—*Royle Fib. Pl. p.* 363.

(2080) BOERHAAVIA DIANDRIA. BOERHAAVIA DIFFUSA, Lin.

Its edible part.

Mookooruttay keeray, TAM.	Spreading Hogweed.
Tikrie ke baujee, DUK.	Smadika, SANS.
Attika mameddee, TEL.	Gadhapoorna, BENG.

Its root.

Mookaruttay vayr, TAM.	Attica mammedie vayroo, TEL.
Tikrie ki jurr, DUK.	Sinadika, SANS.

Horsfield says that in Java the *Boerhaavia diandria* is deemed emetic.—*O'Sh. p.* 512. The root of the spreading Hogweed Boerhaavia diffusa, Lin, the Native Practitioners reckon amongst their laxative medicines, and prescribe it in powder. The small round leaves, which grow at the joints of the stalks of the plant, are eaten by the Natives. In Cyngalese the plant is called Jan Lopes. It appears to be the Taludama of the Hort. Mal.—*Ain's Mat. Med. p.* 90.

(2081) BOERHAAVIA PROCUMBENS.

Mookoorootay-keeray, TAM.

A procumbent weed, with small red flowers, used by the natives with other leaves as greens.

(2082) BOERHAAVIA TUBEROSA, of Persia —

Mookaratty Vayr, TAM.	Attica mamedie varysoo, TEL.
Tikrie ke jur, DUK.	Sindika and Punarnava, SANS.

Spreading hogweed, East Indies.

Root said to be emetic, and purgative deemed laxative, and given by the natives in powder, a tea spoonful twice daily. It is single, oblong, hard within, bark soft and thin, of a dusky colour outside, slightly bitter, and somewhat nauseous taste.

(2083) BLACK. The commonly known substances which are so named, are Ivory Black and Smoke Black. Smoke Black is in colour black, with a bluish tint, of great lightness, adheres to the fingers, retaining a little of the oil of pitch, odour disagreeable, slightly empyreumatic; tasteless after calcination. Smoke black is prepared by the combustion of different resinous bodies, especially of pitch. This substance is burned in large pans under a dome or chimney, within which cloths are suspended to which the soot becomes attached. This species of carbon is employed only in the arts, in the manufacture of printer's ink, of blacking for shoes, &c.—*O'Shaughnessy, page* 618.

(2084) BLACKBURNIA MONODELPHA, Roxb. A large erect timber tree, a native of the mountainous parts of the Northern Circars. The wood is white, close grained and durable, and employed by the natives for a variety of purposes. It flowers at the beginning of the hot season.—*Rox. Vol.* I. *p.* 415.

(2085) BLACKING.

Noir (de cordonnier), FR.	Nero-da-ugner-le-scarpe, IT.
Schuhschwarze, GER.	Negro-de-zapatos, SP.

This article is prepared chiefly of oil, vinegar, galls, and green-copperas; and used in the blacking of boots, shoes, harness, hoods, &c. Each manufacturer has his own recipe, in which the principal ingredients are oil, vinegar and ivory black or some other sort of blacking matter.—*Toml.*

(2086) BLACK LEAD, CARBURET OF IRON, GRAPHITE, PLUMBAGO.

Potloot, DUT.	Miniera di piombo, Piombaggine, Corezolo, IT.
Mine de plomb noir. Plomb-de-mine, Potelot, FR.	Plumbago, LAT.
Pottloth, Reissbley, GER.	Piedra mineral de plomo SP. *Faulkner.*

A mineral of a dark steel-gray colour, and a metallic lustre; it is soft, has a greasy feel, and leaves a dark coloured line when drawn along paper. It is used in the manufacture of pencils, for making crucibles, in compositions for protecting iron from rusting, and for diminishing friction in machinery. The best Plumbago was that procured near Borrowdale in Cumberland. —*Faulkner.* It has also been largely worked in America. Ceylon produces it, also Travancore and Vizianagrum. See PLUMBAGO. Black Lead, occurs in veins, and in kidney shaped lumps, in gneiss mica slate and their subordinate rocks, but that at Borrowdale occurs in transition slate.—*Toml.*

(2087) BLACK LEAD PENCILS.

Potlootpennen, DUT.	Lapis-negro, PORT.
Crayonsnoirs. FR.	Karanaschu, RUS.
Bleystifte, GER.	Lapiz-negro, SP.
Lapis-nero, IT.	Surme-ka-kalm, HIND.

Are formed of black-lead, encircled with cedar and other woods. They are imported into India from the United Kingdom —*Faulkner.*

(2088) BLACK PEPPER.

Filfil-uswod, ARAB.	Maricha, JAV.
Micha, BALI.	Piper-nigrum, LAT.
Hootseaou, CHIN.	Lada, MAL.
Gamniris, CYNG.	Sahan, PALEMBANG.
Peper, DUT.	Fiffil-i-Seeah, PERS.
Poivre, FR.	Pimenta, PORT.
Schwarzen pfeffer, GER.	Maricha, SANS.
Kala-mirch, Gool-mirch, HIND.	Pimienta, SP.
Pepenero, IT.	Mellaghoo, TAM.
	Mirialoo, TEL.

A well known small dark berry or fruit, having an aromatic, pungent, hot taste; used as condiment in seasoning, &c. The best is that of Malabar, which is largely imported into Bombay and re-exported to England, France, the Persian and Arabian Gulfs, and Calcutta. Pepper is also produced in Siam, Malacca, Sumatra, and oth

islands of the Indian Archipelago. See PEPPER. —*Faulkner.*

(2089) BLACKWOOD.

Seesum, Guz. & Hind.

The timber of different species of *Diospyros* and probably of *Dalbergia*, which grow in various parts of the East Indies. It is brought to Bombay from the Malabar Coast, and is largely used in the manufacture of household furniture. —*Faulkner.* Every locality has a wood, which is known by this name, Holtzappfel mentions that East Indian Blackwood is from the *Dalbergia latifolia*, called Blackwood tree by the English and Sit Sal by the natives of India, on the Malabar coast, where it grows to an immense size. The wood of the trunk and large branches is extensively used for making furniture; it is heavy, sinking in water, close grained, of a greenish black colour, with lighter coloured veins running in various directions, and takes a fine polish.—*Holt*

(2090) BLANKET.

Cumblee, Guz. & Hind.

A soft loosely woven woollen stuff, used as a bed covering. The blankets manufactured in India, are of a coarse description, and are only used by the lower orders of the natives. English blankets being in general request, are largely imported. At the Madras Exhibition of 1851, were exposed, manufactured at Hoonsoor in Mysore. Blankets from half bred merino wool, half bred butt wool, warp woof mundium wool, common country wool, mundium wool.

(2091) BLEACHING.—Bleaching is practised in all parts of India; and some places, which are also seats of the cotton manufacture, are famous for bleaching, such as Dacca and Baroche. This has been ascribed to the excellency of the water in the neighbourhood of these places. A very good account has been given by Mr. Taylor, late of Dacca, of the process of bleaching at that place. This is particularly interesting, as including what are called modern discoveries. Fine muslins are merely steeped in water, other cloths are first washed. But all, of whatever texture they may be, are next immersed for some hours in an alkaline ley composed of soap and of "sajie muttee," that is, impure carbonate of soda. They are then spread over the grass, and occasionally sprinkled with water, and when half dried are removed to the boiling-house in order to be steamed. This is effected by twisting the cloths into the form of loose bundles and placing them upon a broad clay platform, which is on a level with, and surrounds, the neck of a boiler sunk into the ground. They are then arranged in circular layers, one above the other, around a bamboo tube, which is kept upright by means of transverse supporters projecting from it, the whole forming a conical pile that rises to a height of five or six feet above the boiler. The fire is kindled in the excavation below, and as the ebullition of the water proceeds, the steam diffuses itself through the mass of the cloths above, swelling by its high temperature the threads of the latter. The operation of steaming is commenced in the evening, and continued all night till the following morning. The cloths are then removed from the boiler, steeped in alkaline ley, and spread on the grass as on the preceding day, and again steamed at night. These alternate processes of *bucking* and *crofting*, as they are technically called, during the day, and of steaming at night, are repeated for ten or twelve days, until the cloths are perfectly bleached. After the last steaming, they are steeped in clear filtered water acidulated with lime-juice, in the proportion, generally, of one large lime to each piece of cloth. Lime-juice has long been used in bleaching in all parts of India, and Tavernier describes Baroche as famous as a bleaching station, on account of its extensive meadows and the large quantity of lemons reared there. Mixed fabrics of cotton and Muga silk are steeped in water mixed with lime-juice and coarse sugar, which latter article is said to have the effect of brightening the natural colour of the silk.—*Royle, Arts &c. of India, page* 481.

(2092) BLENDE. SULPHURET OF ZINC. A term applied to the native sulphuret of zinc, from which the pure metal is obtained. —*Faulkner.*

(2093) BLETTING. All ripe fruits after they have been kept for some time begin to decompose, and the spots formed on the fruit during this process have been called by Professor Lindley 'Blets.' During the whole time of the growth of the fruits of plants various important chemical changes go on in their tissues, especially whilst ripening. These changes have been examined with great care by Berard.—*Eng. Cyc. p.* 507.

(2094) BLIGHIA, a genus of plants named after Captain William Bligh, R. N., master of the Bounty in the celebrated mutiny, belongs to the natural order *Sapindaceæ*. It has a 5-parted calyx, 5 petals, a very short style, 3 stigmas, and a solitary seed with a very large arillus. Only one species of this genus has been described, the *Blighia sapida*, Akee-Tree. It is a native of Guinea, from whence it has been introduced into the East and West Indies and South America. It is a tree attaining a height of 30 or 40 feet. It has pubescent leaves, with three or four pairs of ovate lanceolate veined leaflets. The fruit of this tree is a berry of a reddish or yellowish colour, about the size of a hen's egg. The aril of the seed is pulpy, and of a grateful subacid flavour, and is eaten in Africa and the West Indies. This tree does not produce flowers in Britain. It may however be easily cultivated. It grows well in a mixture of loam and peat.

Cuttings will strike in sand under a hand-glass. They should not be deprived of any of their leaves.—*Eng. Cyc. p.* 508. The fruit, has the size and shape of a pear, of a red colour, and is much esteemed in Guinea and the West Indies. Wood, light and useless.

(2095) BLISTERING FLIES. There are several kinds of fly which when applied to the skin cause great irritation, inflammation, and blistering. These symptoms are occasioned by an acrid principle called *Cantharidin*, contained in these insects. The ancients chiefly employed two species of *Mylabris*, one of which, the *Mylabris cichorii*, (vern. *telini* HIND.) has been used for ages, and is so at present by the European and native physicians of India and China. The *Cantharis vesicatoria*, or Spanish blistering fly, is the species officinal in the British Pharmacopœiæ. Its colour is bright shining green or bluish, length about ⅝ of an inch, breadth ⅛th to ⅓rd of an inch. It occurs in the South of Europe generally, especially in Italy and Spain, and is found occasionally in England. The blistering flies of India are chiefly the Mylabris or Meloe cichorii the Cantharis gigas, and the Cantharis violacea. The *Meloe*, or *Mylabris cichorii* (Telini, *Hind.*) is common in the neighbourhood of Dacca, in the Hydrabad country, in Kurnool, and numerous other localities. Dr. Hunter has published a good account of this article in the 5th vol. of the *Transactions of the Asiatic Society*, p. 216. The insect is about an inch long, and ⅓rd broad; the elytra or wing coverts are marked with six cross stripes of deep blue and russet brown. The *Buprestis* of ancient writers is met with in the bazars under the name of the golden fly (*sonamukki.*) The *Cantharis violacea* is often mixed with specimens of *Meloe* in the bazars. The Telini fly, if procured before the mites have commenced its destruction, yields on an average one-third more of cantharidin than the *Spanish fly* of the European shops. The blue fly is of uncertain strength; the Buprestis, in all the specimens obtained, was quite inert.—A species of Meloe called the *M. trianthema*, from its being usually found on the plant named *Trianthema decandra* (biscopra, *Hind*) is described by Dr. Fleming. A tincture, acetous tincture, plaster, and ointment of the Meloe cichorii are described in the Bengal Pharmacopœia. Some prejudice exists against the article on account of its alleged excessive severity of action. This is solely owing to the presence of a greater quantity of *cantharidin* than that contained in the common fly. Diluting the tincture, and adding to the proportion of lard and wax in the plaster and ointment, perfectly assimilate the action of the indigenous and the imported insects. —*O'Shaughnessy, page* 684. At the Madras Exhibition of 1855, specimens of the Indian Blistering beetles, *Mylabris pustulata*, and *punctum* were exhibited by Monsieur Le Docteur Collas of Pondicherry. These were accompanied with a full and interesting report on their blistering properties printed in the "*Moniteur Officiel*" of 2d March 1855. The larger species is *Mylabris pustulata*, and the smaller is *Mylabris punctum*—Both insects are found in lare quantities at certain seasons all over Southern India. On account of Dr. Collas' careful researches into the natural history of these beetles, as well as his interesting report, and successful experiments with this therapeutic agent, the Jury awarded him a 2d Class Medal.

(2096) BLOCK. A block is a pulley or sheave revolving on a fixed axis or pin, within a chamber or mortace, cut out of a solid piece of elm, ash, or other tough wood which is called a shell. Blocks are employed as a mechanical power under a great variety of circumstances, but are chiefly employed in the rigging of ships, and, according to their shapes and purposes to which they an applicable, receive various names, as *dead-eyes*; *snatch block*; *long tackle block*; *clue garnet block*; *shoulder block*, *spring block*, &c. In England, they are now almost all made by machinery, and the best are those which have the chamber cut across the grain of the wood.—*Toml.*

(2097) BLOODSTONE, HELIOTROPE, ORIENTAL JASPER.

Radawar, GUZ. HIND. *Faulkner.*

Bloodstone, also called *Heliotrope*, is of deep green colour and is a jaspery variety of quartz. It has obtained its name from being spotted with red so as to resemble drops of blood. In addition to silica it contains oxide of iron and clay, which are mechanically introduced, and in this way the red spots are produced. In the royal collection at Paris there is a bust of Christ in this stone, so managed that the red spots represent drops of blood. (Dana, *Mineralogy.*)—*Engl. Cyc. page* 522. It is used for seals, rings, brooches, &c. Localities, India, Siberia, Iceland, &c. It is brought to Bombay from different parts of the Guzerat, &c, and is re-exported largely to England. Its price has lately been very greatly reduced.—*Madras Museum.*

(2098) BLOWPIPE. An instrument of various forms for directing a small jet of air laterally into the flame of a candle or lamp, whereby a portion of the flame is formed into a long slender cone, in the direction of the jet; the heat of which is most intense at the point where the reddish white and bluish portions of the flame meet. In this way common flame is converted into a species of furnace, capable of fusing or raising to a high degree of temperature, any substance minute enough to be involved by the flame.—*Toml.*

(2099) BLUBBER.

Thraan, DUT.	Salo worwannoe, Worwan,
Thran Fischtran, GER.	RUS.
Olio-di-pesce, IT.	Grassa, Aceite-de-pescado,
Oleum piscium. LAT.	SP. *Faulkner.*

The fat of whales and other large sea animals,

of which train oil is made. The blubber is the *Adeps* of the animal, which lies under the skin, and over the muscular flesh; it is about six inches thick in some parts, and from 2 to 3 feet in others —*Faulkner.*

(2100) BLUE CLOTH, is largely made in Southern India, and at Pondicherry there is a manufacture of much interest.

(2101) BLUE STONE, COPPERAS, BLUE VITRIOL, CYPRIAN VITRIOL, ROMAN VITRIOL, SULPHATE OF COPPER,

Zungbar, ARAB.	Virtriuolo blo. IT.
Palmanicum, CYNO.	Cupri-Sulphas, Cuprum Vitriolatum, Vitroleum ceruleum, LAT.
Sulphate de cuivre. FR.	
Schwefelsaures kupfer, GER.	Tutthanjana. SANS.
Moortooth. GUZ.	Caparosa, SP.
Moortooth, Leela, or Neela-tootiah, HIND.	Toorishoo, TAM.
	Toorishie, TEL.

Is of an elegant sapphire blue colour, hard, compact, and semi-transparent; when perfectly crystallised, of a flattish, rhombodial, decahedral figure; its taste is extremely nauseous, styptic, and acrid. It is used for various purposes in the arts, and also in medicine.—*Ure.* It is a product of Pegu, from which place it is brought to India, and is procurable in all bazars.—*Faulkner.*

(2102) BLUMEA GRANDIS. One of the most abundant weeds throughout the Tenasserim Provinces, is a species of Blumea, that grows six or eight feet high with leaves like mullen, which, when bruised, emit a strong odour of camphor. Many years ago, the Tavoyers informed Mr. Mason that they were in the habit of making an impure camphor from the weed by a very simple process; but Mr. O'Riley of Amherst, was the first to make a good article from it, and to bring it to public notice. He made more than a hundred pounds, and the specimens which he sent to Calcutta were reported "in its refined form, to be identical in all its properties with Chinese camphor." The plant is so abundant, that these Provinces might supply half the world with camphor. Wherever the trees are cut down, this weed springs up, and often to the exclusion of almost every thing else; so that an old clearing looks like a field under cultivation. Mr. O'Riley sent flowering specimens of the plant to Dr. M'Clelland for identification, who forwarded them to Dr. Voigt of Serampore, and subsequently reported, "Dr. Voigt states that it belongs to De Candolle's genus Blumea, and is, so far as he can see, a new species." It is without doubt the same plant as that which appeared in Wallich's Catalogue a quarter of a century ago, as *Conyza grandis*, and which De Candolle subsequently described as *Blumea grandis*. Wallich's specimens were from Tavoy, without flowers, and DeCandolle describes the leaf as nine inches long with the petiole, by three wide, ("*cum petiolo 9 poll. longa, 3 poll. lata,*) serrated, and bearing on the petiole five or six remote linear acute lobes, ("*petiolo lobulos 5—6 distantes lineares aculos gerentibus,*) which corresponds very accurately with some specimens of our camphor plant, but it does not correspond to any other species of Blumea in the Provinces with which Mr. Mason is acquainted.—*Mason.*

(2103) BOALEE, BENG. The jaw-bone of this fish is used in carding cotton for the Dacca muslins, as a substitute for the heckle and hand-cards —*Royle, p.* 225.

(2104) BOATS. All the common arts and manufactures of Bengal are carried on at Dacca, but in none of them do the Dacca workmen show superior skill, than in that of boat building. For their work in this art, they have been celebrated since the reign of Jehangire, when the *Nowarrah* was established here for the protection of the lower districts of Bengal, against the incursions of the Mughs of Arrakan. Dacca, it may be mentioned, has also acquired a local name or reputation for a few minor manufactures, such as those of violins, paper, and *shola* hats.—*Dr. Taylor.* The Teesta river in the Terai, at Leelpigoree is navigated by canoes, thirty to forty feet long, some being rudely cut out of a solid log of Sal, while others are built, the planks, of which there are but few, being sewed together, or clamped with iron, and the seams caulked with the fibres of the root of the Dhak (*Butea frondosa*), and afterwards smeared with the gluten of *Diospyros embryopteris.* The bed of the river is here three-quarters of a mile across, of which the stream does not occupy one-third; its banks are sand-cliffs, fourteen feet in height. A few small fish and water-snakes swarm in the pools.—*Hooker Him. Jour. Vol.* I. *page* 392. In the Eastern Archipelago, the Generic name for a boat or vessel, large or small, is Prau, a word almost naturalised in the European languages. It belongs equally to the Malay and Javanese languages, and from these has been very widely spread to others, extending as a synonym to the principal Philippine tongues. The usual name for a canoe or skiff, both in Malay and Javanese, is Sampan. The large vessels which the natives of the Archipelago used in war and trade were called by them Jung, which is the word corrupted junk, that Europeans applied to the large vessels of the Chinese, of which the proper name is wang-kang. For a square-rigged vessel or ship, the natives have borrowed the word Kapal from the Telugu or Telinga. Names vary with the forms of vessels, and the uses to which they are put; and these again differ with nations or tribes so as to be innumerable.—*Crawfurd Dict. page* 55. The boats in use along the coasts of the peninsula of India, well illustrate the readiness with which sea-faring people adapt their materials to the requirements of their respective localities, and I may notice here the rapid sailing boats of Bombay and the vicinity

of Cannanore, and the Catamaran and Masulah boat of the Coromandel coast.

(2105) BLUMENBACHIA *Loasaceæ*. BLUMENBACHIA INSIGNIS.—These are small plants with white flowers, the species are ornamental and may be sown in borders, the stem has the stinging properties of the nettle.

(2106) BOJIDAN. This is the root of a small plant brought from Delhi to Ajmere; esteemed as heating, and used to strengthen, and as an aphrodisiac: one seer costs two Rupees.—*Gen. Med. Top. p.* 130.

(2107) BOKHARA CLOVER. Melilotus arborea, is nearly allied to M. leucantha. Bokhara clover grows so freely as to afford five or six cuttings in the season of green herbage, from which, it is said, strong fibre can be obtained.—*Royle, p.* 298.

(2108) BOLBOPHYLLUM. FRAGRANT BOLBOPHYLLUM. Perhaps the most highly valued of the orchid order among the Burmese and Karens, is the sweet-scented bolbophyllum, which Karen youths wear in the lobes of the ear, and maidens in their hair. It abounds in almost every part of the jungles, throwing down delicate straw coloured racemes over the rough gray bark of old lagerstrœmias—emblems of childhood in the arms of age.—*Mason.*

(2109) BOLBOPHYLLUM CAREYANUM. CAREY-BOLBOPHYLLUM. This is a very common orchid in the vicinity of Maulmain, easily recognized by a long leaf at the apex of a false bulb, and by its small purplish flower.—*Mason.*

(2110) BOLE ARMENIAN.

Hejr, or Teen-armenie, ARAB.	Gurnkatta, SANS.
Ghil-armenie, DUK. HIN. PERS.	Simie kavikullo, TAM.
Bole de armenie, FR.	Simie kavi rai, TEL. *Faulkner.*

Bole is an earthy mineral forming one of the hydrous silicates of alumina. It occurs in masses in Armenia, Saxony, Italy, France, Ireland, Scotland, South America, and various parts of India. Bole found in the island of Lemnos is called Lemnian earth. Armenian Bole is of a fine bright red, is much used as a tooth powder; and is in use in India, amongst native pratitioners, as an astringent. A coarse red bole, calcined and levigated, is sold in Germany as a pigment, under the name of Berlin and English red. Cakes made of these earths called *tanam poo*, are used by the Javanese when they wish to become thin.—*Tomi.* The red boles are largely employed by fraudulent dealers to colour articles of food &c. It has of late years been detected as an ingredient employed in England to adulterate Anchovy Paste, Potted Shrimps, Potted Herrings, Yarmouth bloaters, Ham, Westphalian Ham; Potted beef Hamburgh Beef, Tomato sauce, Essence of Lobsters, and Essence of Shrimps. It is an unclean practice, injurious to health, and in some cases even dangerous to life. This soft, yellowish red, unctuous earth, consisting of alumina, silica, magnesia, and oxide of iron, is brought from the Persian Gulf, but it also occurs of fine quality in the Rajmahl hills, where it is termed *Geru mittee*. At the Madras Exhibition of 1855, samples of *Armenian Bole* were exhibited from Mysore, Bellary and other localities, and were deemed worthy of notice, as being articles of the Indian Materia Medica in general estimation. They are also employed in Native painting and gilding. Reduced to very fine powder it is used as an absorbent application sprinkled over ulcers or other raw surfaces. In many countries, Bengal and South America especially, this and other unctuous earths are eaten freely by pregnant women to allay the craving for food so common in that state. In times of scarcity it has been used by both sexes as a mechanical substitute for proper food.—*O'Shaughnessy, page* 693.

(2111) BOLETUS DESTRUCTOR, is one of the many species of *Fungi*, the ravages of which are too well known under the name of Dry Rot. Their destructive qualities are not, however, caused by the fructification or the part which we commonly consider the fungus itself, but by the ramifications through the substance of the wood of what botanists call the Thallus and gardeners the spawn of such plants, which is in effect their stem and root in a mixed state. Other species of *Fungi* produce dry rot.—*Engl. Cyc. p.* 652.

(2112) BOLETUS IGNIARIUS, when dried and sliced, furnishes the German Tinder, or Amadou, a leathery substance sold in the tobacconist's shops, as "Amadou."—*Engl. Cyc. p.* 552.

(2113) BOL KA GOND, BIJA BOL. This is the name given in Ajmere to a dark reddish yellow opaque gum resin like myrrh (appears to be true myrrh) imported via Bombay. The natives there have a curious idea regarding this gum, that by eating it or even rubbing it in the teeth, they will become loose and fall out: it is considered a warm medicine, is given to children in enlarged abdomen, mixed with musabbur(aloes) as a deobstruent; and is also used in making native ink: one seer costs eleven annas.—*Gen. Med. Top. p.* 129.

(2114) BOLO CHAPTIS, (Buch.) CORVINUS, (McClell.), BOLA. This is a species of Indian whiting that furnishes isinglass and which Mr. O'Riley sent up to Calcutta from Amherst. Dr. M'Clelland wrote that "it belongs to the genus corvinus, closely allied to *C. niger*, but of monstrous dimensions compared with the European species." This is the fish, the jawbone of which is described as "Boalee."—*Mason.*

(2115) BOMARIA, AMARYLLIDACEÆ. The colour of these parterre flowers are red and yellow, spotted, pink, &c.—*Riddell.*

(2116) BOMBACEÆ, a group of plants con-

sidered by some a distinct natural order, by others as a mere section of *Sterculiaceæ*. They are usually large trees, with broad deep-green leaves, and flowers of considerable size. This group contains some of the most majestic and beautiful trees that are known, but nothing of much medical or economical importance is furnished by them. Their wood is light and spongy; the long cottony substance found within their fruit, and which has gained for some of them the name of Cotton-trees, is too short in the staple and has too little cohesion between its fibres, to be manufactured into linen; and the slightly acid or mucilaginous qualities that occur in the group are altogether inferior to those of many *Malvaceæ*. The Baobab tree, *Adansonia*, is one of them. It is remarkable for the excessive thickness of its trunk as compared with its height, and this is a character of common occurrence. Several American species spread enormously near the ground, forming huge buttresses with the angles of their trunks. This is especially the case with the genus *Eriodendron*, which is moreover often defended by very large conical prickles, which do not fall off till they are exfoliated by the gradual distension of the trunk. Among these plants is a singular instance of a flower resembling the paw of some animal.—*Eng. Cyc. page* 553.

(2117) BOMBAX CEIBA. This large "cotton" tree, in South America and the West Indies, is used for canoes.—*Riddell.* It is common at Canton, and the fleshy petals of the flowers are sometimes prepared as food.—*Williams' Middle Kingdom, p.* 284.

(2118) BOMBAX INSIGNE is a native of the Birman Empire, and is remarkable for its large red and very showy flowers.—*Eng. Cyc. page* 554.

(2119) BOMBAX MALABARICUM, De Candolle. *B. heptaphyllum*, Lin.

Boorooga wood, Eng.	Ruckta simal, Hind.
Buruga kurra, Tel.	Mull Elava marum, Tam.
Saur, Duk.	

A large tree, trunk armed with prickles, leaves deciduous in the cold season; flowers in February and March, large, of a bright red colour and vase shaped, which in the morning contains a limpid sweet fluid, drunk by the natives; the wood is white, soft, and of little use. This large stately tree is of handsome appearance when in leaf. Its wood is spongy and of little value. The Bombaceæ and their allied species are more remarkable for their noble aspect than utility: they are, however, not devoid of interest; the seeds of many are enveloped in long wool, like that of the true cotton, but this has been but little manufactured from the slight cohesion existing between the fibres: used in stuffing cushions, pillows &c. The *B. malabaricum*, D. C. (*Bombax heptaphyllum*, L.) the *Ruckta-simal* of Bengal, yields a gum resin called *Moocherus*, and its roots constitute the *safed mooslie* of the bazars. The *Moocherus* occurs in knotty, opaque, dark brown pieces, often with internal cavities. Few remedies are more extensively employed by the natives than their white and black *mooslie*. Blume says that the bark of the root is emetic, and the statement is repeated by Rumphius, but is contrary to Dr. O'Shaughnessy's repeated trials. The white *moosli* is a small brittle root, which in the dry state contains sixty per hundred of gum, fifteen of starch, with traces of resin, the remainder being woody fibre. The powdered root forms a thick mucilage with cold water, and answers admirably as a nutritious demulcent for convalescent persons.—*O'Shaughnessy.*

(2120) BOMBAX PENTANDRUM, Lin. Syn. Eriodendron anfractuosum.

Silk Cotton. Eng.	Elavnai pungee, Tam.
Khattan, Hind.	Elavnu marum, Tam.

This produces a light wood, employed by the toy makers. It is likewise used for making rafts.—*Ain's. Mat. Med. p.* 208.—Dr. McClelland mentions that in the Tenasserim Provinces, *Bombax pentandrum*, *B. heterophyllum* and *Cochlospermum gossypium*, all afford a soft down, which is attached to the seeds and which the Burmese collect for stuffing pillows. At the Madras Exhibition of 1857, a very powerful bast was exhibited by Mr. Jaffrey, from the *B. pentandrum*.

(2121) BOMBAY BOXES are principally ladies' work-boxes of elegant workmanship. The outside is of ivory, curiously inlaid; the internal part of sandal wood.

(2122) BOMBAZINE. A fabric of worsted and silk, the warp being of silk and the weft or shoot of worsted.—*Toml.*

(2123) BOMBYCIDÆ, a family of Insects of the order *Lepidoptera*, belonging to the section *Lepidoptera nocturna* of Latreille, or Moths. The principal characteristics of this family are—their possessing only rudimentary maxilla, remarkably small palpi, and bipectinated antennæ. One of the most interesting of the family is the *Bombyx Mori*, well known as the moth to which the silkworm turns. This species which was originally from China is of a white or cream colour, with a brown fascia and two or more waved lines of a deeper colour crossing the upper wings. In Britain the eggs of this moth hatch early in May: the caterpillar or silkworm is at first of a dark colour, but soon becomes light, and in its tints much resembles the perfect insect, a circumstance common in caterpillars. Its proper food is the mulberry, though it will likewise eat the lettuce and some few other plants: on the latter, however, it does not thrive equally well, and the silk yielded is of a poor quality. The silkworm is about eight weeks in arriving at maturity, during which period it changes its skin four or five times. When about to cast its skin it ceases to eat, raises the fore part of the body slightly and remains in per-

fect repose. In this state it is necessary that it should continue for some little time, in order that the new skin, which is at this time forming, may become sufficiently mature to enable the caterpillar to burst through the old one. This operation, which is apparently one of considerable difficulty, is performed thus :—the fore part of the old skin is burst : the silkworm then by continually writhing its body (but not moving from the spot) contrives to thrust the skin back to the tail, and ultimately to disengage itself altogether ; this last part of the operation, however, is the most difficult, since it is no uncommon occurrence for them to die from not being able to disengage the last segment of the body from the old skin. When full grown the silkworm commences spinning its web in some convenient spot, and as it does not change the position of the hinder portion of its body much, but continues drawing its thread from various points and attaching it to others, it follows that after a time its body becomes in great measure inclosed by the thread. The work is then continued from one thread to another, the silkworm moving its head and spinning in a zigzag way, bending the fore part of the body back to spin in all directions within reach, and shifting the body only to cover with silk the part which was beneath it. As the silkworm spins its web by thus bending the fore part of the body back, and moves the hinder part of the body in such a way only as to enable it to reach the farther back with the fore part, it follows that it incloses itself in a cocoon much shorter than its own body, for soon after the beginning the whole is continued with the body in a bent position. From the foregoing account, it appears that with the most simple instinctive principles all the ends necessary are gained. If the silkworm were gifted with a desire for shifting its position much at the beginning of the work, it could never inclose itself in a cocoon; but by its mode of proceeding, as above explained, it incloses itself in a cocoon which only consumes as much silk as is necessary to hold the chrysalis. During the time of spinning the cocoon the silkworm decreases in length very considerably, and after it is completed, it is not half its original length ; at this time it becomes quite torpid, soon changes its skin, and appears in the form of a chrysalis. The time required to complete the cocoon is about five days. In the chrysalis state the animal remains from a fortnight to three weeks; it then bursts its case and comes forth in the imago state, the mouth having previously dissolved a portion of the cocoon by means of a fluid which it ejects. The moth is short-lived; the female, in many instances, dies almost immediately after she has laid her eggs ; the male survives her but a short time. The silkworms, which are most extensively reared for the purpose of producing silk, are liable to many diseases, and none have been mor destructive than that called muscardine. This disease attacks the caterpillar when about to enter the chrysalis state. It is always attended with the development within the body of a minute fungus closely resembling our common mould. It is probable the fungus only attacks those worms which are predisposed to disease, but in certain seasons this fungus has been so extensively developed as to lead to the supposition that it produces the disease itself. It is very certain that, when this fungus is prevailing and its spores are introduced into the body of the silkworm, it becomes rapidly diseased and dies. The fungus spreads internally before the death of the worm and afterwards it shoots forth from the surface of the skin. The chrysalis and moth will have the disease if inoculated with the fungus, but it only occurs spontaneously in the caterpillar.—*Engl. Cyc. page* 558.

(2124) BOMBYX ATLAS. Eastward of the City of Canton on a range of hills called Lofau shan, there are butterflies of large size and night moths of immense size and brilliant coloring, which are captured for transmission to the Chinese court and for sale. One of these insects (Bombyx atlas) "measures about nine inches across, the ground colour is a rich and varied orange brown, and in the centre of each wing there is a triangular transparent spot," resembling a piece of mica.—*Williams' Middle Kingdom, page* 273.

(2125) BONDUC NUT OIL. GUILANDINA BONDUCELLA.

Calichi kai yennai, TAM.

The oil of this common seed is mentioned by Ainslie, as being considered useful in convulsions and palsy. The seeds themselves are believed to possess tonic virtues. Used solely as a medicine.

(2126) BONDUC NUT.

Kuteulega, HIND.

The seeds of Guilandina bonducella, irregularly round, grey ; the almond is white, very hard, and intensely bitter; gets a blood red colour from nitric acid.—*Med. Top. of Ajmere.*

(2127) BONES.

Huddee, GUZ. HIND. | Yellumboo, TAM.
Istukhan, PERS. | Yemmookulloo, TEL.

The bones of cattle and other animals are extensively used in the arts, in forming handles for knives, walking sticks, inlaying, and various other purposes. They are occasionally exportde from Bombay to England (*Faulkner*), and the bones of animals are, thus, converted into various useful articles of commerce. Small boxes, lanterns, paper knives, buttons, and many small articles of dress, are made in China from horn and bones.—*Morrison, page* 197. Subjected to destructive distillation, in large retorts, amongst the other products which pass over is a peculiar oil,

which is collected and afterwards employed to feed the lamps burning in small close chambers, the sides of which thus become covered with LAMP BLACK. The mass remaining in the retorts consists of the earthy and saline portions of the bone, blackened by the carbon of the animal matter, in which state it is called ivory black, bone black, and animal charcoal. This substance has a remarkable attraction for organic colouring matter, and is largely used for removing the colouring matter from syrup, in the refining of sugar, and in the purification of many other organic liquors. By exposing ivory black to an open fire, the carbon is driven off, and the bones are nearly blanched These are reduced to powder, which is used for making the cupels of the assayer, also as a polishing powder for plate and other articles, and also by the manufacturers of phosphorus for making lucifer matches—*Toml.*

(2128) BON RHEEA, OR BUN RHEEA, OR JUNGLE RHEEA, the Leepeeah of Nepaul, is supposed by some to be the Dom Rheea or China Nettle in an uncultivated or wild state. But of this there is no proof, and it is more than probable that it is a distinct species of Boehmeria, possessed of many of the same properties as theRamee or Rheea Nettle. It grows very common, in all the Assam province, but it is cultivated largely by the Hill Tribes, on the West of Yeunan and to a small extent by the Singpoos and Dhoanneas of the North Eastern frontier of India, to be fabricated into a coarse cloth, but chiefly for nets. A five inch rope of Rheea fibre and one of Bon Rheea each broke within a few pounds of each other, but after sustaining a weight of more than nine tons weight, and it is reported to be all that can be desired for either canvas or lines, and only requires to be known to be generally used for that purpose. The Bon Rheea thrives best in the vicinity of water or of running streams: when unmolested it grows into a tree, but by proper management of it, any quantity of young shoots can be obtained, and as the divided roots of the plant afford numerous shoots, it can be propagated by slips as well as by the seed. This fibre is about five feet in length, brown in colour, strong and flexible.—*Royle, Fib. Plants.* See No. 2079

(2129) BON SURAT, the commercial name given to the fibres of the Urtica crenulata, Orchor Putta, which see. *Royle*, p. 366.

(2130) BOODUNK.—MENTHA [illegible]LEGIUM. —Penny royal.—Cultivated the same as thyme.

(2131) BOOKS.

Chopdee, GUZ.	Poosthakum, TAM.
Kitab, HIND. & PERS.	Poosthakooloo, TEL.

A general term applied to blank, printed, lithographed, or manuscript books.

(2132) BOON, REED OR SHOVE, the woodlike part of the flax plant. It is surrounded by the tough fibres called bast or harl and covered by cuticle, all cemented together by gummy and azotized compounds.—*Royle, p.* 199, *p.* 315.

(2133) BOORAGA the name of the gum, and wood obtained from *Bombax malabaricum*. It is a pure gum.

(2134) BOOR-COLE. Grows to great perfection; the leaves are curled. The tops should be cut off when two feet high; the sprouts being the only part fit for use. It is cultivated in the same way as cabbages, and may be had all the year round.

(2135) BOOREE. The pollen of the plant called Typha elephantina *(putera)* a native of Sinde: it is inflammable like that of Lycopodium, and used as a substitute for it in Europe. It is collected in Sinde.—*Royle, p.* 35.

(2136) BOORUNK KALA.—OCYMUM BASILICUM.—Sweet Basil. Grows common in native gardens; the seeds are used medicinally, an infusion being considered very cooling.

(2137) BOOTA.—This is the head of the Zea mays, which is grown at the commencement of the rains and sown in beds or in the common fields; it requires little care; the heads are either boiled or roasted before being eaten. The ground should be well manured before the seed is sown.

(2138) BORAEE.—Borago officinalis, is used as a pot herb; the young shoots and leaves as salad, requires treatment similar to Angelica. This succeeds at Madras, but flowers rather too early to be of much use; it is suitable for the flower garden, but is a native of England.

(2139) BORAGO ZEYLANICA. CEYLON BORAGE.

Balatti-kulpa, HIND.

Is cultivated in some gardens at Ajmere as a flower.—*Genl. Med. Top. p.* 180.

(2140) BORASSUS FLABELLIFORMIS, SYNONIMS; *The tree* is named,

Tar ka jhar, HIND.	Lontar, MALAY.
Tati chettoo, TEL.	Rontal, JAVANESE.
Panci marum, TAM.	Palmyra Tree, ENG.

The wood is called,

Palmyra and Porcupine wood, ENG.	Tar ke jhar kee Lakree, HIND.
Tatti chettoo kurra, TEL.	Panai marum kuttai, TAM.

The palm wine or *toddy* is known as

Pannang khulloo, TAM.	Tatie khulloo, TEL.
Tarie, DUK.	Palmyra Toddy, ENG.

The sugar is,

Pannay vellum, TAM.	Jaggary of Palmyra Toddy, ENG.
Tarka goor, DUK.	
Tatie bellum, TEL.	

The edible part is called,

Pannang kalung, TAM.	Young Palmyra Plant, ENG.
Geunghool, DUK.	
Tatigudda, TEL.	Tala, SANS.

The fibres of the palmyra leaf are called,

Thatee nara, TEL.	Panai nar, TAM.

Its fruit is the

Palmyra Fruit, ENG.	Tatie pundoo, TEL.
Pannam pollum, TAM.	Boea Iontar, MAL.
Tar phul, DUK.	Tata, SANS.

The Palmyra tree, the Borassus flabelliformis of Linnæus, is a tree only inferior in usefulness to Eastern nations to the date tree and cocoanut palm. By a glance at one of the maps in Berghaus' or Johnston's physical Atlas, showing the distribution of this plant, it will be seen, commencing in the north-eastern parts of Arabia in about 20° north latitude and 54° East longitude, extending through the Indian ocean, and the southern parts of Hindustan and ending in about 20° north and 93° east in the Bay of Bengal, the extent of the distribution being about 5,160 Geographical miles. Its favourite soil is a low sandy plain, and immense groves of it occur on the Malabar Coast, from Cape Comorin to Calicut, but the northern part of Ceylon, and from Tinnevelly to Madras, are the great palmyra regions, though the trees are found skirting the Bay south to Singapore and in all the islands of the Archipelago.—*Seeman.* In the Tenasserim provinces, also, it is the most generally diffused of all the palms. It attains a height of seventy feet; the circumference of its single trunk, at the bottom, is about 5½ feet and at the top 2½ feet. A Tamul Poem entitled Tála Vilásam enumerates 801 different purposes to which the Palmyra may be applied. The trees have to attain a considerable age before they are fit for timber; when a hundred years old, they are excellent, but their wood becomes harder and blacker by age, and the blacker and harder it is, it is the better. Almost every part of this tree is made use of; the leaves are used in thatching: the leaf stalks yield a coarse fibre useful for many purposes. The "olay," (*Tamul*) are the leaves cut into uniform strips upon which the natives write with iron styles. Before the introduction of paper, its leaf was the writing material of all the nations of the East, and still continues to be so of some of them. —*Crawfurd, page* 221. The Jaggery, obtained from it, is extensively used in the manufacture of sugar at Vizianagram and Rajahmundry, and is obtained from the wine of this Palm known as Toddy. This wine can be made a source of extensive drunkenness and dissipation at Madras, and is so among the lower class of Mahomedans, during the months of January, February and March, being the time it is drawn; the sweet pulp called Panavuttoo contained in the husk surrounding the seeds, is sold in the bazars, at 2 pice per ounce and is very pleasant to the taste. Ainslie says, that its fresh tasted gelatinous pulp is cooling and by no means unpalatable, and is called by the Tamools Noonghoo நுங்கு.—*Ainslie.* Indeed the Palmyra fruits form an article much prized by the people of India, and are eaten raw or roasted. These pulps are also made into a preserve, Punatoo, by squeezing them with water into a pulp, and sold in *mats* at 3 to 6 shillings each. Punatoo is much used as food in Jaffna, plain or mixed with gruel obtained from the pounded kelingoo farina, and made into soups puffs, cakes &c. The young Palmyra plants from the germinated seeds, when they are but a few inches high, are reckoned amongst the pot vegetables of the Natives of India, as well as of the Cyngalese; they are usually boiled, and eaten with a little of the kernel of the Cocoanut.—*Ainslie.* These young roots and shoots of the germinated seeds, when dried and ground into a kind of flour, are used as an article of diet. In Jaffna this Palm is looked upon with great reverence. The natives who can afford it, at the birth of a daughter, plant a certain number of trees, according to their circumstances, which become her dowry at marriage. Its wood is one of the porcupine woods of commerce; and the old black wood of the palmrya, is, next to that of Casuarina, the strongest tried; one specimen bore upwards of 700 lbs. and 5 of them gave an average of 648, though some were very bad. Mr. Rohde remarks that it is the strongst wood he tried, retaining for a length of time the position it assumed when loaded, without increase of deflexion: iron nails soon rust in this wood. He procured it of excellent quality in the Circars, the thickness of rafter when trimmed up rarely exceeds 2 inches four feet from the ground and one inch at twenty or twenty-four feet from it. Trees tapped for toddy do not, he believes, form wood. The large carpenter beetle, strange to say, appears to have particular delight in boring this hard wood, the *Cumboo* however is still more attractive to him. Though this wood has great stiffness and strength to resist cross strain and tension, it has none to resist rending which it does very readily—small canoes are formed of this tree, two of which lashed to a couple of spars form the usual mode of crossing lakes and rivers in the Circars—the root forms the head of the canoe, the smaller end is either elevated out of water by the form, or some of the pith is left for six inches at that end. As this decays, a lump of clay supplies its place. Formerly sea going vessels were planked with this wood, but the iron fastenings were soon destroyed. Boats planked with it are still common on the Godavery, being built probably where sawyers are not procurable. The peculiar structure of the wood of the Palms deserves attention, it appears to consist of a series of hard stiff longitudinal fibres not interlaced or twisted but crossed at considerable intervals at various angles by similar fibres which proceed from the soft heart of the tree, to the outer part, probably to the leaf stem—a radial section of Palmyra rafter shews this, the interstices are filled up with pith the proportion of which increases with the distance from the outer part.—*Rohde.* The wood is much used in house-building, for rafters, joists, and reapers. In England for veneers and inlaying. It is

exported in large quantities from Ceylon, where it is used for rafters, pillars, and posts of native houses. In the sandy parts of Jaffna in Ceylon, a hollow palmyra is inserted to form a well. The dark outside wood of very old trees, is used to some extent in Europe for umbrella handles, walking canes, paper rulers, fancy boxes, wafer stamps and other articles. The timber of the female tree is the hardest and best, and that of the male trees is never used, unless the tree be very old. It is too heavy to make ships of. At certain seasons of the year, thousands are employed in felling and dressing it. Each tree has from twenty-five to forty fresh green leaves upon it at a time, of which the natives cut off twelve or fifteen annually to be employed as thatch, fences, manure, mats, and mat baskets, bags, irrigation baskets, winnows, hats, caps, fans, umbrellas &c.; books and olays, tatakoo or puttays, for writing on.

(2141) BORASSUS. WILD PALMYRA. The Tenasserim Provinces yield an indigenous palm, which the natives call the wild palmyra. It has the fruit of the palmyra, but the leaf differs from it sufficiently to constitute it another species.—*Mason.*

(2142) BORAX. TINCAL.

Buruk, ARAB.	Kuddiakhar, Tunkunkhar, GUZ. HIND.
Piger, BALI.	Piger, JAV.
Kuddiakhar, BENG.	Patterie, Piger, MAL,
Lansipuscara. CYNG.	Chaularaya, NEP.
Sohaga, DUK.	Tunkar, PERS.
Boras, DUT.	Tunkanna, SANS.
Borate al calinule de soude, FR.	Velligarum, Vengarum, TAM.
Borax, GER. LAT. PORT.	Bi-borate of soda. ENG.

Borax, Biboras Sodæ, is chiefly procured from a lake near Thibet. The edges and shallows of the lake are covered with a stratum of Borax, which is dug up in considerable masses. In its rough state it is called *Tincal*, and is brought in the form of a brownish grey, impure, amorphous salt, or in detached crystals, less than an inch in length, and of the form of compressed hexahedral prisms. Sometimes it is brought partially refined; but when pure, is in colourless crystalline masses. Crude Borax is often covered with an oily or greasy matter, to prevent it from efflorescing. Its uses in the arts are considerable, being a very active flux. It occurs in dense crystalline masses, sometimes mixed with cha[illegible] totally soluble in warm water, solution [illegible] not effervesce with acids; but it turns turmeric paper brown. Its other localities are said to be Persia, China, South America, Europe. *Tincal* or crude borax, (*Hind. Guz.* Tunkunkhar), is in pale greenish pieces, covered with an earthy coating, and feels greasy to the touch. It is sometimes distinguished in the Indian bazars, but is more frequently sold under the general denomination of (borax) *Kuddiakhar*. Borax is imported into Bombay from Calcutta. Sohaga is brought to the Bengal bazars from Thibet, via Assam; and in the East Indies it is employed, in the moist way, as a solvent for Gum Lac. It is much used by the Tamool goldsmith, Tinkers ரசம் ஊற் (Cannar, Tam.) and Tinmen தகரவேலைக்காரர் (Tagaravelecarer, Tam), to facilitate the fusion of their metals. With it and lime juice, the Hindoos of the sect of Vishnoo prepare their red திருநாமம், Tiroochoornum, with which they mark their foreheads perpendicularly.—*Ains Mat. Med. p.* 144. Borax is readily purified by simple solution and crystallization. Borax is sometimes adulterated with alum and common salt; but Ammonia gives a white precipitate (alumina), if the former, and nitrate of silver, a white precipitate, if the latter, be present.—*Beng. Phar. p.* 364.

(2143) BOS INDICUS, the Zebu, has the following specific characters:—Forehead convex; withers with a more or less large fleshy hump; dewlap deep, waved; the upper part of the rump shelving very much. Amongst scientific writers this animal has had many designations. It is the *Bos Indicus* of Linnæus, the *Bos domesticus* of Hodgson, the *Bos Taurus Indicus* of Fisher, *Bos Zebu* of J. Brookes, *Bos Taurus Zebu* of Wagner. Varieties or particular breeds have also obtained a number of distinct appellations,—Little Indian Buffalo, Indian Bull, Great Indian Ox, Gun Bullock, sacred Bull, Madras Ox, Madhu Givi Oxen, Seringapatam Oxen, Two-humped Zebu, Hornless Zebu, Bucharian Ox, Nepaul Ox, and Javanese Cow. The domesticated zebus vary much in their size and the direction of their horns, but are generally distinguished by a fatty elevated hump below the neck and over the withers. The horns of some are short and suberect (Indian Ox), in others comparatively long and pointed backwards, with an inclination to curve inwards, as in the more common breeds (Zebu). The ears of some are of ordinary size and position (Zebu); in others pendulous. (Indian Ox.) The dewlap is more or less developed, in some very largely. Their colour varies from a light ashy-gray to a milk-white, and their size from the stature of an ordinary bull to that of a large mastiff. The limbs of all are deerlike and elegant. Mr. Bennett says, "they are spread over the whole of Southern Asia, the islands of the Indian Archipelago, and the eastern coast of Africa, from Abyssinia to the Cape of Good Hope." In many parts of India the Zebu is placed under the saddle or harnessed to a carriage, and travels at an easy rate. It must have lost much of its fleetness, if the more ancient writers are to be credited; for they speak of 50 or 60 miles a day as its usual pace, whilst the moderns only allow it 20 or 30 miles. The beef is not bad, but is neither so sweet nor so good as that of the common Ox, the hump always excepted, which when well cooked is very delicate. The Hindoos

venerate the Zebus and hold their slaughter to be a sin, though they do not object to work them. There are however some particularly sanctified Zebus, who lead an easy life, wandering about the villages at their will, and taking their pleasure and their food where they list, if not provided by the contributions of the devout. In most parts of India, they may be seen every day wandering at large in the streets eating rice, grain, and flour and vegetables from the stalls in the bazar; and the utmost a native does when he sees them plundering his goods too much, is to urge them by gestures and shouts to be off. I have never once seen them struck. The superstitious regard for these animals extends even to their excretions, or, as they are termed, the five products of the cow. The cow-dung is collected and dried and used for cooking food, even where wood is in abundance. Mr. Bennett, in his work on the 'Gardens and Menagerie of the Zoological Society,' has expressed an opinion that the Zebu is but a variety of the common Ox, but Mr. Vasey observes that the number of the vertebræ and the period of gestation both differ from that of the Ox.—*Engl. Cyc. p.* 620, 621.

(2144) BOS BUBALUS, THE BUFFALO. Forehead convex, rounded; horns large, flattened at the base, black on the plane of the face, bent down and recurved at the tips; ears quite half the length of the head, slightly ciliated; fur rough, irregular, bristly, often very far apart, on the face before the eyes two-rowed. This animal is the *Bos Bubalus* of Brisson; the *Bos Bubalis* of Linnæus; Buffle, French; and Büffel, German. A variety was called by Shaw *Bos Aruee*, which is the *Bubalus Arna* of Hodgson. Mr. B. H. Hodgson, who has by his labours thrown so much light upon Indian Zoology, says of the Indian Buffaloes: "The Bhainsa, or Tame Buffalo, is universal in India. The Arna, or Wild Buffalo, inhabits the margin rather than the interior of primæval forests. They never ascend the mountains, and adhere like the rhinoceros to the most swampy sites of the district they inhabit. There is no animal upon which ages of domesticity have made so small an impression as upon the Buffalo, the tame being still most clearly referrible to the wild ones at present frequenting all the great swampy jungles of India. In the wilderness as in the cow-house there is a marked distinction between the long (*macrocerus*) and curved-horned (*spirocerus*) baffaloes. The Arna ruts in autumn, gestating ten months and produces one or two young in summer. It lives in large herds, but in the season of love the most lusty males lead off and appropriate several females, with which they form small herds for the time. The Wild Buffalo is fully one-third larger than the largest tame breeds, measuring 10½ feet from snout to vent, and 6 or 6½ feet high at the shoulders, and is of such power and vigour as by his charge frequently to prostrate a well-sized elephant. It is remarkable for the uniform shortness of the tail, which does not extend lower than the hock; for the tufts which cover the forehead and knees; and, lastly, for the great size of its horns. They are uniformly in high condition, so unlike the leanness and angularity of the Domestic Buffalo, even at its best." The Buffalo has been introduced into Italy, where it is made very useful as a beast of burden, its great strength giving it an advantage over horses and ordinary oxen, in the marshy and swampy districts where the roads are frequently two or three feet deep with mud. A singular fact with regard to them is, that they thrive best in those districts which are most infected with malaria. The Manilla Buffalo is also a variety of this species.—*Engl. Cyc*: *page* 622. Crawfurd, speaking of it in the Archipelago, says, it is the same useful, powerful, ugly, sluggish and unwieldy animal which exists in all the warm countries of Asia, and which was introduced into Greece, Egypt, and Southern Italy in the middle ages. It is only, however, within ten or twelve degrees of the equator that it is found of great size, strength, and vigour. Compared with that of the Malayan countries, the buffalo of Southern Italy is certainly an inferior animal, and that of Northern India even a puny one. The buffalo is the principal beast of draught and burden throughout the Archipelago and Philippines, the ox being chiefly reserved for the tillage of dry upland grounds. The buffalo is larger and more powerful than the ox, but much slower and with less capacity of enduring toil. The flesh of this semi-aquatic animal is coarse, and its milk poor in quality compared with that of the cow. Its courage is indomitable, and united to its great strength, makes it an overmatch for the royal tiger. It has a repugnance to strangers, but with its friends is thoroughly docile. I have seen a boy of ten years of age part two enraged bulls with a switch, mount that which was his own by one of its horns, and ride home on it. The domestic buffalo is very scantily covered with hair, the colour of the skin appearing through it. It is either black or white, without any other variety, the black in nine cases out of ten predominating, and being considered, perhaps without much foundation, preferable to the white. Wherever the buffalo is found in the domestic state, it is also found in the wild one; and this makes it exceedingly difficult to determine whether this animal be a native of the Archipelago, or a domesticated stranger. Naturalists, I know, not on what ground, have come to the latter conclusion, and the natives of the country would seem to entertain the same opinion, for they call all buffalos found in the forest by an epithet which implies this, and which in Malay is jalang, meaning "stray" or "vagabond." The names given to

the animal, however, afford no warranty for this conclusion. With one exception, they are native, and not traceable to any foreign tongue. The Malay name is Kârbo, or Kárbau, and this with very slight variations extends over, at least, ten different languages of the Archipelago and Philippines. It is not, however, the only native name, for in the Sunda of Java we have the word munding, and in the Bugis and Macassar of Celebes, tedung. The only foreign name is the Sanscrit Maisa, restricted to the polite language of Java. That the domestic buffalo, however, has often escaped from servitude and become wild, is certain. This, for example, is probably the only source of the wild buffalo of the Philippines, for the buffalo of these islands was the only domesticated beast of burden in them before the arrival of the Spaniards. It seems then to have been confined to Luzon, although it has since spread to the other large islands; and invariably, it is known by the Malay name Karbo only, even the Spaniards themselves having adopted it, although at the same time expressing the inconsistent opinion that the buffalo was introduced into the Philippines from China. It is easy to see how readily it might have been introduced by the nearest Malays, those of Borneo; for even in native craft the voyage from Brunai to Manilla, in the proper season, is performed in seven days.—*Crawfurd Dic. p.* 73.

(2145) BOS FRONTALIS. The Gayal. There are three species which Professor Lundevall regards as subvarieties of a variety of the common bull. *Bos frontalis*, the Gayal. It is the *Bos frontalis* of Lambert, the *Bos Gayeus* of Colebrooke; Gavaya, *Sans*; Gavai or Gayal, *Hind*; Gobay goru, *Beng.*; Gaujangali, *Pers.*; Methana Mountaineers (Cucis, &c.) east of Silhet; Shial, Mountaineers (Cucis) east of Chatgaon; J'hongnua, Mugs; Nunec, Birmas; Gauvera, Ceylon. It is nearly of the size and shape of the English bull. It has short horns, which are distant at their base, and rise in a gentle curve directly out and up: a transverse section near the base is ovate, the thick end of the section being on the inside. The front is broad, and crowned with a tuft of lighter coloured long curved hair. The dewlap is deep and pendant. It has no mane nor hump, but a considerable elevation over the withers. The tail is short, the body covered with a tolerable coat of straight dark-brown hair; on the belly it is lighter coloured; and the legs and face are sometimes white. (Roxburgh.) Dr. Buchanan states that the cry of the Gayal has no resemblance to the grunt of the Indian Ox; but a good deal resembles that of the buffalo. It is a kind of lowing, but shriller and not near so loud as that of the European Ox. To this the Gayal, in Dr. Buchanan's opinion, approaches much nearer than it does to the buffalo. Mr. Macrae states that the Gayal is found wild in the range of mountains that form the eastern boundary of the provinces of Aracan, Chittagong, Tippera, and Silhet. The Cucis, or Lunetas, a race of people inhabiting the hills immediately to the eastward of Chittagong, have herds of them in a domesticated state. The animal is called Gabay in the Hindoo 'Sastra,' but seems however to be little known beyond the limits of its native mountains, except to the inhabitants of the provinces above mentioned. The same author informs us that the Gayal is of a dull, heavy appearance; but at the same time of a form that indicates much strength and activity, like that of the wild buffalo. Its disposition is gentle; even in the wild state on its native hills it is not considered dangerous, never standing the approach of man, much less sustaining his attack. The Cucis hunt the wild ones for the sake of their flesh. The Gayal is a forest animal, and prefers the tender shoots and leaves of shrubs to grass; it never wallows in mud like the buffalo. It is domesticated by the Cucis, but does not undergo any labour. The cow goes 11 (?) months with young, gives but little milk, and does not yield it long; but that little is remarkably rich, almost equalling cream, which it resembles in colour; the Cucis however do not make any use of the milk, but rear the Gayals entirely for their flesh and skins, of which last, or rather their hides, they form their shields. These domesticated herds roam at large in the forests near their village during the day, but return of their own accord at evening, being early taught to do this by being fed when young every night with salt, of which those animals are very fond. The Hindoos, in the province of Chittagong, will not kill this Gayal (their Gabay), which they hold in equal veneration with the cow, but they hunt and kill another Gayal (As'l Gayal or Seloi) as they do the wild buffalo.—*Engl. Cyc. page* 624. Mr. Bird proved that the Gayal will breed with the common Indian bull. He brought a domesticated female Gayal from Chittagong to Dacca directed a common bull (of the breed Deswali, a Zebu of the common kind found in the middle districts of Bengal), which the female received upon being blinded with a cloth thrown over her eyes. The offspring was a cow resembling mostly the Gayal mother; and from that cow, impregnated by a bull of the same common breed, another cow was produced, which also had grown up, and was in calf by a common bull when Mr. Bird wrote his account. (Asiatic Researches, vol. viii.)—*Engl. Cyc. page* 625.

(2146) BOS GAURUS, the Gour or Gaur. Hind hoof only half the size of the front hoof. Colour brown; legs white. This is the *Bos Gour*, Traile; *Bos Gaurus*, Col. Smith; *Bos aculeatus*, Cuvier. "Dr. Traill gives the dimensions of one not fully grown, which measured from tip of nose to end of tail 11 feet 11¾ inches; from the hoof to the withers 5 feet 11¾ inches; and from the withers to the sternum 3

feet 6 inches. The limbs have more of the form of the deer than any other of the bovine genus." The Gour, according to Captain Rogers, occurs in several mountainous parts of Central India, but is chiefly found in Myn Pat or Mine Paut, a high insulated mountain with a tabular summit in the province of Sergojah, in South Bahar. "This table-land is about 36 miles in length by 24 or 25 miles in medial breadth, and rises above the neighbouring plains probably 2000 feet. The sides of the mountain slope with considerable steepness, and are furrowed by streams that water narrow valleys, the verdant banks of which are the favourite haunts of Gours. On being disturbed they retreat into the thick jungles of saul-trees which cover the sides of the whole range.—*Eng. Cyc. page* 626.

(2147) BOS BANTING, the Banting, or Sumatran Ox.—Colour black, distinct large spot on rump, and legs white. This is the *Bos Banting* of Sir Stamford Raffles, *Bos leucoprymnus* of Quoy and Gaimard, *Bos Sondaicus* of Muller. It is a native of Java, Borneo, and Bali. There is a stuffed specimen and skeleton in the British Museum. Vasey in his 'Ox-Tribe,' has given a figure, and observes that it "bears some resemblance to the Gour, but in the skeleton of the Gour the sacrum consists of 5 vertebræ and the tail of 19, while in the skeleton of the Banting the sacrum consists of but 4 vertebræ and the tail of 18."—*Eng. Cyc. p*, 627. Ox (Bos). Exclusive of the buffalo, which is doubtful, two species of the ox are found in the wild state. One of these, called by the Malays, saladang, is sufficiently well ascertained to exist in the forests of the Malay Peninsula, although not as yet described by naturalists. The other is the Bos sondaicus, or Sunda ox, which exists in Java, the Peninsula, and Borneo, but, singularly enough, not in Sumatra, or in Celebes, or any island of the Philippine Archipelago, It is a large, massive, and powerful animal, of a light brown colour, with the hips and legs of the male of a clear white. It is the same species which is found in the forests of Pegu, up at least as far as Martaban.—*Crawfurd Dict. page* 316.

(2148) BOS GRUNNIENS. There is but one species, Poephagus grunniens *Bos grunniens*, the yak, or sarlyk. It is black: the back and tail often white. It is the *Bos grunniens* of Linnæus; *Bos Poephagus* of Colonel H. Smith. It has also been called the Grunting Ox, the Grunting Bull, Svora-Goy, and Bubul. There are several varieties called the Noble Yak, the Plough Yak, the Ghainorik, and Wild Yak. The following notices of the Yak are given in the Catalogue of the British Museum: "The Yaks dislike the warmth of summer, and hide themselves in the shade and water; they swim well; both sexes grunt like a pig. The calves are covered with rough black curled hair, like a curled haired dog. When of three months old they obtain the long hair on the body and tail. They willingly live with the common cows, and breed with them. The long white hairs of the tail are dyed red to form the tufts of hair on the caps of the Chinese. (Pallas, 'Act. Acad. Petrop.' 1777,250.)—*Eng. Cyc. page* 627. "The Yaks used for the plough are ugly and short-legged, and hold their heads very low. The beautiful long silky hair hanging from below the belly is almost if not entirely wanting in them, no less than the bushy tail, which their avaricious owners commonly cut off as an article of trade. They are guided by the nose. (Hoffmeister, 'Travels in Ceylon,' &c. 441.) The Yak-Ox used for riding is an infinitely handsome animal. It has a stately hump, a rich silky hanging tail nearly reaching the ground, twisted horns, a noble bearing, and an erect head (p. 441). They are very shy, and kick with their hind feet, turning their head round perpetually, as if about to gore their riders. Hooker writing of this animal says, "our broad-footed Yak-Ox is the beast with the thick silky white fringe under the body, and the bushy tail, both of which sweep the ground.... As the steepness increased, these poor animals began to moan, or rather grunt, in the most melancholy manner, and this unearthly music gradually rose to such a violent rattle, that driven rather by its irksome sound than by the discomfort of our saddleless seat, we dismounted at the end of the first half-hour (p. 443.)" The Yak, or Chauri Gau, inhabits all the loftiest plateaus of high Asia, between the Altai and the Himalaya, the Belur Tag, and the Peling Mountains, and is found tame as well as wild. It cannot live on the south side of the Himalaya beyond the immediate vicinity of the snow, where the tribes of Cachars on the juxtanivean regions of the Sub-Himalayas rear large herds of it, and cross-breed with the common-ox. They rut in winter, and produce young in autumn. Cæcum simple, not sacked, nor banded, four inches long; ribs 14 or 15 pairs; true dorsal ridge confined to the withers; dewlap none. (Hodgson.)—*Eng. Cyc. p.* 638.

(2149) BOSWELLIA, a genus of balsamic plants belonging to the natural order Amyridaceæ. One of the species is believed by Colebrook to be the Λιβανος of Theophrastus, and the *Thurea virga* of the Romans. ('Asiatic Researches,' vol. ix.) *Engl: Cyc. page* 582. It appears that the gum-resin called olibanum is the frankincense that was used by the ancients in their religious ceremonies. Linnæus was of opinion that it was yielded by the Lycian juniper; but that plant is a native of the south of France as well as of the Levant, and the botanists of that country deny that any such substance is produced by their juniper. The Greeks obtained their frankincense from Arabia. The Arabians call olibanum both Luban and

Cundur; but as benzoin is most used at the present day for religious purposes, the Mohammedan writers of India on Materia Medica apply only the term Cundur to olibanum. This Cundur has been ascertained by Messrs. Colebrook, Hunter, and Roxburgh to be yielded by *Boswellia thurifera* or *Boswellia serrata*. It is a large timber-tree found in the mountainous parts of India, yielding a most fragrant resin from wounds made in the bark. Its leaves are pinnate, and consist of about ten pairs of hairy serrated oblong leaflets, each of which is from an inch to an inch and a half in length. The flowers are pale pink, small, and numerous. The calyx is 5-lobed, the corolla of 5-dowry petals, the disk a fleshy crenelled cup, and the stamens 10, alternately shorter. The fruit is a 3-sided, 3-valved, 3-celled capsule, containing a single-winged pendulous seed in each cell. From this, Roxburgh distinguishes as a different species *Boswellia glabra*, a plant also yielding a resin which is used for incense and as pitch in some parts of India. It differs from the last in having no hairs on its leaves, in its leaflets being often toothless, and in its flowers being panicled. A substance analogous to olibanum, and used in a similar way in various parts of the world, is procured from several different trees, such as, in America, the *Croton niteus* (Schwartz), *C. thurifer* (Kunth), *C. adipatus* (Kunth): in Columbia. *Bailleria nervifolia* (Kunth) yields the American frankincense; the *Amyris* (*Icica Tacamahaca*, Kunth) *ambrosiaca* (Linn), yields also the resin coumier, likewise called American frankincense. *Lætia apetale* (Jacq.) also yields a substance similar to frankincense. *Olibanum* occurs in commerce of two kinds, the Arabian and East Indian. The former kind is now seldom met with, and its origin is a subject of doubt; the latter is obtained from the tree above described, and to it we limit our remarks. There are two varieties or degrees of fineness of it, the best called 'olibanum electrum,' or 'in granis,' sometimes called 'thus mannæ' or 'thus masculum': the other is termed 'olibanum commune,' or 'in sortis,' also fœmineum.' The first occurs in pieces varying from the size of a hazel-nut to that of a walnut, or larger, which are roundish or irregular in shape, of a light yellowish colour, varying to red or brown in some pieces, opaque or semi transparent, the outside often covered with a white powder, and upon being pounded the whole becomes a white powder. It is very friable, and breaks with a dull, sometimes even, sometimes splintery fracture. The second sort is generally in larger pieces, mostly of a dirty-gray or fawn-colour, and intermingled with pieces of wood and other impurities.—*Engl*: *Cyc*: *page* 583.

(2150) BOSWELLIA GLABRA.

Salaee, HIND. | Moræda, TAM.

A small tree; leaves pinnate, deciduous; flowers terminal, small, white with a red nectary, anthers yellow; yields the gum salai.

(2151) BOSWELLIA THURIFERA, Colebrooke, *As. Res.* xi. 317. xi. 158. Roxb. *Fl. Ind.* 383. Pereira, *Medical Gazette*, xx. 676.

Gunda barosa, Avul Kundoor, VERN. | Koonder Zuchir, ARAB.
Looban, DUK. | Dup-salaee, HIND.

A tree with leaves pinnate as the last; grows on the hills of the Deccan. It is a native of the mountainous tracts of Central India, and very common in the Shahabad country. Dr. Hooker remarks, when speaking of this plant, we continued to ascend from Belcuppee in Behar to the height of 1360 feet, where I came upon a small forest of the Indian Olibanum (*Boswellia thurifera*), conspicuous from its pale bark, and spreading curved branches, leafy at their tips; its general appearance is a good deal like that of the mountain ash. The gum, celebrated throughout the East, was flowing abundantly from the trunk, very fragrant and transparent.—*Hooker Him. Jour. p.* 29. The *Salai, salar, Boswellia thurifera*, remarks Dr. Irvine, tree, is plentiful in the Ajmeer hills: the gunda birosa is the prepared gum resin of this tree, and is similar in appearance and qualities to Venice turpentine. It is brought from Mewar, Harowtee and the Shekhawattee hills: and is considered stimulating: an oil is distilled from it, said to cure gonorrhœa. It is used also in ointments: much used in painting and by the lakheries one maund costs twelve rupees.—*Med. Top. of Ajmeer*: From the Shahabad country, Dr. O'Shaughnessy obtained fine specimens of the resinous products there called *sale gond or sale lassa*. At Chandalgur it is termed *gunda biroza*, and in the dry state *sukha biroza*. Dr. Hamilton however thought the English Olibanum to be the produce of an Amyris, partly because he could not find that the sale resin was used as incense by the Hindoos. The B. glabra and B. thurifera both furnish the Male frankincense of Dioscorides. Olibanum. The resin olibanum occurs in reddish or pale yellow tears, oval, oblong, and obtuse, sometimes in dense, opaque, brittle masses. The gunda barosa of the bazars is soft, ductile, opaque, greenish and white. The odour is balsamic and resinous, especially while the resin is burning; the flavour balsamic, and rather bitter, The powder, citron yellow. It is frequently adulterated by dammer, sandarach, and other cheaper resins; when chewed the hard variety softens, and dissolves partially in the saliva, which it renders white and emulsive. —*O'Shaughnessy*.

(2152) BOTANY BAY HE OAK. The wood of this tree is used in making Brush backs for veneers and in the manufacture of Tunbridge ware.

(2153) BOTANY BAY KINO. This is the produce of Eucalyptus resinifera; it is opaque,

dark brown; fracture shining and smooth; watery solution blackens the salts of iron strongly, and precipitates solution of gelatine.

(2154) BOTTLES.

Bouteilles, Fr.	Bottiglie, Fiaschi, It.
Boütteillen, Ger.	Bululki, Rus.
Batlee, Guz. Hind.	Bottellas, Sp.

These are glass or stone-ware vessels of various shapes and sizes, for holding liquids *Faulkner*.—A bottle manufactory was once established in the vicinity of Madras, but it has long been discontinued.

(2155) BOTRYCHIUM VIRGINICUM.—This large succulent fern grows plentifully in the Raklang Pass in the Sikkim Himalayas; it is boiled and eaten, both there and in New Zealand. Indeed ferns are more commonly used for food than is generally supposed. In Calcutta, the Hindoos boil the young tops of a *Polypodium* with their shrimp curries; and both in Sikkim and Nepal the watery tubers of an *Aspidium* are abundantly eaten. So also the pulp of one tree-fern affords food, but only in times of scarcity, as does that of another species in New Zealand (*Cyathea medullaris*): the pith of all is composed of a coarse sago, that is to say, of cellular tissue with starch granules.—*Hooker Him. Jour. p.* 292.

(2156) BOWRINGIA, a very curious and interesting genus of fern was found at Pomrang in the Khasia Hills, which is only known to occur elsewhere at Hong-kong in China, and has been called *Bowringia*, after the eminent Dr. Bowring. —*Hooker Him. Jour. Vol.* II, *page* 313.

(2157) BOZAH, is the Dukhanie and Hindoostanie name of a fermented liquor, obtained from Natchenny, Eleusine (Cynosurus) coracana, and somewhat resembling country beer. It is chiefly used in the higher provinces of India (*Anislie's Mat. Med. p.* 262); but the materials used in brewing or fermenting it vary in different places. The Sorghum vulgare is occasionally used, as also the bark of the margosa tree, and it is occasionally made more intoxicating by the use of drugs.

(2158) BOX WOOD.

Palm-hout, Dut.	Buchsbaum, Ger.
Buis, Fr.	Busso, Bosso, Bossolo, It.

This is a valuable wood of a yellowish colour, close grained, very hard, and heavy, it cuts better than any other wood, and is susceptible of a very fine polish. It is chiefly used by engravers, turners, mathematical, and musical instrument makers, and also in the manufacture of combs, knife-handles, button-moulds, &c. Localities, South of Europe, and West of Asia.—*Faulkner*. A new species of Box-wood has lately, however, been introduced into Britain from the Himalayas; it is the *Buxus emarginatus* of Dr. Wallich. This is found of considerable size and thickness, and the wood appears as good and compact as that of the boxwood in use in Europe.—*Royle, Illust. Himal. Bot. p.* 327. On actual comparison the Himalayan box-wood is found to be softer than the common kinds, but is like them in other respects, and woodcuts have been engraved upon the wood of the Himalayan Buxus emarginatus. The Karens sometimes furnished Mr. Mason with specimens of a wood that can scarcely be distinguished from the box-wood of Europe, but he had never seen the tree, though Mr. Mason has named it a Murraya. Wallich found *Nauclea cordifolia* on the banks of the Irrawaddy, which has "wood coloured like that of the box tree, but much lighter, and at the same time very close grained." It may possibly be the same tree, although the Tenasserim wood is not light; or it may be a Tavoy tree, which he says has "a strong tough wood, in grain like box."—*Mason*.

(2159) BRACELETS. The manufacture of Shell Bracelets is one of the indigenous arts of Bengal, in which the caste of Sankhari at Dacca excel. The *chanks* of which they are made are large univalve shells (several species of turbinella) from six to seven inches long, and of a pure white color. They are imported into Calcutta from Ramnad in Southern India, and from the Maldive Islands. At Dacca they are used for beetling fine Muslins, but principally for making the large massive bracelets which are worn by Hindoo women. They are sawn into semi-circular pieces, and these are rivetted and cemented to form the bracelets, some of which are elaborately carved, and inlaid with a composition of lac and a red pigment. A pair of bracelets of this description frequently costs as high as 80 Rupees. Of the thick pieces of the shells, beads are made to form the necklaces, which the Bengal Sepoys wear.

(2160) BRAGANTIA, a genus of plants belonging to the natural order *Aristolochiaceæ*. One of the species, *Braguntia tomentosa*, is said by Dr. Horsfield to be intensely bitter, and to be used as a medicine in Java.—*Engl. Cyc. page* 648.

(2161) BRAN.

Busa, Guz. Hind.	Towroo, Tam. Tel.

The thin skins of corn, chiefly of rice and wheat, separated from the grain. Its chief use is for feeding pigs, poultry, &c.

(2162) BRANDY.

Brandewyn, Dut.	Vinum adustum, Lat.
Eau de vie, Brandevin, Fr.	Aguardente, Port.
Brantewein, Ger.	Wino, Rus.
Brandy, Vern.	Agtardiente, Sp.
Aquarzente, It.	

A spirituous product obtained by distilling wine. Its qualities vary with the kind of wine employed. It is imported into India from France and England.

(2163) BRASS.

Missing, Messing. Geelkoper, Dut.	Ottone, It.
Cuivre jaune, Laiton, Fr.	Orichalcum, Auricalcum, Lat.
Messing, Ger.	Selenoi-mjed, Rus.
Peetul, Guz. Hind.	Laton, Azofar, Sp.

Brass is an alloy of copper and zinc. The term is generally applied to the yellow alloy of copper, with about half its weight of zinc, in which case it is called by Engineers *yellow brass*: but copper alloyed with about one-ninth its weight of tin is the metal of brass ordnance or gun metal. Similar alloys used for the *brasses* or bearings of machinery are called *hard* brass, and when employed for statues or medals they are called Bronze.—*Toml.* Brass is extensively used in India for the manufacture of cooking and other domestic utensils, and is in greater request than copper among the natives. It is imported into Bombay from England (*Faulk.*) but is largely manufactured in many parts of the country. An excellent specimen of *casting in brass* and bronzing was exhibited at the Madras Exhibition of 1855 by Mr. Rohde, a description of which is thus given by the Exhibitor. "The casting is in loam, 5 days are allowed for pickling (in tamarind leaf and water), scraping, filing, chasing, drilling, turning the cup and lastly annealing. The finished articles are then boiled in *sowdoo* (or wood ashes) and water, to free them from all grease, then set up and kept moist by dabbing with corrosive sublimate 1 oz. dissolved in *slightly* diluted vinegar 1 pint, till the desired tints are obtained, which may take ¼ hour or 20 minutes, they are then plunged and well rinsed in clean water *without friction* and dried in sawdust. Blacklead moistened with spirits of turpentine is then applied with a brush as in blacking a stone: when polished, the article is heated a little above what the hand can bear and lacquered with shell-lac varnish. The only nicety required is in getting the articles perfectly free from all grease, even finger marks, and in checking the bronzing at a proper period; if carried too far, it will scale off, if not far enough or irregularly, the color after rinsing will be varied. If the annealing has been irregular, the same will appear."—*M. E. of* 1855.

(2164) BRASS CAMPHIRE.—Borneo Camphor, Camphor of Baras, Malay Camphor. Bruss-capoor, Guz. & Hind.

The product of a tree (*Dryobalanops camphora*), confined to Sumatra, Borneo, and the Malayan Peninsula. It is found only in small quantities, in concrete masses, in the fissures of the wood. It is more fragrant, and less biting and pungent than the common camphor, and is held in much higher repute. It is imported into Bombay from China.—*Faulkner.*

(2165) BRASS LEAF, or *tinsel*, is manufactured by the Chinese to an enormous extent for making the *kin hwá* or 'golden flowers,' used in worship. It is exported to India, in boxes estimated to hold 50 catties.—*Morrison, page* 143. Also *tin-foil* to a small amount. *Bones* and *horns* are manufactured into buttons, opium-boxes, hair-pins, &c., some of which are exported. Bamboos, fishing-rods, and canes, form articles of commerce under the designation of *whangees*; the former are procured for umbrella handles, the latter sell according to taste or fashion. The same may be said of the great assortment of articles comprised under the head of *curiosities*, more or less of which are purchased by every trader visiting the country. Vases, pots, jars, cups, images, boxes, plates, screens, statuettes, &c., made of copper, iron, bronze, porcelain, stone, wood, clay, or lacquered ware, of almost every shape, size, and degree of workmanship, constitute the articles sent abroad under this designation.—*William's Middle Kingdom, Vol.* II. *page* 400.

(2166) BRASSICA, a genus of cruciferous plants, comprehending among other species the Cabbage, Cauliflower, Broccoli, Borecole, Rape, Turnip, Colza, and the like. It is distinguished from other cruciferous genera by the following characters:—Its seeds contain an embryo, the radicle of which is embraced in the concavity of the folded cotyledons. Its pod is long, slender, and many-seeded. The seeds are spherical. The calyx is equal at the base, and slightly spreading; the petals are undivided; the stamens entire.—*Eng. Cyc. page* 665. This tribe contains several very important alimentary species, viz. the *Brassica oleracea*, cabbage, and the red-leaved variety of that species; also the *B. campestris* and *rapa* (rape), *B. napus*, turnip, and the variety *oleifera*, cultivated for its oil, which is consumed to an immense amount in France for illuminations.—*O'Shaughnessy, page* 188.

(2167) BRASSICA CHINENSIS. Shanghae oil is obtained from this.—*Simmonds Comm. Product, p.* 511.

(2168) BRASSICA NAPUS, the Rape, Colza, or Coleseed, has the lower leaves lyrate, dentate, glabrous; upper leaves oblong, somewhat narrowed below, with a dilated cordate semi-amplexicaul base. It is difficult to find any character by which to distinguish this plant from Brassica campestris. In fact some botanists regard Brassica napus as nothing more than a variety of Brassica *campestris*.—*Eng. Cyc. page* 666.

(2169) BRASSICA OLERACEA, Cabbage. One of the most highly esteemed vegetables of European gardens is the cabbage.

(2170) BRASSICA RAPA, Turnips. Turnips are occasionally grown in the Tenasserim Provinces; but they do not reward the cultivator so well as cabbages.—*Mason.*

(2171) BRAZIL WOOD, Queen's Wood.—

Brasilienhout. Dut.	Legno del Brasile, Verzino It.
Bois de bresil Fr.	Pao Brasil Pao de Rainha, Port.
Brasilien-holz, Ger.	
Madera del Bresil, Sp.	

A wood employed for various purposes by

abinet makers in England, but its principal use s in dyeing red. It is procured in many parts f the Western Hemisphere, from one or two spe- ies of Cæsalpinia, West Indian and South Ameri- an trees, but, within the last fifteen years, from he *Gam Wood* imported from Africa. The true Brazil Wood is supposed to be the Bahia nitida, hich yields a finer and more permanent colour han any other.—*Tomlinson. Faulk.*

(2172) BREAD, may be leavened, or unlea- ened or unfermented. Where leaven is not used, ubstances are employed in imitation of yeast, rom which carbonic acid is disengaged, in making he bread, distending the dough and rendering it esicular and light: in the other, flour, water, ith perhaps the addition of salt, are alone em- loyed. In the former process, the substances mployed are the yeast of Europe, and the Palm ines or toddies of Eastern and Southern Asia. The substitutes for these are Sesqui—carbonate of Ammonia; carbonate of soda and hydrochloric cid; or carbonate of soda and tartaric acid: but y far the best of these substitutes is the carbo- ate of ammonia.

Wheaten Bread.—The species of bread in ommon use in a country depends partly on he taste of the inhabitants, but more in the ort of grain suitable for its soil. The Chinese se little bread and that little is generally of heat-flour. Cakes of wheat-flour, prepared on he girdle, is a common article of diet amongst he races of northern and central India: Further outh, on the table lands of the Peninsula, the atives of India use cakes made of the flour of he Indian Corn, the Zea mays; amongst the Mil- ets, bread is made of the great millet, the Sor- hum vulgare; also of the spiked millet, the Pen- illaria spicata; and the very poor of the people se the hard Raggy, the Eleusine corocana, in he form of cakes. Barley is occasionally used n the westward. Along the Sea-bord, however, f all Southern Asia, and eastward into China, oiled rice is the great article of diet, and it is nly made, with unfermented *palm wine*, into he cakes, familiarly known as Hoppers. The uperiority of wheat to all other farinaceous lants, in the manufacture of bread, is so very reat, that wherever this grain is easily and suc- essfully cultivated, wheaten bread is used, to he nearly total exclusion of most others. The ssential constituents of wheat flour are starch, lso called farina or fecula, glutin, and a little ugar and albumen. *Wheaten Bread* is occa- ionally adulterated with alum, which is added o whiten the flour, and to enable it to retain a arger quantity of water. Salt is also employed n the adulteration of wheaten bread, for the ame purposes as alum, to whiten the flour and nable it to hold more water, and carbonate of nagnesia has the same effect.—*Hassel.*

Indian corn bread, is rather less nutritious han that made from wheat, but is more fattening, in consequence of the greater quantity of oil contained in it.

Rice flour is scarcely ever made into fer- mented bread, although it is said to be oc- casionally mixed with wheat flour, for that purpose.

Bread of wood. In Sweden and Norway, saw-dust is sometimes converted into bread, for which purpose beech, or some wood that does not contain turpentine, is repeatedly ma- cerated and boiled in water, to remove solu- ble matters, and is then reduced to powder, heated several times in an oven, and ground: in this state it is said to have the smell and taste of corn-flour. It has a yellowish colour, and ferments on the addition of leaven; the sour leaven of corn-flour answering best for the purpose. When well baked, it makes a uni- form and spongy bread. By boiling wood-flour in water, a thick nutritious jelly is formed, like that made with wheat starch.—*Tomlinson.* In Eastern and Southern Asia, the ordinary *Wood Bread*, the well known Sago, is made from the starch granules contained in the pith of several species of palms. It is largely used as an article of diet, alike for the robust labourer as for the in- valid, and is extensively exported for the use of the sick, and the nursery.

(2173) BREAD-FRUIT TRIBE. This tribe of plants belongs to the natural family *Artocarpeæ*. Among the Artocarpeæ, we find the Bread- fruit, Fig, and Mulberry, genera of extensive distribution, numerous in species, growing to a great size, many of them of the greatest uti- lity to mankind, and probably much more important than is generally supposed; if we look to them as sources of material for paper- making, since the bark of some of the species is already applied to this purpose in some countries. The true Bread-fruit tree, the *Artocarpus incisa*, so famous for affording the chief article of food to the inhabitants of the South Sea Islands, and for which an expedition was sent by George III, under the celebrated Bligh, to introduce it into the West Indies, has bark which is useful to the people from its fibrous qualities: stripped, beat- en and prepared, it makes a kind of cloth, with which the South Sea Islanders clothe themselves. At Taiti, clothing made of it, and worn chiefly by the common people, was more common than that made with the Paper Mulberry, though in- ferior to it in softness and whiteness. Some of the East Indian species of Artocarpus, as the *Jak* tree, the *Kantal*, or *A. integrifolius*, and the *Dephal* or *A. Lakoocha*, and others, are probably possessed of similar properties; they are very abundant in Southern Asia, grow to a great size, and are frequently cut down on account of their wood. There were sent to the London Exhibi- tion of 1851, bark and bark *cloth*, which may all be produced by species of Artocarpus, as one of them was said to be the bark of the *Trap tree*, a

species of *Artocarpus*, which furnishes the Gutta used as birdlime. The fibre of the bark is used for fishing lines, cordage, and nets at Singapore. Another, *Chowat Kurnat*, similar to the above, was from Baram River. The *Glam* tree bark, from Borneo, furnishes a paper-like bark much used in caulking the seams of vessels. And the *Kumut* or bark cloth worn by the Kayans when mourning for the dead was also from the River Baram.—*Royle Fib. Pl.* p. 340.

(2174) BREAD STUFFS OF COMMERCE. The grain crops, edible roots, and farinaceous plants forming the Bread Stuffs of Commerce, from which man derives his principal sustenance, consist of the nutritious cereal grains, the tuberous rooted plants and the trees yielding farina. They are very widely diffused, and necessarily occupy the main attention of the cultivator; their products forming the most important staples of domestic and foreign commerce. The cereal grasses and roots, cultivated in temperate regions, such as wheat, barley, oats, rye, and the potato, are well known; but the Bread stuffs generally may be most conveniently arranged under three heads. Firstly—the Grain crops and legumes, which comprises the European cultivated grasses, wheat, barley, oats, &c.; and the tropical ones of rice, maize, millet, Guinea corn, &c. Secondly—Palms and other trees yielding farina, including the sago palms, plantain and banana, and the bread fruit tree. And Thirdly—the edible Root crops and Starch producing plants, which are a somewhat extensive class, the chief of which, however, are the common potato, yams, cocos or eddoes, sweet potatoes, the bitter and sweet cassava or manioc, the arrowroot and other plants yielding starch in more or less purity. The Bread stuffs, as they are popularly termed, particularly wheat and wheat flour, maize, and rice, form very important articles of commerce, and enter largely into cultivation in various countries for home consumption and export, and Russia, India, and the United States, carry on a very considerable trade in grain with other countries. The annual imports into England of breadstuffs for food, taking the average of the four years ending with 1852, amounted to,

	Tons.
Corn and grain, 8,085,903 quarters, at 60 lb. the bushel,	173,270
Flour and meal,	207,180
Rice,	40,817
Potatoes,	42,440
Sago, arrowroot, &c,	5,000
Total	468,707

Some portion of this quantity is doubtless consumed in the arts—as starch for stiffening linens, &c., and for other purposes not coming under the term of food, but there has been purposely left out in the calculation about 30,000 to 40,000 quarters of rice in the husk annually imported. With a rapidly increasing population in all parts of the civilized world, the production of bread is obviously the first object to be sought after, alike by the statesman and the peasant. An immense amount would be realised in every country, by the single saving of a bushel to an acre, in the quantity of seed ordinarily sown, and, the same result would follow if an additional bushel could be produced in the annual average yield of the wheat crop. From the best statistical accounts that can be obtained, the wheat annually produced in the United Kingdom of

England, Scotland, Ireland, is,	111,681,320 bushsel.
In France it is	198,660,000 ,,
United States	100,503,899 ,,

The amount of seed ordinarily sown to the acre in France is from two to three bushels. The return of crop for the seed sown is represented as in the best districts averaging 6·25 for one; in the least productive 5·40 for one. Those curious to know the calculations which have been made in some other countries in regard to this matter, will find the following information of use.

COUNTRIES.		Increase for seed sown.
Spain, Denmark, Prussia, France—best lands,		6 for one.
Portugal, Tuscany, Ireland		10 ,,
Plains of Lucca, Bologna,		15 ,,
Piedmont—Plains of Marengo,		4 to five.
Roman States - Pontiae marshes, Kingdom of Naples - best districts		20 ,,
Roman States and Kingdom of Naples - Ordinary lands. Scotland, Poland,		8 ,,
Malta the best lands,		38 to 64 ,,
,, Ordinary lands,		22, 25, 30 ,,
NORTHERN EUROPE.		
Sweden and Norway. Russia, Province of Tambof	1838	4.50 for one.
Russia, a good harvest,	1819	5 ,,
——— provinces north of 50 deg. latitude,	1821	3 ,,
England,	1830	9 ,,
Holland,	1828	7.50 ,,
Belgium,	1828	11 ,,
Bavaria	1827	7 to 8 ,,
Austria,	1812	7.05 ,,
Hungary,	1812	4 ,,
Switzerland, lands of an inferior quality,	1825	3 ,,
Of a good quality, 8; of the best quality,		12 ,,

(Statistique des Cereales de la France par Moreau de Jonnes.)—*Simmonds, p* 217.

(2175) BRICK.

Eent, Hind, Guz. Chengkul. Tam. Eetagarai, Tel.

A building material known since a very early period of the world's history, formed of tempered clay, and hardened either by exposure to the sun's rays or to the heat of a furnace, the former being called sun-dried bricks and the latter burnt bricks. They are also employed to make the metal of roads in countries where stone does not occur. The various argillaceous earths used in brick making are generally mixed with some other substance, being for the most part unfit to be used alone. Some are almost pure clay or alumina, and are strong and exceedingly plastic, but cannot be dried without splitting: others,

being light and sandy clays or loams are too loose to be made into bricks without the admixture of lime as a flux, to bind the materials. Others again, are natural compounds of alumina and silica, and, if free from lime, magnesia or metallic oxides, these are exceedingly valuable clays being from their infusible nature well adapted for making fire clays, for lining furnaces, for making crucibles, glass-house pots, &c. Fire clay is found in many places in India, and Dr. Hunter and the Madras Mint make firebricks equal to any imported and at less than half the cost. Bricks are still made in India by hand moulds, but in Britain they are now almost all made by machinery.

(2176) BRIEDELIA SPINOSA, Roxb. p. 735.; *Euphorbiaceæ*, Roxb. c. 171.

Kora man, TEL.	Moolloo vengay marum, TAM.

This is a large tree, a native of the Circars and Bengal. The qualities of its wood not known, though the tree is not uncommon and attains a considerable size in the Alpine jungles. It is a tree with a pretty large trunk, branches armed with strong thorns, leaves alternate, bifarious; flowers small, of a greenish yellow; berry small and globular; bark a strong astringent, and said to be vermifuge for cattle.—*O'Shaughnessy, page* 552.

(2177) BRINJAL. EGG PLANT.

Kattrikai. TAM.	Bodingan. SUMATRAN.
Byngun, DUK.	Brinzal, ENG.
Vunkaia, TEL.	Solanum melongena, LIN.
Trong, MALAY.	
Nila Barudena, HORT. M.	Vartaka, SANS.

The plant which produces this very excellent pot vegetable, is called in Europe "The Egg plant" it is of the class Pentandria and order Monogynia. There is a fine variety, large and long shaped, called by the Tamools kodivelung Kattrikai.—*Ainslie.*

(2178) BRINJAL. Var. Solanum melongena.

Kaliana kattrikai, TAM.	Kodikaloo vankaia, TEL.
Burree Byngun, DUK.	Deergavartaka, SANS.

This is a variety of the Brinjal, and is eaten by the common people.—*Ainslie p.* 240.

(2179) BRINJAL, prickly stemmed. Solanum insanum. Lin.

Mollu kattrikai, TAM.	Moluka kaia, TEL.
Dorla, DUK.	

This is a small, inferior sort of Brinjal, which takes its Tamool name from the circumstance of its stems being covered with prickles. It would appear to be the Seh unda of the Hortus Malabaricus.—*Ainslie, page* 241. For culinary purposes, the vegetable egg, or brinjal, is one of the best vegetables in India. Several varieties are extensively cultivated and eaten by all classes. It is a large round-shaped fruit, both purple and white; another is white, thin and long; a smaller species again is pear-shaped, red and purple striped; and there is one seldom exceeding the size of an egg. They are all dressed alike and used both in curries and other native dishes, and are much on the tables of Europeans. Their propagation is by seed, at the commencement of the rains. The young plants are placed at about eighteen inches apart and require watering every third or fourth day; they are sold from one to three pice a seer.

(2180) BRISTLES.

Borstels, DUT.	Setæ. LAT.
Soies, FR.	Szczeciny, POL.
Borsten, GER.	Schtschetina, RUS.
Setole, IT.	Cerdas, Setas, SP.

The strong glossy hairs growing on the back of the hog and the wild boar. They are extensively used by brushmakers, shoemakers, saddlers. &c. Russia is the great mart for bristles. —*Faulkner.*

(2181) BROCADE. Luppa. HIND. GUZ.

A fabric composed of satin, striped or purfled with gold or silver. It is now chiefly manufactured in different parts of India—Surat, Benares and Ahmedabad principally, and is almost exclusively used in the making of wedding, and state dresses for native princes and noblemen.

(2182) BRODIÆA. *Liliaceæ* —These bulbs with lilac, blue and white flowers may be grown like other lilies in a rich loam and are increased by off-sets of the roots.

(2183) BROMELIACEÆ. THE PINE-APPLE TRIBE. The Bromel worts, or the Pine apple tribe is a natural order of Endogens consisting of dry herbaceous plants, remarkable for their hardness and dryness of foliage. The flowers of most are pretty, and some of them, remarkably handsome and sweet scented; but, except in the genus "*Ananassa*" the fruit is in no case of any value: the order contains 23 genera and 130 species.—*Eng. Cyc. p.* 669. The Pine-apple, or Ananas, one of this tribe of plants, is an object of the most careful culture in Europe, on account of its pleasantly sweet and aromatic fruit. Its long and rigid leaves, which are thorny at the edges and point, abound in a quantity of fine white fibres, which are, in some countries, woven into the finest fabrics, netted, or twisted into lines for fishing and into ropes possessed of considerable strength. These are said not to be injured by constant immersion in water—a property which the natives increase by tanning them. The Pine-apple (*Ananassa sativa*, formerly Bromelia ananas), being a native of the moist forests of South America, from the level of the sea to elevations of about 1800 feet, requires, for its successful culture as a fruit, a warm and moist climate; but, like others of the family, the species are capable of existing in a warm, dry air. The Pine-apple is said to have been introduced into India by the Portuguese, in the year 1594. It has, in some parts, become so naturalised, as to appear indigenous. Capt. Turner, in his journey to Teshooloomboo, mentions it as very abundant at

the foot of the Himalayas. It flourishes in Assam, and forms thickets near Rangoon, producing, also, according to the accounts of different visitors, very juicy, well-flavoured fruit. Dr. Wallich, in the year 1836, presented to the Agricultural Society, a bag made on the Khasia Hills, of Pine-apple fibre, having purchased it for a trifle at Cheraponjee. He mentions the enormous quantity of Pines grown on that range, and that the plant appears as if it were quite a natural production. Dr. Helfer describes the Pine-apple as so abundant in the Tenasserim provinces as to be sold in Amherst Town in the months of June and July at the rate of one rupee for a boat-load. It chiefly abounds in low grounds, though it is also to be found in the hills amongst the Karens. The natives know it only by the American name, which they transform into *Nannah thi*—'thi' designating fruit. They do not seem to be acquainted with the beautiful fibre yielded by the leaves. The Pine-apple is described as growing in great abundance in the Philippine Islands, but as producing only a small, rather dry fruit. But we require some precise information to enable us to judge whether this is actually the plant escaped from cultivation. M. Perrotet considers it a distinct species, and has named it *Bromelia pigna*, from the Spanish name *Pigna* or *Pina*, signifying a cone. There, this wild plant is valued on account of the fine hair-like fibres which are separated from out of the leaves. Of these fibres, the celebrated pine-apple cloth of the Philippines, sometime called "batiste d'ananas," and resembling the finest muslin-like fabric, is woven. This is embroidered by the nuns of the convents in Manilla, with great skill and taste. Some beautiful specimens of these, under the name of Pina muslin, were to be seen in the Exhibition of 1851. This is sometimes called grass-cloth, but erroneously. With a magnifier the fibres may be seen to be very numerous and fine, but not twisted at all, as in grass-cloth or the finest muslins and cambrics. Mr. Bennet, in his 'Wanderings,' observes that one of the coarser fibres may be subdivided into threads of such fineness as to be barely perceptible, yet sufficiently strong for any purpose. Mr. Bennet mentions visiting a plantation near Singapore, made by a Chinaman, for the preparation of the fibres of the ananas or wild pine-apple, which are exported to China, being used there "in the manufacture of linens." The Chinese said he got 1½ rupees the catty, for the fibre. The leaves recently gathered—and the largest are preferred—are laid upon a board and the epidermis is removed with a broad knife. Upon its removal from the upper surface of the leaf, the long and beautiful fibres were seen lying upon the lower and denser epidermis, running in a longitudinal direction; the fasciculi of fibres were then readily detached by the hand on being raised with the broad knife. The separation of the fibre of the ananas is practised in other places besides the Philippine Islands. The Singapore Committee forwarded specimens (*Tali nanas*) from Malacca, as well as some of three different qualities prepared at Singapore, and a portion as ready for weaving, that is, with the ends gummed, or joined together by some adhesive substance; thus forming the "invisible knots" of an old author. Specimens were also sent from Java and the island of Celebes. Dr. Roxburgh does not appear to have paid much attention to the separation of the ananas fibre; but in the year 1839, Miss Davy sent specimens of a thread prepared from the wild pine-apple plant of Assam, of various degrees of fineness, observing that the thread must be prepared when the leaves are green, as nothing can be done with them in a dry state. Miss Davy subsequently sent specimens of cloth manufactured from this thread to the Agricultural Society of Calcutta, observing that she had had much difficulty in getting it woven, as the principal manufacturers in Dacca positively refused to undertake making it into cloth. A weaver in the jungles near Dacca, afterwards undertook to do so, and wove the cloth which was sent. Of this, Miss Davy had some embroidered in silver, - a style of work in which the natives of that part of the country excel. The specimens of the fibre were shown by Mr. E. Solly to spinners in this country, but who did not consider it could be substituted for flax in the manufacture of textile fabrics. A patent was, however, taken out by Mr. Zincke, for the manufacture of thread from this fibre, because, when bleached, it could be spun in the same way as flax. The process of bleaching, by destroying the adhesion between the bundles of fibres, renders it much finer; and hence enables it to be extended between the rolls in the process of spinning. He considers that, from its beautiful silky lustre, combined with considerable strength, it is well adapted to form a substitute for linen. Pine-apple fibres (*anasa nara*), and the tow or oakum from them, were also sent to the London Exhibition of 1851, from Madras and from Travancore, showing that the art of separating these fibres is extensively diffused. Dr. Hunter received some very fine, strong, and silky fibres from Porto Novo, prepared by Mr. Lima. Besides the fibre, some twine and cord made with it was also sent from Madras and from the Eastward. Mr. Bennett says, that at Singapore, from the cost of labour, the pine-apple fibre could not be prepared under thirty-eight or forty dollars the pecul; but in Penang, or other places where labour is cheap, and women and children could be employed upon it, the expense would hardly exceed ten dollars per pecul. In the experiments which Dr. Royle made with these various fibres, a certain quantity of those prepared at Madras bore 260 lb., while a similar quantity from Singapore bore 350 lb. be-

fore they broke ; but of New Zealand flax the same proportions bore only 260 lb. In a report from the Arsenal of Fort William, dated June 3d, 1853, the results are given of some experiments made by Conductor Wilkins on several kinds of rope manufactured by Messrs. W. H. Horton and Co., of Calcutta ; and among these there is one of Pine-apple fibre, of three inches and a quarter in circumference. The Government proof is that a rope of this size should bear a weight of 42 cwt., but it bore no less than 15 cwt. more, that is, it broke with a weight of 57 cwt. ('Journ. of Agric. Soc. of India,' vol. viii, p. 182); proving incontestably that Pine-apple possesses strength for cordage, as well as fineness for textile fabrics.—*Royle Fib. Pl. p.* 37.

(2184) BRONZE, GUN METAL.

Stuck-goed, DUT.	Metallum tormentorum, LAT.
Stuckgut, GER.	Metal de Canones, SP.
Bronzo, IT.	

It is used for casting statues, cannons, bells, frames, stands for argand lamps, ornaments, &c. Bronze is an alloy of copper and tin, the quantity of tin employed varying according to the effect desired to be produced. Analysis has shown that ancient weapons and tools contained 8 to 15 per cent of tin ; medals from 8 to 12 per cent tin, with 2 parts zinc added to each 100, for improving the bronze colour. The modern alloys of copper and tin have led to the production of a variety of metals bearing different names, as *Soft Gun metal, Brass ordnance* metal, with 8 to 12 per cent tin, the various *Bell metals* and the Chinese gongs with 20 per cent of tin : and *speculum metal*, of 126·4 of copper to 58·9 of tin.—*Tomlinson.*

(2185) BROOM GRASS. Aristida setacea, Lin.

Todapum, TAM.	Cheempirie Kutta, TEL.
Jaroo, DUK.	

This article in the more southern parts of the Peninsula is called Vullakamar Brooms are also made of the சீப்பு, Eerkoo, the midrif of the cocoanut leaf.—*Ains. Mat. Med. p.* 145.

(2186) BROOMS.

Balais, FR.	Scope, IT.
Besen, GER.	Metlu, RUS.
Jaroo. HIND.	Escobas, SP.
Torapum, TAM.	

Are well known articles, formed of various materials, and used for sweeping floors, walls, ceilings, &c. They get the name of broom, because first made in Europe from the small branches of the plant of that name. In India, they are made of the strong grasses which abound. That in Southern India, is the Torapum pilloo, the broom grass, above described.

(2187) BROUSSONETIA, a genus of plants belonging to the natural order *Urticaceæ* and sub-order *Moreæ*. There is but one species Broussonetia *papyrifera*.

(2188) BROUSSONETIA PAPYRIFERA. (Gluga, Javanese.) The Paper Mulberry, formerly Morus, now *Broussonetia papyrifera*, is a tree which has long been famous for its fibrous bark, as this is made into a kind of cloth as well as into paper. It is a native of the isles of the Southern Ocean, as well as of China and of Japan. In Taiti, or Otaheite, and other islands, they make cloth of its bark ; and it is said that the finest and whitest cloth and mantles worn by the principal people at Otaheite and in the Sandwich Islands is made of the bark of this tree, and this when dyed red takes a good colour. It is called *Kilia* on the west coast of Celebes. It is from the inner bark of this plant that the Japanese and the Chinese manufacture a kind of paper. It forms a small tree with soft brittle woolly branches, and large hairy rough leaves, either heart-shaped and undivided, or cut into deep irregular lobes. Some of the individuals are sterile, others fruitful. The flowers of the sterile trees grow in catkins, which fall soon after their anthers have all shed their pollen ; these catkins are composed of little greenish-purple membranous calyxes, each seated in the axil of a hairy bract and containing four elastic stamens. The flowers of the fruitful trees are collected into round green heads, and consist of a calyx like that of the sterile tree, with a small simple pistil occupying its centre, and having a long downy stigma. The heads gradually push forth little oblong greenish bodies ; these are the ripening fruits, which at maturity have a bright scarlet colour, and are of a pulpy consistence, with a sweetish insipid taste. Sir James Smith gives the following abridgment of Kæmpfer's account of the preparation of paper from its bark by the Japanese :—"For this purpose the branches of the present year, after the leaves are fallen, in December, are chosen, and being cut into pieces about a yard long are boiled till the bark shrinks and is easily separable from the wood, which is then thrown away. The bark being dried is preserved till it is wanted. In order to make paper it is soaked for three or four hours in water, after which the external skin and the green internal coat are scraped off ; at the same time the stronger and firmer pieces are selected, the produce of the youngest shoots being of an inferior quality. If any very old portions present themselves they are, on the other hand, rejected as too coarse. All knotty parts and everything which might impair the beauty of the paper are also removed. The chosen bark is boiled in a lixivium till its downy fibres can be separated by a touch of the finger. The pulp so produced is then agitated in water till it resembles tufts of tow. If not sufficiently boiled the paper will be coarse though strong ; if too much, it will indeed be white, but deficient in strength and solidity. Upon the various degrees and modes of washing the pulp much also depends as to the quality and beauty

of the paper. Mucilage obtained from boiling rice, or from a root called *Oreni* (Kæmpf., 474), one of the mallow tribe, is afterwards added to the pulp. The paper is finished much after the European mode, except that stalks of rushes are used instead of brass wires."—*Eng. Cyc. page* 671. Dr. Royle remarks that the manufacture of paper from this bark was long since accurately described by Kæmpfer, as seen by him in Japan, where they are said to cultivate this plant much as osiers are cultivated in Europe; the young shoots being cut down in December, after the leaves have fallen. These are then cut into good long pieces, and are boiled until the separation of the bark displays the naked wood, from which it is then easily separable with the aid of a longitudinal incision. In order to make paper, dried bark is soaked for a few hours in water, after which the outer cuticle and the internal green layer are scraped off. The stronger and firmer pieces are separated from the youngest shoots, which are of inferior quality. The selected bark is boiled in a ley of wood-ashes till the fibres can be separated by a touch of the finger. The pulp so produced is then agitated in water till it resembles tufts of tow. If not sufficiently washed the paper will be coarse, but strong; if too much boiled it will be weaker, but white. It is then beaten on a table, with batons of hard wood, into a pulp. Mucilage obtained from boiled rice, or from a plant called *oreni*, is added to the pulp. These three are stirred with a clean reed till reduced into a homogeneous liquor, and when of a due consistence are ready for conversion into sheets of paper. This process is interesting, from its resemblance to that adopted with the Nepal Paper plant, showing the probable introduction of the art from China Specimens of Paper Mulberry cloth, or rather paper used for the purposes of cloth, and made from the bark of the Paper Mulberry, as well as paper made from the same bark, were sent to the Exhibition of 1851 from Singapore. Mr. Williams says, the alburnum is carefully separated from the bark, and beaten to a pulp, and when mixed with rice sizing, is formed into sheets by moulds. The largest portion of the paper used in Japan is manufactured from this substance, but the Chinese usually employ bamboo and cotton; some of it is very fine and silky. The fibrous properties of this plant are interesting not only on its own account but also because it is allied to the Mulberries, the genus (*Morus*) numerous in species, and abounding in individuals, many of which are cultivated on account of their fruit, but still more for their leaves as food for the silkworm. It is probable that most of the species of the genus Morus have bark of a sufficiently fibrous nature. But few, if any, seem to be turned to this useful account. Yet the bark of the White Mulberry seems from very early times to have been made into paper in China; for Marco Polo informs us that "the Grand Khan causes the bark to be stripped from those Mulberry trees, the leaves of which are used for feeding silk-worms, and takes from it that thin rind which lies between the coarse bark and the wood of the tree. This being steeped, and afterwards pounded in a mortar until reduced to a pulp, is made into paper, resembling that which is made from cotton." This fact directs attention to the bush cultivation of the Mulberry in Bengal, for feeding silk-worms. This culture consists in planting cuttings of the Mulberry, which, as they grow, are cut down about four times in the year, in order to produce young leaves for the successive broods of silk-worms. The countless number of shoots which are thus thrown away, or used as fuel, would probably, under the agency of the dhenkee, yield good half-stuff for the paper-maker. Mr. Henley, indeed, informs us that, before leaving India, he had produced very satisfactory specimens of half-stuff from the bark of these rejected stems. The bark separates when the cut stems are steeped in water, and when pounded up, the greater part of the mucilaginous matter passes off, leaving a mass, having much of the good qualities of linen rag half-stuff. *Royle Fib. Pl. p.* 341. In China, the leaf of the common mulberry is the principal object of its culture, but the fruit is eaten, and the wood burned for lampblack used in making ink.—*Williams' Middle Kingdom, p.* 281.

(2189) BROWALLIA, SCROPHULARIACEÆ. These are handsome plants, blue and white flowers, easily cultivated from seed in any good soil. The white is an upright, and the blue a spreading, plant; both having a pretty and delicate appearance.—*Riddell.*

(2190) BROWN HEMP, is the commercial name given in Bombay to the fibres of the Hibiscus cannabinus. It is the Ambaree or Mesta pat of Bengal and the Palungoo of Madras, and is also known as Indian Hemp. See AMBAREE.

(2191) BRUCEA ANTIDYSENTERICA, is considered by the Wooginoos of Abyssinia a most valuable remedy in dysentery, and severe cases of diarrhœa. The false angustura bark was long supposed to be the produce of this Brucea, and its active principle was accordingly named *Brucine.* It is now however established that the false angustura bark is that of the strychnos nux-vomica, the *Kuchila* tree of Bengal.—*O'Shaughnessy, page* 226.

(2192) BRUCEA SUMATRANA, Roxb. Fl-Ind. i. 449. This is a native of Sumatra, the Moluccas, Cochin China, and China, but has been successfully grown in the Botanic Garden of Calcutta. In one year the plants were about four feet high, with a straight ligneous stem, and few branches; they then began to flower in May, and continued to blossom and ripen their seed all the year.—*O'Shaughnessy, page* 226. *Brucea Sum-*

atrana has serrated leaflets villous beneath, the racemes usually compound, the petals longer than the calyx. The leaves are intensely bitter, and possess the same medicinal properties as the Brucea antidysenterica (Christison, *Dispensatory*; Don, *Gardener's Dictionary*.)—*Engl. Cyc. p.* 671.

(2193) BRUMADUNDOO OR COOROO-KOO OIL. ARGEMONE MEXICANA.

Brumadundoo yennai, TAM.	Oil of Prickly Poppy, or.
Brumadundie Noona, TEL.	Jamaica yellow thistle,
Faringie datura ka tel, HIND.	ENG.

This pale yellow, limpid oil, may be obtained in large quantities from the round corrugated seeds of the prickly poppy, which was originally introduced from Mexico in ballast, but now flourishes luxuriantly in all parts of India. It was noticed under the head of Argemone mexicana. It is sometimes expressed by the natives and used in lamps, but is doubtless adapted to other and more important uses. In North Arcot it costs from Rs. 1-14-0 to Rs. 2-1-0 per maund.—*Madras Exhibition of* 1855. See ARGEMONE MEXICANA.

(2194) BRUNSVIGIA TOXICARIA. Amaryllis disticha, *Linn.* A native of the Cape of Good Hope. The viscid juice of the bulbs is a powerful poison, and used by the Bushmen on their arrows.—*O'Shaughnessy, page* 656.

(2195) BRUSHES.

Brosses, FR.	Schtschetki, RUS.
Bursten, GER.	Brozas. Cepillos, Escobillas, SP.
Setole, Spazzole, IT.	Broosh, VERN.
Escovas, PORT.	

Brushes are made of hairs, hog's bristles, strips of whale-bone, vegetable filaments of palms &c. fastened together in a handle, or in holes drilled for the purpose in a stock of wood, bone, ivory &c. and are of various shapes with various names, according to the purpose for which they are contrived. The smallest kind is the hair brush, used in water colour drawing. Bristles however are the chief of the articles employed in their manufacture, and on the average of the three years ending 1842, the average imports to England of bristles amounted to 1,772,196 lbs. a year, but in 1845 to 2,412,267 lbs.—*Toml.*

(2196) BRYONIA. SPEC.

Chukan pullum, TAM.	Gotoomba, SANS.
Boodama pundoo, TEL.	

The Bryonia, of which this is the fruit, grows in the woods; it is of an inferior order, and is only eaten by the common people.—*Ainslie, page* 223.

(2197) BRYONIA ALBA, same as B. dioica in properties.—*O'Shaughnessy, page* 347.

(2198) BRYONIA CALLOSA.

Boddama Kaia, TEL.

The bitter seeds are given in worm cases, and yield also a fixed oil used in lamps.—*O'Shaughnessy, page* 348. It is called.

Toomuttikai yennai, TAM. | Boddama kaia noona, TEL.

And is used in some parts of the country, where the fruit abounds. It is extracted by boiling in water, and is procurable only in very small quantities.—*Madras Exhibition of* 1857.

(2199) BRYONIA COCCINIA.

Covay-kai, TAM.

The fruit when green is used in making chatney; it is common everywhere in hedges and gardens, where it is a troublesome weed.—*Jaffrey.*

(2200) BRYONIA DIOICA. Αμπελος λευκη, Βρυωμα, Diosc. Root large, white, long, fleshy. Root acrid and purgative, produces also violent vomiting. It was formerly a very popular remedy in Europe, but is now banished from the Pharmacopœiæ.—*O'Shaughnessy, p.* 347.

(2201) BRYONIA EPIGÆA. Rottl.

Kolung kovay kalung, TAM. | Rawkus Gudda, HIND.

This valuable bitter root resembles that of the colombo plant (*O'Sh. p.* 347): it is mucilaginous and tonic, stomachic and aperient; and natives employ it in the latter stages of dysentery; they also give it internally for old venereal affections and chronic rheumatism: it is for the most part prescribed in powder (which is of a very pale yellow color) in doses of a pagoda weight in the course of the four and twenty hours, and is continued for eight or ten days together: this quantity generally produces one or two loose motions. The root when dried very much resembles in taste the Columbo root, to which it also approaches in medicinal qualities. The following is Dr. Rottler's own botanical description of the Bryonia epigæa:—The stalk sulcate, smooth. The leaves somewhat fleshy, cordate, trilobate, dentate, rough, the lateral lobes subbilobate. The flowers in a raceme—male flowers, five, small, female flower single pedunculate, proceeding from the same axilla as the male flowers.—*Ainslie's Mat. Med. p.* 301.

(2202) BRYONIA GRANDIS.

The Plant,

Jivaka, Vimba, Patuparni, SANS.	Telkatcha, HIND.
Koondorie, DUK.	Covay, TAM.

The juice of the leaves is used as an application to obstinate ulcers produced by the bites of animals (*Ainslie, vol.* ii. *p.* 436.)—*O'Shaughnessy, page* 348.

The Leaves,

Covay keeray, TAM.	Donda koora, TEL.
Kundorie ke baujee, DUK.	Bimb, SANS.

The Fruit,

Covay kai, TAM.	Donda kaia, TEL.
Kundorie ka phul, DUK.	Bimb, SANS.

The fruit கசகசக்காய் when unripe is rank-

ed amongst the Kaïs கறி or garden stuffs of the natives of India. In that state it has a slightly acid but not unpleasant taste. When ripe it is considered as a fruit (pullum) பழம், and it is then sweetish but insipid; it is smooth, oblong, and about an inch and a half long.—*Ainslie, page* 139.

(2203) BRYONIA ROSTRATA. Rottl.

Appacovay, TAM.

Leaf of the beaked bryony.—*Ainslie's Mat. Med. p.* 259. This is a native of Tranquebar. The root is prescribed in India as an astringent and emollient poultice in cases of piles. (*Ainslie.*)—*O'Shaughnessy, page* 347.

(2204) BRYONIA SCABRA, Lin. Ainslie

Ahilaykum, SANS.	Musmusa, DUK.
Mosumooskei keeray, TAM.	Noodosa koora. TEL.
Musmusa ka baujee, DUK.	Ahilayka, SANS.

The shoots and leaves are aperient: the fruit slightly bitter also.—*O'Sh. p.* 348.

(2205) BRYOPHYLLUM CALYCINUM. This curious flowered plant with a leaf like the house-leek was introduced into India by Lady Clive, from the Moluccas, and has been so naturalized on the Tenasserim Coast, that it may be sometimes seen growing around old pagodas like a wild plant.—*Mason.*

(2206) BUCHANANIA LATIFOLIA.—BROAD-LEAVED BUCHANANIA.

Moreda, TAM.	Theet-sai, BURMESE.
Pujal, HIND.	

This is a jungle tree, flowering after the rains. It is common in the Kotah jungles. Both the *Buchanania latifolia* and *B. angustifolia*, are found in Tenasserim. The former is plentiful, both in the Pegu and Tounghoo districts, and the latter is only seen about Rangoon. They both yield valuable oil-seeds of the sweet or fatty class.—*McClelland.* A very fine oil might be expressed from the seed. The Buchanania latifolia is very handsome; flowers fragrant, and the wood hard and durable. It bears fruit about the size of a small cherry, in long bunches, colour of a darkish purple: the kernels, or seeds, which are covered with a double shell, after being prepared by the natives, are sold in the bazars of India four or five pounds for a rupee: they possess the flavor of almonds, and are used as such by the native confectioners, the fruit is agreeable, and the seed, called Chironji *Hind*, Chaurapuppoo *Tam.*, has a very pleasant rich flavour. The method of preparing them by the Bheels is this: the fruit when ripe in May is gathered, then soaked in water to soften the outer pulp, when it is washed and rubbed off by the hands: the little nut is then dried in the sun, and afterwards broken between a common chuckee or stone hand-mill, such as is used for grinding wheat: the kernels are then sifted and winnowed. This kernel of the Buchanania latifolia is much used in native confectionary, being brought to Madras from Cuddapah, &c. The oily kernel is roasted and eaten by the Brahmins with milk, and is considered a great delicacy.—*Madras Exhibition. Irvine. Eng. Cyc.*

(2207) BUCKLANDIA is a magnificent tree and one of the most beautiful evergreens of Sikkim. One seen by Dr. Hooker had a trunk twenty-one feet seven inches in girth, at five feet from the ground, and was unbranched for forty feet. Ferns and the beautiful air-plant *Cœlogyne Wallichii* grew on its branches, with other orchids, while *Clematis* and *Stauntonia* climbed the trunk. Such great names (Buckland, Staunton, and Wallich) thus brought before the traveller's notice, never failed to excite lively and pleasing emotions: it is the ignorant and unfeeling alone who can ridicule the association of the names of travellers and naturalists with those of animals and plants. This superb tree is a great desideratum in English gardens; Dr. Hooker believes it would thrive in the warm west of England. Its wood is brown, and not valuable as timber, but the thick, bright, glossy, evergreen foliage is particularly handsome, and so is the form of the crown. It is also interesting in a physiological point of view, from the woody fibre being studded with those curious microscopic discs so characteristic of pines, and which when occurring on fossil wood are considered conclusive as to the natural family to which such woods belong. Geologists should bear in mind that not only does the whole natural order to which *Bucklandia* belongs, possess this character, but also various species of *Magnoliaceæ* found in India, Australia, Borneo, and South America.—*Hooker Him. Jour. Vol.* II *page* 185.

(2208) BUCKWHEAT. POLYGONUM. Buckwheat belongs to the temperate and arctic climates, and is cultivated in Northern Europe, Asia, and America for the farinaceous albumen of its seeds, which, when properly cooked, affords a delicious article of food to a large portion of the human race. It also serves as excellent fodder to milch cows, and the straw, when cut green and converted into hay, and the ripened seeds, are food for cattle, poultry, and swine. It is raised most abundantly in Central Asia and the Himalaya. In the latter country the different varieties are grown at various elevations, between 4,000 and 12,000 feet. The common variety grown in Europe is the *Polygonum fagopyrum*, and *P. emarginatum* is grown in China and the East. In Britain the produce varies from 2 to 4 quarters per acre. The quantity of seed sown is 5 to 8 pecks the acre. It is believed to be a native of Central Asia, as it is supposed to have been first brought to Europe in the early part of the twelfth century, at the time of the crusades for the recovery of Syria from the dominion of the Saracens; while others contend that it was introduced into Spain

by the Moors, four hundred years before. The cultivation of buckwheat, in one or other of its species, is principally confined to Great Britain, France, Switzerland, Italy, Netherlands, Germany, Sweden, Russia, China Tartary, Japan, Algeria, Canada, and the middle and northern portions of the United States. In America from 30 to 45 bushels per acre may be considered as an average yield in favourable seasons and situations, but 60 or more bushels are not unfrequently produced. According to the census returns of 1840, the annual quantity raised in the United States was 7,291,743 bushels; of 1850, 8,950,916 bushels. The average annual imports of buckwheat into Britain have not exceeded 1,000 quarters, until 1852, when they reached 8,085 quarters. A small quantity of the meal is also annually imported.—*Simonds, p.* 259.

(2209) BUDRANJA BOYA. A species of Melissa, a small plant found about Ajmeer, where it is considered heating, and is used to cleanse the blood: one seer for two rupees.—*Gen. Med. Top. p.* 130.

(2210) BUFO SCABRA. The common Bengal and Java toad, abounded in the marshes, in the Lachen Valley, adjoining Thibet. This is a remarkable instance of wide geographical distribution for a Batrachian, which is common at the level of the sea under the tropics.—*Hooker Him. Jour. Vol.* II. *page* 96.

(2211) BUFF.

Buffle, Fr. | Cuojo di Bufalo, It.
Buffel, Buffelhaute, Ger. |

A sort of leather prepared from the skins of buffaloes, elks, oxen, and other like animals, dressed with oil, after the manner of chamois leather. It is used in making gloves, sword belts, &c. It is manufactured in India.

(2212) BUGS. A tallow candle kept in bed, is said to drive away bugs, which are very troublesome in the East, as also in the hills, and Cashmere.—*Honig. p.* 343.

(2213) BUHRSTONE, is a quartzose rock containing cellules. It is as hard and as firm as a quartz crystal, and owes its peculiar value to this quality, and the cellules, which give it a very rough surface. Stones for grinding wheat and other kinds of grain are formed of this rock, and those which are most valued have the cavities about equal in space to the solid part. The best stones for this purpose come from France, and are obtained from the Paris basin and adjoining districts When used for grinding, the stones are cut into wedge shaped parallelopipeds, which are called panes. These are bound together by iron-hoops into millstones. The Paris Buhrstone is a Tertiary Formation. A Bhurstone is obtained in Ohio in America, which is in part a true sandstone, and contains fossils. It also contains lime, and Mr. Dana suggests that the removal of the lime by solution may have given it its cellular character. It overlies the Coal Formation, and has an open cellular structure where quarried for millstones. The quartz rock of Washington in the United States is in some parts cellular, and makes good millstones. Buhrstone also occurs in Georgia near the Carolina line, and in Arkansas near the Cove of Wichitta (Dana, *Manual of Mineralogy.*)—*Eng. Cyc. page* 681.

(2214) BUKUM, Cæsalpinia sappan. q: v: Narrow-leafed Brasiletto. This is a common shrub in most parts of India; the seed is used for colouring milk, and the wood as a red dye.

(2215) BULBS. Those imported into India, for flowering plants do not succeed well in general; this is owing in a great degree to their being disturbed; the best plan to adopt is to prepare a good piece of ground somewhat raised, to throw off the heavy rains and to plant each variety by itself in rows, keeping them clear of weeds. Every season, when they begin to grow, stir up the soil and add a little well decayed horse manure. One thing is perfectly evident regarding this species of plants in India, that the more nursing they receive the weaker they become, they seem to relish neglect, under which they flourish in the greatest beauty. If wanted to be grown in pots, the soil should be three parts sand and one vegetable mould and decayed manure. When the bloom appears, a watering of liquid manure once or twice a week will aid them greatly. After the leaves are decayed, put them in a dry situation till another season; when they begin to show signs of growth: let a slight watering for some time be given to enable them to form new roots, then take out one inch of soil, and put in the same quantity of decayed horse manure mixed with a little sand, after which water freely, till the flowers are past when they should be *gradually dried.*—*Riddell.*

(2216) BULLAR, Eng.

Sem ke pattay, Hind. | Mutche cotte, Tam.

This is a variety of the Lablab vulgaris. It is a shrubby plant, bearing a small bean, sown in June and ripe in October; it is boiled plain and eaten, or put into curries; the natives also give it to cattle.

(2217) BULRUSHES (*Typhaceæ*).

Pun, Booree, Sindeh.

Bulrushes, so conspicuous in the marshes of Europe, extend also to similar situations in most parts of India. The leaves are in some parts of Europe employed in making mats and winter coverings for plants, as well as for stuffing chairs, the leaves of *putera* and *reree* (or *Typha elephantina* and *T. angustifolia*) are employed in making mats in North-West India. Dr. Stocks informed Dr. Royle that in Sindh the former is called *pun*, and its leaves employed for making mats and baskets. The pollen, like that of Lycopo-

dium, is inflammable, and used as a substitute for it in Europe. It is also collected in Sindh, and there called *booree.—Royle Fib. Pl. p.* 85. Bulrushes in Europe are used for putting between the staves of barrels, also for chair bottoms and matting.

(2218) BUNBURBUTTEE, HIND.—Phaseolus lunatus.—Duffin Bean. Sown in rows the same as other beans, but with a much greater space between; they require very strong sticks for support, and are ready in about six months. No very particular care is necessary.

(2219) BUNKA THADA.

Bunka thadah, TEL. | Bahtra, HIND.

A wood which was sent to the Great Exhibition.

(2220) BUN-OCHRA, "Urena lobata."

Wet-khyœ-pa-nai, BURMESE.

A weed, common in most parts of India, abounds in a strong fibre, which is a tolerably fine substitute for flax. The Urena lobata abounds along the coast of Province Amherst; and affords a valuable hemp.

(2221) BUNT. SMUT BALLS OR PEPPER BRAND, (Uredo caries, Dec; Uredo fœtida, Bauer.) The fungus which occasions this well known and much dreaded disease, has hitherto been met with only in the grains of wheat, when its presence is readily recognised by the peculiarly disgusting odour of the infected car. When this disease prevails, it greatly deteriorates the value of the sample; and from imparting its disgusting odour to the flour it makes it less fit for bread.—*Russell.*

(2222) BUOYS.

Bouees, FR. | Gavitelli, IT.
Ankerboyen, GER. | Boyas, SP.

IN naval language, the term buoy signifies any floating body employed to point out the situation of anything under water, as a ship's anchor, a shoal, a sand-bank or the course a ship should take entering a harbour: they receive various names.

(2223) BURGUNDY PITCH. PIX BURGUNDICA. This is a product probably of the Abies excelsa; it is of light yellow colour, often adulterated with dammer or gunda barosa.

(2224) BURI, OR BULI. The name of a Philippine palm, probably the Corypha gebanga of botanists, and the Gabang of the Malays and Javanese. The Philippine islanders make much use of the several parts of this palm. From the leaves they make mats, from the sap both sugar and a distilled spirit, from the pith a sago, and from the seeds rosaries, while the spines boiled in water yield a thread from which a coarse cloth is woven, called Sagoron.—*Crawfurd Dic. p.* 77.

(2225) BURSUNGA. This drug is the leaves of the Bergera Konigii.

(2226) BURNET, POTERIUM SANGUISORBIA This plant is raised from seeds sown annually; it is used in salads, but is of little value as a vegetable.

(2227) BURRIE TOOVAR.—CAJANUS INDICUS, CYTISUS CAJAN. PIGEON PEA.—Large Dhal.

Toor dhal, HIND. | Thovary purpoo, TAM.

This is sown in fields at the commencement of the rains in June and sometimes much later; it is ripe in December. The seeds are sometimes ground into flower or split like dry peas: for the latter they are an excellent substitute. There are several varieties, which sell from 30 to 40 seers for the rupee.

(2228) BUSTARD. OTIS TARDA.

Neel naray. TAM. | Beetmiakie, CAN.
Junglie ka-boot, HIND. | Cowdun, also Jerz, PERS.
Beetmiaka, TEL.

Various species of this genus of buds are to be met with in many parts of India, but the *O. tarda* is more rarely seen in the lower and southern tracts of the Peninsula, than in the more northern regions. In Mysore, which, from its great elevation, is much colder than other countries of the same latitude, the Bustard is still common.—*Ainslie's Mat. Med. p.* 296. Bustard is the English name of a bird belonging to the genus Otis. The species are land birds whose proper position in the ornithological system has caused some embarrassment to Zoologists.—*Eng. Cyc. p.* 697. The Bustards live generally in open countries, preferring plains or wide-spreading extensive downs dotted with low bushes and underwood-localities which give them an opportunity of descrying their enemy from afar.—*Eng. Cyc. page* 697. They are found in Europe, Asia, and Africa; but not in America. The *Otis tarda*, the great Bustard, is the *Otis* and *Avis tarda* of Belon and others; Ostarde Houtarde, Outarde, Bistarde of the French; Starda and Starda commune of the Italians; Der Grosse Trappe, Trapp, Trappgans, and Ackentrapp of the Germans; Abutarda (*Avis tarda*) of the Spaniards; and Gustard of the old Scotch. The *Otis nigriceps* is a native of Asia. The specimen from which the figure in Mr. Gould's magnificent work ('Century of Birds from the Himalaya mountains') was taken, was brought from the highlands of the Himalaya, but it is by no means confined to that locality. Colonel Sykes observed it in the wide and open country of the Mahrattas, where it lives in large flocks, and where it is considered one of the greatest delicacies as an article of food. It is indeed so abundant in the Deccan, that Colonel Sykes records, in the 'Proceedings of the Zoological Society,' that one gentleman shot nearly a thousand. The male has the body above pale bay, lightly undulated with rufous-brown; neck, a few spots on the wings, and belly, white; the head, which

is crested, the outer wing-coverts, the quills, and the large mark on the breast, black; irides deep-brown; bill and feet yellowish. Length, inclusive of tail, 56½ inches; tail, 13⅝ inches. The female resembles the male in plumage, but is only 41½ inches including the tail, which is 10½ inches. The eggs, of which Colonel Sykes found only one in a hole in the earth on the open plain and that considerably advanced in the process of incubation, were in shape a perfect oval, and in colour a brown-olive, with obscure blotches of darker brown-olive. Length 3 4/10 inches, diameter 2 7/10 inches.—*Engl. Cyc. page* 701.

(2229) BUTANEE, Hind. Pisum sativum.

Common Pea, ENG. | Puttanee, TAM.

The native country pea is sown after the rains in drills, and varies in price according to the quality; when green they are tolerable as a vegetable, but are best in soup. Procurable in December and January.

(2230) BUTEA, a genus of plants belonging to the natural order *Leguminosæ*, named after John, Earl of Bute, a great patron of botanists. The species are natives of the East Indies. They are unarmed trees, with pinnately trifoliate leaves, with racemes of deep scarlet flowers.—*Eng. Cyc. page* 703. The flowers of the *Butea frondosa* and *B. superba*, may be had in greater quantity in Pegu than any part of the east. They are called in the Bengal bazars *Palasphool* and afford a bright yellow colour. The Burmese are fully acquainted with the value of this dye, and the article is found in all the bazars.—*McClelland.*

(2231) BUTEA FRONDOSA, LEGUMINOSÆ, Roxb. c. 21.

Porasum marum, TAM. | Palas, SANS.
Moduga chettu, TEL. | Dhak, HIND.
Pouk, BURM. | Thorus mara, CAN.
Pulasa, also kinaka, BENG.

A native of the mountains of India and a common shrub on the village lands, thriving well in many parts of the country. The fields of Plassey took its name from this tree. It is common in some parts of Ajmeer and very common in Boondee and Kotah.—*Genl Med Top. p.* 203. This species of butea is very abundant in Province Amherst where it is a magnificent tree. The Pwo Karens plant it in their sacred groves, where the deep rich orange blossoms seen under a tropic sun in the dry season, enveloping their almost leafless trunks and branches, give the copse the appearance of a burning jungle. The Burman books describe the Himalaya forest, as shining with the flowers of the butea "like a flame of fire."—*Mason. Butea frondosa* is a tree of very general occurrence throughout the province of Pegu, but more especially about Tounghoo, where it cannot escape notice from its bright orange flowers, which illuminate the forests in all that part of the country during the months of February and March. In Burmah, the *Butea frondosa* (Pouk-pin, *Burm.*) is plentiful, but the timber is crooked and only fit for ornamental work. Wood, dark-brown.—*McClelland. Butea frondosa* has pubescent branches, roundish obtuse or emarginate leaflets, velvety beneath; the corolla four times the length of the calyx; the calycine teeth rather acute. It is a native of mountainous districts in Hindustan. *Butea frondosa* when abundantly in flower presents a gorgeous sight. In mass the inflorescence resembles sheets of flame, and individually the flowers are eminently beautiful, the bright orange-red petals contrasting brilliantly against the jet-black velvety calyx.—*Hooker's Him. Jour. p.* 52. "The lac insects are frequently found upon the smaller branches of the tree, but whether the natural juices of its bark contribute to improve their red colouring matter has not been determined." (G. Don.)—*Engl. Cyc. page* 703. The shrub yields firewood, and its bark and roots fibrous matter, which is used as cordage or beaten into oakum for caulking boats, This fibre has considerable strength, and is of great use to the natives for agricultural and domestic purposes though unimportant in commerce.

Its seed,

Porasum verci, TAM. | Porasum seed, ENG.
Moduga vittiloo, TEL. | Palashaw, SANS.

is contained within the very flat, oval, chesnut coloured legume of the plant, and is a medicine held in high estimation by the Tamool practitioners as an anthelmintic, both in cases of Tapeworm and ascarides. Dr. Roxburgh, in his excellent account of the plant, informs us that from fissures and wounds made in the bark of the tree, a beautiful red juice issues, that soon hardens into a ruby coloured, brittle, astringent gum, which he thinks might prove a valuable medicine. In Dukhanie the Porasum tree is called Plas papara. It is the Plaso of the Hortus Malabaricus in which we are told that its fruit powdered, is anthelmintic, and the Dhak of the mahomedans of upper India.—*Ains. Mat. Med. p.* 108.

Its flowers,

Porasum flowers. ENG, | Plaspapare ke phool, also
Porasum poo, TAM. | Tesoo and keesoo, DUK.
| Palasha, SANS.

either by themselves, or in conjunction with those of the sorrowful Nyctanthes, are used by the dyers, in dyeing a beautiful bright yellow. With the juice of the fresh Porasum flowers diluted with alum water and rendered clear by depuration, Dr. Roxburgh prepared a soft extract which he tells us proved a brighter water colour than any gamboge he had met with.—*Ains. Mat. Med. page* 193. *Butea frondosa*, called the Bastard Teak, flowers in March, and the flowers are of a beautiful deep red, shaded with orange, and downy; they are used to dye with: as the juice of the common flowers, which in this species are two inches long, gives

to water a bright yellow colour similar to gamboge. This property is also possessed by the dried petals. Its large flowers *teesoo* and *keesoo* yield a beautiful dye, which is likely to come into extensive use. The கரட்டு பூசுமரம்? அல்லது பூவரசமரம் Koat mookee marum or Poorasee marum is a tree held in high estimation by the natives. The wood, which is said to be elastic and durable, is much esteemed by carpenters, for its toughness, and by many it is preferred for gunpowder charcoal. A red juice, which flows from this tree when evaporated is found to consist principally of tannin, and is brought into the market under the name of East Indian Kino. it is a ruby colored gum, which exudes from incisions into the bark: it abounds in astringent matter, but has been found difficult to apply in tanning leather. Its coloring matter is powerful and permanent; some specimens analysed by Professor Solly, after the impurities had been separated, yielded 72½ per cent. of tannin—*Simmonds, p.* 507. This gum is one of the most valuable articles of the class to which it belongs. It appears to be one of the most useful kinds of gum, and might be supplied to any extent from the province of Pegu.—*McClelland.* The exudation of the Butea tree, or pulas kino, when exported to England a few years ago, was recognized "as being the gummi rubrum astringens" of the old druggists. M. Guibourt of Paris, to whom some of it had been sent, states his opinion in his work on drugs, that it is the original "kino which had entirely disappeared from commerce, and was once so much valued, as to be sold for nearly a guinea a pound." Amherst Province can furnish almost any quantity of the article, the tree which produces it being one of the most common denizens of its forests.—*Mason.* The true *Palass goond*, or Bengal kino, is of brittle texture and ruby-red colour, freely soluble in the mouth, inodorous, of excessively astringent taste, soluble in water, the solution being of a deep red colour, partially soluble in alcohol, giving a pale tincture, the salts of iron blacken all the solutions. This juice is obtained by incisions in the bark; it is at first very fluid and red, then becomes paler and hardens. Its extraction takes place during the hot season. In the Dublin Pharmacopœia this exudation is described as a variety of Kino. The true Kino however proceeds from a different source, but in chemical properties and medicinal effects both are identical. The Palass Kino is extremely rich in tannic and gallic acid, and contains moreover arabine and ulmine; from this composition, as might be expected, it exercises the most powerful astringent effects. In two or three grain doses it is an excellent remedy in many forms of chronic diarrhœa; as an external astringent application it is quite unrivalled. The flowers of this tree give a fine yellow dye.—*O'Shaughnessy, page* 296. Dr. Forbes Royle says of the *Butea frondosa*, that it yields by incisions made in its bark an astringent gum, which was at one time supposed to be the genuine Kino of commerce. It is no doubt possessed of similar properties, is frequently used as such in India, and useful like it in Diarrhœas and advanced stages of Dysentery. It is also used in the art of tanning. It has been occasionally sent to Britain as Kino, and Dr. Pereira found it in an old drug firm marked *Gummi-rubrum astringens.* Its Sanskrit name is *Kin-suka.* It is commonly known in India as *Kini ke gond*, and also by the name *Kumrkus.* Its chemical characteristics are very like those of the Kino of Pterocarpus. It is very carelessly collected, and therefore often contains impurities. It is remarkable for containing a beautiful red colouring matter, difficult of separation. Analysed by Mr. E. Solly, a portion in the crude state yielded about 50 per cent. of Tannin; but when purified by simple solution in water, so as to separate the impurities, 100 parts contained 73·26 parts of Tannin, 5·05 of difficultly-soluble Extractive, and 21·67 of Gum, with Gallic acid and other soluble substances. The colour and properties of Tannin vary with the exposure and season of collection.—(*v. Roxburgh, Fl, Ind.* iii. *p.* 245, and *Pro. R. Asiatic Soc. May* 1838.)

(2232) BUTEA PARVIFLORA.—A scandent shrub, flowers small and white,

(2233) BUTEA SUPERBA. CREEPING BUTEA. Tiga madega, TEL.

This is an immense creeper with flowers resembling the Butea frondosa. It has glabrous branches; roundish ovate obtuse leaflets, velvety beneath; the corolla four times the length of the calyx; calyx-teeth acute. It grows on the mountains of Coromandel, and is not uncommon in the provinces of Tavoy and Mergui. It resembles the last species, but is larger in all its parts. It yields the same kind of juice. There are two other species described.—*Eng. Cyc. page* 703.

(2234) BUTEES. BATIS. Butees is sold in the Lahore Bazar and is called Atees also; both of them seem to be the Aconitum heterophyllum. —*Honigberger, page* 241.

(2235) BUTTER.

Smor. DAN.	Burro, IT.
Boter, DUT.	Masslo korowe, RUS.
Beuerre, FR.	Manteiga, PORT.
Butter, GER.	Butyrum LAT.
Muska. Mucken. GUZ. HIND.	Manteca, SP.

Faulkner.

An oily compound forming one of the components of milk, the others being curd or caseine, a species of sugar, and certain salts. The lighter matters suspended in milk separate in the form of cream, which can be separated by churning into butter and butter milk. The yield of cream is increased by dropping into the milk a

small piece of zinc. Butter is naturally of a yellow colour, which is deepened when the cows feed in rich pastures, but it is often artificially heightened by arnotto.—*Toml.*

(2236) BUTTERS, VEGETABLE, the name given to the concrete oil of certain vegetables, from its resemblance to the butter obtained from the milk of animals, and from being employed for similar purposes. The term is also occasionally, but improperly, applied to some vegetable products which are entirely of a waxy nature, such as the wax of Myrica cerifera. The name is likewise bestowed in Siberia on certain algæ, species of the genus Nostoe, such as N. pruniforme. The most important Vegetable Butters are produced by the Bassia butyracea and other species of Bassia and certain palms, such as the Cocos butyracea and the Elais guineensis; the former of which is of great utility to the inhabitants of Brazil, where it grows naturally, and to the negroes of St. Domingo, where it is cultivated: while the latter is very serviceable to the natives of Guinea.—*Eng. Cyc. page* 704. The generally known solid oils or vegetable butters are as follows: *Butter of Cacao*, from Theobroma cacao; 1000 parts of the seed yield 300 parts of a concrete oil or butter, of a most agreeable flavour. *Butter of Cinnamon*, from Cinnamomum verum or zeylanicum. By strong decoction, the fruit yields a concrete oil, called Cinnamon wax, used for candles, and which exhales while burning a most delicious odour. *Butter of Nutmeg* from Myristica moschata; This is brought from the Moluccas, of two kinds, and is obtained by bruising the Nutmegs into a paste which is compressed in bags between hot metallic plates. *Butter of Cocoa-nut* from Cocos nucifera; which yields a concrete oil, but perhaps expensive. *Cocoanut oil*, prepared by rasping the pulp of fresh ripe cocoa-nut, adding a little hot water, squeezing and boiling the milky juice until the water has evaporated, and filtering through paper, produces an oil which separates into two portions, the one fluid and limpid, the other a solid concrete substance of a pure white color, which in the shade remains unliquidated at all temperatures. It may possibly be found that the process of manufacture affects the out-turn of the solid product. *Butter of Palm oil* from Elais guineensis, a native of Africa and America. The concrete Palm oil is much esteemed in Europe for unguents and has been lately recommended for culinary purposes. A new export from the Western Coast of Africa, has been large quantities of Solid Palm oil, of the consistence of hard butter. *Shea Butter* from Bassia Parkii, or Pentadesmis butyracea. *Galam Butter* or Ghee, from Bassia butyracea, Fulwa or Phulwara, *Hind*, a native of Nepal and Almora in Northern India; produces an excellent butter. Bassia latifolia, *Vern: Tam.* Illoopai Yennai; *Tel.* Ippa noona; *Hind.* Mahwa ka tel. The oil of this Bassia separates into two portions, one on the surface, fluid, and of a pistacio green color: the other of a brownish green, and almost solid. Bassia longifolia, *Vern: Tam.* Illeepai Yennai, *Tel.* Ippa noona, *Hind.* Mohe ka tel. Of three samples of the Illoopoo Oil, one separated into two portions; the upper, fluid, of a pale oil green, in color; and the lower, greenish white and of the consistence of ghee. Another specimen of the oil of this Bassia separated into three portions, the uppermost a golden yellow and fluid, the middle yellowish white, solid, and floating in the upper; and the lowest solid, and brown in color. A third sample in the Madras Exhibition was of the consistence of ordinary ghee and was sent as a material fit for the lubrication of Railway Carriages, and another beautiful specimen, almost solid, from Tanjore was of a light golden yellow colour. *Chinese Vegetable Butter* from Stillingia sebifera produces the butter and oil so much in use in China: the number of these trees in the province of Chekiang is immense. *Indian Vegetable Butter*, Piney Butter, or Doopada solid oil, from the Vateria indica; Piney Marum, Tamil, grows on the Western Coast and in Canara. It is white or yellowish white, of the consistence of hard salt butter, and in the shade remains always solid. It can be procured in quantities in southern India. It is used for lamps principally, but is very suitable for soaps and candles. It is prepared by cleaning the seeds; then roasting and grinding them into a mass. To 5 seers of seed, add 12 seers of water, and boil until the oil rises to the surface. Remove the oil, stir the contents of the vessel, and allow it to stand until the following day, when more oil will be observed on the surface, which may be collected and the process repeated. *African Butter* from Pentadesmis butyracea in Sierra Leone. *Japan Wax* from Rhus succedaneum. *Almond Butter. Gamboge Butter*: this is a product of the Garcinia pictoria, Rox: it is called Muckke Tylum, *Tam.* Arasana Ghoorghy yenni, *Can.* It grows abundantly in Mysore and Western Coast jungles. *Cocum Butter*, Garcinia purpurea? This is one of the two species of Garcinia, G. pictoria and G. purpurea, the seeds of which produce solid oil, the former the Gamboge butter and the latter the Cocum butter: the Gamboge butters are solid and of a deep leek green color. The G. pictoria grows abundantly in certain parts of Mysore and the Western Jungles. The oil is procured by pounding the seed in a stone mortar and boiling the mass until the Butter or oil rises to the surface: 2½ measures of seed yield one seer of butter, and it is sold at the rate of Annas 1-4 per seer of Rupees 24, in the Nuggur division of Mysore, and is used as a lamp oil and as ghee. *Sterculia fœtida oil, Vern: Tam.* Coodiray yennai or Coodira pusjun yennai. This oil is thick at all seasons of the year, and is obtainable probably in large quantities in the

forests on the Nulla Mulla and Yella Mulla range, *Butter of Laurel*—Laurus nobilis, *Simmonds, p.* 510. Solid Oils are obtained from the Dipterocarpi, in the Indian Archipelago. *Simmonds, p.* 511. Solid Oil of the Horse eyes and Cacoons of Jamaica, Fevillea scandens, is white and hard. *Simmonds, p.* 511. *Kawan Solid Oil* is procured from a species of Bassia from Singapore or Java *Sim: p.* 511. *Mijo* or Japan Butter, from Dolichos soja, Japan· *Sim. p.* 512. Solid Oil from Myristica (Virola) sebifera, of British Guiana. *Sim. p.* 512. Solid Oil from the Demerara Butter tree, Pekea (?) Bassia buttyrosa, *Sim. p.* 512. Solid Oil from the Demerara butter tree, Saouari, Pekea tuberculosa, *Sim. p.* 512, *Vegetable Wax* from Shanghae, *Sim. p.* 540. *Myrtle Wax* from Cape of Good Hope, *Sim. p.* 540 and 541. Solid Oil of Bombay, *Sim. p.* 521, from Salvadora persica or Vernonia anthelmintica, *Sim. p.* 521. *Carap* or Carab Vegetable Butter, from Carapa guianensis, a large tree in Trinidad, and British Guiana, *Sim. p.* 519. *Butter* of the Great Macaw Tree, from Acrcomia fusiformis, *Ibid. Broonga Malagum* Oil, or ointment, from Masulipatam, separates into three portions, the uppermost, fluid, resembling brown sherry, the middle, of the consistence of ghee, and brownish yellow; and the lowest almost solid and of a hair brown color. *Mooragana* or Mooroogana Butter or solid oil of Canara, is a solid oil used for medicinal purposes and as an ointment for the wounds of cattle, injured by tigers. It is said to be produced from a forest tree growing in the Canara Jungles. The specimens are dark brown and quite solid and this product merits the best consideration. A very excellent sample of this solid oil was in the Madras Exhibition of 1857 from Mangalore. It is the most solid of the solid oils. *Odul* or Adul oil of Travancore is separated into two portions; the upper, fluid, of the colour of golden sherry; the lower, reddish white, of the consistence of ordinary hard salt butter. *Shacotty oil* of Canara is used for cutaneous eruptions. The specimen of this oil in the Museum separated into two portions; the upper, yellowish and fluid, and the lower brownish red and of the consistence of hard ghee. *Hibavania oil*, Canarese; under this name, there was exhibited at the Madras Exhibition of 1857, a solid oil from the Sampajoy district by Pedro Probhoo, of a clove brown colour, a small phial priced at Rupees 4½ *Camujay* tree oil: a small bottle, priced Rupees 2¼ from the same district, by the same exhibitor, was a dark gelatinous mass, of the consistence of blanc mange. Oil of Hydnocarpus inebrians, the *Thortay oil* of Canara, is a very valuable vegetable solid oil, used for sores. This oil is solid and of the consistence of ordinary hard salt butter. Terminalia Bellerica, *Vern. Tam.* Thaneeka or Tannekae yennay. The oil from the Terminalia bellerica separates into two portions —the one fluid, of a pale oil green color, and the other white, floccular, and of the consistence of ghee. *Nobis.*

(2237) BUTTERFLIES. Azemu Samdong; In the Lachen valley, the caterpillar of the swallow-tail butterfly (*Papilio machaon*), was common, feeding on umbelliferous plants, as in England; and a *Sphynx* (like *S. euphorbiæ*) was devouring the euphorbias; the English *Cynthia cardui* (painted-lady butterfly) was common, as were "sulphurs," "marbles," *Pontia* (whites,) "blues," and *Thecla*, of British aspect but foreign species. Amongst these, tropical forms were rare, except one fine black swallow-tail. —*Hooker, Vol.* II. *p.* 65.

(2238) BUTTONS.

Boutons, Fr.	Bottoni, It.
Knopfe, Ger.	Botoens, Port.
Buttoun, Guz.	Pogowizu, Rus.
Goondee, Hind.	Botones, Sp.

Buttons are made from metal, shell, horn, bone, palm seeds, fruits, woods, glass, wire, mother of pearl: jet, precious stones: linen, velvet; satin, florentine, and embroidered stuff of all kinds. Birmingham is the great seat of this manufacture. Those of metal are often gilt, and fine grains of gold, and sometimes 2½ grains, are made to cover 144 one inch buttons: so great is the divisibility of that precious metal.—*Toml.*

(2239) BUXUS, the genus of plants whose species afford the valuable hard wood called Box. Of the two European species *B. sempervirens* and *B. Balearica*, the former, or common Box, forms a large evergreen bush or small tree, common all over the south of Europe from Spain to Constantinople, and reaching even so far as the north of Persia.—*Eng. Cyc. p.* 704.

(2240) BUXUS EMARGINATUS. This is a new species of Box-wood lately introduced into Britain from the Himalayas; it is the *Buxus emarginatus*, of Dr. Wallich: this is found of considerable size and thickness, and the wood appears as good and compact as that of the box wood in use in Europe.—*Royle, Illust. Himl. Bot. p.* 327. On actual comparison the Himalayan box-wood is found to be softer than the common kinds, but is like them in other respects, and wood cuts have been engraved upon the wood of Himalayan Buxus emarginatus.—*Eng. Cyc.*

(2241) BUYO. The name given in the Philippine Islands to the betel pepper, the sirih of the Malays, and Piper betel of botanists.—*Crawfurd Dictionary, page* 78.

(2242) BYSSUS, the name of a long, delicate, lustrous, and silky fasciculus of filaments, by which some of the conchiferous mollusks (the *Mytilacea*, Mussels, and *Malleacea*, Hammer Oysters, for example) are moored to submarine rocks, &c. This is not, as some authors have stated, a secretion spun by the animal, but, according to De Blainville, an assemblage of muscular fibres dried up in one part of their extent, still

contractile and in a living state at their origin, a condition which they enjoyed throughout their whole length at the period of their attachment. The tendinous foot of *Byssoarca* and *Tridacna* seems to be a step towards the organisation of a true byssus. In the great *Pinna* of the Mediterranean this substance is well and largely developed, and its situation is in a fleshy sac or sheath at the base of the foot, which is attached towards the middle of the abdominal mass of the animal. In Italy the byssus is manufactured into various articles; and there are few museums without a glove or a stocking woven out of this substance. In the great Exhibition of 1851 a large number of articles were exhibited manufactured from this substance, as well as specimens of the silk for making up.—*Eng. Cyc. p.* 707.

(2243) BYTTNERIACEÆ, *Byttneriads*, the Byttneria Tribe, a group of plants by some botanists considered a distinct natural order, by others reduced to a section of Sterculiaceæ. They belong to Lindley's Malval alliance of Exogens, and are readily known by their petals being bagged at the base, their stamens partly sterile and petaloid, and their fruit covered with hooked spiny hairs. From Sterculiaceæ proper they differ by the presence of petals, and their stamens not being united into a column; from Malvaceæ by their 2-celled anthers and bagged petals; and from *Lasiopetaleæ* by their calyx not being coloured like a corolla, and their petals not rudimentary. The species are chiefly inhabitants of tropical countries. They partake of the mucilaginous inert properties of *Malvaceæ*. Their bark often yields a tough fibre fit for manufacture into cordage; and one species, *Theobroma Cacao*, (Theobroma), produces the seeds from which the buttery and somewhat bitter substance called cocoa is obtained, and which forms the basis of chocolate. The fruit of *Guazuma ulmifolia* is eaten by the Brazilians. Many of the species yield fibres which might be manufactured into cordage, as *Microlæna spectabilis* and *Abroma augustum*. In Madagascar the bark of *Dombeya spectabilis* is made into ropes.—*Eng. Cyc. page* 708. In its more extended relations, the natural family of *Byttneriaceæ*, includes such genera as *Bombax*, *Sterculia*, *Abroma*, *Guazuma*, &c., and like that of the Mallow-worts, inhabits hot parts of the globe chiefly, and also like it contains a number of plants remarkable for abounding in mucilage and in fibrous bark. Of these some are employed for cordage in different parts of the world, and of them a few, as *Abroma augusta*, might probably be grown with greater profit, and yield a better product, than some of those which are now in cultivation. Thus the species of Bombax, which are remarkable for their gigantic stature and their splendid inflorescence, are also so on account of their capsules, which, on bursting, display a flocculent substance, often mistaken by travellers for cotton, and the tree is hence called *Cotton tree*. But as this substance is more silky than cotton, it has been distinguished by the name of *Silk Cotton*. It differs also in not spinning like cotton. Some difficulty, therefore, is experienced in making use of this very abundant cotton-like produce; but Mr. Williams, of Jubbulpore, has succeeded in spinning and weaving some of it so as to form a very good coverlet. It might be easily made use of for stuffing pillows, muffs, or coverlets, for wadding, or for conversion into half-stuff for paper-makers, perhaps for making gun-cotton. In the 'Trans. of the Agri-Hortic. Soc.,' iii, p. 274, there is a report from the Society of Arts on two pieces of cloth made from the Simool or Silk Cotton tree; and it is observed that, from the shortness of the staple of the down, and its elasticity, it could not be spun by cotton-spinning machinery. Several of this family abound in mucilage, thus a Guazuma is employed in South America in clarifying sugar; as a Kydia is in India. A species of Sterculia yields a tragacanth-like gum on the west coast of Africa, as another does in India. Several species of this genus are remarkable for the tenacity of the fibre of their bark, which is employed for cordage, as *Myrodia longiflora* in Guiana, and *Chorisia crispifolia* in Brazil, *Dombeya umbellata* in the Isle of Bourbon, and *Sterculia Ivira* in the West Indies. *Helicteres Isora* may be similarly employed in India. *Sterculia guttata* is a tree, a native of Malabar, which was first made known by Capt. Dickenson, in the year 1802. The bark of the younger parts of the tree abounds with very strong, white, flaxen fibres, of which the inhabitants of Wynaad manufacture a kind of coarse cloth. It is not usual to make use of the bark until the tenth year, when its size will be equal to that of most forest trees. The tree is felled, the branches lopped off, and the trunk cut into pieces, of six feet long, a perpendicular incision made in each piece, the bark opened, and taken off whole, chopped, washed, and dried in the sun. By these means, and without any further process, it is fit for the purposes of clothing. *Sterculia villosa*, called *Oadal* in Assam, is another tree of this genus, which is a native of the mountainous countries to the eastward of Bengal. Trunk straight. The bark is smooth, but fibrous. Bags are made of it. Its fibres are made into cords by the natives of the eastern frontier of Bengal, to bind wild elephants with. Of a coil of *Oadal* rope, Major Jenkins gave the following notice in the year 1847: "The *Oadal tree* is very common, and the rope is made most readily; the bark, or rather all the layers, can be stripped off from the bottom to the top of the tree with the greatest facility, and fine pliable ropes may be made from the inner layers of bark, whilst the outer yield coarse ropes. The rope is very strong and very lasting—wet doing it little injury." *Oadhal* is a creeper in Kemaon, with fine, strong fibres; and *Microlæna spectabilis* is a

tree found at the foot of the Himalayas, which yields fibres fit for rope-making. *Guazuma ulmifolia* is a South American tree, which was introduced into India, and largely cultivated at one time in the Madras Presidency under the name of Bastard Cedar, as fodder for cattle. The fibres of its straight, luxuriant, young branches were submitted to trial by Dr. Roxburgh. *Abroma augusta*, the *Woollet-comul* or *Ullat-kumul* of Bengal, and which Dr. Roxburgh at one time called Perennial Indian Hemp or Flax, is a native of various parts of India, growing luxuriantly in gardens even as far as 30° N. lat., and extending eastward to the Philippine Isles. It grows to a small tree, but may be caltivated as an annual; flowers profusely during the rainy season, and ripens its seed in the cold weather. It particularly attracted Dr. Roxburgh's attention; as the bark abounds with strong white fibres, which make a very good substitute for Hemp, affording good common cordage. The plant grows so quickly, as to yield two, three, or even four crops of cuttings, annually, fit for peeling; hence it may be advantageously cultivated, and is deserving of more than common attention on account of the beauty, fineness, and strength of its fibres. Dr. Roxburgh ventured to prognosticate as large a yearly produce as can be obtained from an acre of Danchee, Jute, Sunn, Hemp, or Flax; as it is a perennial, large, shrubby plant, in every respect easier to cultivate and to prepare the fibres than Sunn, and the produce much greater. Indeed, in an experimental culture, he obtained from three cuttings 271 lb. of clean fibre, which he states was three times greater than the average produce of Sunn. To separate the bark from the shoots, maceration in stagnant water, from four to eight days, answers well during the warmer parts of the year, while three times as much is scarce sufficient during the cold season, indeed the process is scarcely practicable then; besides, the fibres are greatly weakened by prolonged maceration. The fibres being naturally very white and clean, they do not require to be cleaned. Dr. Roxburgh states that, in its native state, without being dressed in any way, it is about one tenth part stronger than Sunn, and in that state much more durable in water. A cord of its fibre bore 74 lb., when Sunn broke with 68 lb. (*v.* p. 269.)—*Royle Fib. Pl. p.* 265.

(2244) BYTTNERIA HERBACEA.

Aree-keeray, Tam.

A very common little herbaceous plant with red and yellow flowers, used mixed with others, as greens.

C

(2245) CABBAGE. Brassica oleracea. Nothing is more astonishing than the wide difference existing betwixt the cultivated varieties of cabbage, and the original stock which is an uninviting weed on the shores of Britain, with wavy green leaves, and yellow flowers like the common mustard. This vegetable is raised from seeds, and cuttings; requires a free open rich soil and plenty of water; the surface of the ground round the plants should be repeatedly howed to keep it open and free of weeds. The varieties which seem to grow best at Madras, are the Early York, Vanack, Nonpareil, Carters matchless, Red, Globe Savoy, Brussels sprouts, and Knole-Cole. The seeds of cabbage, should be sown some time before the commencement of N. E. Monsoon at Madras, in a well prepared bed, not too rich.—*Jaffrey*. Writing on the culture of this vegetable in the Dekhan, Dr. Riddell remarks that the drum-head, sugar-loaf, and savoy, and all the others require similar care and attention. Sow the seed in the latter end of May in boxes, or baskets, shaded at first from the sun, and kept continually moist. The advantage of sowing thus early, is that the plants are strong by the time the rains set in, and the leaves do not offer to the small fly which settles upon them to lay its eggs, the nourishment necessary for the young caterpillar when hatched. The plants, when about three inches high, should be pricked out about two inches apart, into other boxes, and lightly covered over with dry thorns to prevent sparrows and other small birds from eating them. When large enough to be transplanted into nursery beds, use the same precaution with regard to thorns; and lastly, place them where they are to remain, in rows about eighteen inches apart, either on the top of the ridge, or in the hollow—the former method in the rains is to be preferred. The soil should be light and rich. In the cold season, the precaution of sowing the seed in boxes is unnecessary, as they grow very well in small beds sown broad-cast, and watered at first by the hand, after which, when removed, they thrive extremely well. If the seed is sown so late as January, a stock of plants may be raised, which come but to a small size, and if kept in the beds and sheltered from hot winds may be transplanted in the rains. They produce good sprouts for eating when other vegetables are scarce; as also the stalks of the old cabbages, of which, if towards the end of the rains the shoots be carefully stripped off, they may be planted, and a succession of cabbages be procured by this means. I have known this

plan adopted for years: in fact, in my own garden, particularly the red cabbage, I have cultivated in this way for many seasons. You cannot be too careful in examining your young plants twice or thrice a day in the early part of the season, and having all the caterpillars picked off or destroyed. Sugar loaf cabbage and knole-cole are particularly infested with them. I found that sprinkling the young plants, after watering, with a little black pepper, caused the small green caterpillar to leave the plant immediately. Slugs and caterpillars have a great aversion to pounded turmeric.

(2246) CABLE. Amar, TEL.

In Southern Asia some cables for ships are made of Coir or Cayar, the requisite quantity being laid out at full length along the beach or other convenient spot: they are made up in strands, and twisted in a very simple machine; viz. a strong wooden frame, in a strong board across which three or four pins are placed and turned like the screws of a carpenter's bench, by as many men; the further end of the cable is fixed to a large revolving pin, which is turned round in a similar manner. As the strands are twisted, the horse in which this is fixed is drawn nearer to the other. It is evident that cable strands thus laid are very unequally strained: the outer lines being tight while the inner ones are slack. By laying the strand and twisting it as each yarn leaves its separate reel, a strand is formed of which each yarn bears its due proportion of the strain. Huddart's patent rope was laid on this principle, the necessary apparatus for winding off the yarn might be readily made. Cables for the Shakespear bridges are formed of the country rattan. In the Red Sea those formed of the coating of the branches of the date tree are used; and the same material with a proportion of fibre of the Kaldera bush, the *Pandanus odoratissimus*, is used by fishermen in forming drag ropes for their nets at Oopada.--*Mr. Rhode's M.S.S.*

(2247) CABOOSE.

Wooleve meen, TAM. | Eesheegay duntie, TEL.
Nuddie ka Shaikra, DUK.

This fish is common at Madras.—*Ains. Mat. Med. p.* 155.

(2248) CACALIA COCCINEA. This flowering plant will grow in any soil, and is mostly found in waste places, the species are numerous and found in all parts of the globe.

(2249) CACALIA KLEINIA.

Lisan ul saur, ARAB. | Gao Zuban, PERS.

The leaves resemble the tongue of the buffalo, and the stalks are prickly and covered with white spots. While fresh the leaves have a strong smell like hemlock, they are given in decoction in rheumatism, syphilis, and lepra, indeed in the class of cases in which sarsaparilla is usually employed by European practitioners. In Bombay they seem to be highly esteemed (*see* Bombay Committee's report in the Journal of the Medical and Physical Society of Calcutta.) The article is common in the bazars, and deserving extensive trial.—*O'Shaughnessy, page* 420. Honigberger (p. 246) states that Cacalia Kleinia is much used in Hindustan, both by Mahomedan hakims and Hindoo practitioners, and but very little by English physicians. Besides the leaves, which resemble the ox-tongue in form, there is a water distilled from them, kept for use.

(2250) CACALIA SONCHIFOLIA. SYN. Emilia sonchifolia, D. C.

Shudimudi, BENG. | Palla camudie, MALAY.
Udiram panum. SANS.

A decoction of this plant is deemed anti-febrile on the Malabar coast.—*O'Shaughnessy, page* 420.

(2251) CACAO OR COCOA. The chocolate nuts or seeds, termed cacao, are the fruit of species of *Theobroma*, an evergreen tree, native of the Western Continent of America, but one of them now naturalised in India. That commonly grown is *T. cacao;* but Lindley enumerates two other species, *T. bicolor*, a native of New Granada; and *T. guianensis*, with yellow flowers, a native of Guiana. The chocolate plant is sparingly cultivated in India. It is unknown as an object of cultivation in every part of the Asiatic Archipelago except the Philippines, and of late the northern peninsula of Celebes. In most of the Philippines it is cultivated, but only for home use, and the quality produced is inferior to that of Guayaquil and other parts of America. That of the island of Cebu is the best, being worth from 15 to 20 per cent. more than the produce of the other islands.—*Crawfurd Dicty. page* 78. The seeds being nourishing and agreeable to most people, are kept in the majority of houses in America, as a part of the provisions of the family. By pressure they yield a fatty oil, called butter of cacao. They also contain a crystalline principle analagous to caffeine, called theobromine. The common cacao of the shops consists generally of the roasted beans, and sometimes of the roasted integuments of the beans, ground to powder. The consumption of cacao in the United Kingdom of Great Britain and Ireland is about three millions of pounds annually, yielding a revenue of £15,500. Few tropical products are more valuable or more useful as food to man than cacao, and were it more generally employed, so that the berries should not be more than two, three, or, at most, six months old, from the time of gathering (for, if kept longer, they lose their nutritive properties), even a smaller quantity than that usually taken in a cup would suffice; in fact, cacao cannot be *too* new. The cacao beans lie in a fruit somewhat like a cucumber, about five inches long and three-and-a-

half inches thick, which contains from twenty to thirty beans, arranged in five regular rows with partitions between, and which are surrounded with a rose-colored spongy substance, like that of water melons. There are fruits, however, so large as to contain from forty to fifty beans. Those grown in the West India islands, as well as Berbice and Demerara, are much smaller, and have only from six to fifteen; their development being less perfect than other parts of South America. After the maturation of the fruit, when their green colour has changed to a dark yellow, they are plucked, opened, their beans cleared of the marrowy substance, and spread out to dry in the air. In the West Indies they are immediately packed up for the market when they are dried; but in Caracas they are subjected to a species of slight fermentation, by putting them into tubs or chests, covering them with boards or stones, and turning them over every morning to equalize the operation. They emit a good deal of moisture, and lose the natural bitterness and acrimony of their taste by this process, as well as some of their weight. Instead of wooden tubs, pits or trenches dug in the ground are sometimes had recourse to for curing the beans; an operation called earthing. They are, lastly, exposed to the sun and dried. According to Lampadius, the kernels of the West India cacao beans contain in 100 parts, besides water, 53·1 of fat or oil, 16·7 of an albuminous brown matter, which contains all the aroma of the bean; 10·91 of starch, 7½ of gum or mucilage, 0·9 of ligunine, and 2.01 of a reddish dye-stuff, somewhat akin to the pigment of cochineal. The husks form 12 per cent. of the weight of the beans. The fatty matter is of the consistence of tallow, white, of a mild agreeable taste, and not apt to turn rancid by keeping. It melts only at 112 degrees Fahr., and should, therefore, make tolerable candles. It is obtained by exposing the beans to strong pressure in canvas bags, after they have been steamed or soaked in boiling water for some time. From five to six ounces of butter may be thus obtained from a pound of cacao. It has a reddish tinge when first expressed, but it becomes white by boiling with water. The beans, being freed from all spoiled and mouldy portions, are to be gently roasted over a fire in an iron cylinder, with holes in its ends for allowing the vapors to escape, the apparatus being similar to a coffee-roaster. When the aroma begins to be well developed, the roasting is known to be finished, and the beans must be turned out, cooled, and freed by fanning and sifting from their husks. The kernels are then to be converted into a paste, either by trituration in a mortar heated to 130 degrees Fahr., or by a powerful mill.—*Ure's Dictionary of Arts and Manufactures.* The cacao tree resembles the English dwarf apple tree both in body and branches, but the leaf, which is of a dark green, is considerably broader and larger. The nuts are of the color and about the size of an almond, and hang eighteen to thirty together by a slender stringy film, enclosed in a pod. A ripe pod is of a beautiful yellow, intermixed with crimson streaks; when dried, it shrivels up and changes to a deep brown; the juice squeezed from the mucilaginous pulp contained in the husks of these nuts appears like cream, and has a very grateful taste of a cordial quality. The nuts have a light pleasant smell, and an unctuous, bitterish, roughish (not ungrateful) taste. Those of Nicaragua and Caracas are the most agreeable and are the largest; those of the French Antilles, and our own West India islands, are the most unctuous. The Mexicans, in preparing the chocolate paste, add some long pepper, a little annatto, and lastly vanilla; some add cinnamon, cloves and anise, and those who love perfumes, musk and ambergris. The finest American cacao is said to be that of Soconusco, but the principal imports are from Caracas and Guayaquil, which is of a very good quality. The province of Barcelona, adjoining Caracas exports annually from 200,000 to 300,000 cwt. The banks of the Magdalena, in the vicinity of Santa Martha and Carthagena, are famed for the excellant cacao they produce. "This tree," says Bonnycastle (Spanish America vol. 1, p. 257), "is indigenous, seldom exceeds the diameter of seven inches, and is extremely beautiful when laden with its fruit, which are disposed on short stalks over the stem and round the great branches, resembling citrons, from their yellow colour, and warty appearance. The leaves are attenuate, stalked, drooping, about a foot long and three inches broad, elliptic, oblong, pointed, slightly wavy, entire, and very smooth on both sides; with one mid-rib and many transverse ones, connected by innumerable veins. The petals of the flowers are yellow, the calyx of a light rose-color, and the flowers themselves are small and placed on tufts on the sides of the branches, with single footstalks, about an inch long. Its fruit is red, or a mixture of red and yellow, and about three inches in diameter, with a fleshy rind half-an-inch thick; the pulp is whitish and of the consistence of butter, containing the seed; these seeds are generally twenty-five in number in each fruit, and when first gathered are of a flesh colour, and form a nice preserve if taken just before they are ripe. Each tree yields about two or three pounds of fruit annually, and comes to maturity the third year after planting from the seed; it also bears leaves, flowers, or fruit all the year round, the usual seasons for gathering being June and December. The excellence of the Magdalena chocolate may be attributed to the moist nature of the soil, as the plant never thrives where the ground is hard and dry, or cannot be irrigated." *Mode of cultivation in the Colombian Republics*—Plantations of cacao were speedily mul-

tiplied in Colombia, and the soil so admirably seconded the labors of the planter, that in the produce abundance was united to excellence. The cacao of this quarter ranks next to that of Soconusco. It is well known that the best commercial recommendation of cacao is that of coming from Caracas. But even in these provinces the quality varies. The cacao of Orituco is superior to that of other places, and a quantity of equal bulk weighs twenty per cent. more The cacao of the coast comes next, and obtains a preference over that of the interior. The plantations of cacao are all to the north of the chain of mountains which coast the sea, and in the interior country. The former extend from Cumana to the mouth of the Tocaygo; the latter are situate in the vallies of Tuy, Orituco, Ocumare, Cura, Marrin, Tare, Santa Theresa, Santa Lucia, Zuapira, Santa Philippo, Barquisimeto, Valencia, Guige and Cariaco. All kinds of soil are not equally adapted to the culture of cacao, still less are all exposures; but an analysis of the soil destined to this culture never furnishes indications on which reliance can be placed. No regard should be had to color or composition; it is only requisite that it should be friable to a certain depth, which is ascertained by the size of the trees with which it is covered; this sign determines the land proper for cacao. A suitable situation is not so easily found. It should be exposed as little as possible to the north, and be on the borders of a river, which may communicate moisture to the soil in dry seasons, and receive its drainings in times of rain. A preference is particularly to be given to land which can receive from the river the benefits of irrigation without being exposed to injury from its overflow. After having chosen the land, it should be cleared of all trees, shrubs, and other plants. This operation is performed in various ways. It is customary in Colombia to commence felling the trees immediately after the rains, that is, about the month of November; the wood, after being cut, is left to dry, then collected in heaps and burnt. As soon as the new plantation is cleared, it is crossed with small ditches, in directions according to the declivity of the soil. These serve to drain the stagnant waters, to carry off the rains, and to irrigate or water the soil whenever necessary. The *alignement* is then laid out, in which the cacao trees are to be arranged. They are planted in triangles or squares. In either case, there is always in the centre an alley, bordered by cacao trees, and running from east to west. When they are planted in squares, this alley is crossed by another running from north to south. The cacao plants should be placed at fifteen or sixteen feet (French measure) from each other, in good soil; and about thirteen or fourteen feet in soil of inferior quality. This is almost the only tree in nature to which the enlivening beams of the sun are obnoxious. It requires to be sheltered from their ardour; and the mode of combining this protection with the principles of fertility, forms a very essential part of the skill which its cultivation demands. The cacao tree is mingled with other trees, which guard it from the rays of the sun, without depriving it of the benefit of their heat. The *Erythrina* and the banana are employed for this purpose. The latter, by the rapidity of its growth, and the magnitude of its leaves, protect it for the first year. The erythrina endures at least as long as the cacao; it is not every soil, however, that agrees with it. It perishes after a while in sandy and clayey ground, but it flourishes in such as combine those two ingredients. In one range of cacao trees, a banana is placed between two cacaos, and an erythrina between the two following. In the other range a banana is placed between each cacao tree, and no erythrinas, so that the latter are at the distance of two alleys. The banana and the erythrina are first planted, and when a shelter from the sun is thus provided, the hole for the cacao is made, around which are planted four stalks of the yucca plant, at the distance of two feet from each other. At the end of two months the cacao is planted. The smaller the plant is, the better. There are, nevertheless, soils subject to worms where the small plants do not thrive; but, excepting in this particular, the small plants are preferable, because the large require more labor for their transportation and planting; many of them die, and those which survive bud and shoot forth, but are never of any value. The cacao plant should not exceed thirty-six inches in size when transplanted; if larger, it succeeds with difficulty. The nurseries of cacao demand an excellent soil, well prepared, where the water does not remain. They should be well sheltered from the sun. Small knolls of earth are formed, in each of which are put two seeds of cacao, in such a manner that they are parallel with the level of the ground. During the first twenty days the seeds are covered with two layers of banana or other leaves. If necessary, the ground is watered: but the water is not suffered to remain. The most suitable time for sowing is in November. Where there is not a facility for watering, the planting of the cacao should take place in the rainy season; but when the former is practicable, it is best to plant in dry weather and assist nature by irrigation, since it is then in the power of the cultivator to give the exact quality of moisture necessary. But, in all cases, care should be taken that the plants are not wet in the interval between their being taken out of the ground and replanted. When the bananas grow old, they should be carefully felled, lest the cacaos should be injured by their accidental fall. They are totally removed as soon as the erythrina yields sufficient shade; this operation gives more air to the trees of the plantation, and encourages

their growth. Until the cacao attains four feet in height, it is trimmed to the stem. If it shoots forth several branches, they are reduced to three, at equal distances; and, in proportion as the plant increases, the leaves which appear on the three branches are stripped off. If they bend much, and incline towards the earth, they are tied in bunches, so that the tree may not remain crooked. The branches, which are trimmed, are cut at the distance of two fingers from the tree. The suckers which spring from the tree are also removed, as they only live at its expense.

Harvest of the cacao.—The tree yields two principal crops in a year, one about St John's day, the other towards the end of December. The cacao however ripens and is gathered during the whole year. But in all seasons the planters of the Central American republics make it a point, so far as possible, to collect their crops only at the decline of the moon; because experience proves that this precaution renders the cacao more solid, and less liable to spoil. To collect the fruit, those negroes and Indians are employed who have the sharpest sight, that only the ripe fruit may be gathered. The most robust and active are chosen to carry it to the places where the beans are to be shaken out, and this is left to the aged and maimed to do. The operation is performed on a floor well swept, and covered with green leaves, on which they place the cacao. Some open the pod, and others strike out the beans with a small piece of wood, which must not be sharp, lest it should injure them. The good and bad beans must not be mingled together. There are four sorts of cacao in every crop; the ripe and in good condition, the green but sound, the worm-eaten, and the rotten. The first quality is best, the second is not bad; but the two others should be rejected. As soon as that which is not fully ripe begins to show specks, it must be separated. As to the pods which are not perfectly ripe, they should remain in heaps during three days under green banana leaves, that they may ripen before they are hulled. When the cacao is stored, great care is necessary not to leave amongst it pieces of the pod or leaves, or any other extraneous particles. This care must be repeated every time that it is removed from the store, or replaced in it. The cacao must always be exposed to the sun on the fourth day after it has been gathered, and this exposure should be daily repeated until it is perfectly dry. When that is the case, the beans burst on being squeezed, their shell resounds when struck, and they no longer become heated when placed in heaps; the latter is the best proof that the moisture injurious to their preservation is dissipated. If the cacao is not sufficiently exposed to the sun, it becomes mouldy; if too much, it withers, and easily pulverises; in either case it soon rots. When the quantity of cacao gathered is considerable, it is placed in the sunshine by a hundred quintals at a time, unless the cultivator has a sufficient number of persons employed to expose a greater quantity. This operation is indispensable, to prevent it from becoming mouldy. If the rains prevent this exposure to the sun, it is necessary, as soon as it is sufficiently cleaned or purified, to spread it in apartments, galleries, or halls, with which the plantation must be provided; this operation cannot be delayed without danger of losing the crop. It is to be wished that stoves were employed to dry the Cacao when the sun fails, but this expedient, so simple and important, is generally unknown. It is almost universally believed that the most essential precautions for preserving the cacao consists in gathering it at the decline of the moon, I believe that they may more seriously calculate on the care of depositing it in apartments so hermetically closed that the air cannot penetrate; it would be advisable to make these apartments of wood, for the more perfect exclusion of moisture. The floor should be elevated two feet; under the floor a pan of coals is placed, covered with a funnel, the point of which enters into the heap of cacao and then diffuses the vapor. In the apartment which contains the cacao, some persons place bottles of vinegar, slightly stopped with paper, to prevent the formation of worms. The beans which begin to show specks, may be preserved from entire corruption by a slight application of brine. This occasions a small degree of fermentation, which is sufficient to destroy the worms, and to preserve the cacao during a considerable time from new attacks. Why is not this preservative also employed after the cacao is dried, and when placed in the store, where it awaits the purchaser? At St. Philip they make use of smoke to preserve the cacao; it is also ascertained that fine salt, thrown in small quantities on the cacao, protects it from worms. Much has been done for the cacao when it has been cleared of all green or dead beans, and extraneous substances; when it has received no bruise or injury in the operation of drying, and when it has been subsequently kept in a place that is dry and not exposed to the air; yet, even with all these precautions, cacao of the best quality is seldom found marketable at the end of a year. These circumstances sufficiently prove that the culture of cacao requires attention more than science, vigilance rather than genius, and assiduity in preference to theory. Choice of ground, distribution and draining of the waters, and position of the trees destined to shade the cacao, are almost the only points which require more than common intelligence. Less expense is also required for an establishment of this kind than for any other of equal revenue. One able hand is sufficient for the preservation and harvest of a thousand plants, each of which should yield at

least one pound of cacao, in ground of moderate quality, and a pound and a half in the best soil. By an averaged calculation of twenty ounces to each plant, the thousand plants must produce twelve hundred and fifty pounds, which, at the ordinary price of 31s. 6d. per cwt., would produce about £17 10s. per annum for each laborer. The expences of the plantation, including those of utensils, machines, and buildings, are also less considerable for cacao than for any other produce. The delay of the first crop, and the accidents peculiar to cacao, can alone diminish the number of planters attached to its culture, and induce a preference to other commodities. The cacao plant is not in a state of prolific produce till the eighth year in the interior, and the ninth in plantations on the coast. Yet, by a singularity which situation alone can explain, the crops of cacao commence in the ninth year in the valley of Goapa, and at the east of the mouth of the Tuy. In the vicinity of the line, and on the banks of Rio-Negro, the plantations are in full produce on the fourth, or at most the fifth year. The cacao tree continues productive to the age of fifty years on the coast, and thirty years in the interior of the country. The cultivation of cacao will be most situable to the less wealthy individual, as it demands so little labor and outlay. Baron Humboldt observes, in alluding to Spanish America, that cacao plantations are occupied by persons of humble condition, who prepare for themselves and their children a slow but certain fortune; a single laborer is sufficient to aid them in their plantations, and 30,000 trees, once established, assure competence for a generation and a half. *Cultivation in the West India Islands*—The only English colonies where this nutritious and wholesome substance is now cultivated to any extent, are Trinidad, St. Lucia, Grenada, and St. Vincent. There are few, perhaps no agricultural or horticultural pursuits, so delightful (observes Mr. Joseph, in his "History of Trinidad,") as that of the cultivation of the cacao. It is planted in rows, intersecting each other at right angles, at the distance of from twelve to fifteen feet, according to the nature of the soil. The tree is not suffered to grow higher than about fifteen feet, and its broad rich foliage, the hues of which vary from a light green to a dark red, loaded with yellow and dark red pods, which contain the chocolate bean, are beautiful objects; these alleys are shaded by rows of magnificent trees, called *Bois Immortel* by the French and English, by the Spaniards the Madre de Cacao. It is the *Erythrina umbrosa* or *arborea* of Linnæus. Like the Bignonia or Pouie, this tree, at particular seasons, throws off its foliage and is covered with blossoms; those of the Erythrina are of a brilliant red color, justifying its Greek appellation. In this state they are literally dazzling to behold —no object in the vegetable world looks more striking than the alleys of a Cacao walk shaded

by a forest above them of the Bois Immortel. Mr. W. Purdie, Government Botanist of Trinidad, observes as follows. My attention has been lately directed to the average produce per tree, which will, I hope, throw some light on its cultivation. From fifteen cacao trees, at St. Ann's, I have this year gathered 115 lbs. of cacoa (dried), and at present there is at least 50 lbs. more ripe on the same trees. This gives 165 lbs. of cacao from fifteen trees, or 11 lbs. per tree. These cannot be considered fine trees; on the contrary, they are what would be considered ordinary ones; therefore the average in this case is fair, and differs materially from selecting the produce of fifteen trees from a large plantation, and giving the average return of what might be obtained from cacao cultivation. Last year these trees did not average more than 2 lbs. per tree, and I attribute the increase of crop to the thinning out of both the cacao and shade trees. In a former letter to the cacao-planters of Trinidad, I recommended twenty-four to thirty feet from tree to tree as the proper distance; but so as to meet the feelings of those who, unfortunately for themselves, consider every cacao tree cut down a sacrifice, I propose that the trees be thinned out to twenty-four feet, and that, at intervals of twenty rows at most, avenues of fifty feet in both directions should be left. After this, it will be better seen what may be necessary to be done to each individual tree; neither should the shade trees be forgotten; as a general rule, they are prejudicially thick. At twenty-four feet apart there would be seventy-five trees per acre, 250 per quarree. This, at 11 lbs. per tree, gives 2,750 lbs. of dried cacao per quarree, at 5 dollars per 100 lbs., gives 137 dollars 50 cents gross; deducting 80 dollars per quarree expenses, leaves 57 dollars 50 cents net profit. Thus an estate of 120 acres, or 36 quarrees, would contain 9,000 trees, 11 lbs. per tree will give 33,000 lbs. of cacao, at 5 dollars gives 4,350 dollars gross per annum; deducting 80 dollars per quarree (a much more liberal sum than is at present laid out), leaves a net balance of 1,950 dollars, or 16 dollars 25 cents per acre. Now this, it must be remembered, would be the produce from 9,000 trees, and from an estate containing only 36 quarrees of land (which cannot be considered a large one); what, then, might be expected from estates containing 40,000 trees? A very important economy might also be made in the curing of the cacao, by which much time would be saved, and consequently expense, by adopting the same method as is used in Jamaica for drying coffee, namely, floorings of cement, or, as they are called, barbecues. At convenient distances in the centre of these floorings (which are inclined planes) a slightly-raised circular ridge is formed with cement, leaving an aperture at the lower side to allow the escape of any water that may have lodged in them.

The cacao is easily brought together in the these places in the event of rain, and at night covered with portable wooden frames, which are readily removed by two men. In this way the cacao would be dried in a fifth of the time much more effectually, and of a brighter colour. The beverage generally called *cacao* is merely the berries of *Theobroma Cacao*, pounded and drank either with water or milk, or with both. *Chocolate* (of which I shall speak by and bye) is a compound drink, and is manufactured chiefly from the kernels of this plant, whose natural habitat would seem to be Guayaquil, in South America, though it flourishes in great perfection in the West Indies. It grows also spontaneously and luxuriantly on the banks of the Magdalena, in South America; but the fruit of those trees that are found in the district of Carthagena is preferred to all others, probably from a superior mode of cultivation. Sir R. Schomburgh, in his expedition into the interior of British Guiana, found the country abounding in cacao, "which the Indians were most anxious to secure, as the pulpy arillus surrounding the seed has an agreeable vinous taste." Singular to say, however, they appeared perfectly ignorant of the qualities of the seed, which possesses the most delightful aroma. Sir Robert adds, they evinced the greatest astonishment when they beheld him and Mr. Goodall collecting these seeds and using them as chocolate, which was the most delicious they had ever tasted. These indigenous cacao trees were met with in innumerable quantities on the 5th of June, 1843, and the following day; and thus inexhaustible stores of a highly-prized luxury are here reaped solely by the wild hog, the agouti, monkeys, and the rats of the interior.—(*Simmonds's Col. Mag. Vol.* I., *p.* 41.) The height of the cacao shrub is generally from eighteen to twenty feet; the leaf is between four and six inches long, and its breadth three or four, very smooth, and terminating in a point like that of the orange tree, but differing from it in color; of a dull green, without gloss, and not so thickly set upon the branches. The blossom is first white, then reddish and contains the rudiments of the kernels or berries. When fully developed, the pericarp or seed-vessel is a pod, which grows not only from the branches, but the stem of the tree, and is from six to seven inches in length, and shaped like a cucumber. Its color is green when growing, like that of the leaf; but when ripe, is yellow, smooth, clear and thin. When arrived at its full growth, and before it is ripe, it is gathered and eaten like any other fruit, the taste being subacid. If allowed to ripen, the kernels become hard; and, when taken out of the seed-vessel, are preserved in skins, or, more frequently, laid on the vijahua leaves, and placed in the air to dry. When fully dry, they are put in leathern bags, and sent to market: this is the Spanish mode of taking in the crop. A somewhat different method is followed in Trinidad and Jamaica (in the latter island it can scarcely be said to be cultivated now); but it differs in no essential degree from the principle of gradual exsiccation, and protection from moisture. *Chocolate*, properly so called, and so prized both in the Spanish continent and in the West Indies, never reaches Great Britain except as a contraband article, being, like nearly all colonial manufactured articles, prohibited by the Custom-house laws. What is generally drank under that name is simply the cacao boiled in milk, gruel, or even water, and is as much like the Spanish or West India chocolate as vinegar is to Burgundy. It is, without any exception, of all domestic drinks the most alimentary; and the Spaniards esteem it so necessary to the health and support of the body, that it is considered the severest punishment to withhold it, even from criminals; nay, to be unable to procure chocolate, is deemed the greatest misfortune in life! Yet, notwithstanding this estimation in which it is held, the quantity made in the neighbourhood of Carthagena is insufficient for the demands of the population, and is so highly priced that none is exported but as presents! The manner in which the Spaniards first manufactured this veritable Theobroma—this food for gods (from *Theos*, God, and *broma*, food)—was very simple. They employed the cacao, maize, Indian corn (*Zea Mays*), and raw cane-juice, and coloured it with arnatto, which they called *achiotti* or *rocou*, but which was known in Europe at that time by the name of *Terra Orellana*. These four substances were levigated between two stones, and afterwards, in certain proportions, mixed together in one mass, which mass was subsequently divided into little cakes, and used as required, both in the solid and fluid form. The Indians used one pound of the wasted nuts, half a pound of sugar, and half a pound of ground corn (maize) each and then added rose-water to make it palatable. This the Mexicans called chocolate, from two words in their language, signifying the noise made by the instruments used to mill and prepare it in the water. Chocolate, as used in Mexico, is thus prepared:—The kernels are roasted in an iron pot pierced with holes; they are then pounded in a mortar, and afterwards ground between two stones, generally of marble, till it is brought to a paste, to which sugar is added, according to the taste of the manufacturer. From time to time, as the paste assumes consistency, they add long pepper, arnatto, and lastly, vanilla. Some manufacturers vary these ingredients, and substitute cinnamon, cloves, or aniseed, and sometimes musk and ambergris—the two latter on account of their aphrodisiac qualities. The following is the formula given by a late writer:—To six pounds of the nut add three-and-a-half pounds of sugar, seven pods of vanilla, one-and-a-half pounds of corn meal (maize ground), half-

a-pound of cinnamon, six cloves, one drachm of capsicums (bird pepper), and as much of the rocou or arnatto as is sufficient to color it, together with ambergris or musk, to enforce (as he says) the flavor, but in reality to stimulate the system. There is another chocolate made of filberts and almonds, but this is not considered genuine. In old Spain it is somewhat differently made: two or three kinds of flowers, also the pods of campeche, almonds, and hazel-nuts, being mixed up with it, while the paste is worked with orange-water. With regard to the manner in which chocolate is prepared in England nothing need be said, as it is too well known to require description. That which has appeared to Mr. Simmonds the best is "*Fry's Chocolate*" which requires only to be rubbed up with a little boiling water, and scalded milk added to it with sugar according to the taste of the drinker; there is a flavour, however, in this chocolate sometimes of *suet*, which is probably added to give it a richness which the cacao employed may not possess of itself. In the West Indies they rarely add anything to cacao but arnatto (sometimes a little fresh butter), though it is often scented and sweetened, and sold in little rolls at five-pence and ten-pence each, currency. It is always boiled with milk, which, though very indigestible when boiled and taken alone, seems to lose this quality when taken with chocolate. Chocolate thus made is much drank, when cold, in the middle of the day, and is considered, both by the negroes and the old settlers, as a most nutritive and salutary beverage. The signs by which *good chocolate* or cacao is known are these:—It should dissolve entirely in water, and be without sediment; it should be oily, and yet melt in the mouth; and if genuine, and carefully prepared, should deposit no grits or grounds. That made in the West Indies, and in some parts of Cuba, is dark: but that manufactured in Jamaica is of a bright brick colour, owing to the greater quantity of arnatto which is used in the preparation, and which, he thinks, gives it a richer and more agreeable flavor. In an economical point of view, chocolate is a very important article of diet, as it may be literally termed meat and drink; and were the half starved artisans, over-wrought factory children, and ricketty millinery girls, of Britain induced to drink it instead of the innutritious beverage called "tea," its nutritive qualities would soon develop themselves in their improved looks and more robust constitutions. The price too, is in its favour, cacao being eight-pence per pound; while the cheapest black tea, such as even the Chinese beggar would despise, drank by milliners, washer-women, and the poorer classes in the metropolis, is three shillings a pound, or three hundred and fifty per cent. dearer, while it is decidedly injurious to health. The heads of the naval and military medical departments in England have been so impressed with the wholesomeness and

superior nutriment of cacao, that they have judiciously directed that it shall be served out twice or thrice a week to regiments of the line, and daily to the seamen on broad Her Majesty's ships, and this wise regulation has evinced its salutary effects in the improved health and condition of the men. Indeed, this has been most satisfactorily established in Jamaica among the troops; and the same may be asserted of the seamen in men of war on the coast. It is also certain that those who indulge in excesses find their vigor more speedily restored by the alternate use of chocolate and coffee than by any other ingesta; and pigs, goats, and horses, which are fed even on the spoiled berries, are observed to become very speedily fat, and in good condition. But cacao has not only the property of rapidly restoring the invalid to health, strength and condition, but a very inconsiderable quantity of it will sustain life for a long period. The South American Indians perform extraordinary journeys, subsisting, during these prolonged travels, on an incredibly small quantity of chocolate—so small, indeed, as to render the accounts of travellers upon the subject almost marvellous. In this respect it resembles coffee, which also possesses the estimable property of sustaining the powers of life, while it modifies and restrains the passion of hunger. It is a curious fact, and how far this condition may be connected with its powers of sustenance is worthy of inquiry, that chocolate recently boiled, if the operation be performed in a tin pan, is highly electrical; and this property may be frequently manifested by repeating the process. The mode of cultivating the cacao is given at some length by Edwards; it is that of the Spaniards, a process strictly followed in Trinidad, where, of all the West India islands, it constitutes a considerable item of exports. It is thus described:—"A spot of level land being chosen—preference is always given to a deep black mould, sheltered by a hedge or thicket, so as to be screened by the wind, especially the north, and cleared of all weeds and stumps of trees—a number of holes are dug, at ten or twelve feet distance from each other, each hole being about a foot in length, and six or eight inches deep. A very important matter is the selection of the seeds for planting, and this is done in the following manner: the finest and largest pods of the cacao are selected when full ripe, and the grains taken out and placed in a vessel of water. Those which swim are rejected; those chosen are washed clean from the pulp, skinned, and then replaced in the water till they begin to sprout; Banana (*Musa paradisiaca*), or some other large leaves, those of the sea-side grape (*Coccoloba uvifera*), for instance, are then taken, and each hole is lined with one of them, leaving, however, the sides of the leaves some inches above ground; after which the mould is rubbed in gently till the hole is filled; three nuts are then selected for

each hole, and they are set triangularly in the earth, by making a small opening with the finger about two inches deep, into which the nuts are put, with that end downwards from which the sprout issues." They are then covered lightly with mould, the leaf folded over, and a small stone placed on the top, to prevent its opening; in eight or ten days the young shoots appear above the ground; the leaves are then opened to give them light and air, and a shelter from the sun, either in the shape of plantain or banana leaves, is not forgotten; but the cocoa-nut and other species of palm, on account of their fibrous structure and great durability, are always preferred. This artificial shelter is continued for five or six months. But, as a further security to the young plants, for they are very delicate, other trees or shrubs are planted to the south-west of the plants, that they may grow up with and shelter them, for young cacao will grow and flourish only in the shade. For this purpose the coral bean-tree (*Erythrina corallodendrum*) is chosen. Mr. Simmonds presumes there are other trees and plants equally eligible for this purpose, and more useful; but his experience does not enable him to speak positively upon the subject. Should the three seeds placed in each hole spring up, it is thought necessary, when the plants are fifteen or twenty inches high, to cut one of them down. The two others, if they devaricate, are sometimes suffered to remain, but it does not always happen that even *one* of the three springs above the earth; consequently this additional labor is not invariably requisite. On the fourth or fifth year the tree begins to bear, and attains perfection by the eighth, continuing to produce two crops of fruit per annum, yielding at each crop from 10 lbs. to 20 lbs, according to the nature of the soil. It will continue bearing for twenty years; but, as it is a delicate plant, it suffers from drought, and is liable to blight. In these respects, however, it does not differ from many other plants, which are even more subject to disease, though not half so valuable. Besides, a proper system of irrigation, such as could be had recourse to in many parts of Jamaica, would obviate and prevent these evils. Cacao is cultivated in the highlands as well as on the coasts of the north-eastern peninsula of the large and rich island of Celebes, which has, within the last year or two, been thrown open to foreign trade. The plantations of it are even now considerable, and this branch of Industry only requires not to be impeded by any obstacles in order to be still further extended. It forms a large ingredient in the local trade, and furnishes many petty traders with their daily bread, not to speak of the landowners, for whom the cultivation of the cacao affords the only subsistence. The preparation of the product differs from that adopted in the West Indies, but we have not been able to ascertain the practice. We may reckon that 1,200 to 2,000 piculs of 133 lbs. are yearly produced; the prices vary much, being from 50 to 75 florins per picul.—("Journal of the Indian Archipelago," vol. ii., p. 829.) Bourbon now produces 15,000 to 20,000 kilogrammes of cacao annually. Cacao is grown to a small extent in some of the settlements of Western Africa, but as yet only a few puncheons have been exported, all the produce being required for local consumption. The following figures give the imports and consumption of cacao into the United Kingdom in the last five years:—

	Imports. lbs.	Consumption. lbs.
1848 . .	6,442,986 . .	
1849 . .	7,769,234 . .	3,233,135
1850 . .	4,478,252 . .	3,103,926
1851 . .	6,773,960 . .	3,024,338
1852 . .	6,268,525 . .	3,382,944

The home consumption is very steady at about 3,000,000 lbs., yielding to the revenue £15,000 to £16,000 for duty. The produce of British colonies pays 1d. per lb. duty, that from foreign countries 2d; cocoa husks and shells half these amounts; when manufactured into chocolate or cocoa paste the duty is 2d. per lb. from British possessions, and 6d from other parts. The quantity imported in this form is to the extent of about 14,000 lbs. weight.

(2252) CACTACEÆ, OR CACTEÆ, Indian Figs the Cactus Tribe, a natural order of Exogenous plants.—*Engl. Cyc. page* 707. It is on species of the *Cactaceæ* that the cochineal insect feeds. Of these, the *Opuntia tuna* seems the most employed in Peru; *O. Hernandezii*, is the most celebrated in Mexico: and *O. cochenillifera*, the native province of which is somewhat doubtful.—*Engl. Cyc. p.* 710. The Cactus plants are a very small division of a large family, and rank amongst botanical curiosities; natives of the tropics, they grow in brick and lime rubbish with a little well decayed manure and vegetable mould.—*Riddell.*

(2253) CADABA INDICA, *Capparideæ.*—The Indian Cadaba is a straggling shrub, its flowers in terminal racemes, of a dingy white, nearly throughout the year, very common about Mussulman burial grounds.—*Riddell.*

(2254) CADJANS.

Jowlee. GUZ. HIND.	Cobaray yakoo, TEL.
Tenary Elle, TAM.	

Cadjans are the dried leaves of the cocoanut Palm; they are largely used as a thatch, which resists the rain better than tiles: but roofs made of them should be relaid before the commencement of the rainy season: 149,500 were imported into Bombay in the year 1850-51.

(2255) CÆSALPINEÆ, OR CÆSALPINIADS, *Brown.* The Cæsalpineæ abound in tropical and

warm parts of the world; a few, as Cercis siliquastrum, spread into more northern latitudes. Some are highly ornamental. The wood of many is red-coloured and astringent. Hymenæa courbaril yields a resin, the *Gum Anime* of the shops. The leaves and fruit of some are purgative, as of the Cassia Sennas and of the Tamarind. Calyx 5-toothed or bilabiate, deciduous or withering on the plant. Corol irregular, imbricated, subpapilionaceous, or nearly regular, spreading, of 5 petals, which are free, inserted into the bottom of the calyx. Stamens 10, or fewer from abortion, often unequal, perigynous, or inserted with the petals, usually free, sometimes united. Ovary free, placenta unilateral. Seeds without albumen. Embryo straight. Leaves alternate stipulate, impari or abruptly pinnate, sometimes single.—*Royle.*

(2256) CÆSALPINIA, a genus of plants belonging to the above, or according to others, to the tribe *Cassieæ*, of the natural order *Leguminosæ*, and especially distinguished by the lowermost of its sepals being arched, the uppermost of its stalked petals being the shortest, its stamens all perfect with shaggy bases, and the fruit a compressed bivalved pod. The species are trees or shrubs, found both in the East and West Indies, with showy yellow flowers, abruptly pinnated leaves, and stems which are usually more or less prickly. The Brazil-Wood of commerce is said to be furnished by two of its species. Fée considers the sappan wood of the East Indies (*Cæsalpinia sappan*) to be one of the Brazil-Woods of the merchants. Upon the whole it appears that we have no good testimony as to what the tree is that yields it; but it is probable that it is the produce of many species, and possibly of more than one genus, for De Candolle and Sprengel doubt whether the *Cæsalpinia echinata* is not rather a *Guilandina*. The best Brazil-Wood is said to come from Pernambuco, where it is called Pao da Rainha or Queen's Wood, on account of its being a royal monopoly. The Bukkum or Sappan wood of commerce is yielded by *C. Sappan*. A substance known in the markets under the name of Dividivi or Libidibi, lately become important on account of the tannin it contains, is the fruit or pods of *C. coriaria*. They are not used in medicine, but in dyeing and tanning.—*Engl. Cyc. page* 711.

(2257) CÆSALPINIA BONDUCCELLA, Syn. Guilandina Bonduccella. *Vern.* Kutkulega—Kutkaranga. Akulmookt of Avicenna. A climbing plant and a native of the East and West Indies; seeds a powerful tonic, and very valuable febrifuge. The kernels are very bitter; reduced to powder and mixed with black pepper they are used in 3 to 6 gr. doses in ague with the best results; powdered small with castor oil they are applied externally in hydrocele. The seeds yield oil, starch, sugar, and resin. Mr. Piddington published an analysis in the Trans. Medical and Physical Society of Calcutta, in which these principles were described. Nitric acid reddens the nut, and subsequently gives it a yellow colour. The root is deemed in Amboyna to be a good tonic.—*O'Sh. p.* 311. The powder is tonic and febrifuge, and given in ague with decided benefit. Dose, six to twenty grains three times daily.—*Beng. Phar. p.* 405. It grows in hedges near gardens at Ajmeer, where the nuts and leaves are used as febrifuges by the natives. *Bonduc nut oil*, Calichi kai yennai, Tam. is the oil of its common seed and is mentioned by Ainslie, as being considered useful in convulsions and palsy. The seeds themselves are believed to possess tonic virtues and are used solely as a medicine. *Bonduc nuts*, are irregularly round, and grey; the almond is white, very hard, and intensely bitter; and gets a blood red colour from nitric acid.—*Med. Top. of Ajmere.*

(2258) CÆSALPINIA CORIARIA. The "Cæsalpina coriaria," is a plant of South American origin, belonging to the natural order "Cæsalpineæ." It appears to have been introduced some 12 or 15 years ago, into the Botanical gardens at Calcutta. From thence, seeds or young plants were sent to Madras and cultivated in the Horticultural Gardens. It is now grown at several stations in the Madras Presidency, Bangalore, Hoonsoor and Guntoor. The seed pods have been extensively used for tanning leather, and for this purpose are considered superior to all the Indian astringents. Leather tanned in this way is considered equal to that of the best of Europe manufacture. (Vide Juror's Report, Madras Exhibition 1855, article, "Tanning materials.")—*Indian Annals* No. VII. page 120. Dr. Cornish met with a specimen of the plant in an officer's garden at Secunderabad. It was a large and handsome tree about 20 feet high, with very wide and spreading branches. A large quantity of seed pods ripened in the year 1855; probably more than a hundredweight fell in the course of the year. A good sized tree in the West Indies is said to produce about 80lbs. annually. The soil and climate of the Deccan appear to be well suited for the growth of this tree, and as the pods are likely to be in demand for "tanning material," it might be cultivated on a large scale with every prospect of success. Jacquin describes the Cæsalpinia coriaria as a handsome branching tree, of about fifteen feet in stature, covered with a dark spotted bark. Its leaves are doubly pinnate, and the leaflets of twelve pair without a terminal one; they are oblong, obtuse, smooth, very entire. The flowers are disposed in spikes issuing from the extremities of the branches; they are small, yellowish and slightly fragrant. To these succeed oblong compressed somewhat obtuse pods curved laterally, the inner side being concave and the other convex. The seeds rarely exceed three or four in each pod, and are

of a brownish color. It is to the curved pod of this leguminous shrub that the commercial term of Divi Divi, or Libi-Libi, is given. The average produce of pods from a full grown tree has been estimated at 100lbs. weight, one-fourth of which consists of seeds or refuse, leaving about 75lbs. of marketable matter. Dr. Cornish observes, that the "divi divi" pods are of a dark brown color externally, when ripe, transversely wrinkled and curled, from 1 to 2 inches long, and ¾ of an inch wide. The outer skin of the pods is very thin, and peels off easily if the pods are ripe. Underneath it, and separated from the seeds by a layer of woody fibre, is a considerable thickness of astringent matter of a light yellow color. Each pod contains from 2 to 4 seeds in separate compartments. The astringent matter in the walls of the pod, he found, on examination, is almost pure tannin. An excellent tannin, slightly darker in color than that manufactured from galls, may be prepared by the other process. About 60 or 65 per cent, of the whole pod, (excluding seeds) consists of impure tannin. The remainder being made up of woody fibre, starch, and gum. The powder of the pods is of a light yellow color, taste purely astringent, and strongly resembling tannin, as met with in commerce. At an interval of six feet apart, an acre of ground will contain 1210 trees, yielding an average of 810 cwts., and 30 pounds of divi-divi, or above 20½ tons of marketable matter, worth, at only £5 per ton, £200. Should the interval between the trees be extended two feet more, we shall still have 680 to the acre, the produce of which would not improbably be increased by the increased space given for the extention of the branches. The ground in which this tree admits of being cultivated is that which is least adapted to the staple products of tropical agriculture; guinea grass may be profitably raised beneath its shade, and as with the exception of the three years which precede the commencement of its bearing, there is hardly any deduction to be made from its returns, it promises to be among the most valuable objects of a planter's attention. Divi-divi resembles a dried pea-shuck curled up filled with yellow powder, and a few dark brown seeds. Its tannin differs materially from that of nutgalls. The quantity of mucilage it contains precludes it from the use of dyers, but the experiments of Mr. Rootsey of Bristol show the pods to contain 50 per cent of tannin, and it is largely used by curriers. It appears also from trials made that one part of Divi-Divi is sufficient for tanning as much leather as four parts of Bark and the process occupies only one third of the time. The selling price ranges from £8 to £13 per ton. The imports into the United Kingdom in 1844, were 3,900 tons; in 1845 and 1846, about 1,400 tons each year; during the subsequent three years the imports were merely nominal, but in 1850 a renewed demand seems to have sprung up, for 2,770 tons were imported into Liverpool, and a few tons into London.—*Simmonds Comm. Products, p.* 503. The seed pods of this tree being known to contain a large per centage of astringent matter, induced Dr. Cornish to give it a trial in Fever. The ætherial extract is not completely soluble in water, but the re-actions of the soluble portion, prove its indentity with tannin. Dr. Cornish has given the divi divi powder to nearly 100 patients suffering from Intermittent Fever in its various forms, and on the whole with considerable success. The dose of the powder pods commonly used was from 40 to 60 grains three times a day. He began cautiously with 10 grains, but found that doses below 30 grains rarely produced any effect in controlling the febrile paroxysms. As was the case with powdered galls, constipation of the bowels, as a result of treatment, was very uncommon. No inconvenience resulted from the use of large doses of this astringent. In two cases out of 94, it had to be omitted on account of gastric irritation, and diarrhœa existing. The astringent matter appears to have been rapidly absorbed into the circulation.—*Dr. Cornish in Indian Annals No.* VII, *page* 121.

(2259) CÆSALPINIA PANICULATA, A magnificent climber festooning the trees with its dark glossy foliage and gorgeous racemes of orange blossoms.—*Hooker's Him. Jour. p.* 25.

(2260) CÆSALPINIA SAPPAN. *Leguminosæ*, Roxb. c. 16. The Sappan tree.

Patonga, Sans, Bukum, Puttungay, Hind.	Isiapangum, Vuttunghy, Tam.

This tree is a native of Siam and Amboyna. It grows in the Kotah jungles. It is found in the immediate vicinity of Prome, growing in the small hills of the place, but except near Thoungzai, in the northern part of the Rangoon district, where it is also seen in small quantity, Dr. McClelland has not found it in the interior of the province or in the larger forests, so that it is perhaps scarcely entitled to a place amongst the natural productions of Pegu.—*McClelland.* It is cultivated in Palghaut for the purpose of dyeing the straw used in mat making (Wight); from its high price for this purpose, it is not used for carpentry. It grows to a larger size in China than India. The Sappan-Wood, *sapan* of Bengal commerce, constitutes an article of very important trade to Calcutta: the wood, *bukum*, is solid, heavy, hard, compact, whitish while recent, but reddening on exposure to the air. It is tasteless and inodorous, communicates a fine red colour to water, and the alkalies remove more colouring matter when water ceases to act. Alcohol forms a deep red tincture. Like logwood, the sapan is considerably astringent, and contains a principle if not identical with, at least much resembling, *hæmatin*. The extract may be substituted for that of logwood. Paper dyed with the tincture is a good test

for alkalies, being turned to a reddish-violet colour.—*O'Shaughnessy, page* 310. An extract of Sappan Wood is a useful astringent, (containing much gallic and tannic acid,) and a good substitute for the logwood of the British Pharmacopeiæ. The dose is five to ten grains twice or thrice daily in chonic dysenteries chiefly. It is seldom given alone, but usually with quinine, gentian or chiretta. It should not be given with the preparations of iron.—*Beng. Phar. p.* 295. A decoction of Sappan is a perfect indigenous substitute for the decoction of Hæmatoxylon of the Edinburgh Pharmacopeia.—*Beng. Phar. p.* 280. The Sappan Wood is an article of considerable commerce in the East. It is the bukkum wood of India, and is procured in Mergui, Bengal, the Tenasserim Provinces, Malabar and Ceylon. In 1842 as much as78,000 cwts.were shipped from Ceylon, but the export from thence has decreased. This island, however, ships dyewoods annually to the amount of £2,000. A large quantity is exported from Siam and the Philippine Islands; as much as 200,000 piculs annually from the former and 23,000 piculs from Manila. 3,524 piculs were shipped from Singapore in 1851, and 4,074 piculs in 1852. The picul is about one cwt and a quarter. Sappan wood yields a yellowish color, like that of Brazil wood (C. brasiliensis), but it does not afford of dye matter so much in quantity or so good in quality. The shipments from Ceylon were: in 1842, 77,694 cwt; in 1843, 1,692; in 1844, 2,592; in 1845, 2,854. I have no detailed returns at hand, but in 1837, 23,695 piculs of sappan wood, and 2,266 piculs of roots of ditto were shipped, and in the first six months of 1843, 22,326 piculs were exported from Manila. A large portion of this comes to Europe, but some goes to China, to United States, Singapore. &c. 15,500 piculs were shipped from Manila in 1845, 5,250 ditto in 1845, and 1,210 tons in 1850. About 3,000 piculs of sappan wood and the same quantity of other dye-stuffs are annually imported into Shanghae. The price of straight Sappan wood at Shanghae in July 1853, was thirty dollars per picul. In Calcutta, in June 1853, 4,000 piculs of the root of Manila Sappan wood sold freely at about 7s. 6d. per factory maund; Siam ditto 6s. 15 tons were imported into Liverpool in 1849, and 120 tons in 1850, from Calcutta. The imports of Sappan wood into the United Kingdom in 1850, amounted to 3,670 tons, worth £8 to £12 the ton, and this continued the price in January 1853.—*Simmonds.*

(2261) CÆSALPINIA SEPIARIA. Chilloor: Kilgutch, Hind.

A scandent strong armed shrub; flowers yellow, generally used to fence round fields. Kilgutch, grows in one hedge at Ajmeer, and forms a splendid impenetrable hedge, covered, with bright green leaves and large yellow spikes of flowers.—*Gen. Med. Top. p.* 192.

(2262) CAJANUS INDICUS.

Tovaray. Tam.	Toor also Ukhur, Mahr.
Toovar, Duk	Shukhool, Pers.
Kandaloo, Tel.	Doll or Pigeon pea.
Dhol. Hind.	Citysus Cajan, Lin.
Toovaray, Can.	Adaki, Sans.

This excellent pulse is the produce of a plant of the class Diadelphia and order Decandria, and makes a pudding little inferior to that made of pease—*Ainslie.* The doll bean is raised to a small extent in Tenasserim, but the doll sold in market is principally imported.—*Mason.*

(2263) CAJANUS INDICUS. Cytisus Cajan. *Variety.*

Malay Towaray. Tam.	Ghirie Adaki, Sans.
Burry Toovur. Duk	Hill Doll.
Konda Kandaloo. Tel.	

This differs from the Tovaray துவரை in being larger, and somewhat darker in colour; it is a very valuable pulse.—*Ainslie, p.* 281.

(2264) CAJAPUTI, L. Cajuputi Oleum, E. Cajeput, D. Oleum e foliis distillatum, L. Volatile Oil of the Leaves of Melaleuca Cajaputi, *Maton and Rorb.* (*M. minor*, Sm.) L. E. *Polyadelphia Icosandria*, Linn. Cayaputi Oil, or Oil of Cajeput.

Kayaputty-ka-teil, Hind.	Kayapooti-tailam, Tam.
Kayaputteih. Mal.	

Cajuputti Oil, pronounced *Kayapootee* (meaning *Arbor alba*) in the East, appears to have been known only since the time of Rumphius, who describes two trees, 1. *Arbor alba major*, H. A, ii. t. 16. 2. *Arbor alba minor*, H. A. ii. t. 17. f. 1. In 1798, Mr. Smith, of the Calcutta Botanic Garden, was sent to the Molucca Islands to obtain the true sort of Cayaputi plant. He obtained several, which were introduced into the above Garden, and have since been distributed all over India, and it is curious that this species, though a native of Molucca, is able to stand the cold of N. W. India, probably owing to the thickness of its bark. Mr. S. having also sent specimens to England they were ascertained by Dr. Maton to be those of the second kind, and named *Melaleuca cajaputi* in the London Pharm. For 1809, a name which Dr. J. E. Smith afterwards unnecessarily changed to *M. minor.* The other species obtained by Mr. Smith in 1798, which the Malays also call Cayaputi, (In Murray, App. Medicam, we have it named *Caieput* s. *Kaiuput Oleum,*) is the *Melaleuca leucadendron*, of which the leaves are larger, more falcate, 3-nerved, and smooth, but possess little or no fragrance, and are not known to yield any of this celebrated Volatile Oil. The *Melaleuca cajuputi*, according to Mr. Mason, is an elegant little tree, with birch-like bark and produces cajuput-oil. It is indigenous in the Karen forests of the southern provinces of Tenasserim but he has not observed it north of the valley of Palouk river, in latitude about 13°. Simmonds remarks that the leaf of this *Melaleuca*

minor yields, by distillation, the volatile oil of cajeputy, well known as a powerful sudorific, and a useful external application in chronic rheumatism. It is an evergreen shrub, with white flowers like a myrtle, native of Eastern Asia principally flourishing on the sea coasts of the Moluccas and other Indian Islands. Two sacks full of the leaves yield scarcely three drachms of the oil, which is limpid, pellucid, and of a green color. Cajeput is a corruption of the Malay words kayuputih, literally "white wood," from the colour of the bark of the Melaleuca cajeputi of botanists. It most abounds in the island of Boeroe in the Molucca Sea, where the essential oil is obtained by the distillation of the leaves.—*Crawfurd's Dictionary, page* 79. Dr. Royle mentions that *Melaleuca cajuputi*, Roxb. (fig. 64), forms a small tree with an erect but crooked stem covered with thick, rather soft, light-coloured bark; branches scattered, with slender twigs which droop like those of the Weeping Willow. Leaves alternate, lanceolate, acute, slightly falcate, 3 to 5 nerved, while young silky, and diffusing a powerful odour when bruised. Spikes terminal and from the extreme axils, downy as well as the calyx and branchlets, while in flower there is only a scaly conic bud at the apex, which soon advances into a leafy branchlet. Bracts solitary, 3 flowered. Calyx urceolate, (fig. 64, 3,) limb 5 parted. Petals 5, white, scentless. Stamens from 30 to 40, in five bundles; filaments 3 or 4 times longer than petals. Anthers incumbent with a yellow gland at the apex. Style long Stigma obscurely 3-lobed. Ovary ovate, and like the capsule 3-celled, (f. 64, 2 and 1,) many seeded, lower half united with, but the capsule is enclosed within the thickened tube of the calyx. Seeds angularly wedge shaped. A native of the Molucca Islands, especially of Boeroe, Manipe and of the S. of Borneo. It is called *Daun. kitajil*, but also Cajuputi. The leaves are collected on a warm dry day in autumn, and placed in dry sacks, in which they nevertheless become heated and moist. They are then cut in pieces, macerated in water for a night and then distilled. Two sackfuls of the leaves yield only about 3 drachms of the oil. This is clear and limpid, of a light green colour, very volatile, diffusing a powerful odour, having a warm aromatic taste, something resembling that of Camphor, followed by a sense of coolness. Sp. Gr. 0·914 to 0·927; soluble in Alcohol. It boils at 343°. When distilled with water, a light and colourless oil first comes over, and then a green-coloured and denser oil, which, with less odour, is more acrid. Comp. C_{10} H_9 O=77. Some adulterations are occasionally practised with this oil, especially at the time when it reached a high price, chiefly with the oils of Rosemary and of Camphor; but it is now commonly met with in a pure state, and without any admixture of Copper. *Action. Uses.* Diffusible Stimulant, Antispasmodic; externally in Rheumatism. Surprise was excited in India when Cayaputi Oil was stated to be a cure for Cholera, as Oil of Peppermint is as useful. Dose *M.* iij—v. given on lump of sugar.

(2265) CALABAR SKINS.

Petitgris, Fr.	Bjelka, Rus.
Grauwerk, Ger.	Gris pequeno, Sp.
Vaor, Vajo, It.	

Are the Siberian squirrel skins, of various colours, used in making muffs, tippets, &c.—*Faulk.*

(2266) CALABASH. Cucurbita lagenaria, Lin.

Anapa kaya, Tel.	Hurrea kuddoo, Hind.
Chooraykai, Tam.	Laboo Ambon, Malay.

Is of two kinds the long or Ceylon and the round: they are good vegetables when young and are useful when dry as vessels.—*Rhode, M.S.S.*

(2267) CALADIUM COSTATUM. The root of the Berar (*Caladium costatum*) is eaten by the natives of the Pedir cost (Achin), after being well washed —*Simmonds' Comm. Product, p.* 377.

(2268) CALADIUM CUCULATUM. In China, several species of the Aroideæ are cultivated for food, among which the Caladium cuculatum, Arum esculentum and indicum, are the most common. The tuberous roots of the Sagittaria sinensis also contain much farinaceous matter and are esteemed for their food; the taste resembles that of the preceding and all grow in marshy lands. The roots of these plants and of the water chesnut are manufactured into a powder resembling arrowroot, much in request among the people.

(2269) CALADIUM ESCULENTUM. Ventenat. The vegetable.

Saymboo keeray, Tam.	Chama koora, Tel.
Urvi ke baujee, Duk.	Chamaka, Sans.

The root.

Saymboo kalung, Tam,	Tallas, Javanese.
Urvi gudda, Duk.	Bete. Ternatese.
Chama gudda, Tel.	Kelady, Malay.
Urvee, Hind.	Chamaka, Sans.

This is a valuable root which appears to be generally cultivated in eastern countries. It is shaped somewhat like a yam and when well boiled and afterwards roasted is not inferior to it in taste. It is the common food of the inhabitants of Travancore, where there is a superior variety of it, with broad, purple colored leaves. The Worriahs in the Ganjam Circars (where it grows large), call it Cutchoo, the Malays of the Eastern islands hold it in high estimation. Niebhur in his "Travels in Arabia" says, it is produced in abundance in marshy situations in this country as well as in Egypt. He speaks of it under the name of Arum esculentum. Rumphius, speaking of this esculent root at Amboyna, says, "Nutrimentum est "catholicum in orientalibus hisce insulis et tan- "quam utilissima regionis censetur planta eodem

" modo, quo ab antiquis jam fuit temporibus in " Ægypto, licet ibi haberetur cibus rusticorum, " ac forte per saracenos ejus usus innotuit Occi- " dentalibus Africæ et Europæ partibus, ita ut " haud inepte Æthiopum panis vocari posset." Vide Rumphius, tom. v. page 316.—*Ainslie.* Mr. Jaffrey says that Caladium esculentum, *Saim-may-keeray*, is cultivated for its arrow shaped leaves, which are used as greens both in the East and West Indies; called by the French *Chou de Bresie*, and by the Germans *Essbare Arum.* Also that the roots are sometimes eaten though not considered wholesome.

(2270) CALAMANDER WOOD.

Calamander marum, Tam. | Koulmidvies, Ceylon. Also Kalu mederige.

Is scarce even in Ceylon whence it has been occasionally brought by private individuals: it is probably the most beautiful of all fancy woods—*McCulloch.* The figure is between that of rose wood and zebra wood; the colour of the ground is usually a rich hazel brown described as chocolate brown with black stripes. It is a hard wood and turns well: it is considered to be a variety of ebony. Mr. Laizor says, there are three varieties of Coromandel, the *Calamander* or *Coromandel*, which is the darkest and most commonly imported into England; the *Calemberri*, which is lighter coloured and striped; and the *Omander*, the ground of which is as light as English yew, but of a redder cast, with a few slight veins, and marks of darker tints. It grows between the clefts of rocks, thus rendering it difficult to extract the roots which are the most beautiful parts of the tree —Mr. Rhode (M.S.S.) has met with variegated ebony of rich lustre in logs of ebony cut in the Northern Circar hills: but whether this is owing to the wood being young or whether the wood is from a distinct tree he does not know, but there seems no doubt that very many trees yield an ebony. *Rhode* M.S.S. This beautiful fancy wood as obtained from Ceylon, is exceedingly hard, and finely veined, with different shades of black and brown. It is very scarce and dear. This very beautiful wood is called by the Natives Kuloumidvie. Thumberg was inclined to believe that this was the true Ebony, but Koenig afterwards discovered that to be a different tree.—*Ain's. Mat. Med. p.* 211.

(2271) CALAMBUCO. The name of one of the best timber-trees of the Philippine Islands, the wood of which is largely employed by the natives in the fabrication of domestic utensils and agricultural implements.—*Crawfurd Dic. p. 79.*

(2272) CALAMINA PREPARATA, Zinci Carbonas impurum præparatum. Prepared Calamine.—Burn *Calamine* with a red heat, triturate and reduce to a very fine powder, as directed for Chalk. By the process of roasting, some of the Carbonic acid and water are expelled, and a portion of Oxide of Zinc is formed. The mass being subjected to elutriation, it is often, like Chalk, prepared in little conical masses. It usually contains many impurities, as Oxide of Iron and other metals, and is adulterated with Sulph. Baryta, Carb. Lime, &c. Much of the Calamine of commerce has been shown by Dr. R. D. Thomson and Mr. Murdoch to contain no Zinc, but to be Sulph. Baryta coloured with Armenian Bole. *Uses.* A dessicant powder for excoriations in children.—*Royle.*

(2273) CALAMPELIS. Bignoniaceæ,—C. Scabra.—This plant is of much beauty, well adapted for training on trellis-work, the orange coloured flowers being very showy; any light loamy soil suits it.—*Riddell.*

(2274) CALAMUS. A genus of palm trees, indigenous to Asia, and abounding in the islands of the Indian Archipelago, as well as in the Malayan peninsula. Martius enumerates fifty-two species, but the total number is not known. All the species are spreading shrubs or small trees, erect or often climbing to a considerable height. They furnish the "Dragons-Blood," "Malacca-Canes," and "Ratans of Commerce."—*Seeman.* Although a genuine palm, yet from the slender stems and its general habit, it has more the look of some tall grass, and has been considered as one of the links in the chain of organisation which connect the Grasses with the Palms. The species are principally found in the hotter parts of the East Indies, where they grow in the forests, climbing over trees and bushes to a greater extent than any other known plants. The stem of *Calamus verus* is described as being 100 feet long, that of *C. oblongus* 300 to 400 feet, of *C. rudentum* upwards of 500 feet, and of *C. extensus* as much as 600 feet; Rumphius even states that one kind attains the extraordinary length of 1200 feet (vol. v. 100). It is closely covered over by the tubular bases of the leaves, through which it is drawn by the cane-gatherers when green; afterwards it is dried in the sun, and then is ready for the market. These canes are extensively used for the sake of the hard flinty coating of their stems, which are readily split into strips, from which the bottoms of chairs and similar articles are manufactured. It is not possible to say from what particular species the canes of the shops are obtained, it being probable that many are gathered indiscriminately; *C. rotang* has however been said to furnish the stouter, and *C. Scipionum* the slenderer sorts. The flesh that surrounds the seeds of this genus is a delicate article of food; limpid water flows from the stems when cut through; and the young shoots of some of them, while still tender, are roasted or boiled, chopped small, and, being fried with pepper and gravy, are said to furnish a very delicate dish. Several species are copiously

described in Rumphius 'Herbarium Amboinense,' (vol. v.) under the name of Palmijuncus. Dragon's Blood or Djurnang, is the produce of a species of Calamus. Those which chiefly yield it are the *C. petræus* (Lour.) *C. rudentum* (Lour.), *C. verus* (Lour.), and *C. draco* (Willd.), of which the last three were by Linnæus reckoned mere varieties of the *C. rotang* (Linn.) They are natives only of Hindustan, Cochin China, and the Moluccas. The ripe fruits are covered with a reddish-brown dry resinous substance, which is the Dragon's Blood. In this state they are collected, and allowed to remain in rice-mills till the resin drops off. The resin is afterwards melted, either by the natural warmth of the air or by artificial heat, and then moulded into the different forms in which it occurs in commerce. Another mode of obtaining it is as follows:—The ripe fruits are shaken in bags, and the resin so obtained is formed into pieces about the size of a bean, which are then wrapped up in leaves; this kind is much prised in the East Indies. A second sort is procured by throwing together the fruits after they have been treated in the foregoing manner, melting them in the sun or with a slow fire, and collecting what exudes, which is then formed into small four-cornered cakes. A third sort is obtained from what remains after the two foregoing processes, being run out and formed into round cakes, which contain hard portions of the fruit. According to other accounts, the finest sort is procured by exposing the fruits to the vapour of boiling water, and scraping off the soft resin as it exudes.—*Eng. Cyc. page* 713. As before observed, the species of *Calamus*, yielding the different kinds of Cane, have little of the appearance of Palms, are usually remarkable for their weak and trailing stems, which often extend to a great length, and ascend the loftiest trees. It is these long stems, which, when divested of their sheathing leaves, form the canes of commerce—some so much admired as sticks; others for their flexibility, conjoined with tenacity. These, when their smooth and shining dense outsides are separated in strips, are universally employed for *caning* the bottoms of chairs, of couches, and for other articles. Some are occasionally twisted into ropes, in the localities where they are indigenous: but they are more generally employed, as sticks, and for mat-making and cane work, as their great strength admits of such narrow strips being employed, as to allow of large spaces being left, and thus enables strength to be combined with lightness and free ventilation. The species of Calamus abound in the Islands of the Indian Archipelago, as well as in the Malayan Peninsula. A few species are found within the Madras territories, but in India they chiefly abound in the forests of the districts of Chittagong, Silhet, and Assam, whence they extend along the foot of the Himalayas as far north as the Deyra Doon, where a species is found which the late Mr. Griffith has named *C. Royleanus*, and applied the name of *C. Roxburghii* to the plant which Dr. Roxburgh called *C. Rotang* common in Bengal and on the Coromandel Coast. Both are called *bet*, and used for all the ordinary purposes of cane; as are *C. tenuis* of Assam, *gracilis*, *extensus*, and others. *C. Scipionum* of Loureiro, Mr. Griffith considered to be the species which yields the well-known Malacca Cane, but the plant does not appear about Malacca. He was, however, informed that the canes are imported from Siak, on the opposite coast of Sumatra. The extensive uses to which Canes are applied, both in their entire and split state, are well known. They are abundant in all the moist tropical parts of the East, both on the continent and in islands. In Java, the cane is cut into fine slips, which are platted into excellent mats, or made into strong, and at the same time, neat baskets. In Japan, all sorts of basket-work are made of split cane, and even cabinets with drawers. Cane is also platted or twisted into cordage, and slender fibres are made to answer the ordinary purposes of twine. It is stated that in China, as also in "Java and Sumatra, and indeed throughout the Eastern islands, vessels are furnished with cables formed of cane twisted or platted. This sort of cable was very extensively manufactured at Malacca." The species employed for this purpose is probably the *Calamus rudentum* of Loureiro, which this author describes as being twisted into ropes in these Eastern regions, and employed, among other things, for dragging great weights, and for binding untamed elephants. So Dampier says: "Here we made two new cables of rattans, each of them four inches about. Our captain bought the rattans, and hired a Chinese to work them, who was very expert in making such wooden cables. These cables I found serviceable enough after, in mooring the vessel with either of them; for when I carried out the anchor, the cable being thrown out after me, swam like cork in the sea, so that I could see when it was tight; which we cannot so well discern in our hemp cables, whose weight sinks them down—nor can we carry them out but by placing two or three boats at some distance asunder, to buoy up the cable, while the long boat rows out the anchor." The tow-ropes mentioned by Marco Polo as used by the Chinese for tracking their vessels on their numerous rivers and canals, seem also to have been made of cane—and not of bamboo, as sometimes stated—as they were split in their whole length of about thirty feet, and then twisted together into strong ropes some hundred feet in length. Mr. G. Bennett says, in his 'Wanderings,' ii, p. 121, that he "remarked some Chinese one morning near Macao, engaged in making some very durable ropes from rattan. The rattans were split longitudinally, soaked, and attached to a wheel, which one person was

keeping in motion, whilst another was binding the split rattans together, adding others to the length from a quantity he carried around his waist, until the required length of the rope was completed." Though apparently insignificant, Canes yet form a considerable article of commerce, inasmuch as in some years between four and five millions of them have been exported from the territories under the government of the East India Company. Though not employed for their fibres, yet, as connected with the different kinds of the genus Calamus, we may mention the different Canes which are imported. Most of them are produced by species of Calamus. The walking sticks called "Penang Lawyers" are the stems of a small Palm called *Licuala acutifida*. The Ground Rattan is distinguished by its straight head and straight and stiff character altogether, as well as by its pale colour; though some are at least an inch in diameter, and others not half that thickness. Some are distinguished by a hard, and others by a soft bark It is not known whether the slender are of the same species as the thicker kinds, growing in different situations, or from roots of different ages, but *Rhapis flabelliformis* is said to yield the Ground Rattan. The Malacca Cane is supposed to be produced by *Calamus Scipionum*, said to be imported from Siak, on the coast of Sumatra. Some of these are simply mottled or clouded, others of a brown colour, in consequence, it is said, of their having been smoked. The more slender specimens of these, with the longest internodes, are those most highly valued. The most common kind of Cane, that employed for caning chairs, &c., is known in commerce by the name of Rattan Cane. This must be yielded by a variety of the long trailing species which abound wherever the genus is found. The most northern one, *Calamus Royleanus*, no doubt yields the Rattans collected in the Deyra Doon, while *C. Roxburghii* doubtless yields those collected in more southern latitudes. But it is probable that a variety of species yield the thin Rattans of different localities, and some of which have already been mentioned. Another kind of Rattan is called Dragon Cane. This is thicker than the last, both light and dark coloured, with long internodes and a hard bark, less flexible than the common Rattans, but strong, springy, and much valued. A variety, with soft bark, is called Manilla Dragon Cane. Other kinds of Canes, imported from China, are known, one with stiff stems and large knots by the name of *Jambee*, and one as *Whanghee*. This has a pale, hard bark, and flexible stems, with internodes of about an inch and a half or two inches, and a number of little holes at the knots. Some, which are occasionally called Canes, are produced by species of Bambusa, Saccharum, and other grasses. *Calamus Draco*, a native of Sumatra and the Malay Islands, yields, as a natural secretion of its fruit, the best D'jurnang or Dragon's blood, which has been an article of commerce from the earliest times, and still continues in demand.—*Royle Fib. Pl.*

(2275) CALAMUS ARBORESCENS. An arboreous species of ratan common in the jungles. Griffith justly terms it "a very elegant palm."—*Mason.*

(2276) CALAMUS DRACO. Dragon's blood plant. The resin called Damoolukwain, *Hind.* A native of the Indian archipelago, also in the forests of Tenasserim: the natives call it "Red ratan," it produces a red exudation like dragon's blood.—*Mason.* It is little known in the Peninsula of India. The plants when young are elegant, and resemble small palm trees, after which they become scandent and overrun any neighbouring trees. The fruits are fleshly, red, astringent, and yield the resin called *Dragon's blood.* It is of much more importance in the arts than in medicine, being chiefly used as an ingredient in varnishes and paints. In commerce, it occurs in powder, grains, masses, drops the size of an olive, and in sticks enveloped in the leaf of the talipot palm.—*O'Shaughnessy, page* 642.

(2277) CALAMOSAGUS LACINIOSUS, RATAN SAGO PALM. The sago palm has not been discovered in the Tenasserim Provinces, but Griffith describes a palm from the Mergui Islands, which he named the ratan sago palm. "It appears," he says, "to be osculant, between calamus, sagus, and zalacca, having the habit of the former, the inflorescence of the second, and in some measure the seed of the last genus:" so that while it resembles a ratan, it has flowers like the sago palm.—*Mason.*

(2278) CALAMUS ROTANG. BEN BET, *Hind.*—This plant has been introduced from the Moluccas, and is the well known Rattan plant. It is called the marsh date, the leaves are used at Cuddapah for making ropes and mats: this may be the ground rattan, or *Calamus rotang* which grows abundantly in marshy ground, and bears leaves resembling those of the date.

(2279) CALAMUS RUDENTUM. MOTIE BET, *Hind.*—This is a larger species, and is found in some of the gardens of the Deccan.

(2280) CALAMUS VIMINALIS. RATTAN FRUIT.

Perupum pullum, TAM.	Betta pundoo, TEL.
Bete ka pull, DUK.	Vetra, SANS.

This fruit hardly deserves a place here, it grows in the woods and is eaten by the common people.—*Ainslie, p.* 231.

(2281) CALUMBA, COCCULUS PALMATUS, *Dec.* The Calumba Plant. *Diœcia Hexandria*, Linn. Calumba-root was first made known as a medicine by F. Redi about 1677. Semedus mentioned it before 1722 among medicines from

India. In works on Materia Medica in use in India, it occurs by the name of *Kalumb*. Dr. Berry first ascertained that it was the root of a plant (of which he figured the male) inhabiting the forests on the coast of Mozambique and Oibo in Eastern Africa, but where it is never cultivated. Sir W. Hooker in 1830 described and figured both male and female plants, from plants introduced by Capt. Owen into the Isle of France. Figs 39 and 40. Calumba-root is sometimes adulterated with American or False Calumba, of which the infusion becomes dark green with the Sesquichloride of Iron; also with Bryony-root, which is distinguished by a permanent bitterness of taste with acridity.

(2282) CALCAREOUS SPAR, crystallized native carbonate of lime, of which the primitive form, as it occurs in *Iceland spar*, is an obtuse rhomboid of 105° 5' and 74° 55' Its specific gravity is 2·72. The secondary forms are more numerous than those of any other substance. Bournon in his *Traite de Mineralogie* has described and figured 680 modifications of this mineral—*Tomlinson, page* 265. But under this term it is usual to include only those varieties of Carbonate of Lime which occur in distinct individual crystals of the rhombohedral system, the name never being used to denote Arragonite, or any crystals of carbonate of lime belonging to the prismatic system; nor is it usual to apply it to those more or less crystalline limestones of which marble is the purest variety, where each crystal is so embedded in the mass as to have lost all individuality. The following are the names of the more common varieties of Calcareous spar:—Iceland spar, Satin spar, Chalk, Rock Milk, Calcareous Tufa, Stalactites, Stalagmite, Limestone, Oolite, Pisolite, Argentine, Fontainbleau Limestone, white and clouded Marbles, Statuary Marble, compact Limestone, Stinkstone, Anthraconite, Plumbo Calcite, Mineral Agaric, &c.—*Eng. Cyc. page* 717. Calc. Spar is found in many parts of India, and the following article merits attention. Sir,—I have the honor to inform you that I have this day forwarded per banghy to you a specimen of limestone found at Sankerydroog 25 miles S. W. of Salem. It requires a much greater heat to burn it than the ordinary kinds of limestone and is generally burnt by the natives of this part in small circular kilns with a jungle shrub named ஆவாரஞ்செடி which burns with a great heat. When burnt it is much whiter than the general chunam and takes a most beautiful polish, and is therefore much used for the last coat of plaster in houses &c.giving the appearance of the whitest marble when polished. A great quantity is burnt in Sankerydroog and sent to Salem and other parts of this Collectorate for eating with betel, as betel eaters hold it in great esteem owing to its piquant flavor. I am sorry to say that my maistry was not successful in getting any stone at Curpor likely to answer for Lithography, but I intend visiting the spot myself next week in order to see if I can find any. (Sd.) C. Wilkieson, Lieut., A. Civ. Eng. 5th Division.

(2283) CALCEDONY.

Akeek, Guz. and Hind.

A species of agate of a uniform colour, generally of a milky white or pale yellow, often with an internal wavy structure. Localities, Faroe island, Iceland, Great Britain, Cambay, &c. This one of the inferior gems, is abundant in Cambay, and in the amygdaloid trap of the Dekhan. Calcedony, is so called from having been early found at Calchedon (sometimes incorrectly written chalcedon) in Bithynia opposite Constantinople. It is of a uniform colour, generally of a milky white or pale yellow, like turbid jelly, often with an internal wavy structure in the form of stalactites, and very generally with a peculiar mammillary surface. It is found in great abundance in the Faroe Islands, in Iceland, in Cornwall, and many places of Great Britain, as well as other countries; sometimes in large masses, from which cups and other vessels are formed. Pliny describes it as being found in the neighbourhood of Thebes in Egypt, and as brought to Rome from Carthage.

(2284) CALCEOLARIA. Scrophulariaceæ. These are both shrubby and herbaceous plants, they thrive best in a light rich loamy soil and may be cultivated both by seed and cuttings. The hybrids raised from this genus are very numerous and showy, the colours are chiefly purple, orange, yellow, and spotted.—*Riddell.*

(2285) CALCULUS CYSTICUS.

Koroshanum, Tam.	Gauzereh, Pers.
Gyroon, Duk.	Biliary Calculus of a Cow.
Hejrulbuckir, Arab.	Gorochana, Sans,

Koroshanum, or Korashaaum, is the Tamul name given to those biliary concretions occasionally found in the gall bladder of Cows or Bullocks in India. They are generally contained in a little bag, which holds two or three small ones, each about the size of a tamarind stone, or one large one, as big as a marble. They are of a bright yellow colour, and are considered by the Native practitioners as highly valuable in certain indispositions of young children, owing to their cordial and alexipharmic qualities. A piece about the bigness of a mustard seed, is commonly given for a dose to a babe of two months old, in conjunction with an infusion of ஓமம் Womum or சீரகம் Siragum. This substance is also used together with கடுக்காய் Kadukai and மாச்சக்காய் Machakai, in preparing a mixture for cleansing the inside of the mouths of new-born infants. The Vyteans prescribe a solution of it in warm ghee, to be poured up the nose in cases of nervous head-ache, and they administer it too, in தோஷம் Doshum, (Typhus Fever), made into a draught with women's milk.—*Ains. Mat. Med. page* 85.) *See* Bezoar.

(2286) CALDERA BUSH, Pandanus odoratissimus.

Mogali, Tel.

This valuable bush, or another species, furnishes material for the sugar bags of the Mauritius; the leaves also contain fibres that might be applied to many useful purposes: the droops from the stem are a mass of tolerably fine fibres: and with the ends beaten out are used by plasterers for brushes: the fibre is used for lines and cordage, and the plant itself makes good fences near the sea; but it soon becomes straggling. —*Rhode M.S.S*

(2287) CALAMBEG, or Calambao, sometimes called Aloes-wood, is the Agallochum of the ancients, and the Agila or Eagle wood of the moderns. It is produced in Siam and Silhet by Aquilaria Agallocha.—*Royle, Illustr. p.* 171.

(2288) CALENDERING, Mora, *Tel.* a term said to be corrupted from *cylindering*, and signifying the finishing process in Europe in the manufacture of cotton or linen goods, by which they are passed between *cylinders* or rollers, and made of a level and uniform surface. The starch used in calendering is made from flour, deprived of gluten by fermentation in water, in the proportion of a pound of flour to a gallon of water. The whole is passed through a sieve after fermentation, and this separates the bran. The flour is then boiled, and a small quantity of indigo added, to give it a blue colour, after which more water is added, according to the degree of stiffness to be given to the goods. This liquid is frequently thickened with porcelain clay, or calcined plaster of Paris, or both, in order to give an appearance of strength and thickness to the cloth. This all disappears as soon as the goods are washed; therefore, it merely makes them more attractive to the eye of the purchaser. The practice was originally deceptive; but it can scarcely be called so now that it is generally adopted, and is perfectly well known to the great majority of buyers.—*Tomlinson, page* 273. In India, an appearance similar to that produced by Calendering is given to goods particularly to such chintzes as were intended for the Persian market by beating them and then rubbing them on a board with a shell slightly waxed. The texture is no doubt injured by it. The coarse cloths formerly largely exported were beaten with a heavy block on a log of wood before being made up in bales.—*Rhode M.S.S.*

(2289) CALICO.

Kattun, Dan.	Chaelwarree, Pers.
Katoen, Dut.	Baweluika, Pol.
Coton, Toile de coton, Fr.	Pano de Algodao, Port.
Kattun, Ger.	Wuboika, Rus.
Tela bambagina, Tela di pinta, It.	Tela de Algodon, Sp.
	Cattun, Sw.

White or plain cotton cloth. The name is known to have been derived from Calicut on the Malabar Coast, whence it was first taken to Great Britain. It is now brought to India from England.—*Faulkner.*

(2290) CALICO-PRINTING. The art of producing a coloured pattern on cloth by the application of colouring substances appears to be of great antiquity. In India the art of calico-printing has been practised for ages, and it derives its English name from *Calicut*, a town on the Malabar Coast, where it was formerly carried on extensively. The large cotton chintz counterpanes, called *pallampoors*, which from an early period have been made in the East Indies, are prepared by placing on the cloth a pattern of wax, and dyeing the parts not so protected. Printed goods which half a century ago were sold for 2*s.* 3*d.* per yard, may now be had for 8*d.* or less; and a cotton print, sufficient for a complete dress, may be had for 3*s.* or 4*s.*, or less. It is stated by Mr. M'Culloch, as an example of the prodigious increase of calico-printing, that in 1829, before the abolition of the duty, 89,862,433 yards of all descriptions of printed goods were exported; whereas in 1841, there were exported of printed cottons alone, 329,241,892 yards, of the declared value of £7,772,735. The object of colico-printing is to apply one or more colours to particular parts of cloth, so as to represent a distinct pattern, and the beauty of a print depends on the elegance of the pattern, and the brilliancy and contrast of the colours. The processes employed are applicable to linen, silk, worsted, and mixed fabrics, although they are usually referred to cotton cloth, or calico. There are various methods of calico-printing, the simplest of which is block-printing by hand, in which the pattern or a portion thereof is engraved in relief, upon the face of a block of sycamore, holly, or pear-tree wood, backed with deal, and furnished with a strong handle of box-wood. A machine called the *Perrotine*, in honour of its inventor, M. Perrot of Rouen, is in use in France and Belgium as a substitute for hand-block printing. Copper-plate printing similar to that used in the production of engravings has also been applied to calico-printing. The invention of *cylinder* or *roller-printing*, is the greatest achievement that has been made in the art, producing results which are truly extraordinary: a length of calico equal to one mile can by this method be printed off with four different colours in one hour, and more accurately and with better effect than block printing by hand. Another method of calico-printing remains to be described, namely, *press-printing*, by which several colours can be printed at once. The cloth to be printed is wound upon a roller at one end of the machine, and the design, which is formed in a block of mixed metal about 2½ feet square, is supported with its face downwards in an iron frame, and can be raised or lowered at pleasure. The face of the block is divided into as many stripes,

ranging crossways with the table, as there are colours to be printed. The colours used in calico-printing are derived from all the three kingdoms of nature, but it seldom happens that solutions, infusions, or directions of these colours admit of being applied at once to the cloth without some previous preparation, either of the cloth itself, or of the colouring material. It is often necessary to apply some substance to the cloth which shall act as a bond of union between it and the colouring matter. The substance is usually a metallic salt, which has an affinity for the tissue of the cloth as well as for the colouring matter when in state of solution, forms with the latter an insoluble compound. Such a substance is called a *mordant*, (from the Latin *mordere*, to bite,) a term given by the French dyers under the idea that it exerted a corrosive action on the fibre, expanding the pores, and allowing the colour to be absorbed. The usual mordants are common alum and several salts of alumina, peroxide of tin, protoxide of tin, and oxide of chrome. These have an affinity for colouring matters, but many of their salts have also a considerable attraction for the tissue of the cloth, which withdraws them to a certain extent from their solutions. Mordants are useful for all those vegetable and animal colouring matters which are soluble in water, but have not a strong affinity for tissues. The action of the mordant is to withdraw them from solution, and to form with them, upon the cloth itself, certain compounds which are insoluble in water. Although the different methods of printing are numerous, and the combinations of colours and shades of colour almost infinite, yet each colour in a pattern must, in the present state of the art, be applied by one of six different *styles* of work. These are termed. 1, the Madder style; 2, Printing by steam; 3, the Padding style; 4, the Resist style; 5, the Discharge style; and 6, the China-Blue style. By the proper combination of two or more of these styles any pattern however complicated is produced. The processes actually required for finishing a piece of cloth are numerous, as for example, in producing a red stripe upon a white ground, the bleached cloth is submitted to nineteen operations, as follows:—1. Printing on mordant of red liquor, (a preparation of alumina,) thickened with flour, and dyeing; 2. Ageing for three days; 3. Dunging; 4. Wincing in cold water; 5. Washing at the dash-wheel; 6. Wincing in dung-substitute and size; 7. Wincing in cold water; 8. Dyeing in madder; 9. Wincing in cold water; 10. Washing at the dash-wheel; 11. Wincing in soap-water containing a salt of tin; 12. Washing at the dash-wheel; 13. Wincing in soap-water; 14. Wincing in a solution of bleaching-powder; 15. Washing at the dash-wheel; 16. Drying by the water extractor; 17. Folding; 18. Starching; 19. Drying by steam.—*Tomlinson, page* 282. The art of *Calico-printing* is one which was common to the Egyptians and Indians, and is still largely practised by the latter, and with a skill which in 1851, produced much to be admired even in the midst of the productions of the world, and after so many attempts have been made to improve an art certainly imported from the East. Pliny was acquainted with the wonderful art by which cloths, though immersed in a heated dyeing liquor of one uniform colour, come out tinged with different colours, and afterwards could not be discharged by washing. The people of India were found practising the art when first visited by Europeans. The mordaunts they apply both by pencils and by engraved blocks, though it has been said that the former method was the only one employed. Blocks are however used throughout India, but silk handkerchiefs, some exhibited by Mr. Warrington, to show the different stages of dyeing as practised in India, had the parts where the round spots were to be, tied up with thread so as not to be affected by the dye-liquors. The cloth-printers at Dacca stamp the figures, on cloth which is to be embroidered. The stamps are formed of small blocks of kantul (*artocarpus*) wood, with the figures carved in relief. The colouring matter is a red earth imported from Bombay, probably the so called "Indian earth" from the Persian Gulf. Though the art is now practised to much perfection in Britain the Indian patterns still retain their own particular beauties, and command a crowd of admirers. This is no doubt due in a great measure to the knowledge which they have of the effects of colours, and the proportion which they preserve between the ground and the pattern, by which a good effect is procured both at a distance and on a near inspection. *Printing in Gold and in Silver* is a branch of the art which has been carried to great perfection in India, as well upon thick calico as upon fine muslin. The size which is used is not mentioned, but in the Burmese territory the juice of a plant is used, which, no doubt, contains caoutchouc in a state of solution.—*Royle, Arts &c. of India, p.* 483. The well-known imitations of Bandana handkerchiefs, white figures formed on a ground of Turkey-red are by means of an aqueous solution of chlorine. This is made to flow down through the red cloth in certain points which are defined and circumscribed by the pressure of hollow lead types inserted into plates of lead contained in a hydraulic press. The press is furnished with a pair of pattern plates, one attached to the upper block of the press, and the other to the movable part of it. From twelve to fourteen pieces of cloth previously dyed in Turkey-red are stretched over each other as evenly as possible, and then rolled round a drum. A portion of the fourteen layers equal to the area of the plates being drawn through between them, the press is worked, and the plates are brought together with a force of upwards of

300 tons. The solution of chlorine is then allowed to flow into the hollows of the upper lead plate, whence it descends on the cloth and percolates through it, extracting the Turkey-red dye, the intense pressure preventing the bleaching liquor from spreading beyond the limits of the figures perforated in the plates. When a certain quantity of bleaching liquor has passed through, water is admitted in a similar manner to wash away the chlorine. The pressure is then removed, and another square of the fourteen layers is moved forward under the plates, and the process is repeated. When all the pieces have been discharged, they are winced in water, and further treated so as to improve the lustre both of the white and of the red.—*Tomlinson, page* 284.

(2291) CALLICARPA CANA (VERBENACEÆ). Aroosha Fibre of Chittagong. The family of plants to which the above belongs is not remarkable for any fibrous bark, but it is so from the great diversity of appearance in the plants placed in it, inasmuch as it includes the lowly Vervein and the lofty Teak. Mr. Sconce, when at Chittagong, had some of the fibres of this plant, which he says is there called Aroosha, prepared, first by cutting the stems, which grew three or four feet high, and then steeping. The inner bark was then easily stripped off. This was afterwards heckled, and a portion of the fibre spun into thread, but it does not appear of much value in a country where so many others abound. Capt. Thompson reports that a line made from the fibre forwarded from Chittagong, broke at once, without stretching, with only 127 lb.; though only the finest and largest of the material was made into this line. A line of Russian Hemp of the same size will sustain with ease 400 lb.; so that this fibre is much too weak for either sail-cloth or cordage. It however possesses all the free and kindly nature of flax, and even smells like Flax. It is easily worked, with little or no waste, and he thinks must have been prepared with vegetable oil."—*Royle, Fib. Pl. p.* 310.

(2292) CALLICARPA LANATA, Roxb. bitterish and rather aromatic.—*O'Sh. p.* 456.

(2293) CALLICHROA. *Compositæ.*—C. Platyglossa.—This is a border flower, yellow with a broad ray, requiring a good soil and should only be watered by the hand, it seldom exceeds a foot in height.—*Riddell.*

(2294) CALONYCTION ROXBURGHII. *Ipomæa grandiflora.*

Chandnee, Hind.

A large flowered species of ipomea whose snowy blossoms open at sunset and shut at daylight is sometimes seen carried over arbours and pandals on the Tenasserim Coast. It is

> ——"the white moon-flower, such as shows
> On Serendib's high crags to those
> Who near the isle at evening sail
> Scenting her clove trees in the gale."—*Mason.*

(2295) CALONYCTION SPECIOSUM. Another species with the same English name is occasionally seen in European gardens, in Tenasserim.—*Mason.*

(2296) CALOPHYLLUM (from καλός, beautiful, and φύλλον, leaf), a genus of plants belonging to the natural order Guttiferæ.—*Engl. Cyc. page* 723. In the Tenasserim Provinces, house carpenters often use the timber of a species of calophyllum, and this tree also furnishes spars. A species of Calophyllum, Poona marum, is a large tree common on the western Ghauts of Peninsular India. Its wood is much used in house and to same extent in ship building.—*McIvor.*

(2297) CALOPHYLLUM ANGUSTIFOLIUM is the Piney-Tree of Penang, yields a hard timber.—*Engl. Cyc. page* 728.

(2298) CALOPHYLLUM, CALABA.

Calaba Tree.

This is a native of Travancore, and produces true East India tacamahaca resin. This resin is rarely met with: it is yellow, translucent, adhesive, of acrid taste, and pleasant aromatic smell.—*O'Shaughnessy, page* 238. The Calaba-tree, has obovate or oblong, obtuse or emarginate leaves; hermaphrodite or male flowers; lateral very short racemes. This plant is a tree 60 feet in height, and is a native of the Caribbee Islands. It has white, sweet scented flowers, and a green fruit something like the cornelian cherry, which contains a white solid kernel. An oil is expressed from the seed for domestic uses and for burning in lamps. The timber is used for various purposes especially for staves and cask-headings. Lindley says that the commercial product known as "the true East Indian Tacamahaca is produced by the Calophyllum calaba." There are, however, several gums brought into the market under the name of Tacamahaca, of which formerly more was used than at the present day. The 'Tacamahaca seu Resina Tacamahaca' of the old Pharmacopœias appears to have been the produce of the *Elaphrium tomentosum* and *E. excelsum*, plants belonging to the natural order Amyrideæ. It is described as a resin of a brownish yellow colour, spotted with white, easily broken into pieces, which have a shining fracture, easily melting in the fire, and having a pleasant scent. Cullen says that it was not employed in his day "as an internal medicine; and as an external I cannot perceive its virtues." It was used for making plasters as a counter irritant, for which there are forms in the continental Pharmacopœias at the present day. There is however another form of Tacamahaca-in-Shells? It has got this name from being collected in little gourd-shells. This is the true East Indian Tacamahaca, which is collected from *C. Inophyllum* in the East Indian Islands and from *C. Tacamahaca* in Madagascar and the Mauritius. *C. Brasiliense* yields an acrid aromatic lemon-scented resin.—*Eng. Cyc. p.* 723.

(2299) CALOPHYLLUM INOPHYLLUM.

Guttiferæ, Icon. 77.

Alexandrian Laurel, ENG.	Ponna chettoo. TEL.
Pinnay marum, TAM.	Sultana champa, HIND.
Wooma mara, CAN.	

The beauty of the leaves has given name both to the genus and species—Calophyllum, *handsome leaf*, and Inophyllum, *fibre leaf*, "because the middle nerve of the leaf seems to ramify into a multitude of fibres;" while the flowers are in elegant white bunches, and very sweet scented. —*Mason*. Calophyllum *inophyllum* has oblong or obovate obtuse leaves, usually emarginate; round branches; loosely racemose flowers; racemes axillary, 1-flowered; usually opposite peduncles. This tree is a native of the East Indies, and often attains a height of 90 or 100 feet. It has large handsome leaves like those of a water-lily, snow-white fragrant flowers, and a fruit about the size of a walnut.—*Eng. Cyc. p* 723. The Alexandrian Laurel, grows to a considerable size on the Malabar Coast, but is a still larger tree on the island of Balambangam and along the shores of Banguey and Sampanmangio where it has got the names of Palo-Maria and Dancawn. *Ainslie*. It occurs in all parts of India, and is in flower and fruit most part of the year. The tree is worthy of attention, as it grows well in sandy tracts close to the sea, where few others thrive, it is rare at a distance from the Coast. In the alpine forests, it attains a great size and it is said furnishes the poon spars so valuable for shipping; so far as Dr. Wight can learn, there are two or three species of calophyllum used for the same purpose under the general name of poon.—*Wight*. It is a common plant in Malabar, where it yields fruit twice a year, in March and September, and frequently attains the age of 300 years. It is cultivated in Java for the sake of its shade and the fragrance of its flowers.—*Eng. Cyc*. It is also common in the Philippine islands, where the natives prepare oil from the fruit of it in the same manner as is done in Malabar.—*Ainslie*. Near the Burman monasteries, this fragrant flowered species of Calophyllum is occasionally seen in cultivation, and is a remarkably handsome tree.—*Mason*.

The flower.

Pinnay poo, TAM.	Ponna poo, TEL,
Surpunka phool, HIND.	Poonaga, SANS.

This fragrant and delightful white flower is the produce of this most beautiful tree. It is held in great veneration by the Hindoos who offer it at the shrines of both Sheva சிவன் and Vishnu விஷ்ணு.—*Ains. Mat. Med. p.* 159.

The oil.

Pinnacottay TAM.	Pinnay yennai, TAM.
Poon-seed Oil, ENG.	Pinnay noona, TEL.
Calophyllum inophyllum,	Surpun ka Tael, HIND.

The seeds or berries contain nearly 60 per cent. of a fragrant, fixed oil, which is used for burning as well as for medicinal purposes, being considered a cure for the itch. As commonly prepared, it has a dark green color. It is perfectly fluid at common temperatures, but begins to solidify when cooled below 50 degrees.—*Simmonds' Com. Products, p.* 5 3. It is the fresh seeds when shelled, and subjected to pressure which yield this dark green oil. Old seeds yield a higher colored and thicker product. In the year 1847-48, Galls. 3,871 of the oil, and cwt. 508 of the seeds, were shipped from Madras chiefly to Ceylon and the Straits. It has now ceased to be an article of export. In Tanjore 437 acres producing on an average 24⅝ collums per acre of seed are covered with this tree: this yields 267¼ maunds of oil at Rs 20-4 per maund. In Tinnevelly, it costs As. 4-8 and Trichinopoly As. 4 per seer. In Tanjore, it is used for lamps, and for caulking vessels, but it appears to be chiefly valuable as a medicine. It is seldom procurable in the bazar, but is expressed when required at the Madras Exhibition of 1855, excellent samples were shown by Mr. Kohlhoff, from Tinnevelly and Travancore, the Tanjore Local Committee, Cochin and Madras:—Also from Canara, under the name of "Honay," from Goa by the name of "Oleum unda," from Cochin called "Perun Poonak," and from Masulipatam. When the trunk of this tree is wounded it exudes a yellow viscid juice, which frequently hardens to the consistence of a gum.—*Eng. Cyc*. And according to Dr. O'Shaughnessy, the roots yield a resin, deemed the same as the Bourbon *Tacamahaca*. The balsam seems analogous to myrrh, and is useful in indolent ulcers—*O'Sh*. The bark and the exudation are used for medicinal purposes.—*Eng. Cyc. page* 723. The seeds are bitterish. In Java the tree is said to be diuretic.—*O'Sh*. This large tree is common on the Western Ghauts where the wood is much used in house, and to some extent in ship building. The wood is coarse grained, strong, durable and ornamental. Mr. Dalrymple tells us, that no tree is superior to this for knees and crooked timber.—*Ainslie*.

(2300) CALOPHYLLUM LONGIFOLIUM

Thar-rabee, BURM.

In Pegu this is found near towns, together with two other species of the same genus, which are of smaller growth. Its wood is red, and adapted to cabinet making. The *Calophyllum longifolium*, from its size, may be reckoned among the timber trees of the province. It affords an oil-seed, which would yield an oil probably similar to that of *C. inophyllum*, which is known in Madras as *Pinnacotay oil* (*vide* list of oil-seeds circulated for information by the Madras Government, November 1854.) This tree, together with *C. inophyllum* and *C. lanceolaria* is cultivated for the fragrance

of its flowers. The seeds are large and contain a considerable proportion of oily matter, which possesses much of the aroma of the flower.—*McClelland.*

(2301) CALOSANTHES INDICA, *Bignoniaceæ*, Icon. 1337. Pana woodachie marum, *Tam.* Said to be a very soft and juicy wood, of no value.

(2302) CALOTROPIS.

Arka and Akund, SANS.	Ashur. ARAB.
Ak, Mudar, and Muddar, HIND.	Yercum, TAM.
	Tamella Jilladdoo, TEL.

In the Southern, as in the Northern parts of India, there is met with in considerable quantities in all uncultivated, and encroaching even on cultivated grounds, two species *Asclepias* now *Calotropis gigantea*, and *C. Hamiltonii* (*Asclepiadeæ*) of a plant with broad, rather fleshy, glaucous-coloured leaves; and which, on being wounded, gives out a milky juice from every part. The former of these is called *Ak* and *Mudar* in Northern, and *Yercum* in Southern India. Its juice and the powdered bark of its roots, have long been employed as an alterative, by the natives of India, in leprosy and other cutaneous affections, and are no doubt possessed of active properties. Dr. Duncan obtained from it a principle which he called *Mudarine*. In Arabic authors on Materia Medica it is even supposed to have been known to the Greeks. It has long been famous for yielding a kind of Manna, which is called *Sukkur-al-ashur*, and *Ak* or *Mudar ke shukur* (sugar). ('Himal. Bot.,' p. 275.) Lately its milky juice has been collected by making incisions into the plant, and prepared as a substitute for Caoutchouc and Gutta Percha. (*v.* 'Journ. of the Agri-Hortic. Soc. of India,' viii, pp. 107 and 226.) Dr. Riddell calculated that ten average sized plants will yield as much juice as will make a pound of Gutta-Percha-like substance. This is evaporated in a shallow dish, either in the sun or in the shade; when dry, it may be worked up in hot water with a wooden kneader, as this process removes the acridity of the gum. It becomes immediately flexible in hot water, but is said to become hard in cold water, and is soluble in oil of turpentine, takes impressions, and will no doubt prove a valuable product, either alone or mixed, with other substances. It is however a conductor of electricity. Mr. Moncton, C. S., has proposed making use of the downy substance contained in the follicles of the Mudar: and, indeed, has had paper made of it, as well pure as when mixed with two fifths of the pulp of the Hemp (Sunn ?), such as the natives use for making paper. As the glossy and silky, but comparatively short fibre, is difficult to spin, a mixture of one fifth of cotton was made, in order to enable it to be worked. A good wearing cloth, which stands washing and takes a dye, was produced. It is, however, well suited for stuffing pillows or coverlets. Mr. Moncton calculated that its cost would be one rupee a maund. This silky down of the pods is used by the natives on the Madras side in making a soft, cotton-like thread. The Mudar, Mr. Moncton observes, grows all over India; it seems to thrive on soils that either reject or destroy everything else. It is difficult to conceive anything less productive than dry sand, and yet the Mudar thrives in it. Should its cotton be found useful, the waste lands of India could be covered with it, as it requires no *culture* and no *water*. It comes to maturity in a year, but is perennial; and when once planted or sown, would require no further care; and where thickly planted, might be made the means of reclaiming poor soils, as the leaves and some of the upper branches rot, while the root and stem remain. Col. Tremenheere, of the Engineers, has suggested that the Mudar should be used as a hedge to protect desert land brought under cultivation from the encroachment of drift sand. This would give a healthful impetus to the cultivation of the plant itself.—*Royle.* Writing of the Calotropis, Dr. Hooker says, the *mudar* plant was abundant here, but I found that its properties and nomenclature were far from settled points. On the banks of the Ganges, the larger, white flowered, subarboreous species prevailed; in the interior, and along my whole previous route, the small purple-flowered kind only was seen. Mr. Davis, of Rotas, was in the habit of using the medicine copiously, and vouched for the cure of eighty cases, chiefly of leprosy, by the *white mudar*, gathered on the Ganges, whilst the purple of Rotas and the neighbourhood was quite inert: Dr. Irvine, again, used the purple only, and found the white inert. The European and native doctors, who knew the two plants, all gave the preference to the *white*; except Dr. Irvine, whose experience over various parts of India is entitled to great weight.—*Hooker Him: Jour. Vol.* I. *page* 86. It is a plant yielding a very excellent fibre. Of this, some beautiful specimens were sent to the Exhibition of 1851, by Dr. Wight, who made experiments upon its great strength. The late Dr. Stocks enumerated it among the cordage plants of Sindh; and Capt. G. J. Hollings, Deputy-Commissioner of Leia, in the Punjab, has published an account of this fibre being used for fishing nets, and as cordage, at Dehra Ghazee Khan, on the Indus. The species, however, is not the same in all these places. *Calotropis gigantea* is that common in the Southern, and *C. Hamiltonii* in the Northern parts of India, and *C. procera* in Persia; the last extends even to Syria. The mode of separation of the fibre is tedious, and may for the present oppose some obstacles to the ready supply of this material. Capt. Hollings states that the sticks of the Mudar were cut about twelve or eighteen inches in length; the outer bark was then carefully peeled

off, and the fibre picked from the inner part of it. Several threads were then placed side by side, and twisted into a twine by rubbing them between the hands. No water is used (indeed it is injurious); everything is done by manipulation. In a subsequent paper, Capt. Hollings observes, that the best plan is to select the straightest branches, which are always the largest; to let them dry for at least twenty-four hours, before any attempt is made to separate the fibre. On the second or third day the sticks are slightly beaten, especially at the joints, which ensures the bark, with the fibre attached, being peeled off without breaking. The workmen then bite through the bark, about the centre of its length; they then hold the tissue of threads in one hand, and separate the bark with the other. He did not find that any of the ordinary methods of separating fibre were useful; but it is probable that some of the mechanical methods of separating Flax would be effectual with this fibre when in a dry state. Dr. Wight's specimens, which are of those of *C. gigantea*, he describes as being merely stripped off from the stalk, and slightly prepared, to remove the epidermis. He observes, that as it is a most common plant, it may become a valuable article of commerce, if a less costly mode of separating it can be devised, without injuring its quality. The colour, when fresh, is of a greenish-white. Dr. Wight, from his experiments, considered it the strongest fibre on the Madras side of India, where it is used for fishing lines. It bore 552 lb., when the Janapa or Sunn of Coimbatore bore 414 lb. A small cord, made of the specimens from the Punjab, examined by Captain Thompson, at Calcutta, bore 3 cwt., "without shewing symptoms of distress," and was therefore equal to the best cordage; but it seemed to him still better adapted for the purposes of Flax than of Hemp. Mr. Willis considered the fibre to possess extraordinary merit, which would be valued by spinners for use in their finer fabrics. So, when examined by practical men in Europe, it has been pronounced to be well calculated for supplying the place of good Flax, for making prime yarns. One gentleman observed that it twists all up at the end, and therefore could not be heckled. But this is probably owing to the mode of preparation; as the natives are described as twisting it between their hands. It was considered well worth £30, or rather £35 a ton. Capt. Thompson thought, in Calcutta, that it would be valued at from £30 to £40 per ton in England; perhaps more. Though the Mudar or Yercum fibre, from its fineness, seems well calculated to answer for many of the purposes of Flax; yet, from its strength, it is also well suited to supply the place of Hemp. In Royle's experiments, when Petersburgh Hemp bore 160 lb., and the Brown Hemp of Bombay and Jubbulpore Hemp bore 190 lb., the Yercum also bore 190 lb. Dr. Wight has given the following as the results of his experiments of the strength of Mudar fibre: —

Coir	224 lb.
Pooley Mungee (*Hibiscus cannabinus*)	290 ,,
Marool (*Sanseviera zeylanica*)	316 ,,
Cotton (*Gossypium herbaceum*)	346 ,,
Cutthalay nar (*Agave americana*)	362 ,,
Janapa (*Crotolaria juncea*), Sunn, hindee	407 ,,
Yercum (*Calotropis gigantea*)	552 ,,

In considering the varied useful properties of these plants, we cannot but be struck with the fact, of how wonderfully the Creator of all has furnished every part of the world with plants and animals suited to its diversified soils and climates. So that if the people residing near these barren places would make use of the natural riches within their reach, they have the means, by commercial interchange, of commanding comforts to which they are now strangers; and we might then apply literally the words of the Prophet: "The wilderness and the solitary place shall be glad for them; and the desert shall rejoice, and blossom as the rose." ('Isaiah,' xxxv, 1.)—*Royle Fib. Pl. p.* 306.

(2303) CALOTROPIS GIGANTEA. MUDAR.
Syn. Asclepias gigantea, *Linn.*

Madorius, RUMPH.	Jumakioos, GREEK.
Erich, RHEEDE.	Yerkum. TAM
Arka Akund. SANS.	Jilroo chettoo. TEL.
Ashur, ARAB.	Ak-ka jhar, Mudar, H.

This is a large shrub common in many parts of India, and cultivated in the Calcutta Botanic Garden.—*O'Shaughnessy, page* 453. Red Variety, Mudar, grows wild all over India. —*Riddle.* It will grow on barren sands, and it has been suggested to plant it as a barrier to drift sands. The late Dr. Duncan obtained from its juice a principle which he called Mudarine. It has long been famous for yielding a kind of Manna, which is called *Sakkur-al, ushur* also *Ak* or *Mudar ke shukker* and, lately, its milky juice has been collected, by making incisions into the plant, and prepared as a substitute for Caoutchouc and Gutta Percha. Dr. Riddell calculates that the average sized plants will yield as much juice as will make a pound of Gutta Percha-like substance. This is evaporated in a shallow dish either in the sun or in the shade; when dry, it may be worked up in hot water with a wooden kneader, as this process removes the acridity of the gum. It becomes immediately flexible in hot water, but is said to harden in cold water, and is soluble in oil of turpentine; takes impressions: is not, however, a non-conductor, like Gutta Percha, but will no doubt form a valuable product either alone or mixed with other substances.—*Royle Fib. Pl.* The milky juice is also said to be used for tanning.—*Simmonds.* The follicles, when ripe, contain a fine silky down which has been spun and converted into cloth.—*M. E. of* 1857. Latterly the silky cotton like substance, which fills its pods, has been wove into cloth,

with sufficient success to encourage further trials. The down-like substance has been made into paper, and is well suited for stuffing pillows.

Fibre of the Yercum.

Jillade nara, TEL. Aku HIND.	Yeroocum nar, TAM.

Rope or Coir.

Toondee coir, TAM. Galum Taroo, TEL.	Lamb-dore, HIND.

The soft, white fibre, though till lately unknown in England, has long been so to the Natives of India. The plant which furnishes it being one of the most common all over the country. Were a cheap and easy mode of separating the fibre from the bark discovered, it might become a valuable article of export on account of its great strength.—*Wight.* It is susceptible of being spun into the finest yarn for cambric. Of two ropes made of the fibre, a piece of one, about 7 feet long, sustained for some time 540 lbs. and broke with 552. This was found the strongest of the cordage fibres tried in the Coimbatore district, and would doubtless be much used if more were easily procurable, the shrub being most abundant.—*Wight.* The fibre is used everywhere in Asia to make fishing lines, being of extraordinary strength, and it is even considered better adapted for cloth than for cordage. The strength of the fibre exceeds that of all other vegetable substances, as the following experiments, of a three strand $\frac{3}{8}$ inch rope, will show.

	Weight sustained.
1 Coir (Cocos nucifera), ...	224 lbs.
2 Pooley Manjee (Hibiscus Cannabinus),	290

7 Yercum nar (Calotropis gigantea), ...	552

Its fibre is valued at £30 to £35 a ton. The leaves warmed and moistened with oil are used by the Natives as a discutient —*Riddell.* In the Tenasserim Provinces, the mudar plant is propagated for its medicinal properties, which are said to be very numerous, and European practitioners recommend the juice of the plant in cases of leprosy above all other preparations. There, two varieties occur, one with a cream-coloured flower, and another with a black and purple tinge.—*Mason.* At the Madras Exhibition of 1855, among the manufactures from flax, hemp and their substitutes were a few novel and interesting fabrics, some of which have been made expressly for this Exhibition. The finest of these was Cambric made from the fibres of the Yercum or Calotropis gigantea exhibited by Mr. Underwood. This cambric was of very fine quality and suited for pocket handkerchiefs or collars. A prize was awarded in another class to the maker of a ladies' embroidered handkerchief manufactured from yercum fibre. These specimens were sent to the

Paris Exhibition. A very fine dressed and corded Flax from the fibres of the Calotropis gigantea was exhibited by Mr. F. Crampton, Madras, and by the Madras School of Industrial Arts. The Cuddapah Local Committee also contributed very clean white and strong fibres, thread and cloth from the same fibre.—*M. E. Juries Reports.* Dr. Honigberger (p. 247) states that the Calotropis gigantea grows profusely in all parts of the Punjab; and that in some countries it attains the size of a small tree. Amongst the ruins of the old city of Lahore, nearly the whole vegetation consists of Calotropis and Harmala Ruta. The charcoal made from this root was usually employed in the gunpowder manufactories of the Punjab. The native doctors use the leaves, the buds, the bark of the root as well as the milky juice of the Calotropis: the root is used in cancer. Dr. O'Shaughnessy, writing on the medicinal properties of this plant, states that the root, bark, and inspissated juice are used extensively for their emetic, diaphoretic, and purgative properties which have been known for many centuries to the Indian practitioners, and have of late attracted much notice from European physicians. The dried bark of the root is of a greyish yellow colour; heavy and very peculiar smell, acrid, nauseous. This principle was termed *mudarine* by its discoverer Dr. Duncan. The powdered bark of the root in doses of from $\frac{1}{2}$ a drachm to one drachm proves emetic after an interval of from 29 minutes to an hour, generally causing much nausea, and in about one case in every three inducing a cathartic operation. In doses of from 2 to 5 grs. taken every half hour, it proves nauseant, powerfully diaphoretic, and after several doses gently cathartic. On the whole this preparation may be deemed one of our best substitutes for ipecachuana, producing similar emetic and diaphoretic results; combined with opium it affords a good representative of the Dover's powder of the British Pharmacopœiæ. In dysentery it may be very safely substituted for ipecachuan in Mr. Twining's and other formulæ, about twice the quantity being used in each dose.—In India medicine the powdered root, bark, and the dried milk are used in small doses in a multitude of disorders, and enjoy high reputation as alteratives in the treatment of lepra, elephantiasis, secondary syphilis, and in several spasmodic diseases. The clinical experiments of Mr. Playfair, Dr. Duncan, and Dr. Royle, leave no doubt of the bark of the root being really efficacious in incipient leprosy, and in numerous diseases of the skin. Mr. Playfair's Essay occurs in the Transactions of the Med. Society of Calcutta. The results of Dr. Duncan's chemical experiments appear in the "Lancet" vol. 1829-30.—*O'Shaughnessy, pages 453 and 454.* The compound powder of this plant, is an excellent substitute for Dover's powder, but in preparing it, we require to substitute for ipecacu-

anna twice the quantity of the powdered mudar. When a supply of ipecacuanha is not obtainable, this drug will be found a moderately good substitute. Many practitioners attribute to the mudar specific utility in the treatment of several cutaneous diseases and leprosy.—*Beng. Phar. page* 405.

(2304) CALOTROPIS HAMILTONII, Wight. This is the most common species in the upper provinces of India, and obtains the same native names as the true mudar. By Dr. Royle's experiments and those of Dr. O'Shaughnessy, the bark of the root and the dried milk possess similar properties to those of the C. gigantea; iti s, however, far inferior as an emetic remedy. According to Dr. Wallich, this and C. gigantea are the same species.—*O'Shaughnessy, page* 454.

(2305) CALOTROPIS PROCERA, Persia and Arabia. *Syn.* Asclepias procera, *Hort. Kew.* Ascl. gigantea. *Bot. Rep.* Beid-el-sar. *Prosper Alp.* A shrub, much resembling C. gigantea, juice extremely acrid, used to remove hair from the skin, and as an external remedy in ringworm, and several other cutaneous diseases. A kind of manna named Shukr-ul-ashur is produced on this or some nearly allied species by the puncture of an insect called *Gattigul*, (Royle Illustr. p. 275.)—*O'Shaughnessy, page* 454.

(2306) CALPICARPUM ROXBURGHII. PERIWINCLE TREE. *Syn.* Cerbera fructicosa; this is a handsome shrub almost constantly covered with blossoms, that can scarcely be distinguished from the flowers of the rosy-periwincle, though of a different genus. It was first discovered in Burmah, and Roxburgh, who introduced it into the Botanical Garden of Calcutta, said in his description: "The flower is like those of *Vinca rosea*, but larger and faintly fragrant; it is in fact one of the most ornamental shrubs in the garden."—*Mason.*

(2307) CALYPTRANTHES CARYOPHYLLIFOLIA. Willd. Swartz. *Myrtaceæ.*

The tree.

Jamoon, HIND.	Nawel marum, TAM.
Nawel wood, ENG.	Neredie chettoo, TEL.

The fruit.

Nawel pullum, TAM.	Nuwel fruit, ENG.
Jamoon ka phull, DUK.	Kaka jemboo, SANS.
Neredie pundoo, TEL.	

These are large growing timber trees, the wood is light, and chiefly used for making grain measures. It is also made into carriage frames, cots &c.—*Ains. Mat. Med. p.* 206. The bark is astringent, and is used in a decoction by the natives for dysentery.—*Riddell.* The fruit when ripe, is of a very dark purple colour, and about the size of a large cherry. In taste it somewhat resembles the sloe, but is much sweeter.—*Ainslie, page* 229.

(2308) CALYPTRANTHES CARYOPHYLLIFOLIA. Variety.

Vullay nawel pullum, TAM.	Tella neredie pundoo, TEL.
Oojla jamooon ka pull, DUC.	Sweta jemboo, SANS.

This variety of the Nawel pullum fruit is nearly similar to it in natural qualities and has got its names from being of a different colour (white).—*Ainslie, page* 235.

(2309) CALYPTRANTHES JAMBOLANA.

Jamoon, HIND.	Turkolum, TAM.

This is a large and handsome tree, which flowers in February and March, and thrives in any good soil. The fruit of the best sort is as large as a common blue plum, which it resembles in appearance; it has a rough astringent flavour, and should be soaked in salt and water before it is eaten. The fresh stone if planted grows immediately.—*Riddell.*

(2310) CAMBESSEDEA OPPOSITIFOLIA. *Syn.* Mangifera Oppositifolia. Opposite-leaved mango. This indigenous tree of Tenasserim produces a fruit much like a plum. There are two varieties, one bearing an intensely sour fruit, and the other one as insipidly sweet.—*Mason.*

(2311) CAMBRIC.

Kameryksdoek, DUT.	Cambraja, IT.
Cambray Batiste, FR.	Cambraia, PORT.
Kammertuch, GER.	Cambrai, SP.

A fine linen fabric, first made at Cambray in French Flanders, whence it derives its name. It is now manufactured, of a superior quality, in England and Scotland.—*Faulkner.*

(2312) CAMELLIA, a genus of plants belonging to the natural order *Ternstromiaceæ*, and nearly related to the plants which yield the tea of the shops. All the species are natives of China and Japan, or of corresponding climates in the north of India, whence they have been introduced into Europe. *C. Japonica*, a species with broad shining leaves, and red flowers, is the original of the numerous beautiful varieties now so common in British gardens. The principal part of these have been raised by the skill of the Chinese or Japanese, and are remarkable not only for their gay colours, but for the great symmetry with which their petals are arranged, the flowers when seen in perfection resembling nothing so much as beautiful shell-work. The sorts that have been raised in England are in most instances inferior to the Chinese in symmetry, but they occasionally surpass them in richness of colour. They are multiplied by cuttings, grafts, and buds, and also by seeds, which the Waratah and some single sorts produce in plenty. The other species of *Camellia* in our gardens which deserve notice are, the *C. maliflora*, the Apple-Blossomed Camellia, which is probably a mere variety of the last; *C. Oleifera*, whose seeds yield a valuable oil in China; and *C. Reticulata*, which is by far the handsomest

of all. The leaves of this species are very remarkably netted, and the semi-double flowers, which are sometimes as much as six inches across, are of a deep rich rose-colour.—*Engl. Cyc. page* 728.

(2313) CAMELLIA JAPONICA. Its elegant flowers are as much admired by the people of China, its native country, as by florists abroad. The Chinese enumerate thirty or forty varieties, for each of which they have a separate name, many of these varieties are unknown out of China and Chinese gardeners are likewise ignorant of a large proportion of those found in Western conservatories. This elegant flower is cultivated solely for its beauty, but there are other species of Camellia raised for their seeds, the oil expressed from them being serviceable for many household and mechanical purposes. The Camellia bears the same name that the tea plant does, and the term "cha" is likewise employed, as tea is with ourselves, to designate any infusion.—*Williams' Middle Kingdom p.* 285.

(2314) CAMEL'S HAIR.

Poil de Chameau, Laine de chevron, Fr.	Pelo di Camello, It.
Kameel-haar, Ger.	Moo-i-Shutur, Pers.
Oont-ka-bal, Hind.	Peló o lana de Camello, Sp.

In England, Camel's hair is principally used in the manufacture of pencils for painting; and in the East it is woven into clothing, tents, ropes, &c.—*Faulkner.*

(2315) CAMELUS.

Gamal, Heb.	Cammello, It. & Sp.
Djemel, Arab.	Kameel, Ger.
Κάμηλος, Gr.	Chameau Fr.
Camelus, Lat.	Camel, Eng.

A genus of ruminant animals without horns. It includes two species, *Camelus Bactrianus*, the Camel, and *Camelus Arabicus*, the Dromedary. The existing peculiarities of form in this genus lead to the opinion that the Camels and the Llamas form the link between the *Ruminantia* and *Pachydermata.—Engl. Cyc. p.* 728. The two species of Camel were well known to Aristotle, who, in his 'Natural History' (ii. 1), mentions both the Arabian and the Bactrian, remarking that the latter has two humps, whereas the former has but one. The organisation of the Camels is wonderfully adapted to their habits and uses to man.—*Engl. Cyc. p.* 729.

(2316) CAMELUS BACTRIANUS (Linn.), the Mecheri, or Camel. It is the *C. Ditophus* of Walther, *C. Turcicus* of Alpinus, the Bactrian Camel of Pennant, Le Chameau of Buffon, and the Trampeltheir of Knorr. It has two humps on the back. Length about 10 feet. Hair shaggy, particularly under the throat. Colour generally dark-brown. Localities, Persia, Turkey, &c.—*Engl. Cyc. page* 732.

(2317) CAMELUS DROMEDARIUS (Linn.) the Sghinel, or Dromedary. It is the *C. Luk* of Eversmann, *C. vulgaris* of Forskal, *C. monotophus* of Walther, *C. Dromas* of Gesner, *C. minimus* of Klein, *C. vetus* of Frisch, the Arabian Camel of Pennant, and Le Dromedaire of Buffon. It has one hump, situated on the middle of the back. Length about 8 feet. Hair pale brown. Localties, Arabia, Africa, &c. Purchas (book vi., c. 1, 8. 9) says that of camels there are three kinds; the first called Huguin, of tall stature and able to carry a thousand pounds weight; the second less, having a double bunch, fit for carriage and to ride on, called Becheti, bred only in Asia; the third sort, called Raguahill, small, able to travel (for they are unfit for burdens) above an hundred miles in a day. The king of Timbuctoo can send messengers on such camels to Segelmesse or Dasha.—*Engl. Cyc. p.* 732. A fossil species, *C. Sivalensis*, of this genus was discovered by Dr. Falconer and Captain Cautley in the Tertiary deposits of the Sewalik Hills of Hindustan. The crania, jaws, and teeth of this species are to be seen in a fine state of preservation in the British Museum. It was nearly related to the existing species, but exceeded them by at least one-seventh in height.—*Engl. Cyc. page* 733.

(2318) CAMLET.

Kamelot, Dut.	Ciambellotto, It.
Camelot, Fr.	Kamlot, Rus.
Kamelot, Ger.	Camelote, Sp.

A light stuff, made of long wool hard spun, sometimes mixed in the loom with cotton or linen yarn.—*Faulkner.*

(2319) CAMOENS. The Cave of Camoens, where the Portuguese poet is supposed to have written a portion of his Lusaid, is a place of universal interest and resort at Macao. It is picturesquely situated upon the summit of a small hill, on the margin of the inner harbor. Large granite rocks are here gathered in a confused cluster, which form a natural cave, from the entrance of which there is a wide prospect of the surrounding country. The banians, the pagoda, and other oriental trees unite their foliage and form a grove in which the rocky cave is embowered. Surrounding it are grounds cultivated with trees, creeping vines and flowering shrubs, charmingly arranged by the borders of winding paths, and upon the sides of the hills. Artificial terraces, ingeniously disposed, invite the visitor to the enjoyment of the view or to rest beneath the shade. Above the cave rises a rotunda, from which there is an enchanting prospect, and a marble monument, with a bronze bust and an inscription here record the fortunes, the genius, and virtue of Camoens, the poet. Camoens' visit to Macao was during his banishment from Portugal, in consequence of his pertinacious courtship of a lady of rank, whose parents did not affect an alliance with the poet, who, although of a respectable family, was poor, and looked upon as an uncertain adventurer,

In 1551, he proceeded to Goa, in India, where he again involved himself in trouble by writing his "Absurdities of India," and was banished to the Moluccas, and in the course of his exile he resorted frequently to Macao, which was a favorite residence of the poet. The cave was his chosen spot of retirement, where, in its "sweet retired solitude," he meditated his great work, the Lusaid. Camoens returned to Portugal, but only to live in misery and die in an hospital.—*American expedition to Japan, page* 165.

(2320) CAMOMILE.

Ehdakl-mirzie, ARAB.	Camomilla, IT.
Baboone-ka phul, DUK.	Chamomilla, LAT.
Camomile, FR.	Babooneh-gow, PERS.
Romische hamiller, GER.	Manzanilla, SP.
Baboone-ka-phul, HIND.	Chamaindoo-poo, TAM.

A useful herb, a native of Europe and Persia, and grows plentifully in most parts of Great Britain. It is celebrated as a tonic and stimulant, an infusion of the flower heads being much used in domestic medicine.—*Faulkner.*

(2321) CAMPANULA. *Campanulaceæ.*—This genus of plants are cultivated for the flower garden. It includes the Canterbury-bell and Venus's looking glass, and is well known for its ornamental beauty and profusion of flowers. All the species grow freely in any soil and are propagated by seed and dividing the roots.—*Riddell.* The species of *Campanula* seldom succeed in Madras. They should be raised from seeds sown during the rains; the seed requires care, being very small.—*Jaffrey.*

(2322) CAMPANULA EDULIS, Chobs, Okab, is a hispid plant with a thick root, erect one-flowered stems, ovate-lanceolate crenate leaves; lobes of the calyx linear-lanceolate, equal in length to the corolla, which is hispid. It is a native of Arabia Felix. Its root is thick and sapid, and contains a considerable quantity of starch. It is on this account frequently eaten by children, as are the roots of many other species. —*Eng. Cyc. page* 733.

(2323) CAMPANULA LILIFOLIA (*Adenophora lilifolia*, Ledebore) has alternate leaves, the radicle ones petiolate, ovate-roundish, cordate toothed; the corolla campanulate, the style exerted. It is a native of Siberia, and of the east of Europe. Like many others of the genus it has an edible root, which is sometimes divided into several turnip-formed tubers. The flowers are numerous and sweet-scented. It is interesting from the fact that the leaves before blossoming are crowded together on the summit of the stem, so as to form a green rose-like body. But as the axis elongates, the leaves become afterwards scattered on the prolonged stem. The roots are eaten in China both raw and cooked. The other British species of this genus not described are *C. latifolia*, great Bell-Flower, common in the North; *C. Rapunculoides*, very rare; and *C. patula*, frequent in hedges and thickets. *Eng. Cyc. page.* 734.

(2324) CAMPHOR.

Kafoor, ARAB.	Kaafur, MALAY.
Kapur, BALI.	Kafoor, PERS.
Capooroo, CYNG.	Alcanfor, PORT.
Camphre, FR.	Kamfora, RUS.
Kampfer, GER.	Kapoor, SANS.
Kapoor, GUZ. & HIND.	Alcanfor, SP.
Canfora, IT.	Carpoorum, TAM & TEL.
Camphora, LAT.	

Camphor is a principle found in many plants, but only in two in any great abundance. Like several substances the produce of countries to the southward or eastward of India, Camphor was unknown to the ancients. (Hindoo Med. p. 93.) It was known to the Arabs, and called by them *Kaphoor*. The Camphor tree, Camphora Officinarum, *Nees v. Esenbeck*, (*Laurus Camphora*, Linn.) is an evergreen tree, grows to a considerable size, is straight below and branched. All parts emit a camphoraceous odour when bruised. Wood white, fragrant, much used in China for making trunks, boxes, &c. Branches somewhat lax, smooth, with a greenish bark. Leaves alternate, with long petioles, ovate-lanceolate, rather coriaceous, smooth, shining, and bright-green above, paler beneath, triple-nerved, with a sunken gland opening by a pore beneath, at the axils of the principal lateral veins. Leaf-buds scaly. Flowers small, hermaphrodite, smooth externally, in naked, axillary, and terminal corymbose panicles. Perianth 6-cleft, with a decidous limb. Fertile stamens 9, in 3 rows, the 3 inner supported at the base with 2 stipitate compressed glands. Anthers 4-celled, opening by as many ascending valves, the 3 interior looking outwards, the others opening inwards. Three sterile stamens subalternate with those of the second row, three others stipitate, each with an ovate head. Drupe situated in the truncate cup-like base of the perianth. It is a native of China principally near Chinchew in the province of Fokien; also of Formosa and Japan.—Nees von Esenb. 130. St. and Ch. 129. Mr. Williams states it is found in Kwangsi, Fuhkien, Formosa, and Cochin China, and affords both timber and gum for exportation and domestic use. The tree itself is large, and furnishes excellent planks, beams, and boards, for building vessels and making trunks and other articles, and the preparation of Camphor, sawing of the timber, and the construction of trunks, articles of furniture, and vessels in whole or in part, occupies great numbers of carpenters, shipwrights, and boat-builders.—*Williams' Middle Kingdom, Vol.* II. *page* 137. Camphor is diffused through all parts of the plant, and is separated from the root, trunk, and branches, which when cut into chips, are boiled in water and then sublimed into inverted straw cones contained within earthen capitals. It is thus obtained in the form of *Crude Camphor*, chiefly from

the province of Fokien and the opposite island of Formosa, but some of good quality is also procured from Japan. The Dutch exported from thence into Europe 310,520 lbs. in seven years. It is sometimes imported into Britain from Batavia. The ordinary Crude Camphor is in small greyish-coloured, slightly sparkling grains, which by aggregation form greyish crumbling cakes, with all the properties of purified Camphor. This is separated from impurities by being mixed with lime and sublimed in thin glass vessels, which being afterwards cracked, the Camphor is obtained in a concavo-convex cake about three inches thick with a hole in its middle. Camphor is solid, colourless, and translucent, with a crystalline texture, has a strong, penetrating, aromatic odour, and a bitter, rather pungent taste, followed by a sensation of coolness : though brittle, it is not, from its toughness, easily pulverized. Sp. Gr. ·98 to ·99 ; so that it floats on water, and, evaporating, produces a circulatory movement. From its volatility, it volatilizes at ordinary temperatures, and crystallizes on the inside of bottles.—*Royle.* Another kind of Camphor, the Camphor of Sumatra, is procured from the stem of a large tree, the *Dryobalanops Camphora*, Colebrook ; *D. aromatica*, Gaertner. It is a large forest tree, as far as is known, confined to a few parts of the islands of Sumatra and Borneo, but in these abundant. It is secreted in crystalline masses naturally into cavities of the wood. It supplies this camphor only after attaining a considerable age. In its young state it yields, however, by incision, a pale yellow liquid, called the liquid camphor of Borneo and Sumatra, which consists of resin and a volatile oil having a camphorated odor. An account of this tree, and of the mode of procuring the peculiar and high-priced camphor which it yields, is given by Dr. Junghuhn, who has travelled lately in Sumatra, and Prof. De Vriese, of Leyden, in the "Nederlandsch Kruidkundig Archief" for 1851. An abstract of the memoir, translated into English by Miss De Variese, is published in "Hooker's Journal of Botany" for February and March 1852:—The Dryobalanops is a gigantic tree, rising for fifty or even a hundred feet above those which compose the chief mass of the forests where they grow, just as the steeples of the churches appear above the roofs of the houses in a town. The trunks of the full-grown trees are from 7 to 10 feet in diameter at the very base, and from 5 to 8 feet higher up; they rise to the height of 100 or 130 feet, and their ample crown is from 50 to 70 feet in diameter. The tree has a limited range, being confined to the seaward slope of the mountains of south-western Sumatra, most abundant on the lower slopes and the outlying hills of the alluvial plain, and extending in latitude from 1 deg. 10m. to 2 deg. 20m. N., and perhaps further to the north. Camphor oil occurs in all the trees, and is most abundant in the younger branches and leaves. The solid camphor is found only on the trunks of older trees, especially in fissures of the wood, and in smaller quantity than is generally supposed. Colebrooke, and authors who have copied from him, assert that camphor is found in the heart of the tree in such a quantity as to fill a cavity of the thickness of a man's arm, and that a single tree yields about eleven pounds. The price of this camphor, which at Padang sells for about 340 dollars per hundred weight, suffices to show that the account is much exaggerated. The camphor occurs only in small fissures, from which the natives, having felled the trees and split up the wood, scrape it off with small splinters or with their nails. From the oldest and richest trees they rarely collect more than two ounces. After a long stay in the woods, frequently of three months, during which they may fell a hundred trees, a party of thirty persons rarely bring away more than 15 or 20 pounds of solid camphor, worth from 200 to 250 dollars. The variety and price of this costly substance are enhanced by a custom which has immemorially prevailed among the Battas, of delaying the burial of every person who during his life had a claim to the title of Rajah (of which each village has one) until some rice, sown on the day of his death, has sprung up, grown and borne fruit. The corpse, till then kept above ground among the living, is now, with these ears of rice, committed to the earth, like the grain six months before, and thus the hope is emblematically expressed that, as a new life arises from the seed, so another life shall begin for man after his death. During this time the corpse is kept in the house, enclosed in a coffin made of the hollowed trunk of a Durion, and the whole space between the coffin and the body is filled with pounded camphor, for the purchase of which the family of the deceased Rajah frequently impoverish themselves. The camphor oil is collected by incisions at the base of the trunk, from which the clear balsamic juice is very slowly discharged. In Sumatra the best camphor is obtained in a district called Barus, and all good camphor bears that local name, being known in Commerce as Brass Camphire, Borneo Camphor, Camphor of Baras, Malay Camphor, Bruss-capoor, *Guz.* and *Hind.* It appears that the tree is cut down to obtain the gum and that not in one tenth of the trees is it found. Barus camphor is getting scarce, as the tree must be destroyed before it is ascertained whether it is productive or not. About 800 piculs are annually sent to China. The proportion between Malay and Chinese camphor is as eighteen to one; the former is more fragrant and not so pungent as the latter. Nine hundred and eighty-three tubs of camphor were exported from Java in 1843 ; 625 bales were imported in 1843, the produce of the

Japanese empire, and 559 piculs exported from Canton in 1844. The price of unrefined camphor in the Liverpool market in July, 1853, was £4 to £4 10s. the cwt. There have been no imports there direct in the last two years.—*Simmonds.* Borneo camphor, as found in the wood of the Dryobalanops camphora, is in white crystalline fragments. Sp. G. 1.009. Its odour is not of so diffusable a nature, otherwise it closely resembles the camphor from the Camphora officinarum.—*Royle, page* 536. The wood of the camphor tree is good timber, suited for house and ship-building.—*Crawfurd Dictionary, page* 81. The liquid camphor of the same tree appears of the nature of Camphogen. Dr. A. T. Thomson, by passing a current of oxygen gas through it converted it into camphor.—*Royle.* The oil both in a fluid and solid state, is found in the body of the tree where the sap should be, but not in all trees. The liquid oil is abundant, and little appreciated, but the concrete bears a very high price, which depends wholly on its scarcity and the fancy of the Chinese and Japanese, who ascribe high medicinal virtues to it, which it probably possesses in no higher degree than the cheap article which they themselves obtain by the distillation of the wood of the Cinnamomum camphora, and which may be had in the same markets for about one hundredth part of the price. The Malay name is a slight corruption of the Sanscrit one, karpura. To distinguish it from the camphor of China and Japan, the wood Barus is annexed, being the name of the sea-port of the western coast of Sumatra, from which the article was principally exported from that island. From what Barbosa says, it is to be presumed that both the Malay and Chinese camphor were in use by the Hindus before the arrival of Europeans. The prices of the different sorts reduced to present Indian weights and moneys will be as they existed in Malabar and Calicut in the beginning of the sixteenth century, as follows: coarse camphor, in cakes (canfore grossa in pani), from 40 to 45 Spanish dollars, the picul of 133⅓ pounds, which is about double the present price at Singapore; camphor, to use internally, and for the eyes (canfora da mangiar, e per gl' occhi) 1360 dollars the picul, which is probably no more than 35 per cent. above existing prices in Singapore. There was also a sort used for anointing the idols (per ugner gl' idoli) at half the price of the last. These two must have been Malay camphor, while the first, from its low price, must have been Chinese or Japanese.—*Crawfurd Dict. page* 81. Another and new source of Camphor is the Blumea grandis, one of the most abundant weeds throughout the Tenasserim Provinces: It grows six or eight feet high with leaves like mullen, which, when bruised, emit a strong odour of camphor. Many years ago, the Tavoyers informed Mr. Mason that they were in the habit of making an impure camphor from the weed by a very simple process; but Mr. O'Riley of Amherst, was the first to make a good article from it, and to bring it to public notice. He made more than a hundred pounds, and the specimens which he sent to Calcutta were reported "in its refined form, to be identical in all its properties with Chinese camphor." The plant is so abundant, that these Provinces might supply half the world with camphor. Wherever the trees are cut down, this weed springs up, and often to the exclusion of almost every thing else: so that an old clearing looks like a field under cultivation. Mr. O'Riley sent flowering specimens of the plant to Dr. McClelland for identification, who forwarded them to Dr. Voigt of Serampore, and subsequently reported "Dr. Voigt states that it belongs to De Candolle's genus Blumea, and is, so far as he can see, a new species." It is without doubt the same plant as that which appeared in Wallich's Catalogue a quarter of a century ago, as *Conyza grandis*, and which De Candolle subsequently described as *Blumea grandis.* Wallich's specimens were from Tavoy, without flowers, and De Candolle describes the leaf as nine inches long with the petiole, by three wide, ("*cum petiolo* 9 *poll. longa*, 3 *poll. lata*") serrated, and bearing on the petiole five or six remote linear acute lobes, ("*petiolo lobulos* 5—6 *distantes lineares aculos gerentibus*") which corresponds very accurately with some specimens of this camphor plant, but it does not correspond to any other species of Blumea in the Provinces with which Mr. Mason is acquainted.—*Mason.* Camphor has been manufactured in Spain from several Labiatæ, and has been prepared artificially by passing a current of muriatic acid gas through turpentine; this last variety however has not been used in medicine. Camphor is not mentioned by the ancient writers; it was introduced into Europe about six centuries since, but it was previously known to the Arabs. The Camphor tree has been successfully cultivated in Europe, and Fée mentions one at Malmaison, over 20 feet high by 6 inches in diameter. There are several descriptions of the mode of obtaining Camphor from the *Camphora officinalis.* According to Ure, the wood is cut into small pieces and put, with plenty of water, into large iron boilers. which are covered with an earthen capital or dome, lined within with rice straw. As the water boils the camphor rises, with the steam, and attaches itself as a sublimate to the stalks, under the form of granulations of a grey color. In this state it is picked off the straw and packed up for exportation to Europe.—("Dictionary of Arts and Manufactures.") According to Tomlinson, the roots and wood of the tree are chopped up, and boiled with water in an iron vessel, to which an earthen head containing straw is adapted; and the camphor sublimes, and condenses upon the

straw. In China the chopped branches are boiled in water till the camphor begins to adhere to the stirrer: the liquor is then strained, and the camphor concretes on standing: it is afterwards mixed with a finely powdered earth and sublimed from one metallic vessel into another.—*Tom. p.* 288. Kæmpfer says that the Japanese camphor is made by a simple decoction of the wood and roots, but bears no proportion in value to that of Borneo. There is also an imitation of camphor in Japan, but every body can distinguish it from the genuine.—*Simmonds.* Two kinds of unrefined or crude amphor are known in commerce: 1. *Dutch* or *Japan camphor*, also called *tub-camphor*, from the circumstance of its being brought from Batavia (and reported to be the produce of Japan) in tubs, covered by matting, each surrounded by a second tub, secured on the outside by hoops of twisted cane. Each tub contains from 1 cwt. to 1¼ cwt. or more. It consists of pinkish grains, which by their mutual adhesion form lumps. It is of larger grain, clearer, and sublimes at a lower temperature than the second variety, which is known in commerce as, 2. *Ordinary crude camphor*, *China camphor*, and *Formosa camphor*. This is imported from Singapore, Bombay, &c., in square chests, lined with lead foil, and containing from 1¼ to 1½ cwt. It is chiefly produced in the island of Formosa, and is conveyed in junks to Canton, whence the foreign markets are supplied. It consists of dirty greyish grains. It varies in quality, but is sometimes as fine as the Dutch kind. Crude camphor very much resembles moist sugar before it is cleaned. It is refined, and converted into the beautiful well-known article sold in the shops, by sublimation. This process is carried on in spheroidal vessels, called *bomboloes* (Fig. 418.) They are made of thin flint glass, and weigh about 1lb. each, and measure about 12 inches across. Each vessel has a short neck. When filled with crude camphor, they are imbedded in a sand-bath, and heated to a temparature of from 250° to 280°, which is afterwards raised to between 300° and 400°. About 2 per cent. of quick-lime, and 2 parts bone-black, in fine powder, are added to the melted camphor and the heat raised, so as to boil the liquid. The vapour condenses in the upper part of the vessel. As the sublimation proceeds, the height of the sand around the vessel is diminished. The process is completed in about 48 hours. This operation requires considerable attention and experience. Dr. Ure says:—"If the temperature be raised too slowly, the neck of the bottle might be filled with camphor, before the heat had acquired the proper subliming pitch: and if too quickly, the whole contents might be exploded. If the operation be carried on languidly, and the heat of the upper part of the bottle be somewhat under the melting point of camphor, that is to say, a little under 350°, the condensed camphor would be snowy, and not sufficiently compact and transparent to be saleable. Occasionally, sudden alternations of temperature cause little jets to be thrown up out of the cake formed above, which soil it, and render its re-sublimation necessary." The vessels being removed from the sand-bath, the mouth is closed with tow, and in this hot state, water is sprinkled over them, and they crack. When quite cold, the cake of camphor, weighing about 11 lbs., is removed, and trimmed, by paring and scraping in the form of large hemispherical cakes, perforated in the middle. In this process the lime retains the impurities and a portion of the camphor: the latter is recovered by heating the mixture in an iron pot, with a head to it, and the product is refined by a second sublimation.—*Tomlinson, page* 287. Of this process Dr. O'Shaughnessy briefly says (p. 545) that to purify the camphor it is introduced into a subliming vessel with one-fiftieth its weight of quicklime, to retain some oil with which it is contaminated, and heat is gently applied by a sand bath. Two Kedgeree pots luted together answer perfectly, a very small aperture being left for the escape of air on the first application of heat. Camphor ($C_{10}H_8O$) is a white and semi-transparent solid, (sp. gr. 0.987,) of a crystalline fracture, a peculiarly fragrant odour, and a warm, pungent, and somewhat bitterish taste, accompanied by a sense of coldness on the tongue. It is soft and tough, but can be readily pulverised if moistened with a few drops of spirits of wine. It evaporates in the air at ordinary temperatures, and gradually sublimes in close vessels and attaches itself to the surfaces most exposed to the light. If a vessel exhausted of air, and containing a piece of camphor, be exposed to the direct rays of the sun, those crystals will be formed speedily. When small pieces of perfectly clean camphor are allowed to fall upon the surface of pure water, they rotate and move about with great rapidity, sometimes for several hours together; but if, while the camphor is rotating, the surface of the water be touched with any greasy substance, (a glass rod dipped in turpentine answers best,) all the floating particles quickly dart back, and are instantly deprived of all motion. See "Magazine of Popular Science 1837" on "The rotatory motion of camphor upon the surface of water." Raspings of cork, steeped in sulphuric ether, sublimated benzoic acid, potassium, and some other substances, also rotate and move about on the surface of water. The motions of the camphor are accelerated by placing the glass in vacuo. Camphor fuses at 347°, and boils at 400°, when it may be distilled without decomposition. The density of camphor-vapour is 5·27. Camphor is sparingly soluble in water; 1 part of camphor requiring about 1,000 parts

of water for solution. This aqueous solution is named *camphor julep*. It is very soluble in alcohol, ether, acetic acid, sulphuret of carbon, and some other substances, 100 parts of spirits of wine (specific gravity 0.806) dissolve 120 of camphor, forming the *camphorated spirit* of the Pharmacopœia. On adding water to this, nearly all the camphor is thrown down, in a minutely divided state. Considerable use is made of camphor in medicine, both as an internal and an external remedy; but it ought never to be taken internally without medical advice. A dose of two scruples appears to be sufficient to cause death.—*Tomlinson, page* 287. Camphor has been much used in all low fevers, about eight years ago, Dr. Barareh, a Military Surgeon, announced that he cured the bad intermittents of Wallachia with it, giving 1½ gr. pills every two hours for six or eight hours before the expected paroxysm. The advantages were—1. Relapses not so common as under Quinine; 2. Its use is not attended by any of the disagreeable effects of Quinine; 3. It is much cheaper. The action of Camphor is variously described Applied locally for a time to any delicate surface, it will act as an irritant. Its action when taken internally, is chiefly on the nervous system. In moderate doses it will exhilarate, and also allay nervous irritation, and produce quietude and placidity of feeling. Being absorbed into the system, in large doses, or in particular constitutions, the circulation may be affected. It afterwards passes off by the skin and bronchial membranes, but not by the urine; the pulse is increased in fulness, and diaphoresis produced, especially if the patient be covered over; consequent relief of febrile symptoms ensue. But other cases occur, in which sedative effects are perceived. In large doses it acts as a Narcotic, and might be poisonous. It is chiefly useful as a Calmative and Anodyne in various Nervous, especially Hysterical, affections, in doses of gr. v.—gr. x., and in some Nervous and Typhoid fevers. Camphor wood is considered valuable for the construction of chests and almirahs, as its powerful odour protects the contents from the ravages of white ants and other insects.—*O'Sh. page* 545.

(2325) CAMPHORA, a genus of plants belonging to the natural order *Lauraceæ*. This genus was constituted by Nees von Esenbeck for the *Laurus Camphorifera* of Kämpfer. the plant which yields the Camphor of commerce.—*Engl. Cyc. page* 735.

(2326) CAMPHORA GLANDULIFERA.—Sassafras of Nipal. This product was described in the Transactions of the Bengal Medical and Physical Society. The bark corresponds precisely in appearance, chemical properties, odour and stimulating effects, with the Sassafras bark (Laurus Sassafras) of European pharmacy. It is perhaps the bark of the Camphora glandulifera of Nipal.—*Royle, page* 324. *O'Shaughnessy, page* 545

(2327) CAMPHORA OFFICINALIS, the Camphor Laurel, is a tree with lax smooth branches; the leaves are bright-green and shiny above, paler beneath, and somewhat coriaceous, with a sunken gland at the axils of the principal veins, projecting at the upper side, opening by an oval pore beneath. This plant is a native of Japan and China, and is cultivated in most of the warmer parts of the world. The chief part of the Camphor of commerce is yielded by this tree, which is cultivated most extensively in the island of Formosa, from whence it is taken to Canton, which is the principal market for Camphor.—*Eng. Cyc. page* 735.

(2328) CAMPHOR-WOOD. The camphor-tree of Sumatra is the Dryobalanops camphora, of which the wood is hard, compact and brownish-coloured. The fragrant light coloured soft wood of which the trunks and boxes from China are made, is supposed to be that of the Camphor tree of Japan, Laurus Camphora, or Camphora officinalis. One or more of the tribe of Laurels yield the Sirevabali wood of Guiana, which is light, fragrant, and much used in the building of boats.—*Holt.* The Martaban Camphor-wood *Laurus* (Sassafras) is a very large tree, scattered sparsely throughout the Tenasserim provinces. Wallich wrote that it was very like *Laurus glandulifera*, which furnishes the sassafras, and camphor-wood of Nepaul. The Karens call it the "tree galanga," from its fragrance.—*Mason*

(2329) CAMWOOD. A red dye-wood of a very fine colour, obtained from Sierra Leone. It is chiefly used in turnery for knife-handles, and similar articles. Camwood, *Baphia nitida*, red sanders wood, barwood, and other dry woods are found in great quanties in many parts of Africa. In 1849, 216 tons were imported into Liverpool, from Sierra Leone, worth £ 20 to £25 per ton. The dyes of Africa are found to resist both acids and light, properties which no other dyes seem to possess in the same degree. About thirty miles east of Bassia Cove, in the republic of Liberia, is the commencement of a region of unknown extent, where scarcely any tree is seen except the camwood. This boundless forest of wealth, as yet untouched, is easily accessible from that settlement; roads can be opened to it with little expense, and the neighbouring kings would probably give their co-operation to a measure so vastly beneficial to themselves. It is impossible to ascertain the exact amount of export of these commodities to Europe and the United States, but it is very great, and employs a large amount of vessels. One Liverpool house imported 600 tons in a single year, worth £ 9,000. In 1841 upwards of 3,000 tons of dye woods were imported into Liverpool from

the western coast of Africa. Camwood is used as a mordaunt and for producing the bright red colour seen in English Bandana handkerchiefs. —*Simmonds' Commil. Product, p.* 445.

(2330) CANARA. At the Madras Exhibition of 1855, a very extensive collection of medicinal substances, illustrating the Native Pharmacopœia of Western India, was forwarded by the Local Committee of Canara. This collection, not limited to indigenous products, contained not a few articles imported from Arabia and elsewhere. Amongst the drugs were *gamboge, catechu, dikkamully* gum, *cubebs, colocynth, assafœtida, wood oil,* (dipterocarpus) *cocculus cordifolius, sphæranthus ?, plumbago zeylanica, acorus calamus, guilandina bondnc, argemone mexicana, cannabis indica, cyperus ?, fish oil, cocum butter,* and *sago.*— *Madras Ex. J. R.*

(2331) CANARIUM BENGALENSE. (*Roxb. Fl. Ind.* vol. iii. p 136.) According to Roxburgh, this is an immense forest tree, a native of Sylhet and the adjacent mountainous countries, and flowering in May and June. From fissures or wounds in the bark, a large quantity of very pure, clear, amber-coloured resin exudes, which soon becomes hard and brittle, and is not unlike copal; yet the natives set little or no value on it. In the Calcutta bazar it is only valued at from 2 to 3 Rs. for seven maunds of eighty pounds each. Roxburgh does not mention the native name of this resin.—*O'Shaughnessy, page* 285.

(2332) CANARIUM COMMUNE. (*Roxb. Fl. Ind.* vol. iii. p. 137.) A native of the continent of India, the Archipelago, and Isle of France, where it is called *Bois de colophane.* It was brought from the Moluccas to the Botanic Garden of Calcutta, but in Roxburgh's time did not thrive, owing to the coldness of the winter months. The bark yields an abundance of limpid oil with a pungent turpentine smell, congealing into a buttery camphoraceous mass, (*Lind. Fl. Med.* p. 170.) The writer adds, that it has the same properties as balsam of copaiba; and is said to yield East Indian elemi. —*O'Shaughnessy, page* 288.

(2333) CANARIUM GENICULATUM. This is a large and valuable timber tree found in the Pegu valley, but it is scarce. Wood, white colored, adapted to every purpose of house-building.—*McClelland.*

(2334) CANARY SEED. The produce of an annual grass cultivated in different parts of Great Britain, and used as food for singing birds.— *Faulkner.*

(2335) CANARY WOOD. A fancy wood of a golden yellow colour.—*Faulkner.*

(2336) CANAVALIA GLADIATA. *Dolichos gladiatus.* Sword Bean. The sword bean is planted to a small extent, and its young pods are used as a vegetable.—*Mason.*

(2337) CANAVALIA VIROSA. Wild sword bean. On the sea shore of the Tenasserim provinces, a wild species of sword bean is found growing in great profusion.—*Mason.*

(2338) CANCER, a genus of Short-Tailed *Crustacea,* the type of the family Canceridæ. Dr. Leach restricted the genus Cancer to the form of *Cancer Pagurus,* Linn., the large eatable Crab of English coasts, which was, when he defined the genus, the only species known. The genus *Cancer* of Linnæus included a large number of species, and the term Crab, which is a translation of it, is in common parlance applied to the great bulk of the Brachyurous Crustaceans. For the Blood-spotted Crab of the Asiatic seas (*Cancer maculatus.* Linn. &c.) and the Coralline Crab (*Cancer corallinus.* Fabr.), Dr. Leach instituted the genus *Carpilius,* characterised by the existence of a single tooth on the border of the carapace, and by the tridentated front; and, for the Eleven Toothed Crab (*Cancer* undecimdentatus, Fabr.) —*Engl. Cyc. page* 741. Ainslie gives the following vernacular names for C. pagurus. Kaddel Nundoo కడల్ నండు ⑥, *Tam.*, Dirya ka kekra, *Duk.*, Catan, *Malay*, Samoodrapoo Nundrakaya, *Tel.* —*Ains. Mat. Med. p.* 156.

(2339) CANDLES.

Kaarzen, DUT.	Candela, LAT.
Chandelle, FR.	Velas. PORT.
Lichter, Kerzen, GER.	Swjetschi, RUS.
Butty, GUZ. HIND.	Velas, SP.
Candelle, IT.	

Candles are manufactured from tallow, bleached bees-wax, spermaceti, the concrete part of cocoanut oil. A candle is a cylinder or slightly conical rod formed of solid fat, in the axis of which a bundle of parallel, twisted or woven fibres is enclosed. It is necessary to the due comprehension of some of the details of candle-making to enter briefly into the chemistry of fats and oils, substances of first-rate importance to the welfare of a country, the large proportion of carbon contained in them rendering them valuable sources of food and artificial light. Most fats and fixed oils, vegetable and animal, are mixtures of two, and generally three distinct compounds, each of which taken singly has all the properties of fats. The first of these substances, called *stearine,* (from στέαρ, tallow or suet,) is solid at common temperatures; it constitutes the solid fatty ingredient in mutton-tallow; the second is *oleine,* (from ἔλαιον, *oleum,* oil,) and is liquid at ordinary temperatures, and down to the temperature of freezing water: the third substance is named *margarine,* (from μαργάρον, a pearl,) on account of its mother-of-pearl lustre: it is solid at ordinary temperatures. All fats may therefore be regarded as mixtures of the fluid oleine with the solid stearine of margarine. If the solid be in larger proportion than the fluid, as in various kinds of tallow, it requires a greater degree of heat to melt it. If the fluid portion

prevails, as in the oils, the melting point is lowered. The chief material used in making candles is tallow. This substance is the concrete fat of oxen, deer, sheep, and other large quadrupeds, separated from the fibrous matter which accompanies it. There are two principal varieties of tallow, arranged according to their purity and consistence into *candle* and *soap tallow*. It is generally sufficiently pure for soap-making without previous preparation. Candles are also made in very great numbers from palm oil. This substance is obtained from the western coast of Africa, south of Fernando Po, from the fruit of the oil palm (*Elais guineensis.*) Such are the chief materials used in the manufacture of candles. Ordinary candles are made of tallow, and are either *dipped* or *moulded*. Mutton-suet with a proportion of ox-tallow is used for mould candles, which are required to be hard, and to have a glassy surface. Coarse tallow is used for *dips*. The wicks used for the best candles are cotton rovings imported from Turkey. Wax is not adapted for moulding, in consequence of the contraction which it undergoes in cooling, and the tenacity with which it adheres to the sides of the moulds, but candles are made of it in the following manner :—A set of wicks properly cut and twisted, and warmed at a stove, are attached to a ring of wood or metal, and suspended over a basin of melted wax, which is taken up by a large ladle and poured on the tops of the wicks, each wick being kept constantly twisted round its axis by the fingers ; the wax in running down adheres to the wicks, and completely covers them. This process is repeated at intervals until a sufficient thickness is attained. The candles are then rolled while hot with a flat surface of box-wood upon a smooth table of walnut-wood kept constantly wet ; this makes them truly cylindrical. This basting, twisting of the wicks and rolling, is sometimes repeated two or three times before the candles are finished, but a skiful workman will cover the wicks with the proper quantity of wax without taking them down. If a wax candle be broken across, the annular layers, like the yearly rings in wood, can be easily counted, and their number indicates the number of times the wax, has been poured over the wick. The large wax candles used in Roman Catholic churches are made by placing a wick upon a slab of wax bending this together and then rolling it. The long, thin, coiled wax tapers are made in the following manner :—the wick, which must be uniform, is wound round a drum, from which it is passed into the wax pan, at the bottom of which is fixed a guiding roller, and from thence through a drawing plate to a second drum. The drawing plate is of metal, and is similar to that used in wire-drawing : the holes in it correspond in size to the diameter of the taper, and the wick is passed through smaller and smaller holes until it is of the proper thickness. Rush-lights are made in the same manner as dip candles. *Tomlinson, page* 290. Wax candles of an inferior description have long been made in the town of Vizagapatam. Of late years the large importations of candles from Europe have caused the manufacture to deteriorate considerably. Wax candles are made in Goa and Malabar, whence they are sometimes imported into Bombay ; but English, French, and German candles are the kinds that are in general use in India. The usual price of the best Wax candles made at Vizagapatam, in 1838, was about 8 annas a pound, they are also made at Peddapore, at Berhampore and other parts, they are generally of very irregular shapes. It is a great improvement to place two thin instead of one thick wick in each, and the wicks should be plaited not twisted. Wax candles improve with age.—*Rhode M.S.S.*

(2340) CANDY (Sugar).

Kurree-shakur, Hind. Guz. | Nabhat, Pers.

A preparation of sugar made by melting and crystallising it several times. Sugar-candy is largely imported in tubs from China into Bombay.

(2341) CANES.

Nathur, Guz. | Bate, Hind.

Canes are the produce of the "Calamus" genus of palms. Their origin and the several varieties have been described at some length under the article "Calamus," which see. The species of Calamus are numerous in the Islands of the Indian Archipelago, as well as in the Malayan Peninsula. A few species are found within the Madras territories, but in India they chiefly abound in the forests of the districts of Chittagong, Silhet, and Assam, whence they extend along the foot of the Himalayas as far north as the Deyra Doon, where a species is found which the late Mr. Griffith has named *C. Royleanus*, and applied the name of *C. Roxburghii* to the plant which Dr. Roxburgh called *C. Rotang* common in Bengal and on the Coromandel Coast. Both are called *bet*, and used for all the ordinary purposes of cane ; as are *C. tenuis* of Assam, *C. gracilis*, *C. extensus*, and others. *C. Scipionum* of Loureiro, Mr. Griffith considered to be the species which yields the well-known Malacca Cane, but the plant does not appear about Malacca. He was, however, informed that the canes are imported from Siak, on the opposite coast of Sumatra. The stem of *Calamus verus* is described as being 100 feet long, that of *C. oblongus* 300 to 400 feet, of *C. rudentum* upwards of 500 feet, and of *C. extensus* as much as 600 feet ; Rumphius even states that one kind attains the extraordinary length of 1200 feet (vol. v. 100). It is not possible to say from what particular species the canes of the shops are gathered indiscriminately ; *C. rotang* has however been said to furnish the stouter, and *C. Scipionum* the slenderer sorts. Mr. Mason adds, that in the Tenasserim Provinces, cane

or ratan is used extensively by the natives instead of cordage. The stays of the masts in native boats are usually made of ratans, and they are split up into strings for the innumerable purposes to which cord and twine are usually applied. All that gives stability to bamboo houses, is the ratan which ties them together. There are numerous species indigenous in the forest, and the Karens have different names for seventeen species or varieties.—*Mason.* The Calamus rudentum of Loureiro is manufactured at Malacca into cables, and is employed for dragging great weights and binding wild elephants. See CALAMUS.

(2342) CANIS, a genus of Carnivorous *Mammalia*, of which the common dog may be regarded as the type. Under the Linnæan genus *Canis* are to be found the Dogs (*Canis familiaris*); the Wolves (*Canis Lupus*); the Hyænas (*Canis Hyæna*); the Foxes (*Canis Vulpes*), &c.; the Jackals (*Canis aureus*); the Mexican Wolf (*Canis Mexicanus*), Xoloitzcuintli of Hernandez; and *Canis Thous* of Surinam. M. Lesson in his 'Manuel' begins the second section of the Digitigrades with the genus *Canis*, and he adopts the following subdivisions:—1. Those genera which have the pupil of the eye round, including the Dogs properly so called, the Wolves, and the Jackals. 2. Those genera in which the pupil of the eye contracts vertically, the Foxes and the Zerdas. 3. The Dogs with Hyæna-like feet, the Hyæna-Dog. *Canis pictus*, Desm., *Hyæna picta*, Temm., *Lycaon*, Brookes. The genus *Canis* being mostly restricted at the present day to the animals of Lesson's first section, this article will be confined to the animals commonly called Dogs, Wolves, and Jackals. *Canis familiaris.* The specific description given by Linnæus is simply "Canis caudâ (sinistrosum) recurvatâ"—"dog with tail curled towards the left." Cuvier observes that the Domestic Dog is distinguished by its recurved tail, and that it varies infinitely besides in stature, form, colour, and the quality of the hair. It exhibits, he adds, "the most singular, the most complete, and the most useful conquest that man has made. The whole species is become our property; each individual is entirely devoted to his master, adopts his manners, distinguishes and defends his property, and remains attached to him even unto death; and all this springs not from mere necessity, nor from constraint, but simply from reconnaissance and a true friendship. The swiftness, the strength, and the highly developed power of smelling of the dog, have made him a powerful ally of man against the other animals, and were perhaps necessary to the establishment of society. It is the only animal that has followed man all over the earth." It is a question of considerable interest as to what was the parent-stock of the dog. Some zoologists are of opinion that the breed is derived from the Wolf; others that it is a familiraised Jackal; all agree that no trace of it is to be found in a primitive state of nature. That there were dogs or rather animals of the canine form in Europe long ago we have evidence from their remains, which we shall presently notice; and that there are wild dogs we know. India, for example, affords many of them, living in a state of complete independence, and without any indication of a wish to approach the dwellings of man. These dogs, though they have been accurately noticed by competent observers, do not throw much light on the question. They may have escaped from the dominion or half dominion of man, and have betaken themselves to a vagabond life. It becomes necessary however to examine into the state of these dogs, some of which are entirely wild and keep to the mountain and forest, whilst others hang about the villages, and though without owners give tokens of a more social disposition, and are tolerated as the scavengers of the place, which they clear of disgusting incumbrances, somewhat after the Portuguese fashion. Colonel Sykes thus describes the Deccan Dog, *Canis Dukhunensis*, Sykes, Kolsun of the Mahrattas, *Cuon Dukhunensis*:—"Red, paler underneath; tail bushy, pendulous; pupil rounded. This is the Wild Dog of the Deccan. Its head is compressed and elongated; its nose not very sharp, the eyes are oblique: the pupils round, irides light brown. The expression of the countenance that of a coarse ill-natured Persian Grayhound, without any resemblance to the Jackal, the Fox, or the Wolf, and in consequence essentially distinct from the *Canis Quao* or *Sumatrensis* of General Hardwicke. Ears long, erect, somewhat rounded at the top, without any replication of the tragus. Limbs remarkably large and strong in relation to the bulk of the animal, its size being intermediate between the Wolf and the Jackal. Neck long. Body elongated. Between the eyes and nose red brown: end of the tail blackish. From the tip of the nose to the insertion of the tail 33 inches in length: tail 8½ inches. Height of the shoulders 16½ inches." Colonel Sykes adds that none of the domesticated dogs of Dukhun are common to Europe. The first in strength and size is the Brinjaree Dog, somewhat resembling the Persian Grayhound but much more powerful. The Pariah Dog, he states, is referrible to M. Cuvier's second section. This is very numerous, not individual property, but breeds in the towns and villages unmolested. The Colonel remarks that the Turnspit Dog, long backed, with short crooked legs, is frequently found among the Pariahs. There is also a petted minute variety of the Pariah Dog, usually of a white colour, and with long silky hair, corresponding to a common Lapdog of Europe; this is taught to carry flambeaux and lanterns. The last variety noticed is the dog with hair so short as to appear naked like the *Canis Ægyptius.* It is known to Europeans by the name of the Poly-

gar Dog. ('Zool. Proc.,' part i.) In 1832 the skin of the Wild Dog of Nepaul was compared by Colonel Sykes with a specimen of the Kolsun of the Mahrattas above described, and he stated his impression to be that the animals are identical, differing only by the denser coat and more woolly feet of the Nepaul race, a difference readily accounted for by the greater cold of the elevated regions inhabited by it. Colonel Sykes is also of opinion that the Kolsun is identical with the Buansuah, an Indian Dog, described by Mr. B. H. Hodgson under the name of *Cuon primævus*. Specimens of these dogs are to be seen in the British Museum, in the Catalogue of which institution they are not only made specifically distinct, but are placed under the genus Cuon as distinct from *Canis*. Mr. Bell, in his 'History of British Quadrupeds,' discusses the question of origin. "In order," says Mr. Bell, "to come to any rational conclusion on this head, it will be necessary to ascertain to what type the animal approaches most nearly, after having for many successive generations existed in a wild state, removed from the influence of domestication and of association with mankind. Now we find that there are several different instances of the existence of dogs in such a state of wildness as to have lost even that common character of domestication, variety of colour and marking. Of these, two very remarkable ones are the Dhole of India and the Dingo of Australia: there is besides a half reclaimed race amongst the Indians of North America; and another also partially tamed in South America which deserve attention; and it is found that these races in different degrees, and in a greater degree as they are more wild, exhibit the lank and gaunt form, the lengthened limbs, the long and slender muzzle, and the great comparative strength which characterise the wolf; and that the tail of the Australian dog, which may be considered as the most remote from a state of domestication, assumes the slightly bushy form of that animal.—*Eng. Cyc. page* 742. The Esquimaux Dog (*Canis familiaris Borealis*), and the Hare-Indian or Mackenzie River Dog (*Canis familiaris Lagopus*), will occur as instances to those who have been familiar—and who is not?—with the histories of our northern expeditions and the Garden of the Zoological Society of London in the Regent's Park. In that menagerie the three dogs last named might at one time be seen side by side. The period, says Mr. Bell, "at which the domestication of the dog first took place is wholly lost in the mist of antiquity. The earliest mention of it in the sacred Scriptures occurs during the sojourn of the Israelites in Egypt—'But against Israel shall not a dog move his tongue.' It is again mentioned in the Mosaic law in a manner which would seem to show that they were the common scavengers of the Israelitish camp, as they are still in many of the cities of the East:—'Neither shall he eat any flesh that is torn of beasts in the field: ye shall cast it to the dogs.' A similar office seems to be repeatedly alluded to in the course of the Jewish history. The Shepherd's Dog, a variety which was most probably one of the first that civilised and settled man called in aid to preserve his flocks from beasts and birds of prey and the depredations of roving human tribes, is remarkable for the capacity of its cranium and its great sagacity. We give the gigantic Tibet Dog as a fine example of the Mastiffs. Dr. Wallich gave to Mr. Broderip the data which enabled the latter to write the following account:—"These noble animals are the watch-dogs of the table-land of the Himalaya Mountains, about Tibet. Their masters, the Bhoteas, to whom they are most strongly attached, are a singular race, of a ruddy copper-colour, indicating the bracing air which they breathe, rather short, but of an excellent disposition. Their clothing is adapted to the cold climate they inhabit, and consists of fur and woollen cloth. The men till the ground and keep sheep, and at certain seasons come down to trade, bringing borax, tincal, and musk, for sale. They sometimes penetrate as far as Calcutta. On these occasions the women remain at home with the dogs, and the encampment is watched by the latter, which have an almost irreconcileable aversion to Europeans, and in general fly ferociously at a white face. A warmer climate relaxes all their energies, and they dwindle even in the valley of Nepaul." Some specimens were taken to England by Dr. Wallich; they were placed in the Zoological Society's Garden in the Regent's Park, but died soon after their arrival. The Hon. Edward Gardner, British resident at the court of the Raja of Nepaul, never heard of any other instance of this variety being domesticated by Europeans. In all the varieties of the domestic dog the period of gestation is 63 days. The litter is generally numerous, often as many as eight or nine. The whelps are born blind, and do not see till nine days are fully expired: they sometimes see on the tenth, and sometimes not till the twelfth day. At the fourth month the teeth begin to change, and at two years the growth of the animal is considered complete. A dog is considered old at the expiration of five years, and the limits of his existence rarely exceed 20 years. It is confidently stated that in all the varieties, if a Dog has any white on any part of his tail, that colour will invariably be found at the tip. *Canis Lupus* (Linnæus), the Wolf. Lieutenant Colonel Hamilton Smith makes *Lupus* the first section of his first sub-genus *Chaon*, of the Diurnal *Canidæ*, or Canine group furnished with a round pupil of the eye. Several varieties or species of Wolf are met with in Asia. The Landgah, or Indian Wolf, is the *Canis pallipes* of Sykes, and the *Saccalius Indi-*

cus of Hodgson. It is an inhabitant of Nepaul. Of the Indian wolves, one, the Beriah, is described as being of a light fox-colour inclining to dun, not larger than a grayhound, slenderly made, but bony; the head and ears long, like those of a Jackal, and the tail long, but not very hairy; the other, which is smaller, Colonel Smith refers to his Lyciscan group. The last-named Zoologist refers the black Derboun of the mountains of Arabia and the south of Syria to the Wolf. *Canis aureus* (Linnæus), the Jackal, or Tschakkal, Chacal or Loup Doré of the French, Adive of Buffon. It is an inhabitant of India, other parts of Asia, and Africa. Cuvier says that Jackals are met with from India and the environs of the Caspian Sea to Guinea, but that it is not certain that they are all of the same species. The habits of the Jackal are gregarious hunting in packs, and the pests of the countries where they are found, and where they burrow in the earth. In their huntings the Jackals will frequently attack the larger quadrupeds, but the smaller animals and the poultry are their most frequent prey. The offensive odour of the Jackal has been given as one of the reasons against reducing it to a state of domestication. We do not see what advantage is to be derived from such a process, but if it were desirable that objection it seems would not hold. Colonel Sykes, who notices it as the Kholah of the Mahrattas and as being numerous in Dukhun (Deccan), had in his possession at the same time a very large wild male and a domesticated female. The odour of the wild animal was almost unbearable; that of the domesticated Jackal was scarcely perceptible.—*Engl. Cyc. p.* 757.

(2343) CANNA, a genus of plants belonging to the natural order *Marantaceæ*. There are several species of this genus, all of which are known by the name of Indian Shot. They are inhabitants of South America and of the East Indies.—*Engl. Cyc. p.* 758.

(2344) CANNA EDULIS has smooth leaves and stems coloured at the base, the roots tuberous and large, the middle segment of the corolla very short. This is one of the species of the order the rootstock of which is used for making arrowroot. Nearly all the species contain starch in the rootstock, which renders them fit to be used as food after being cooked. The starch is separated by tearing the rootstock in pieces and submitting it to the action of water. The water with the starch suspended is poured off from the ligneous portion of the rootstock, and the starch is afterwards allowed to subside.—*Engl. Cyc.p.* 758.

(2345) CANNA INDICA. Lin. The plant itself, is the Krishna tamara of the Telingas, and the Katu-bala of the Hortus Malabaricus.—*Ains. Mat. Med. p.* 142. Its Bead seed is,

Kull valei munnie, TAM.	Sabba jaya, HIND.
Ukkilbar ke munkeh, DUK.	Seelarumba, SANS.

Canna In dica has the inner limb of the corolla trifid, the segments lanceolate, acuminate, straight.—*Engl. Cyc. p.* 758. There are several varieties of this; the colours of the flowers scarlet, orange, red and yellow mixed, they blossom throughout the year and are cultivated by dividing the roots or by seed: the latter should be sown whilst fresh, or if otherwise they will require to be soaked for a few hours in water; a good common soil is all that is requisite.—*Riddell.* The seeds of most of the species are round, black, shining, hard, heavy, and about the sixteenth of an inch in diameter, resembling shot, for which they are sometimes used as a substitute. They are roasted and employed in infusion in the same manner as coffee. They yield also a purple dye.—*Engl. Cyc. p.* 758. With the round, hard, black seeds, contained in the hairy pericarpe of the Canna Indica the natives make necklaces and other ornaments. In the Tenasserim Provinces, both the red and yellow varieties of Indian shot are often seen in gardens, and the first is much cultivated by the Burmese for the seeds which they use for sacred beads.—*Mason.*

(2346) CANNABIS SATIVA, and its variety *C. indica.* The Hemp appears to be a plant of the Persian region, where it is subjected to great cold in winter, and to considerable heat in summer. It has thus been able to travel on one hand into Europe, and on the other into India; so that the varieties produced by climate have by some been thought to be distinct species, the European being called *C. sativa*, and the Indian *C. indica.* The name κανναβις, by which it was known to the Greeks, seems to be derived from the Arabic *kinnub*, the *canape* of the middle ages, Dutch *hinnup* and *kinnup*, German *hanf*, whence the English *hemp.* Herodotus mentions it as Scythian. Bieberstein met with it in Tauria and the Caucasian region. It is well known in Bokhara, Persia, and abundant in the Himalayas. Its resin seems to have been employed as an intoxicating substance in Asia and Egypt from very early times, and even in medicine in Europe in former times, as we find it notieed in Dale (*Pharmacologia*, i. 133) and Murray (*Apparat. Medicaminum*, iv. p 608—620), where it is arranged, as in this work, next to the Humulus. It has of late years been brought into European notice by Dr. O'Shaughnessy. The Indian plant has by some, been thought to be a species distinct from the European one; but, like Dr. Roxburgh and others, Dr. Royle was unable, when in India, to observe any difference between the plant of the plains and that of the hills of India, nor between these and the European plant. The Indian secretes a much larger proportion of resin than is observable in the European plant, but a difference is observed in this point in India between plants grown in the plains, and those of

the mountains, and also when grown thickly together. The natives plant them wide apart, to enable them to secrete their full powers. In Europe, the thick sowing, and moister, often dull, climate will prevent the due secretion of the peculiar principles of a plant of the Persian region. "The leaves are sometimes smoked in India, and occasionally added to tobacco, but are chiefly employed for making *bhang* and *subzee*, of which the intoxicating powers are so well known. But a peculiar substance is yielded by the plants on the hills, in the form of a glandular secretion, which is collected by the natives pressing the upper part of the young plant between the palms of their hands, and then scraping off the secretion which adheres. This is well known in India by the name of *churrus*, and is considered more intoxicating than any other preparation of the plant; which is so highly esteemed by many Asiatics, and serves them both for wine and opium: it has, in consequence, a variety of names applied to it in Arabic, some of which were translated to Dr. Royle as "grass of faqueers," "leaf of delusion," "increaser of pleasure," "exciter of desire," "cementer of friendship," &c. Linnæus was well acquainted with its "vis narcotica, phantastica, dementens," (anodyna et repellens). It is as likely as any other to have been the *Nepenthes* of Homer.—*Royle p.* 569. Dr. O'Shaughnessy remarks that in certain seasons and in warm countries a resinous juice exudes and concretes on the leaves, slender stems, and flowers. Separated and in masses, this juice constitutes the *Churrus* of Nipal and Hindostan, and to this, the type or basis of all the hemp preparations, are the powers of these drugs attributable. In Central India and the Saugor territory and in Nipal, *Churrus* is collected during the hot season in the following singular manner:—men clad in leathern dresses run through the hemp-fields brushing through the plant with all possible violence; the soft resin adheres to the leather, and is subsequently scraped off and kneaded into balls, which sell from five to six rupees the seer. A still finer kind, the *Momeea* or waxen *Churrus*, is collected by the hand in Nipal, and sells for nearly double the price of the ordinary kind. In Nipal, Dr. McKinnon informs us, that the leathern attire is dispensed with, and the resin is gathered on the skins of naked coolies. In Persia, it is stated by Mirza Abdul Russac, that the *Churrus* is prepared by pressing the resinous plant on coarse cloths, and then scraping it from these and melting it in a pot with a little warm water. He considers the *Churrus* of Herat as the best and most powerful of all the varieties of the drug. The dried Hemp plant which has flowered, and *from which the resin has not been removed*, is called *Ganjah*. It sells for twelve annas to one rupee the seer in the Calcutta bazars, and yields to alcohol twenty per 100 of resinous extract, composed of the resin (*Churrus*), and green colouring matter (*chlorophylle.*) Distilled with a large quantity of water, traces of essential oil pass over, and the distilled liquor has the powerful narcotic odour of the plant. The *Ganjah* is sold for smoking chiefly. The bundles of *Ganjah* are about two feet long and three inches in diameter, and contain twenty-four plants. The colour is dusky green—the odour agreeably narcotic—the whole plant resinous, and adhesive to the touch. According to Mr. McCann's notes, the *Ganjah* consumed in Bengal is chiefly brought from Mirzapur, and Gazeepur being extensively cultivated near Gwalior and in Tirhoot. The natives cut the plant when in flower, allow it to dry for three days, and then lay it in bundles averaging one seer weight, which are distributed to the licensed dealers. The best kinds are brought from Gwalior and Bhurtpore, and it is also cultivated, of good quality in a few gardens round Calcutta. In Jessore, we are informed, the drug is produced of excellent quality, and to a very considerable extent of cultivation. The larger leaves and capsules without stalks, are called "*Bang*, *Subzee*, or *Sidhee*." They are used for making an intoxicating drink, for smoking, and in the conserve or confection termed *Majoon*. *Bang* is cheaper than *Ganjah*, and though less powerful, is sold at such a low price that for one pice enough can be purchased to intoxicate an "habituated person." *Sidhee*, *Subjee*, and *Bang* (synonomous) are used with water as a drink, which is thus prepared:—About three tola weight (540 troy grains) are well washed with cold water, then rubbed to powder, mixed with black pepper, cucumber, and melon seeds, sugar, half a pint of milk, and an equal quantity of water. This is considered sufficient to intoxicate an habituated person. Half the quantity is enough for a novice. This composition is chiefly used by the Mahomedans of the better classes. The same quantity of *Sidhee* is washed and ground, mixed with black pepper, and a quart of cold water added. This is drank at one sitting. This is the favourite beverage of the Hindus who practice this vice, especially the Brijobassies and many of the Rajpootana soldiery. —*O'Shaughnessy, page* 582. It is from its possessing a remarkably tough kind of woody tissue capable of being manufactured into linen and cordage, that hemp is best known; and for its good qualities in this respect it is unrivalled among the many plants possessing similar properties. See HEMP.

(2347) CANNONS.

Kanonen, DUT.	Top, PERS.

(2348) CANTHARIDES, BLISTER BEETLE, SPANISH FLIES. *Latreille.* Class INSECTA. Order *Coleoptera.*

Cantharides, Mouches d'-espagne, FR.	Cantharis, LAT.
Spanische Fliegen, GER.	Hischpanskie muchi, RUS.
Canterelle, IT.	Cantaridas, SP.

The name *κανθαρις* was applied by the Greeks to a species of Coleopterous Insect which possessed the properties of the officinal Blistering Beetle, but it was distinguished by *yellow* transverse bands. This is the characteristic of species of Mylabris, one of which, *M. Fusseleni*, occurs in the south of Europe, and another, *M. Cichorii* (fig. 96,4), in Syria, and apparently throughout the East. In India it is called *telee* and *telee mukhee*, or the Oily Fly, no doubt from the oil-like exudation which the insects of this genus give out from the articulations of their legs when seized. Another species, *M. Trianthema*, is mentioned by Dr. Fleming, and the *Lytta gigas*, Fab. is found there as well as in Senegal. One is mentioned by the Arabs under the name of *zurareh*. It is not known when the officinal Blistering Fly came to be used, but it has had a variety of names. It was called *Meloe vesicatorius* by Linnæus, *Lytta vesicatoria* by Fabricius, and *Cantharis vesicatoria* by Geoffroy, and now by the Pharmacopœias. Geoffroy grouped the Vesicatory Beetles in a small tribe corresponding nearly with the Linnean genus Meloe, and distinguished it by the title Cantharideæ. This he divides into eleven genera, among which are *Cantharis*, *Mylabris*, and *Meloe*, all of which species have been employed as vesicatories. *Meloe majalis*, or May-worm, is a specimen of the genus.—*Royle.*

(2349) CANTHARIS VESICATORIA, is of an elongated, almost cylindrical form, from 6 to 10 lines in length by about 2 in breadth, the male somewhat smaller than the female. It is easily distinguished by its two beautiful elytra or wing-cases, which are long and flexible and of a shining golden green colour, and cover two thin brownish membranous wings. The head is large and sub-cordate, with a longitudinal furrow along the head and the thorax: this is not larger than the head, rather quadrate. Its thorax chiefly, but also the rest of the body covered with whitish gray hairs; antennæ black, long, simple filiform. The maxillæ support the jointed palpæ, of which the terminal joint is somewhat ovate. The legs are from 4 to 6 lines long, smooth, 5 joints to the first pair of the tarsi, and 4 only to the last, all violaceous. Single spine on leg and notch in tarsus. The last joint of tarsus with a pair of claws, each of which is bifid. Near the anus of the female are two articulated caudal appendages somewhat similar to palpi.—It abounds in the S. of France, Spain and Italy; and it has spread into Germany and the S. of Russia. It is found upon the Ash, Lilac and Privet especially, but also upon the Elder and Honeysuckle, more rarely on the Plum-tree, Rose, Willow, and Elm. M. Farines states, that the insects produced in warm places, and such as are exposed to the sun, are most energetic. Cantharides are stated not to live above eight or ten days. When alive, they exhale a strong, fœtid, and penetrating odour by which their presence is readily detected, and so offensive, that public walks sometimes become deserted until they have disappeared. They are usually caught early in the morning, when persons with covered hands and faces shake them off the trees, plunge them into vinegar, or expose them in sieves to the vapour of vinegar, and then dry them in the sun or in warmed apartments. They should be preserved in well stoppered bottles, as they are subject to be destroyed by other insects, introducing with them a little Alcohol, Petroleum, Camphor, Chloride of Lime (*Derheims*), or Pyroligneous acid (*M Farines*), as it is preferable to employ fresh, well-dried, and smooth, not dusty, insects. They long preserve their form and colour, also to some extent the disagreeable odour of the living insect, and have an acrid burning taste. The powder is of a greyish-brown colour, interspersed with shining particles, which are the fragments of the elytra, head and feet; and, though comparatively inert, these parts are very indestructible, and thus often serve to detect their presence in fatal cases. *Action. Uses.* Narcotic, Acrid Poison; Rubefacient and Irritant; Stimulant Diuretic; sometimes producing inflammation of the urinary organs; but useful in smaller doses in inducing a healthy state of the mucous membrane in chronic gonorrhœa, Leucorrhœa, &c. Best known and most extensively employed for raising Blisters when applied to the skin, in a space of from six to twelve hours sometimes accompanied with the disadvantage of producing painful strangury. The ancients chiefly employed two species of *Mylabris*, one of which, the *Mylabris cichorii*, (*vern.* telini, *Hind.*) has been used for ages, and is so at present by the European and native physicians of India and China. The blistering flies of India are chiefly the Mylabris or Melœ cichorii the Cantharis gigas, and the Cantharis violacea. The *Meloe* or *Mylabris cichorii* (Telini, *Hind.*) is common in the neighbourhood of Dacca, in the Hydrabad country, in Kurnool, and numerous other localities. Dr. Hunter has published a good account of this article in the 5th vol. of the *Transactions of the Asiatic Society*, p. 216. The insect is about an inch long, and $\frac{1}{3}$rd abroad; the elytra or wing coverts are marked with six cross stripes of deep blue and russet brown. The *Ruprestis* of ancient writers is met with in the bazars under the name of the golden fly (*sonamukki*.) The *Cantharis violacea* is often mixed with specimens of *Meloe* in the bazars. The Telini fly, if procured before the mites have commenced its destruction, yields on an average one-third more of cantharidin than

the *Spanish fly* of the European shops. The blue fly is of uncertain strength; the Buprestis, in all the specimens obtained, was quite inert.—A species of Meloe called the *M. trianthema*, from its being usually found on the plant named *Trianthema decandra* (biscopra, *Hind.*) is described by Dr. Fleming. A tincture, acetous tincture, plaster, and ointment of the Meloe cichorii are described in the Bengal Pharmacopœia. Some prejudice exists against the article on account of its alleged excessive severity of action. This is solely owing to the presence of a greater quantity of *Cantharidin* than that contained in the common fly. Diluting the tincture, and adding to the proportion of lard and wax in the plaster and ointment, perfectly assimilate the action of the indigenous and the imported insects.—*O'Shaughnessy, page* 684. At the Madras Exhibition of 1855, specimens of the Indian Blistering beetles, *Mylabris pustulata*, and *punctum* were exhibited by Monsieur Le Docteur Collas of Pondicherry. These were accompanied with a full and interesting report on their blistering properties printed in the "*Moniteur Officiel*" of 2d March 1855. The larger species is *Mylabris pustulata*, and the smaller is *Mylabris punctum*. Both insects are found in large quantities at certain seasons all over Southern India. On account of Dr. Collas' careful researches into the natural history of these beetles, as well as his interesting report, and successful experiments with this therapeutic agent, the Jury awarded him a 2d Class Medal.

(2350) CANTHIUM NITENS? *Rubiaceæ.*

Malay cauray, TAM.

The wood of this, like that of the succeeding, is unknown to me. The plant is described as a small tree. I only know it from the specimens which accompanied the name, but which were not accompanied with timber.—*Wight.*

(2351) CANTHIUM PARVIFLORUM.

Balusoo-kura, TAM.	Burra munga, HIND.
Naga valli, SANS.	Sengarary marum, TAM.
Nulla baloosoo, TEL.	Keernee, CAN.

A common thorny bush throughout India, especially on the Coromandel coast. Its wood is close grained, hard and suited for turning small objects. A decoction of the leaves or root is prescribed in India in dysentery, and is also given in worm cases. About three ounces, being given daily. The fruit and leaves are eaten.—*O'Shaughnessy, p.* 401.

(2352) CANVASS, SAIL CLOTH.

Zeildock, DUT.	Lona, PORT.
Toile a voile, FR.	Parusnoe polotno, Parusina, RUS.
Segeltuch, GER.	Lona, SP.
Canevazza, Lona, IT.	

Canvass is a woven frabic, made from the fibres of hemp. The word is said to be a corruption of the Latin name for hemp, *cannabis.* The Italians call it *canape.* A finer description of canvass, called *huck-aback*, is made from hemp for towels and common table-cloths. Canvass is manufactured at Pondicherry and at Cuddalore in the South Arcot district of a superior and of an inferior description, and sold in bolts containing 40 yards; the better quality is sold at from 20 to 25 Rupees, and the coarser at 8 to 15 Rupees a bolt. Canvass of excellent quality is manufactured in Travancore. European canvass though much dearer is generally preferred in India to the native material. Europe material selling at Rs. 24-5-6, per bolt, while the ordinary country can he had for Rs. 16. At the Madras Exhibition of 1855, Mr. Underwood exhibited fibres of the Agave Americana in a number of different stages of preparation, as in dressed fibre, plain and colored yarns, cloth, and damask, checked, colored, and striped canvas, imitation horse hair cloth and tabaret, all made from the same fibre. Dr. Riddell exhibited some good plain and penelope canvas, colored cloth, brushes, white and colored ladies' shoes made from the fibres of the Agave Americana. The canvas and ladies shoes were of excellent quality, and the cloth of brilliant colors—*M. E. J. R.* A coarse description of very hard brown canvas has been for some time produced in Bengal. At present in some parts of the Madras presidency, cotton canvas of very good quality is produced: two or more threads are placed together, sometimes the threads of the web are twisted either wet or dry. Native vessels have all their sails made of an inferior description obtained at the rate of 6 to 8 Rupees a maund of 25 lbs. in the northern parts of Madras Presidency. The better description would probably be more suitable than European canvas for sails which are only occasionally used. If well washed, to get rid of the dressing previous to use, it would be less liable to mildew, would be lighter and more easily handled; but the best could not be procured much under the price of ordinary English canvas.—*Rhode M.S.S.*

(2353) CAOUTCHOUC, ELASTIC GUM, INDIAN RUBBER.

Caoutchou, FR.	Boracha, PORT.
Federharz, GER.	Resina elastica, Ule, SP.

Caoutchouc. One source of this very remarkable substance (also called *elastic resin, elastic gum* or *India-rubber,*) is the syringe-tree of Cayenne and other parts of South America. For the first knowledge in Europe of the source of caoutchouc, we are indebted to some French academicians, who were sent out for the purpose of astronomical observation, in 1735. They discovered that it was the white milky juice of certain plants, found abundantly in Para, in the Brazils, in Quito, and since found in Asia. Of late years, considerable quantities have been brought from Java, Penang, Singapore, and Assam. The trees grow so abundantly in some

places, that hundreds of miles are covered with them. Caoutchouc oozes out as a vegetable milk from incisions made in the tree: it is collected chiefly in wet weather, when it flows most abundantly. The methods of inspissating and indurating it are still said to be kept secret, but this is unlikely: and it appears, that the juice thickens and hardens gradually on exposure to the air, and that, as soon as it becomes solid, it displays an extraordinary degree of flexibility and elasticity. Hence it is supposed that the natives make moulds of clay, or some substance that can be easily broken, and cover them with repeated layers of the juice, allowing each layer to dry before the next is applied. When the proper thickness is attained, the mould with its elastic covering is held over the smoke of a wood fire. The mould is then broken out, and the dried bottle forms the India-rubber of commerce. Mr. Solly, in a paper on the preparation of Caoutchouc, (*Trs. Asiatic Soc., London.*) adverts to the manner in which the sap is prepared for the market, by being laid on to some substance in successive layers, which are allowed to dry. That such is the case is evident on cutting a bottle of caoutchouc: the layers are distinctly visible, and they may even be separated if the mass be soaked in boiling water. It is evident that a great quantity of impurities must be deposited on the surface.—*Tomlinson, page* 297. Another of its sources was discovered in Assam in the beginning of this century and was fully brought into notice by Dr. Royle in 1836.—*Royle Prod. Res.* 76. The plant which yields it there, is the Ficus elastica which might no doubt be cultivated with advantage, and the banyan tribe generally yield a milky juice which, for many purposes to which caoutchouc is applied, might be rendered serviceable. Within a dozen years the true caoutchouc tree of Assam *Ficus elastica* has been introduced into the Tenasserim Provinces, and appears to grow as well as an indigenous plant.—*Mason.* In the Tenasserim Provinces, also, *Echites*, an indigenous creeper yields caoutchouc not at all inferior to that which is obtained from the elastic fig tree. The Agricultural and Horticultural Society, in reporting on a specimen sent them by Major Macfarquhar of Tavoy, observed: "With care in preparing, it would be equal to the best South American." I have never seen the plant in flower, but to judge from the fruit, it belongs to the dogbane tribe, and Echites group, for its seeds are comose above.—*Mason.* Caoutchouc is also procurable from the Nerium grandiflora, a beautiful climbing shrub often met with in gardens. In the *Asiatic Researches*, v. 167 is a description of a plant yielding caoutchouc, the "Urceola elastica" of Sumatra and Pulo Penang: From wounds in the bark of this plant a milky fluid oozes, which separates into an elastic coagulum and watery liquid of no use. This coagulum, after some months keeping, is described as having the properties of Indian rubber. Poisonous properties are attributed to the juice of this plant.—*Rhode M.S.S.* Caoutchouc is also yielded in abundance by *Vahea gummifera*, and Willoughbya edulis, genera of the natural order Apocynaceæ or Dogbanes; and is also produced from the Siphonia elastica. The milky juices of some trees of Malabar might be collected with the view of ascertaining the proportion of caoutchouc in them, and from the Loranthi which abound to an incredible extent in Malabar, a similar substance might readily be procured. Caoutchouc was not known in Europe until the commencement of the last century, and it continued for a long time in comparative obscurity. Few persons are probably aware of the comparatively late introduction of India-rubber into Britain. Dr. Priestly, in the preface of his work on Perspective, printed in 1770, says:—"Since this work was printed off, I have seen a substance [no name is given to it] excellently adapted to the purpose of wiping from paper the marks of a blacklead pencil. It must, therefore, be of singular use to those who practice drawing. It is sold by Mr. Nairne, Mathematical Instrument maker, opposite the Royal Exchange. He sells a cubical piece of about half an inch for three shillings; and he says it will last several years." It was first used for rubbing out the marks of black-lead pencils. Its use was then extended to the preparation of certain varnishes, which it rendered capable of resisting changes of temperature without cracking and scaling off. The facility with which two recently cut and perfectly clean surfaces of caoutchouc weld together, led to its use in the laboratory for the formation of short elastic tubes, which are used as connectors for a variety of apparatus in which separate pieces of glass tubing are thus joined together with flexible joints: they are prepared by wrapping a piece of sheet caoutchouc loosely over a glass tube or rod, and then cutting off the superfluous portion with a pair of scissors, on pressing the fresh cut edges together, they cohere so as to form a perfect tube. Caoutchouc is also used in the preparation of certain surgical instruments, which are required to be both supple and flexible. But the most important application of caoutchouc has been in waterproofing. In fact, caoutchouc is, as M. Dumas remarks, a very wonderful substance. The ordinary method of making waterproof cloth is exceedingly simple. The caoutchouc is dissolved in the oil distilled from gas-tar, and spread upon the surface of a piece of cloth, upon which a similiar piece is then extended. Both pieces are then passed between a couple of rollers. Hence the waterproof fabric consists of two pieces of cloth united by an interposed layer of caoutchouc. This cloth is so impervious to moisture that floating or hydrostatic beds are formed of it, and beds and

cushions are rendered elastic by inflating them. —*Tomlinson, page* 299.

(2354) CAPE ASTER. CINERARIA.

(2355) CAPE JESSAMINE. GARDENIA

(2356) CAPE OR BRAZIL GOOSEBERRY. PHYSALIS PERUVIANA.

(2357) CAPERS.

Kebbir, ARAB.	Capparis, LAT.
Kappers, DUT.	Kebbir, PERS.
Capres, FR.	Kaperszu. RUS
Cappern, GER.	Alcapparris, SP. *Faulkner.*

Capers, are the unexpanded flower-buds of the caper-tree, (*Capparis spinosa,*) a trailing shrub, growing in Italy and the South of France. Preserved in vinegar, these flower-buds constitute a well-known article of commerce, and of luxury at our tables. The cultivation of the tree for this purpose is confined to a comparatively narrow district in the south of France, namely, Cuges and Roquevaire, in the department of the Bouches-du-Rhone and Olioulles, in the department of Du Var. The gathering time is from June to August. As soon as the morning dew is off the trees, women, wearing a sort of flexible basket at their waists, collect the buds, at the rate of twenty-five or thirty pounds' weight in a day. The plantations are divided into compartments, each of which is visited every week during the season ; an experienced picker being able to tell the precise day when the buds will be in the best condition. A small and choice form of bud is called the *nonpareil* ; but if this be neglected for one day, it becomes a second-rate bud, called *capucine* : if not gathered then, it becomes on the third a *capote*. These three qualities are perfectly well known to merchants, and are more esteemed than buds gathered at random. But the less scrupulous cultivators are not only careless in this respect, but often allow the flower to ripen its fruit, which is a kidney-shaped seed, and which is sold with the commoner sort of capers. An inferior sort of caper is sold as *flat capers.—Tomlinson, page* 303. It will be seen that the quality depends exclusively upon the age at which they are gathered, the smallest and youngest being the dearest and most delicate, and the largest and oldest the coarsest and cheapest. On an average each plant of the caper-bush gives a pound of buds. The consumption of capers in Britain is inconsiderable, not amounting to more than about 60,000 lbs. a year. Several other species of *Capparis* possess stimulating properties. There is a plant found in the neighbourhood of Carthagena called Fruta de Buno, supposed to be a *Capparis,* the fruit of which is extremely poisonous. The order has 28 genera and about 840 species. Some of the American species of *Capparidaceæ* are very poisonous ; others act as vesicatories ; and a few are merely stimulant. To the latter class belongs the *Capparis spinosa* of the south of Europe.—*Eng. Cyc. p.* 765.

(2358) CAPILAPODI, *Tam.* (Produce of *Rottleria tinctoria.*) (Ainslie). A fine reddish brown light powder which the natives employ for dyeing a beautiful pale orange colour, it is the red dust shaken from the seed of the plant above named and is an export from Malabar, where the tree is called Corunga munjemaram.—*Rhode M.S.S.*

(2359) CAPILLAIRE, SYRUP OF. This Syrup, which is brought to India for sale from Bourbon, is prepared with leaves of the Adianthum, Capillus Veneris. I understand from Dr. Klein, that at the same island, the article is sometimes made with another species of Adianthum (Adianthum caudatum), this grows in Ceylon, amongst the Courtalum hills and in other parts of the Indian Peninsula. Both the plants just mentioned (which are of the class Cryptogamia and order of Filices), are natives of Cochin China, the first is also found at Amboyna and is called by Rumphius Micca Miccan Uttan. Vide Rumph. Sib. x. Tab. xxxiv.—*Ainslie's Mat. Med. p.* 297.

(2360) CAPOOR CUTCHERRY, is the root of a plant sent to India and Persia for medicinal purposes and for perfumery, and to preserve clothes from insects. It is about half an inch in diameter, and cut up when brought to market; it has a pungent bitterish taste, and slightly aromatic smell.—*Middle Kingd. Vol.* II, *p.* 400.

(2361) CAPPARIS ACUMINATA. This was found by Dr. Hooker in full flower along the road side, in the Soane valley.—*Hooker, Him. Jour. Vol* I. *p.* 38.

(2362) CAPPARIS APHYLLA, common wild Caper tree. Kurela, *Hind.* This is very common every where in Rajwarra, and often becomes a considerable tree, in the jungles; the flowers are red and very handsome: one species has yellow flowers.—*Genl. Med. Top. p.* 199. The fruit of the *C. aphylla* of India, is used as a pickle.—*O'Shaughnessy.*

(2363) CAPPARIS BREVISPINA. *Authoonday-kai,* Tam. The green fruit is used in making pickles. It is a scrambling shrub, common in hedges with a beautiful red fruit, the size of a small pear ; the stem armed with yellow thorns in pairs at the leaves.—*Jaffrey.*

(2364) CAPPARIS DIVARICATA. *Capparideæ,* Icon. 889. Toarattie marum, *Tam.* A small sized tree, wood only fit for fuel.—*Wight.*

(2365) CAPPARIS GRANDIS. *Capparideæ,* Icon. 21. Vellay toarattie marum, *Tam.* A small tree, but the wood is close grained and hard, too small for general use.—*Wight.*

(2366) CAPPARIS HORRIDA, Lin.

Catallikai also Atunday, TAM.	Aradoonda, TEL.
Ardunda, DUK.	Hoonkara, SANS.

The Natives eat this dressed in different ways. It is the produce of a tree of the class Polyandria and order Monogynia.—*Ainslie, p.* 238.

(2367) CAPPARIS SINAICA. The buds of the *Capparis Sinaica*, or Caper of Mount Sinai, are the *filfil-ul-jibbel*, or mountain pepper of the East.—*O'Shaughnessy.*

(2368) CAPPARIS SPINOSA, The caper plant, is well known through its young flower buds, which constitute the capers of the shops. —*O'Shaughnessy.*

(2369) CAPREÆ, a sub-tribe of the family *Bovidæ* amongst the Ruminant *Mammalia*, and equivalent to the sub-tribes *Boveæ*, *Antilopeæ*, *Strepsiceræ* and *Oveæ* according to Dr. Gray's arrangement of the *Mammalia* in the British Museum. The Capreæ include what are commonly known by the name of Goats. The classification of these animals has been the cause of much difference of opinion. Ray established three genera of Ruminants with bisulcated hoofs. 1. *Bovinum genus*—the Oxen. 2. *Ovinum genus*—the sheep. 3. *Caprinum genus*—the Goats; comprising the Common Goat, the Ibex, the Chamois, the Gazelles, &c. Mr. Hodgson, after remarking on the difficulty experienced by zoologists in the determination of distinctive marks adequate for the separation of the genera *Antilope*, *Capra*, and *Ovis* insists that, as he has shown, the character founded on the presumed absence of cavities in the cores of the horns connected with the frontal sinus is incorrect, and he conceives that the value of the characters, which are generally admitted by authors as distinguishing between the genera *Capra* and *Ovis* may be tested by a comparison of the wild race of either genus which belongs to the Himalaya. He then describes *Capra Jharal*, which is "clad in close short hair, and without the least vestige of a beard," as related to the Alpine *Ægagri* and to *Capra Jemlaica* and *Ovis Nahoor* (Hodgson), placing them both under the tribe *Capridæ* (H. Smith); and having completed the description of this wild goat and wild sheep, he exhibits the points of difference and of resemblance between the two. In describing the wild sheep, Mr. Hodgson observes that the horns are inserted high above the orbits on the crown of the forehead touching nearly at the base with their whole depth, and carrying the frontal bones very high up between them, the parietals being depressed in an equal degree. The goat's skull has, he states, the same form, but less strikingly developed; and he seems to think that this form of the skull would afford a just and general mark to separate *Ovis* and *Capra* from *Cervus* and *Antilope*, remarking that there is a gradation of characters in this respect among the Antilopes tending to the Capryne type in their general structure. Mr. Hodgson thus concludes; "The goat and sheep have in common, hair and wool; no beard; no suborbital sinuses; evanescent muzzle; no inguinal pore; horns in contact at the top of the head; knees and sternum callous; angular and transversely wrinkled horns; striated ears; two teats only in the females; horns in both sexes; and, lastly, incisors of precisely the same form. Of the various diagnostics then proposed by Colonel Hamilton Smith, it would seem that the following only can be perfectly relied on to separate *Ovis* from *Capra*:—slender limbs; longer pointed ears; chaffron arched; nares long and oblique; very voluminous horns, turned laterally with double flexures. I should add myself the strong and invariable distinction—males not odorous, as opposed to the males odorous of the genus *Capra*. But after all, there are no physical distinctions at all equivalent to the moral ones so finely and truly delineated by Buffon, and which, notwithstanding what Colonel H. Smith urges in favour of the courage and activity of sheep, will for ever continue to be recognised as the only essential diagnostics of the two genera."—The following is a synopsis of the genera of Capreæ.

A. Muffle Naked.

1. *Hemitragus.* Horns trigonal, compressed and knotted in front.
2. *Kemas.* Horns square, flat, and cross-ridged in front—*Eng. Cyc. p.* 767.

B. Muffle Hairy.

3. *Ægoceros.* Horns roundish, conical.
4. *Capra.* Horns square, flat, and nodose in front.
5. *Hircus.* Horns trigonal, compressed, sharp-edged and knotted in front.

Dr. Gray refers the Common Goat, which must be taken as the type of the family, to the last genus, of which it is the only species. Hircus *Ægagrus*, the Goat, is Αἴξ (ὁ καὶ ἡ, but generally used for the female), τράγος, χίμαρος (the male), ἔριφος (young male kid of three or four months.) It is the *Capra Hircus* of Linnæus; the *Capra caucasia*, H. Smith; *Ægoceros Capra*, Pallas, *Capra Ægagrus*, Gmelin. The varieties of this animal are very numerous; and many of these are regarded by writers on natural history as species. Fischer speaks of the *Ægagrus* as being, without doubt, the parent of our domestic Goat. Whilst upon this inquiry we must not omit the Jemlah Goat (*Capra Jemlaica*, of Hamilton Smith), which is said to inhabit the district of Jemlah, between the sources of the Sargew and the Sampoo; that is, says Colonel Smith, the most elevated range of Central Asia, forming the nucleus between the western and south-eastern branches of the Himalaya Mountains. This animal appears to be the same as the Jharal of the Nepaulese, *Capra Jharal* (*Hemitragus Jemlaicus*, Gray,) described by Mr. Hodgson ('Zool. Proc.', 1834), from a fine male specimen kept in his garden at Nepaul. He states that the Jharal is found wild in the Kachar region, in small flocks, or solitarily, and gives its character as bold, capricious, wanton, eminently scansorial, pugnacious, and easily tamed and acclimatised in foreign parts. He remarks that the Jharal has a close affinity, by the character of the horns to the Alpine *Ægagri*

and still more nearly, in other respects, to *Capra Jemlaica*. It differs, he observes, from the former by the less volume of the horns, by their smooth anterior edge, and by the absence of the beard; from the latter, by the horns being much less compressed, not turned inwards at the points, nor nodose. He adds, that the Jharal breeds with the Domestic Goat, and more nearly resembles the ordinary types of the tame races than any wild species yet discovered. During a visit to Rhenish Germany in the autumn of 1837, Mr. Ogilby learned from Professor Cretzschmar, the well known editor of the Mammalogical part of Dr. Ruppell's first 'Atlas,' the success of an experiment which the professor had been carrying on for some years in the neighbourhood of Frankfort-on-the-Main, to ascertain the possibility of procuring a cross between the Cashmere Goat and the Saxon Merino Sheep. With this intention Professor Cretzschmar had two or three years ago procured a large Cashmere buck, which was put into a stable with twelve Merino ewes. For two seasons however his hopes were disappointed, and it was not till the season of 1836 that the desired union took place. During the spring of that year the sheep very freely took the buck, and produced fine healthy lambs, which were, when Mr. Ogilby obtained his information, rather better than a year old. They were kept in a large stable with a number of pure Merinos, which is the usual mode of treating these valuable animals in that part of Germany, where the land is all under the plough, and there are neither sheep nor grazing farms; and so closely did they resemble the pure Saxon breed, that it was impossible to perceive any difference in their external characters. The species of the genera of *Capreæ* in the British Museum Catalogue are as follows;—*Hemitragus Jemlaicus*, the Jharal or Tehr. This animal inhabits the loftiest mountains of India. *Kemas Warryato*, the Warryato or Jungle kemas. It is a native of India, and has been called the Wild Sheep of Tenasserim. *Ægoceros Caucasia*, the Tur, or Zac. It inhabits the Caucasus, and is sometimes called the Caucasian Ibex. *Capra Himalayana*, the Sakeen or Skyn. It is also called the Himalaya Ibex. Dr. Gray observes that this is not probably distinct from *Ibex* (*Capra*) *Sibirica*. *Capra* (?) *lævicornis*, the Smooth-Horned Ibex. It is probably a hybrid. *Capra Nubiana*, the Beden or Jaela. It is an inhabitant of Egypt, Arabia, and Crete.—*Eng. Cyc. page* 772.

(2370) CAPRIFOLIUM SEMPERVIRENS. *Caprifoliaceæ*.—The Lonicera or Trumpet honeysuckle, named after Adam Loniceir, a German botanist. Common all over England. Grows in hedges, thickets, and clefts of rocks; flower yellow, or white with deep red streaks, and remarkable for its odour. Lonicera sempervirens, a native of North America, with flowers, scarlet outside and yellowish white within—very useful in covering walls; the perfume at night is unpleasant to some persons, being sickly. Lonicera chinensis is common in some gardens of the Deccan. Is propagated by slips and layers in any good garden soil.—*Riddell.*

(2371) CAPRIMULGUS, a genus of Birds belonging to the tribe *Insessores* and the family *Caprimulgidæ*.

(2372) CAPSELLA BURSA PASTORIS, Mullay muntha-kerray. *Tam.*—The shepherds purse, an English weed, common on the Neilgherries, used by the natives as a pot herb.—*Jaffrey.*

(2373) CAPSICUM.

Chillies, Eng	Moollaghai, Tam.
Mirchie, Lall Mirich, Duk. Hind. and Guz.	Lombok, Javan.
Meerapa kailoo Tel.	Chabe or Chabul, Malay.

Capsicum, a genus of plants belonging to the natural order *Solanaceæ*. The shell of the fruit is fleshy and coloured, and contains a pungent principle, which also exists in its seed in great activity. On this account both the fruit and seeds of different varieties or species of *Capsicum* are in request as a condiment, and either in the unprepared state or ground, when they are called Cayenne Pepper, form a conspicuous feature amongst the plants affording stimulating substances used by man. In Europe the *Capsicum* enters largely into the seasoning of food and the preparation of pickles, and in warmer countries it constitutes one of the first necessaries of life either green or ripe.—*Tomlin.* It is this plant, and not any of the genus Piper, which is the universal peppery condiment of all the inhabitants of the Asiatic islands in Eastern Asia; the latter, indeed, being little used, and mostly raised for exportation. Foreign species or varieties of Capsicum have been introduced into the Archipelago, and are named Chabe China, the Capsicum of China; and Chabe sabrang, the Capsicum of India, literally, of "the other side of the water."—*Crawfurd Dicty. p.* 82. There are now numerous varieties of chillies in India, many of which have been introduced. They are raised from seeds, that have been kept for one year, for if fresher, the crop is generally a failure. One species called "devil's pepper," introduced by Lord Harris, from Trinidad, is so intensely hot that the natives can hardly manage to use it. It is cultivated during the cold months. —*Jaffrey.* In the Tenasserim Provinces they have large quantities of Cayenne-pepper, or chillies, of which two or three species, enter into all the native dishes; not in the form of pepper, but the fruit, stewed or roasted, is eaten with the food. In India, the dried fruits of several species and varieties of Capsicum are the

Capsicum grossum (Bell pepper)
" annuum.
" frutescens. Goat "
" minimum (Bird's Eye.)

These, valued as a digestive condiment, are raised all over the country, the principal use of them being as condiments and to make Cayenne Pepper and Chilly vinegar. The several species of Capsicum are natives of South America, whence they have been introduced into the Old World, and become universally diffused, from the fondness of Asiatics for warm condiments. The Hindoos, though cultivating the Capsicum extensively, have no specific name for it, but call it *Red Pepper*. "Chilli, either simply or in composition, being the Mexican name for all the varieties and species of this genus" (*R. Brown*), indicates that the genus is American. Many varieties have no doubt been raised to the rank of species. The genus is distinguished by its berry-like but dry fruit. The fruit varies much in form, being round, oblong, cordate, or horned, and either scarlet or yellow, and more or less pungent in taste. The horn-shaped variety is most common, from 2—3 inches in length, and from ½—1 inch diameter at the base, and usually called Capsicums, and the plant C. annuum. One variety, called Cockspur pepper, has the fruit long and slender. Sometimes the fruit is globose or lobed; the variety is then called *C. baccatum*. When the fruit is small, elongated, and pointed, the variety is called Bird-Pepper, and botanically *C. minimum*. When the plants are allowed to grow beyond the year, they become shrubby, and form the variety called *C. frutescens*. Nees von E. 190. St. and Ch. 44. The berry or fruit of the Capsicum, in its dried state, when powdered, form Cayenne Pepper, but are often preserved in vinegar as a pickle, and the fluid likewise employed under the name of Chilly Vinegar. Rubefacient, Acrid Stimulant. Much used as a Condiment in hot countries. Sometimes used as a counter-irritant, with salt as a stimulant in Scarlatina maligna, as a gargle in relaxed sore throat, or in the form of Cayenne Lozenges. The fresh Capsicums used in Europe are principally obtained from the *Capsicum annuum*. This is a weedy plant found wild in South America and the West Indies but grown largely in Southern Asia. This species grows from one to two feet high, forming a dark green bush, with ovate or ovate-lanceolate leaves; its flowers are small and white; its fruit is extremely variable in size, colour, position, and even in quality. Red and yellow are the prevailing colours; the oblong-conical is the ordinary figure; and to hang in a drooping position is the most usual direction of the fruit. But round, ovate, and even depressed fruit is known, and many varieties constantly bear their fruit in an erect position. Most of them are too pungent for European palates; but the large Red Bullock's Heart and yellow Tomato Capsicums are mild enough to be sliced with salad. A much hotter species is the *C. fruticosum*, or frutescens, or Goat-Pepper, of the East Indies, which differs from the *C. annuum* in being a shrub and in its fruit being very small. There is also a kind cultivated by the Chinese, with black fruit; and botanists recognise many others, but they appear to be in many cases mere varieties of *C. annuum* or *C. fruticosum*.—*Eng. Cyc. page* 774.

(2374) CAPSICUM ANNUUM, *Vern.* Gachmirch, grows in South America, Mexico, East Indies, and called Chillee, capsicum, cayenne pepper, red pepper. Fruit of various forms, and either scarlet or yellow, in some scarcely pungent, in others intolerably hot.—Capsicum is of greater importance as a condiment than as a remedial agent. It possesses strong stimulating properties, and has been employed with success as a topical application to elongated uvula, and relaxation of the pendulous veil of the palate; made into a lozenge with sugar and tracacanth it is a favourite remedy for hoarseness with professional singers and public speakers. In putrid sore throat, whether symptomatic or strictly local, gargles of an infusion of red pepper are often very usefully employed. In native formulæ we meet this ingredient constantly, especially in the prescription for gout, dyspepsia, cholera, and ague. The practice is doubtless good, and derived from long experience of the beneficial effects of this stimulant on the native of the East. —*O'Shaughnessy, page* 467 and 8.

(2375) CAPSICUM FRUTESCENS, Willd. Cayenne pepper. Goat pepper. Bird pepper.

Mollaghai, TAM.	Merapakailoo, TEL.
Laal mircha, DUK.	Braha Maricha, SANS.
Laal mirch, HIND.	Lunka mirch, BENG.

This plant is so well known all over India as the large red pepper, that it is hardly neceesary to describe the method of culture, which merely consists in sowing the seed broad-cast, and when the plants are about six inches high, putting them either in rows or beds eighteen inches apart. The soil should be rich. They require watering, and being kept clear of weeds.—*O'Shaughnessy, page* 468.

(2376) CAPSICUM MINIMUM.

Oosee-moolakyai, TAM.

The East Indian bird pepper, generally cultivated for pickles: they are very hot: this plant is of a shrubby nature, yielding fruit for a series of years. The Caffree Chilley, *Capsicum grossum* of Botanists and the Nepaul Chilley, *C. Nepalense*, are varieties of *C. frutescens*.—*Jaffirey*.

(2377) CAPSICUM PURPUREUM and *C. minimum*, or Cayenne pepper. In Pegu, both species are cultivated in small quantity for domestic use.—*McClelland*.

(2378) CARABUS, a genus of Coleopterous Insects, of the family Carabidæ. This must not be confounded with the genus *Carabus* of Lin-

næus, which, according to many of the modern authors, is divided into several families, and each of those families contains numerous genera. The necessity for sub-dividing the group called *Carabus* by Linnæus will be seen when it is taken into consideration that there are probably now about 800 species discovered. —*Eng. Cyc. page* 774.

(2379) CARALLUMA ADSCENDENS. Cullee-moolayan, *Tam.* This curious looking fleshy plant with angular stems belonging to the natural order Asclepiadæ, is used by the natives in making pickles, and sometimes in chatney. —*Jaffrey.*

(2380) CARANA PALM, (Maurita Carana) its leaves are used as a thatch for houses.—*Seem.*

(2381) CARANX, a genus of Acanthopterygious Fishes, belonging to the family *Scomberidæ.* —*Engl. Cyc. page* 775.

(2382) CARBON is one of the elements which occurs pure in nature. In this state it is called *Diamond,* and forms one of the most precious gems. It is also found in a tolerably pure condition in *Graphite* called *Plumbago* or *Black-Lead.*) This substance contains from 90 to 96 per cent. of Carbon, with the rest iron. Carbon enters largely into the composition of Amber and also of mineral Caoutchouc and the various forms of Bitumen. It forms the distinguishing element of *Coal.—Eng. Cyc. page* 776.

(2383) CARBONATE OF LIME. This is a very abundant mineral in the Tenasserim Provinces and embraces several varieties. Stalactical Carbonate of Lime is one of these. All the limestone caves have stalactites hanging from their roofs; and stalagmites raised on their floors. The Siamese Karens often bring over bits of limestone of the shape of a shell, and when broken, a shell usually of the genus melania appears, that has been encrusted with carbonate of lime. Much of the alabaster of which ornaments are made is stalagmite; but all the alabaster images of that coast are made of marble: and not of compact gypsum, which they much resemble.—*Mason.*

(2384) CARBUNCLE.

Escarboukle, Fr.	Carbunculus, Lat.
Karfunkel, Ger,	Carbunculo, Sp.
Carbonchio, It.	

A precious stone once highly esteemed. A variety of garnet.

(2385) CARDAMOM.

Ebil, Heelbuya, Arab.	Kapol, Jav.
Ensal, Cyng.	Capulaga. also Powar, Malay.
Ellachi. Duk. Guz. and Hind.	Kakelah-seghar, Heil, Pers.
Cardamomen, Dut.	Cardamomus, Port.
Cardamomes. Fr.	Kardamomos, Sp
Kardamom, Ger.	Yaydersie, Tam.
Cardamomi, It.	Yaylakooloo, Tel.

Cardamoms are the production of various species of plants of the same tribe as the ginger, growing in India, Ceylon, and Java. Various species of *Alpiniæ, Amomum, Elettaria, and Renealmia,* appear to furnish the cardamoms of the shops, which consist of the oval, trivalvular capsules containing the seeds. These are used in medicine as aromatic tonics and carminatives; and in culinary purposes for curries, ketchups, soups, &c. Their active ingredient is a pungent volatile oil. The least dampness injures the finer sorts. About 687 cwts. of cardamoms, and 5,000 cwts. of bastard cardamoms, are annually exported from Siam. England imported about 300 tons in 1849. The price ranges from 1s. 6d. to 3s. the pound. The estimated value of the cardamoms and pepper shipped from Ceylon in the past few years was as follows:—1846, £2? 8; 1847, £246; 1848, £205; 1849, £454; 1850, £960; 1851, £771; 1852, £590. The following are some of the plants from which cardamoms are procured. 1. *Amomum cardamomum,* a plant of Eastern and Southern Asia, supplies the round cardamoms. It has pale brown flowers. The fruit varies in size from that of a black currant to a cherry. 2. *A. angustifolium* (Pereira), a plant having red blossoms, furnishes the large Madagascar cardamoms, and also supplies some of the seeds called "Grains of Paradise," which are, however, larger than those imported under that name. This species is found in Abyssinia, according to Mr. Chas. Johnston, author of "Travels in Abyssinia." The seeds are pale olive brown, devoid of the fiery peppery taste of the grains of paradise. 3. *A. maximum,* the great winged amomum produces the Java cardamoms of the London market, and is also grown extensively in Ceylon, the Malay islands, Nepaul, Sumatra, and other islands of the Eastern Archipelago. There were exported from Ceylon in 1842, 5,364lbs.; in 1843, 9,632lbs.; 1844, 7,280lbs.; and in 1845, 11,812lbs. The pods are large and long, and dark colored, approaching to black, the taste nauseous and disagreeable, not the least resembling that of the Malabar cardamoms. It is propagated by cuttings of the rhizoma. The plants yield in three years, and afterwards give an annual crop. They are not used in Britain but sent to the continent. 4. *Alpina Cardamomum.*—This is the source of the clustered cardamoms, and furnishes the best known sort. Its produce is in great request throughout India, fetching as much as £30 the candy of 600 lbs. About 192 candies are grown annually in Travancore, and the usual crop in Malabar is reckoned at 100 candies annually. It flourishes on the mountainous parts of the Malabar coast, and among the western mountains of Wynaad. The bulbous plants, which grow three or four feet high, are produced in the recesses of the mountains by felling trees, and afterwards burning them, for wherever the ashes fall in the openings

or fissures of the rocks, the plant naturally springs up. In the third year, the plants come to perfection, bearing abundantly for a year or two, and then die. In Soonda Balaghat, and other places where cardamoms are planted, they are much inferior to those grown in the wild state. It may be propagated by cuttings or divisions of the roots. Not more than one-hundredth part of the cardamoms raised in Malabar are used in the country. They are sent in large quantities to the ports on the Red Sea, and the Persian Gulf, up the Indus to Scinde, to Bengal and Bombay. The price of Malabar cardamoms at Madras, in June, 1853, was about £3 the maund of 25 lbs. They fetch in the Bombay market £4 10s. the maund of 40 lbs. Cardamoms form a universal ingredient in curries, pillaus, &c The seed capsules are gathered as they ripen, and when dried in the sun are fit for sale. They should be chosen full, plump, and difficult to be broken; of a bright yellow color, and piercing smell; with an acrid, bitterish, though not very unpleasant taste, and particular care should be taken that they are properly dried. 5. *Amomum Grana-Paradisi*, which is indigenous to the islands of Madagascar and Ceylon, yields an inferior sort of cardamoms, known by the names of grains of paradise, or Meleguetta pepper. These are worth in the English market only from 1s. 2d. to 1s. 4d. per pound, while the long and Malabar cardamoms fetch 2s. 8d. to 3s. 3d. the pound. This plant is a native of Guinea, and the western parts of Africa about Sierra Leone. Britain imported from thence in 1841, 7,911 pounds. The taste of these Guinea grains is aromatic and vehemently hot or peppery. They are imported in casks from Africa, and are principally used in veterinary medicine, and to give an artificial strength to spirits, wine, beer, &c. The average quantity on which duty was paid in the six years ending with 1840, was 16,000lbs. per annum. They are esteemed in Africa the most wholesome of species, and generally used by the natives to season their food. Dr. Pereira, from a careful examination and close inquiry, is of opinion that the *Amomum Grana-Paradisi* of Smith, and the *Amomum Melegueta* of Roscoe, are identical species. In the second volume of the "Pharmaceutical Journal," Dr. Pereira states that the term "grains of paradise," or Melegueta, has been applied to the produce of no less than six scitamineous plants. At the present time, and in this country, the term is exclusively given to the hot acrid seeds imported into England from the coast of Guinea, and frequently called Guinea grains; and by the Africans Guinea pepper. 6. ***Elettaria cardomomum***, Don. The fruit of this species constitutes the true, small, officinal Malabar cardamoms. It is an ovate, oblong, obtusely triangular capsule from three to ten lines along, rarely exceeding three lines in breadth, coriaceous, ribbed, greyish or brownish yellow. It contains many angular, blackish or reddish brown rugose seeds, which are white internally, have a pleasant aromatic odor, and a warm agreeable taste. 100 parts of the fruit yield 74 parts of seeds, and 26 parts of pericarpal coats.—*Simmonds, p.* 420. *Elettaria major*, is a perennial, native of Ceylon, which grows in shady situations in a rich mixed soil. The dried capsules are known in commerce as wild or Ceylon cardamoms, and are of less value in the market than those of Malabar (Elettaria Cardamomum, Maton). It is chiefly grown about the Kandyan district; and in the eight years ending with 1813, the average export was nine and a-half candies per annum. At the Madras Exhibition of 1855, the Elettaria Cardamomum, so much used for various kinds of food, was exhibited in fine order from Mysore, Coorg, Canara andTravancore, and seemed to be identical with Amomum Cardamomum. The seeds in taste resemble our carraways, and are used for seasoning various dishes. Ceylon cardamoms are now worth in the London market (Sept. 1853. 1s. to 1s. 3d. per lb; Malabar ditto 2s. 3d.to 3s.—*Simmonds' Comml. Product, p.* 421. The Karen forests of Tavoy, and Mergui abound with Cardamom plants; and while subject to the Burmese Government, the Karens were required to collect the seeds and pay them in as tribute; but they gather very few now, as they can employ their time more profitably; and when they did collect, they were in the practice of mixing a spurious kind of cardamom with the true, the produce of a plant belonging to the genus amomum, believed to have been *A. Cardamomum.*—*Mason.* Cardamoms are imported into Bombay from the Malabar Coast, and are re-exported to England, and the Arabian and Persian Gulfs.—*Faulkner.*

(2386) CARDAMOMS BASTARD.

Kurrocha, Guz. Hind.	Kapulaga, Bali. Jav.
Heel kilan, Pers	Mal.

Are much larger than the true Cardamom, more pungent, but less aromatic, with a strong camphoraceous taste. They are not much esteemed, and are only used by the poorer classes of natives as a substitute for real cardamoms. They are brought to Bombay from the Malabar Coast.—*Faulkner.*

(2387) CARDIOPTERIS. At Cachar, Cardiopteris covered the trees for upwards of sixty feet, like hops, with a mass of pale-green foliage, and dry white glistening seed-vessels. It is a remarkable plant of unknown affinity; see Brown and Bennett, "Flora Javæ:" it is found in the Assam valley and Chittagong.—*Hooker, Him. Jour. Vol.* II. *page* 334.

(2388) CARDIOSPERMUM HALICACABUM. Lin. *Sapindaceæ.*

Shibjool, Duk.	Smooth leaved heart pea.
Mooda-cottan, Tam.	Karavee, Sans.
Boodda-kanka-rakoo, Tel	

The heart pea or balloon vine; an annual

climbing plant, with an inflated membranous capsule, hence its name. The root of this twining plant, the leaves of which are broad, lanceolated, and sub-divided, is considered by the Native practitioners as aperient. It is mucilaginous, and in a very slight degree nauseous to the taste. The Vyteans prescribe it in decoction to carry off offending bile, and purify the intestinal canal. Rheede says the leaves are given in pulmonic complaints on the Malabar coast.—*Ains. Mat. Med. p.* 89. The heart-seed, which has an aperient root, is raised in great quantities by the natives of Tenasserim, but more as a vegetable than a medicine.—*Mason.*

(2389) CARDIUM, a genus of Bivalve *Mollusca* belonging to the Acephalous *Lamellibranchiata*. The shells belonging to this genus are very widely distributed, and many of them are remarkable for the elegance of their form and colouring. The species are about 200 in number. "We find," say the authors of the 'History of British Mollusca,' "the great assemblage of Cockles in the Indian Ocean."—*Eng. Cyc. p.* 777.

(2390) CARDIUM EDULE.

Fish cockle, ENG.	Seepee, DUK.—*Ains. Mat. Med. page* 155.
Muttie, TAM.	

(2391) CARDOLE, a thick black oily substance, obtained from the pericarp of "Anacardium occidentale" the cashew nut, was exhibited from Tanjore, at the Madras Exhibition of 1855, and by Lieutenant Hawkes. It is a powerful vesicating agent.

(2392) CAREX, a genus of plants belonging to the natural order Cyperaceæ, and the tribe Cariceæ.—*Eng. Cyc. page* 778.

(2393) CAREX ARENARIA grows on the sands of the sea-shore and is one of the plants which, in conjunction with the *Elymus*, *Arundo*, and *Psamma*, binds the loose sands, and forms them into solid embankments. Although most of the species are devoid of striking beauty, some of them when in flower are much admired on account of the elegant drooping of their panicles of golden-coloured flowers.—*Eng. Cyc. page* 778.

(2394) CAREX MOORCROFTII. Grass was very scarce in Thibet but a running wiry sedge (Carex Moorcroftii) binds the sand, like the *Carex arenaria* of the English coasts.—*Hooker Him. Jour. Vol.* II. *page* 155.

(2395) CAREYA ARBOREA, *Myrtaceæ*, Ill. 99.

Pailæ marum, TAM.	Cumbia, CAN.
Budada-nedi, TEL.	Kumba or Koomba, HIND.
Baubwai, BUR.	

A good sized tree, leaves deciduous in the cold season, bears an oblong fruit, size of an egg; has a very peculiar scent, no use is made of it.—*Riddell.* This is one of the most numerous trees throughout the Tenasserim province. The timber is large, and forms the chief material of which the carts of the country are made: wood, red: equivalent to mahogany.—*McClelland.* Furnishes a useful timber for house building. In some parts of India matchlocks are made from it.—*Mason.* In India the stringy bark of this tree is employed by the natives of the countries in the circars and along the foot of the Himalayas as a slow match for their match-lock guns.—*Royle Fib. p.* 301. The bark is very astringent, worthy of examination; Salsette jungle; Guzerat; Candesh; Malabar Hills and Parell Hills.

(2396) CAREYA SPHÆRICA, almost identical with the above Careya arborea, serves as cordage, and is used as slow match for guns in N. Circars. Hort. Garden 22.

(2397) CARICA, a genus of plants belonging to the natural order Papayaceæ. One of the species is,

(2398) CARICA PAPAYA, Lin.

Uruu khurbooza, HIND.	Bapai pundoo, TEL.
Thin baw, BURMESE.	Papa, MALAY.
Puppalie pullum, TAM.	Paupoy, MALEAL.
Puppaya, DUK.	

Carica Papaya, is a remarkable tree found in various parts of South America, with a simple unbranched erect trunk (*Eng. Cyc. page* 780), is generally found in villages throughout India and grows without much care. The fruit is generally gathered in a green state and dressed as curry, which, with rice, forms a very common repast.—*McClelland.* Carica papaya, *Puppiley-kai*, T., is used green by Mussulmen, and the lower class of natives as a vegetable. The fruit when ripe used as a dessert. Rumphius tells us that in the Eastern Island the Popaie fruit, sliced and dressed while green and white, is a pleasant table vegetable. Vide Rumphius, tom. 1. cap. xliv, page 148. —*Ainslie.* It contains in its centre dark colored seeds with taste like the water cress. In its unripe state the Popaie is made into tarts which are not easily distinguished from those made of apples. The fruit is formed by a large oblong pepo suspended upon the leafless part of the trunk, like the jack fruit; the surface when ripe is a pale, and rather dingy orange yellow, obscurely furrowed, and often rough, with little elevated points. A milky juice exudes on incision from the rind. It is deemed a powerful vermifuge in the Mauritius, and the power of the seeds (which taste like water-cress) is said to possess the like virtue. The milky juice very closely resembles white of egg in its chemical composition. It is alkaline, contains albumen in such quantities that it coagulates when heated to 170°, and it putrifies readily, evolving a very offensive odour. It is stated in several works of high authority that tough meat rubbed with this juice becomes very tender and fit for the table, without any injurious property being communicated to it. The flesh of animals fed on the

leaves and seeds is said also to be remarkably tender. It is even asserted that dead animals hung from the branches of the tree undergo this alteration. These ideas prevail also in Bengal, where the Mahomedan table servants frequently use the juice with the view of softening beef-steaks and old fowls. In numerous experiments which Dr. O'Shaughnessy instituted he could not trace any well marked discisive effect of this kind. Putrefaction appeared to him to be accelerated by contact with this as well as other albuminous fluids. Just before putrefaction commences, muscular fibre is doubtless less rigid than at any previous time. It is thus that we may possibly best explain the effect, if any, produced by the practice in question. As to the alleged efficacy of suspending meat from the tree, he is disposed to regard it as a mere popular delusion. The leaves are used by the negroes in washing linen, as a substitute for soap. He cannot speak from his own experience of the anthelmintic virtue of the juice. He has given it in doses of from 20 to 60 drops, without observing any marked effects.—*O'Shaughnessy, page* 352.

(2399) CARINARIA, the name of a genus of *Mollusca*, arranged by Cuvier under his fifth order of Gasteropods (Lamarck's *Heteropoda*) as the type of that order, and by De Blainville under the first family (*Nectopoda*) of his order *Nucleobranchiata*. The shells of this genus were formerly known to collectors under the names of Venus's Slipper and the Glass Nautilus: indeed one of the species is the *Argonauta vitreus* of Gmelin.—*Eng. Cyc. page* 782. *Carinaria* has never yet been taken in any other than warm latitudes. Three species, *C. vitrea*, *C. fragilis*, and *C. Mediterranea*, are recorded without reckoning Lamarck's *C. cymbium*.

(2400) CARISSA CARANDAS. Lin. *Apocynacea*.

The Wild Black Carandas. Bengal currants. Jasmine flowered Carissa., *Eng.* A large thorny bush, cultivated for the fruit at Ajmeer, but the plant grows abundantly wild in the Kotah jungles, and in March and April fills the air with the fragrance of its blossom. This plant forms beautiful and impassible hedges.—*Med. Top. page* 185. In some of the European gardens of Tenasserim this species of Carissa is cultivated for its berries, which taste when stewed like currants.—*Mason.* It grows wild in most parts of the Deccan, bearing a dark blue coloured berry when ripe, and sold in the bazar. There is also a cultivated sort in gardens. The fruit of the latter when ripe is sometimes eaten by Europeans, but in the green state is made into tarts, jellies, and pickles: the jelly is considered inferior to none made of other Indian fruits. The wild sort is gathered and sold by the natives for the same purpose. This species is a marked exception to the generally poisonous nature of the family, the acid fruits affording the well known and favourite caranda jelly of our tables.—*O'Shaughnessy, page* 444. This fruit is about the size of a large olive and when ripe is black and has a very pleasant taste somewhat like a damson.—*Ainslie, p.* 230.

(2402) CARMINE.

Karmyn, DUT.	Carminio, IT.
Carmine, FR.	Carminium, LAT.
Karmin, GER.	

A beautiful pigment prepared from cochineal. It was discovered accidentally by a Franciscan monk of Pisa, who having formed an extract of cochineal with salt of tartar for the purpose of employing it as a medicine, obtained a fine red precipitate on the addition of an acid. Homberg, in 1656, published a method for preparing it. As the use of this substance in reviving the roses on the cheek of beauty, and concealing the attacks of time, became known, the costly pigment became much in request. The makers of it in some of the principal towns of Europe, succeeded in preparing different varieties of it of greater or less purity and lustre. Many of these processes, even to the present day, are kept secret; and although the chemistry of the art is well understood, yet there are certain details of manipulation, and an empirical knowledge of the effects of temperature, doubtless acquired after long experience and many failures, which confer on the carmines of some makers a greater lustre than on those of others. The use of carmine has of late years been extended to the manufacture of superfine red inks, of artificial flowers, and to silk dyeing. Carmine is the finest red colour which the painter possesses. It is chiefly used in miniature painting and in water colours. It is made in large quantities in Paris. Carmine is one of those colours called *lakes*, a term applied to certain colouring substances, which behave like acids and combine by precipitation with a white earthy basis, usually alumina. Carmine is the richest and purest portion of the colouring matter of cochineal isolated in the manner here alluded to. Various imitations of carmine are prepared for the use of those who exhibit rouge on their cheeks. The common rouge of the theatres is prepared by pounding benzoin, red sandal wood, Brazil wood and alum in brandy, The mixture is then boiled until three-fourths of the liquid has evaporated: a paint of an intense red colour remains, and this is applied to the face with a

piece of soft cotton. Vinegar is sometimes substituted for the brandy; but as both fluids injure the skin, the colouring matter is sometimes extracted from the dye-woods, and unguents formed therewith, by means of balm of Mecca, butter of cacao or spermaceti. If the colour be too intense it is mixed with chalk.—*Rouge dishes* are small saucers containing a layer of dry rouge. Those which are prepared in Portugal probably contain genuine carmine: clumsy imitations of these dishes are prepared in London. *Spanish wool* and *oriental wool* are also rouge vehicles. Wool is impregnated with the colour, and formed into cakes about the size of a crown-piece by the Spaniards, and somewhat larger by the Chinese: the latter is most esteemed, since it affords (in the language of a modern pharmacopist) "a most lovely and agreeable blush to the check." Beautifully painted and japanned *colour-boxes* are also imported from China. Each box contains 24 papers, and in each paper are 3 smaller ones, namely, a "lovely blushing red" for the cheeks, an "alabaster white" for the face and neck, and a "jet black" for the eyebrows. French carmine is superior to that of English manufacture, and the superiority is said to depend on the influence of light on its formation and precipitation; the clear sky of the south of France being more favourable for the process than the more hazy atmosphere of England.—*Tomlinson, page* 326.

(2403) CARNATIONS, DIANTHUS CARYOPHILLUS.—These plants succeed pretty well so long as they are kept young, but degenerate soon, if not propagated annually: this is done by pipings. The soil in which they are grown must be entirely free from vermin; they succeed well in fine river sand to which has been added to every third part one part of well decayed manure. This beautiful genus of plants embraces about 130 species and varieties, besides a host of florist's varieties.

(2404) CARNAUBA. The *Copernicia cerifera* is a native of Brazil, a farina is prepared from its trunk and by shaking the young leaves after being detached from the tree, each leaf yields about fifty grains of a whitish scaly powder, which is melted in pots over a fire. It is employed to adulterate bees wax and is imported into Britain for manufacturing Candles.—*Seeman.*

(2405) CARNELIAN. One of the inferior gems of a uniform white or flesh colour: largely exported from Japan and from the Gulf of Cambay. It is also abundant in the trap rocks of the Dekhan and beds of its rivers. Carnelian, so called because some kinds are of a flesh colour, (Carnis, Latin for flesh) is that variety of a uniform colour, which is of commonest occurrence. Carnelians are never figured or striped. The colours are shades of red and yellow, the deep clear red being the rarest and most valuable. The great supply of carnelians is from Japan, where they exist in vast quantities, and they are also exported from Bombay, being collected in the province of Guzerat; but the best, according to Neibuhr, come from the Gulf of Cambay. Many of the antique gems are engraved in carnelian, and it is now much used for seals.

(2406) CARPETS.

Tappeti, IT.	

Persian and Turkey carpets are most esteemed, but those made in Axminster, Wilton, and Edinburgh, are believed to be very little, if any, inferior to those of Persia and Turkey. A variety of carpets are made in different parts of India, both of cotton and wool, and we now refer to these. Climate chiefly influences everything relating to the clothing or habitation of man. Among the latter, coverings for the floor, are necessarily included. In a cold, wet climate, it is hardly possible to use the floors of rooms without some kind of covering; and therefore we read in earlier times of the floors in Europe being covered with straw, rushes, hay, or heather. In warm countries, on the contrary, it is more the habit to sit in the open air under the shade of trees; and it is there desirable to have some covering over the sandy or dusty earth, either to sit or lie down upon. It is not surprising, therefore, that the invention of carpets should have originated in Eastern countries. Mats are the most agreeable in hot weather; and for these, India is famous, as well for their variety as for their fineness and pattern. Carpets, either of cotton, silk, or woollen, are employed in all Eastern countries, from the south of India to Turkey in Europe, for praying on, and for occasions of state. The carpets employed by the ancients are thought to have been of the nature of tapestry, and used for covering couches rather than floors. True carpets seem to have been first employed in Persia; and those called Turkish were probably originally of Persian manufacture, whence the manufacture might have been introduced into Turkey, and where, as well as in Egypt, the art is still practised. The Persians still remain unrivalled in the happy combination of colour and pattern for which their carpets have long been distinguished, whence the most varied hues and deepest tints are brought into close approximation, and, far from offending the eye, please by their striking, because harmonious contrasts. Though printed calicos of large size, and suitable patterns are sometimes used for covering the floors in India, yet the most common carpets employed there are those made of cotton, and *sutrunjees*, of different colours, usually blue and

white, in red or orange stripes, squares, or stars; some of large size, and well suited for halls and tents. They are thick and strong in texture, the two surfaces alike, smooth and without pile, and they are manufactured in different parts of India at Moorshedabad, Rungpore, Agra &c., and at many places in the Madras Presidency. Another kind of cotton carpet is that with a pile of cotton, and similar in appearance to a Turkey carpet, manufactured at Sasserim,—white, with a centre and border of blue, and they are made with every variety of coloured pattern, in the Hyderabad country. Silk is another material of which carpets are made in the East; and the pile being of silk, imparts both softness and richness to the surface, while the colours are clear and brilliant. They are beautiful as specimens of variety in pattern, brilliancy in colouring, as well as of pleasing harmony in the whole. Silk carpets, of small size, are made in Tanjore, Hyderabad, and Khyrpore. Woollen carpets, of large size, and of beautiful and well-coloured oriental patterns, are made at Mirzapore & Gorukpore, and many parts of Madras. The former is most famous in India for its carpets, which are frequently sold in Britain as Turkey carpets. The rugs from Ellore are universally admired for their general characteristics of oriental pattern and colouring; and these, as well as the large carpets from Mirzapore, all in the same style, seem well adapted for sale in Europe. At the Madras Exhibition of 1857, there was a large display of carpets and rugs, the manufacture having been brought to considerable perfection in several parts of Southern India. There were four distinct branches in these contributions; 1. The imitation Axminister or close nap woven carpet; 2. The short velvet pile or tapestry carpet and woollen rug; 3. The long velvet pile or imitation Turkey carpet; 4. The silk or velvet pile carpet. Of the *Axminister Carpet*, there were some very good specimens of close nap carpets from Warungul, the colors clear and bright, but a sameness in the patterns. The carpets were strong, soft, and very close in the weaving. The chief of the manufactures and the only one for which Warungal is famed is that of Persian Carpets, which are made of all sizes and of worsted, cotton, or even of silk. The weavers are all Mahomedans and are congregated principally at Mutwarrah, although there are a few looms within the Warungal fort. The weavers are drunken, turbulent, ignorant Mussulmans, possessing no capital, but dissipating in excess the little money they may procure on accomplishing a piece of work. Carpets chiefly of a small size, about two yards long and a little more than a yard in breadth, are made for the Hyderabad market, money being advanced to the Weavers by the dealers there. A worsted Carpet of this size and shape costs at Warungul from Rupees 2¼ to Rupees 2¼. A cotton Carpet is twice the price of a worsted. A silk one very highly priced.

A common trick among these weavers is to substitute hemp for worsted. Of the *Velvet Pile Carpets*, some large and creditable specimens were exhibited from Ellore and Tanjore. The former were closely woven, bright, and harmonious in color, and the patterns more varied than those from any other locality. Some of the rugs from Tanjore were also very tasteful. The long velvet pile or Turkey carpet was but poorly imitated at Bangalore and Trichinopoly. There was considerable variety and boldness in the patterns of these carpets, but the wool was dirty and coarsely dyed and the weaving loose. The carpets are cheap, but it was doubtful if they would wear well as the wool seemed to be easily pulled out.—*Madras Exhibition Juries Reports.* At Iyrempettah in Tanjore they make very handsome Carpets of silk. In Southern India, the cotton carpets used for tents are made at Cumbum, Rajahmundry, and other parts, the price being under one Rupee the square yard. They are generally in broad stripes of red and shades of blue. Small carpets of this description are produced in almost every district, and are used by sepoys and others for sleeping on: they are somewhat less in price in proportion than the larger ones. Carpets of a small description, woven with woollen in stripes on a stout cotton web, are made at about the same cost. Mr. Rohde has no doubt but that a fabric woven like striped cumbly in sufficient lengths would sell for carpeting in our colonies, as it could be sold at one fourth the price of English carpets and would be well suited to the colonists' wants. Silk carpets are made in Ramnad and at Tanjore—*Rhode M.S.S.* The best rugs and carpets are produced at Ellore, the better descriptions varying in price from 2½ to 4 or 5 Rupees a yard, they are of dyed wool upon a cotton web, the colours being arranged much in the same manner as a printer's composer sets up type, the colours are not so bright as those given in Europe. Commoner descriptions, of the size of small hearth rugs, are exported thence to England and Persia. Carpets of an inferior description are produced in Mysore, North Arcot Collectorate and other parts. Dr. Walker in the Asiatic Journal, No. 113, gives the following description of Carpet weaving at Hunumcoonda which is generally applicable. "The Carpet loom is nothing more than the common native loom placed vertically instead of horizontally. The waft is of thick strong cotton twist being arranged by no wafting mill but by one of the workmen going round and round two stakes fixed in the ground and dropping the thread at each as he passes, in the loom it is kept on the stretch by two strong billets of wood, the threads being attached by separate loops of cotton fixed to a bamboo, which is elevated or depressed at the will of the weaver. The worsted is held in the left hand and a crescent shaped knife in

the right, the fingers of both being left free. The inner thread of the waft is then seized, the worsted wound round the outer, crossed on itself, and the extremity drawn out by which it is made to descend in the form of an open figure of eight to be snipped by the curved knife. It is superfluous to say that this is the work of an instant. When the pattern is new or difficult, the order and position of the worsted threads is changed by a reader in a kind of rhyme. On a row being completed, the warp, in the shape of a cotton thread, dyed dark brown by the bark of the Swietenia febrifuga, is forced down by means of an iron toothed comb, in form something like an adze; the whole is completed by cutting the worsted to its proper length by large scissors held steadily against the waft. Infant labour is employed and preferred in Warungal Carpet weaving, it being averred that their more limber finger joints are best fitted for the finer parts of the work. Dried springs of Toolsee (Ocymum sanctum) and bunches of Lepidigathis indica are attached to the loom frames; the workmen say that these make their labour go on more cleverly. Twelve different worsteds are employed. The *blue* is produced from Indigo, the *yellow* and the *sulphur yellow*, from boiling the sulphur yellow in water impregnated with Carbonate of Soda, in which a little turmeric has been mixed, the deepest yellow is produced by dipping the same in potash ley. The *reds* are all produced by lac dye dissolved by tamarind juice with sulphate of alumina and potash as a mordant. The depth of colour depends in three cases upon the original black, brown, or white colour of the wool; in the fourth on the length of time the last description of wool was allowed to remain in the dye. The *greens* are produced by immersion in Indigo, and then, in pulas or turmeric, their degrees also depend on the original colour of the wool. Bengal Indigo is always preferred to the home manufactured by the worsted dyers. Cotton carpeting is also prepared in the same way as the woollen. As a general rule the lighter worsteds wear the longest. The red seems to render the wool brittle and I doubt not some destructive agent is employed in preparing the wool. If the weavers would be induced to wash the wools thoroughly with soap, both before and after dying the carpets, this would probably be far more desireable. Messrs. Watson Bell of Broad Street have lately imported into England the Ellore carpets, furnishing flax for the web which at an additional cost of about 8 annas a yard ensures a very superior article. By offering high rates for superior articles, they have done much to improve the manufacture. Contrary to Mr. Rhode's expectation, they find it best to purchase none of inferior quality, the charges, probably, precluding their profiting by the common but generally bulky articles. The duty on import into the United kingdom is 5 per cent.—*Rhode* M.*S.S*,

(2407) CARPINUS, a genus of plants belonging to the natural order Cupuliferæ.—*Engl. Cyc. p.* 786. *C. viminea* has taper-pointed leaves with simple or nearly simple serratures, and less deeply serrated lobes to the cupules. It is a large handsome tree with weeping branches, found on the mountains of Nepaul.—*Engl. Cyc. p.* 787.

(2408) CARPOBALSAMUM. An inferior quality of opobalsam, obtained from the fruit and twigs on the same tree (*Amyris Gileadensis*) that yields the superior quality.

(2409) CARPOPOGON PRURIENS of Roxburgh is closely allied to Mucuna pruriens and is now called *Mucuna pruritus*, or more properly *fabacea.*—*O'Shaughnessy, page* 297.

(2410) CARROT. DAUCUS CAROTA, Linn. The Carrot has long been cultivated in the East, where it is called *jugur* and *gajur*. The Arabs giva *istufleen* as its Greek name,—a corruption, no doubt, of the σταφυλινος of Dioscorides. The root of the cultivated Carrot is too well known from its fusiform shape, yellow colour, sweetish taste, and nutritious nature, to require description. It is officinal on account of its succulent nature, being favourable for making poultices, which are moderately stimulant. The seeds are larger but milder in consequence of being cultivated.—*Royle page* 425. As a vegetable it is so well known as to need little description. The two kinds in general use all over the Deccan are the red and yellow—(orange and lemon colour): they may be sown at the commencement of the rains, broad-cast, in beds of about six feet square, and should be thinned, leaving a space of six or eight inches at least between each root: this distance is sufficient for the first crop, but those that are sown later should have at least six inches space allowed between each root. If you wish to preserve your carrots until the commencement of the rains, in the months of March and April, cut off the green tops, and let the roots remain in the ground; this checks their growth, and by this means good carrots can be had until the middle of July. I found the yellow Cape to answer the best for preserving; the seed was not sown until January. They bear transplanting well, and may be sown with advantage in drills. The soil should be light and good: care must be taken, the same as in moving beet, not to break the root.—*Riddell.*

(2411) CARTHAMUS TINCTORIUS, Lin. Safflower, or Bastard saffron. Κυηκος, Hippocr.

Koosumbha, SANS.	Kooshumba chettoo, TEL.
Koosum, BENG.	
Sendoorkum, TAM.	Usfur, ARAB.
Koosum, HIND. DUK.	Kajeereh, BENGALIE.

Carthamus, is a genus of plants belonging to the natural order *Compositæ*. *C. tinctorius*, the safflower, is a pretty annual plant, found wild in

Egypt and the Levant. It has an erect cylindrical stem, branching near the summit, a foot or two high, and furnished with sharp-pointed, oval, sessile, somewhat spiny leaves.—*Engl. Cyc. p.* 787. The Carthamus has a smooth stem, of a colour approaching to white, and about 3 feet in height. The plant is propagated by seeds sown in drills at 1½ feet distance from each other. The young plants appear in about a month, and after the second month are hoed and thinned, each plant being left a foot from the other. The richer the land, the larger the proportion of colouring matter afforded by the flower. On the opening of the flowerets they are rapidly gathered without being allowed to expand fully. They are then dried in the shade with great care. It grows naturally in Egypt, and is cultivated largely in Spain and in many parts of the Levant, whence it is chiefly imported and from India. That of India, is cultivated especially in Behar and Dacca, and in the low country between the Ganges and Dullasery; and the produce of Paterghautta and Belispore situated in that locality, is considered, in the London Market, as the best that is exported from India. In 1787, all the Safflower raised in the District was consumed by the Dyers of Dacca, on account of its yellow dye. In 1800, 2,000 maunds of it were exported; and since that time, the quantity annually sent to Calcutta has gradually increased and is now little short of 6,000 maunds. The Dacca Safflower ranks next to that of China which is reputed to be of a superior quality. The Safflower is widely grown on the banks of the Irrawaddy, and may be occasionally seen on the banks of the Salwen. Its flowers furnish the best yellow dye in the country, and mixed with other ingredients they are used to dye red, and to give a variety of tints.—*Mason.* These flowers are used by the Dyers in dyeing pink and scarlet.—*Ains. Mat. Med. p.* 195. Safflower, according to Dr. McClelland, is cultivated to a small extent for its flowers, which yield a yellow dye. The dry flowers are found in the bazars of India and Bengal, in the latter under the name of *Koosum* It is used by the Burmese for dyeing cotton, and might be much more largely cultivated, as the climate seems favourable to its growth.—*McClelland.* According to the experiments of Dufour, Marchaco, and Dobereiner, the petals of the safflower contain in 100 parts moisture 6, dust 3, vegetable albumen 5, yellow colouring matter 24, extract and saline matter 5, resin 0.3, red colouring matter 5, (per 100) with wax, fibre, oxide of iron, &c. It contains a red colouring matter insoluble in water, and called carthamêine derived probably from the oxidation of a peculiar principle existing in the petals called *carthamine*, and by Dumas, *carthamous acid.* When a weak soda solution of carthamine is left in contact with oxygen, it first becomes yellow and then red, and on saturating this red liquor with citric acid, red carthamine is thrown down. When air is excluded the alkaline solution remains colourless. 'The affinity of carthamêine for cotton and silk is such, that when it is recently precipitated, those substances immediately combine with it, and become at first rose-coloured, and afterwards of a fine red, so that they may be thus dyed without the intervention of the mordant; the stuffs so dyed are rendered yellow by the alkalis, and the colour is to a certain extent restored by the acids. Carthamêine is never used in dyeing wool. When it is precipitated from concentrated solutions, it furnishes a liquid paint, which, evaporated upon saucers, leaves a residue of somewhat metallic, lustre, used as a pink dye-stuff, and which mixed with finely powdered talc and dried, constitutes common rouge. Safflower also contains a yellow substance soluble in water. When the infusion is evaporated it leaves an extract very soluble in water, precipitated by acids and soluble in alkalis. It is not reddened by oxidizing agents.—*Tomlinson, page* 333. The yellow principle is worthless as a dye. It is soluble in water, is removed by washing, and thrown away as the first step, in the preparation of the valuable red product. The red dye is an acid resinous substance of superb colour, insoluble in water and in acid solutions, little soluble in alcohol, and not at all in ether. It is dissolved freely by aqueous alkaline solutions, which it neutralizes. Its salts (carthamates) are crystallizable, and quite colourless; acids precipitate the carthamic acid from solutions of these salts. To obtain it on the large scale, after the separation of the yellow matter, the dried flowers are treated by a solution of carbonate of soda, and lemon juice added; the carthamic acid precipitate, is collected by subsidence, washed, and carefully dried at a gentle heat. The most lovely tints are imparted by this dye to silk and cotton; *rouge* is a mixture of the dry carthamic acid, and finely powdered talc. The *pink saucers* used for giving a flesh tint to silk are prepared from this dye with a small portion of soda. 8 oz. of the prepared petals, and 2 oz. carbonate of soda are acted on by 2 gallons of water. 4 lbs of prepared chalk are added, and the colour precipitated upon this by citric or tartaric acid. The Chinese card-rouge is a carthamate of soda, colourless when rubbed on, but by the salt being decomposed by the acetic acid secreted by the skin itself, the carthamic acid separates in the most perfect rosy tint, which can be imagined. The seeds are said to be purgative and emetic in moderate doses. It is certain, however, that paroquets feed on them with great avidity, and without experiencing any ill effect. They yield abundance of fixed oil.—*O'Shaughnessy, page* 411. A fixed oil is prepared from this plant, which is used, as an external application, in paralytic affections, and for bad ulcers; and small seeds are reckoned by the Vyteans amongst their laxative medicines.—*Ains. Mat.*

Med. page 118. It is cultivated in China, India, Egypt, America, Spain, and some of the warmer parts of Europe, and is indigenous to the whole of the Indian Archipelago. A large quantity is grown in and exported from Bali. The Chinese safflower is considered the best, and that from Bombay is least esteemed. The price of Safflower in the English market varies from £ 1 to £ 8 per ton, according to quality. The annual quantity imported into England is from 400 to 500 tons, ¼ths of which is sent from Calcutta, and about 150 tons is grown in the Dacca Collectorate.—*Simmonds, p.* 450. A pale brownish yellow oil is obtained from the seeds of Carthamus tinctorius, in Bombay ; the seeds contain about 28 per cent. of oil.—*Faulkner.*

(2412) CARVING.—The term Carving is, in the present day, applied to the cutting into particular shapes and patterns different materials, such as wood, horn, and ivory. Wood-carving the natives of India must have practised from very early times, for their idols, and for calico-printing, as they have long used wood-blocks for this purpose. They are fond of carving many of their ordinary utensils, as spinning-wheels &c ; but their skill is shown according to European taste, in the carving of the blackwood and Ebony furnitures of Bombay and Madras, especially in the elegance of the patterns of the backs of the chairs and sofas, in the side-boards and book-cases. Such furniture is well adapted for even the best English houses. Carvings in ivory in different parts of India, are much to be admired, whether for the size or the minuteness, for the elaborateness of detail or for the truth of representation. Among these the ivory carvings of Berhampore are conspicuous. A set of chessmen from there, at the Exhibition of 1851, carved from the drawings in Layard's "Nineveh," were excellent representations of what they could only have seen in the above work ; and showed that they are capable of doing new things when required ; their representations of an elephant and other animals, were so true to nature, that they might be considered the works of real artists. The carvings in the same material in the state chair from Travancore were greatly admired, and from the truth of representation on a minute scale, where an elephant is enclosed in the shell of a pea, from Calicut. Chouries, or fly-flappers, where the ivory, or sandal-wood, is cut into long hair-like threads, are also specimens of their mechanical skill. Their skill in wood-carving was conspicuously displayed in the elaborate details of the sandal-wood boxes from the Malabar Coast. The skill of the Indian carver is also conspicuously shown in the beauty of the figures and buildings in the pith like stems of the marsh-plant called shola (*Æschynomene aspera*). In the latter all the elaborate detail of the richly ornamented Hindoo architecture of the South of India is carefully brought out. For this work only two tools seem to be employed,—one a large and heavy knife and one with a fine sharp cutting edge. Besides these, cocoa-nut shells and gourds are carved and made into cups, vases, and snuff-boxes, also the kernel of the cocoa-nut variously cut, for making garlands for state occasions. The natives of India display great skill and neatness, as well as habitual taste, in their work (and other) boxes of ivory, horn, or porcupine-quill, ebony and sandal-wood, their fans and umbrellas, chouries, and khuskhus or other baskets, hookah-snakes, imitation fruits and flowers, toys, and puzzles. The skill is remarkable with which the unyielding substance of a hard thick shell is converted into necklaces for men and into bracelets for the women. "The manufacture of shell bracelets is one of the indigenous arts of Bengal, in which the caste of Sankari at Dacca excel. The *chanks* of which they are made are the large species of Turbinella, from six to seven inches long, and of a pure white colour. They are imported into Calcutta from Ramnad and South India, opposite to Ceylon, and from the Maldive Islands."—*Taylor.* With the Chinese, *Ivory* for carving comes to China principally from Cochin-china and Africa, via Bombay, and always finds a ready sale at Canton ; the largest and best tusks weigh from 16 to 25 pounds each, decreasing to five or six pounds. The cuttings and fragments also form an article of trade, as the workmen can employ the smallest pieces. *Bones* and *horns*, especially the long horns of buffaloes, are in China worked into handles, buttons, &c. Rhinoceros' horns are brought from Burmah and Sumatra, and from Africa through Bombay ; they are highly valued by the Chinese from a notion that cups made from them sweat whenever a poisonous mixture is poured into them. A perfect horn sometimes sells as high as $300, but those that come from Africa do not usually rate above $30 or $40 each. The principal use of these horns is in medicine and for amulets, for only one good cup can be carved from the end of each horn ; and consequently the parings and fragments are all preserved. The hard teeth of the walrus, lamantin, and other cetaceous animals, also form an article of import into China from the Pacific, under the designation of *seahorse*-teeth ; they weigh one or two pounds a piece, and the ivory is nearly as compact, though not so white, as that of the elephant. The delicate carving of Chinese workmen is well known, and has often been described ; many specimens of it are annually sent abroad. Few products of their skill are more remarkable than the balls, containing ten or twelve spheres cut out one within another. The manner of cutting them is simple. A piece of ivory or wood is first made perfectly globular, and then several conical holes are bored into it in such a manner that their apices all meet at the centre, which is usually hollowed out an inch or less after the

holes are bored. A long crooked tool is then inserted in one of the conical holes, so bent at the end and stoppered on the shaft that it cuts the ivory at the same distance from the surface when its edge is applied to the insides of the cone. By successively cutting a little on the insides of each conical hole, their incisures meet, and a sphericle is at last detached, which is now turned over and its faces one after another brought opposite the largest hole and firmly secured by wedges in the other holes, while its surfaces are smoothed and carved. When the central sphere is done, a similar knife, somewhat larger, is again introduced into the holes, and another sphere detached and smoothed in the same way, and then another, until the whole are completed, each being polished and carved before the next outer one is commenced. It has been supposed by some that these curious toys were made of hemispheres nicely luted together, and they have been boiled in oil for hours in order to separate them and solve the mystery of their construction. Fans and card-cases are carved of wood, ivory, and mother-of-pearl in alto-relievo, with an elaborateness which shows the great skill and patience of the workman, and at the same time his bad taste in drawing, the figures, houses, trees, and other objects being grouped in violation of all propriety and perspective. Beautiful ornaments are made by carving roots of plants, branches, gnarled knots, &c., into fantastic groups of birds or animals, the artist taking advantage of the natural form of his materials. Models of pagodas, boats, and houses are also entirely constructed of ivory, even to representing the ornamental roofs, the men working at the oar, and women looking from the balconies. Baskets of elegant shape are woven from ivory splinths; and the shopmen at Canton, exhibit a variety of seals, paper-knives, chessmen counters, combs, &c., exceeding in finish and delicacy the same kind of work found anywhere else in the world. The most elaborate coat of arms, or complicated cypher, will also be imitated by these skilful carvers. The national taste prefers this style of carving on plane surfaces; it is seen on the walls of houses and granite slabs of fences, the woodwork of boats and shops, and on articles of furniture. Some of it is pretty, but the disproportion and cramped position of the figures detracts from its beauty.—*Williams' Middle Kingdom, Vol.* II. *pages* 141 *and* 408.

(2413) CARYOCAR. This is the only genus of the natural order *Rhizoboluceæ* and its species deserve to be introduced into Southern Asia. One of the species yields the Butter Nuts of the London fruiterers' shops. One species is described by Aublet, under the name of *Pekea buttyrosa*, as a large tree with a trunk 80 feet high, and 3 feet in diameter. The berries are covered by a rind two or three lines thick, and consisting internally of a buttery yellowish substance, which melts between the fingers, and which is sometimes used in cooking instead of animal butter. Under the rind lies a stone covered all over with slender stings, which easily separate, and become very troublesome to those who open the stones; within is a kidney-shaped kernel covered with a brownish membrane, and very good to eat; it is commonly served at table. It is called Pekea by the blacks in the neighbourhood of Oyapoco in French Guyana, where it is much cultivated. The species that furnishes the Butter-Nuts of the London markets is much like this, but is called Tata-youba by the natives of Guyana, and differs in having no stings upon the surface of the stone of its fruits: this is the *Pekea tuberculosa* of Aublet; the *Caryocar tomentosum* of modern botanists. Another species, *Caryocar nuciferum*, bears what are called the Suwarrow, or more properly Saouari, Nuts of commerce. It has only three leaflets to each leaf, each with a toothed margin and a taper-pointed extremity; the flowers are very large, deep brown externally and rich crimson in the inside; the fruit is in form like an egg, covered with a thick rough brown rind, beneath which is a soft greenish buttery substance. The nut has a stinging surface, and contains a very excellent kernel, from which may be extracted an oil like that from sweet almonds. These plants might with advantage be introduced into India.—*Engl. Cyc. page* 790.

(2414) CARYODAPHNE DENSIFLORA, Blume, Java. *Kiteja.* A tree 60 to 80 feet high, leaves gratefully aromatic, used in infusion like tea against spasms of the bowels, and in puerperal convulsions.—*O'Shaughnessy, page* 547.

(2415) CARYOPHYLLUS AROMATICUS, *Linn.* (*Eugenia caryophyllata*) Clove. *Icosand. Monog.* Tribe *Myrteæ*, Linn.

Cramboo, TAM.	Chankee, MALAY.
Long, DUK and HIND	Lawangum, TEL.
Warrala, CING.	Karenful, ARAB.
Lavanga, SANS.	Mykek, PERS.—*O'Sh.*

The Clove-tree is an evergreen and, like other of the Myrtaceæ, elegant in appearance. It is like the Pimento. The wood is hard and covered with a smooth grey bark. The leaves opposite and decussate, ovate-lanceolate, tapering towards both ends, about 4 inches long, somewhat leathery, shining, and minutely dotted, diffusing a clove-like fragrance when bruised. Panicles short, trichotomously divided, jointed at every division. The calyx tube is cylindrical, of a dark purple colour, adhering to the ovary, divided into 4 ovate concave segments. Petals 4, overlapping each other and of a globular form when in bud, afterwards spreading, roundish, whitish and said to exhale a grateful odour. Within the calyx and at the top of the ovary is a quadrangular disk, surrounding but not embracing the base of the short obtuse style. Stamens in 4 bundles, filaments long, yellow. Ovary

nearly cylindrical, 2 celled, with many small ovules in each cell attached to the sides of the dissepiment. Fruit a large elliptical berry, containing a single seed, by the growth of which the second cell and numerous ovules have been obliterated. Embryo large, elliptical, dotted. Cotyledons unequal, sinuose, the larger one partly enveloping the smaller, including the superior radicle.—See the Bot. Mag. t. ii. 749, for a full description: Dict. des Sciences, Nat. for detailed dissection. It is a native of the Moluccas, but confined by the Dutch to Amboyna and Ternate. It has, however, been introduced into the Isle of France, India, the West Indies and Guyana.—*Royle.* The tree can scarcely be made to live in Bengal.—*O'Sh. pages* 334-36. Cloves, are the unexpanded flower-buds, and are picked by hand or with long reeds, and then quickly dried in the shade Cloves should be large, heavy, brittle, brown externally, red within, and when compressed or rasped allowing a volatile oil to exude. Their odour is aromatic, very sweet, taste aromatic, strong, hot, and acrid, almost to burning, slightly bitter. The best are obtained from the Moluccas. They have considerable weight. Their actual properties are extracted by water and by alcohol. The cloves are gathered in October, or in February. Each shrub gives from 2 to 4 lbs. of cloves, but in the arborescent state 20 lbs. have been produced. One clove tree is described, the trunk of which was eight feet in diameter, and which furnished annually 50 to 60 lbs. A pound of cloves contains about 5000 flowers. The ripe fruits dried before the sun, are also found in commerce, and are called clove berries, or *mother cloves.* Their properties are analogous to, but much feebler than cloves, and are still imported into China.—*Royle, p.* 797. It is impossible to ascertain when cloves were first introduced into Europe. The Chinese who visited the Molucca islands before their discovery by the English, disseminated this spice through India, whence it spread to Persia, Arabia, and Europe. After the Dutch conquest of the Moluccas they restricted the cultivation of the clove to the island of Amboyna and to Ternate. Nevertheless the plant was introduced by the French into the Mauritius and Bourbon, and by the English into Barbadoes and the Antilles, in all which localities it succeeds perfectly.—(*Fee.*) The clove plant resembles the coffee. It grows quickly, and bears while young. Its height seldom exceeds 18 feet, its trunk is straight, and sustains a large somewhat conical cyme, so tufted that it resists the efforts of the wind, and the tree is thus frequently destroyed by storms.—*O'Shaughnessy.* It is extremely handsome, and of luxuriant foliage, the whole tree and leaves are strongly Aromatic. The Clove tree is propagated by seed or layers, the plant thrives best in a strong compact soil of a clayey nature, and arrives at maturity eight or nine years after sowing. The seeds should be sown about six inches apart, in beds with plaintain leaves or mats suspended two or three feet from the ground to shelter the young plants from the sun, for if not protected from it when young, they droop and die. When the plants are five or six months old, they should be transplanted at a space of fifteen or sixteen feet asunder, and will bear about the sixth year.—*Riddell.* Cloves are universally employed as spice, and enter into some pharmaceutical preparations; the volatile oil is much used by perfumers, and dentists apply it to carious teeth to cauterize the exposed nerve. The *volatile oil* is very fluid, but thickens by age, clear, transparent, at first colourless, then amber-like or brown, heavier than water, entirely soluble in alcohol, reddened deeply by nitric acid, and producing oxalic acid; odour very powerful and agreeable, taste very hot, acrid, and burning. It is much adulterated, especially with pimento oil. The oil is obtained by distilling cloves from a saturated solution of common salt in water: the salt being added in order that the liquid should acquire a higher boiling point, viz. 224. —*O'Shaughnessy.* The resin, named caryophullin, is obtained in brilliant satiny crystals. —*Royle.*

(2416) CARYOTA URENS.

Evimpannah, TAM.	Bon khejur,
Bastard Sago Palm, ENG.	Burra flawan,
Bhynee, CAN.	Kittul, CING.
Jeroogoo, TEL.	Bherlee-mahar, also
Ramguoah,	Coondal panai marum. TAM.

The Caryota urens, is one of a genus of elegant palm trees frequent in woody mountains of the East Indies. Their trunks are ringed and often lofty, but they flower only once in the course of their existence. The C. Urens is a native of Ceylon, Malabar, Bengal, Assam and various other parts of India. It is a lofty palm, being more than forty feet high and the trunk is more than a foot in diameter. It ascends the mountains of Sikkim to the height of 5000 feet. —*Hooker, page* 143, *Vol.* 1. Dr. Roxburgh describes it as highly valuable to the natives of the country where it grows in plenty. During the hot season, a single tree will yield at the rate of one hundred pints of toddy or palm wine in the twenty-four hours.—*Royle.* Its spathes yield this toddy or palm wine, koondel panei khulloo, which is used in the Deccan as yeast for fermenting bread but is also used by the Natives of Ceylon, Canara and Malabar. It is converted into Sugar or Jaggery, Koondel panei vellum, *Tam.*, and into the spirit known as Bynee Arrack.—*Ainslie's Mat. Med. page* 265. The wood is extensively used under the name of Napiera in Ceylon for rafters which are exceedingly hard and durable.—*M. E.* The pith, or farinaceous part, is filled with starch granules equal to the best sago. The natives make it into bread, and boil it into thick gruel. According to Knox,

'the inside is nothing but pith. It yieldeth a sort of liquor, which they, the Cyngalese, call *Jelligee*: it is rarely sweet and pleasing to the palate, and as wholesome but no stronger than water." It "bears leaf like to that of a betel-nut tree, which is fastened to a skin as the betel-nut leaves are, only this skin is hard and stubborn, like a piece of board; the skin is all full of strings as strong as wire; they use them to make ropes withal."—*Royle.* Its leaves are very large, measuring eighteen or twenty feet in length, and from ten to twelve across; from their fibre, the "kittul fibre" of commerce, ropes of great strength, brushes, brooms, caps, and similar articles are manufactured; the kernel is used for buttons and beads: the woolly material found on the petioles is used for caulking ships as oakum.—*Seeman.* In a recent account of the 'Vegetable Products of Ceylon,' by Mr. Ondatjee, it is said that the *black fibre* from the leaf-stalks, manufactured into rope, of great strength and durability, is used for tying wild elephants. The Rodyahs, or outcasts among the Kandyans, make this rope generally with considerable skill, as it is both regular and compact.—*Royle.* At the Madras Exhibition of 1855, the nar of this, the Indian Sago palm, was exhibited from Cocanada, Nellore, Masulipatam and Travancore. It is much used by the natives for making fishing lines and bow-strings, is very strong and resists water for some time, but is liable to snap if suddenly bent or knotted. It resembles black horse hair and might be employed similarly.—*M. E. J. R.*

(2417) CARAGANA GERARDIANA, its common name 'Tartarian furze.'

(2418) CARAWAY SEED.

Carvi, Cumin des pres, Fr.	Carvi, It.
Keummel, Brodkummel, Ger.	

Carum Carui, Caraway plant. Caraway seeds have an aromatic smell, a warm pungent taste, and yield much essential oil. They are used in confectionary, for flavouring cheese, spirits, liqueurs; and in medicine. They are imported into Bombay from England and the Persian Gulf. The essential oil, which is much used in pharmacy, is of a yellow colour, sweet smell, and very hot taste: in Germany caraway seeds are used in bread. The essential oil is much used as an adjunct and solvent in the preparation of the resinous cathartic pills. The roots of the caraway plant are very agreeable, and are eaten in the north of Europe.—*O'Shaughnessy, page* 358.

(2419) CARUM NIGRUM. *Vern.* Zeera seeah. Brought into India from Kunawur, and used as a carminative. (*Royle.*)—*O'Shaughnessy, page* 358.

(2420) CASEARIA ELLIPTICA. Klaare marum, *Tam.* This is a large shrub rather than a tree, the wood therefore can be of little value except for ornamental purposes. It is smooth, fine grained and yellow coloured. The juice said to cure snake-bites.—*Wight.*

(2421) CASHEW NUT.

Hidgeillee, Badam, Beng.	Cajew, Guz. & Hin.
Catsjoenooten, Dut.	Acaju, It.
Noix d' acajou, Fr.	Nozes d'acaju: Port.
Akajunusse, Westindische Anakarden, Ger.	Nueces, d'acaju, Sp.

Cashew nuts have already been noticed at some length, when describing the *Anacardium occidentale*, the tree from which they are obtained. Cashew nuts are kidney shaped bodies, attached to the fruit of the tree which is found in the East and West Indies, and America. They are used as an article of food, and also as an ingredient in chocolate and are procurable in all Southern and Eastern Asia.

(2422) CASHEW APPLE OIL. Anacardium occidentale. This powerfully vesicating oil is obtained from the pericarp of the Cashew Apple. It has been long known to the Native Physicians, and much resembles in its properties the acrid oil obtained from the marking nut (Semecarpus Anacardium).—*M. E. J. Rep.*

(2423) CASHEW GUM. Anacardium occidentale. The trunk and branches of this tree yield, on being wounded during the ascent of the sap, a transparent gum similar in appearance to gum arabic, for which it is a good substitute. This gum is subastringent and being unpalatable to insects, is particularly adapted for use, where their depredations require to be guarded against.—*M. E. J. R.*

(2424) CASHEW NUT OIL. Anacardium occidentale.

Moondree cottay yennai, Tam.	Kajo ka tel, Hind.

The light, yellow, sweet tasted, and edible oil obtained from the *nut* of this tree, is in every respect equal, if not indeed superior, to either olive, or almond oil. It is very seldom prepared, the nuts being used as a table fruit.—*M. E. J. R.*

(2425) CASHMERE GOAT. Perhaps the most highly prized of any animal in the East is the goat of Cashmere, with the long silky hair of which are worked the world-famed Cashmere shawls. They thrive best on the grassy slopes of the Cashmere hills, but are also reared with success in Lahore and still further to the south.

(2426) CASHMERE, a beautiful fabric manufactured in the kingdom of Cashmere, from the fine wool growing about the roots of the hair of the Thibet goat. Cashmere shawls have a wide-spread fame, on account of their extreme softness, brilliancy, and elegance; and it has long been the aim of European nations to imitate, and if possible to equal them, applying to their manufacture the more speedy and elaborate methods which modern science has placed within reach. The oriental shawls are woven by an extremely slow process,

and are therefore very costly. The date of the manufacture is unknown, but these shawls have been celebrated ever since the British established themselves in India. As far as we can gather from the observations of various writers, the Thibetian wool, being imported from Thibet and Tartary into Cashmere, is first bleached to rid it of a greyish hue which naturally belongs to it, then spun into yarn by women, and dyed of various colours. The yarn is next given out to the weavers by a merchant, who perhaps enters largely into the shawl trade, and engages a number of shops in which men work for him; or else he supplies a certain number of overseers called Oostands with yarn, delivering to them at the same time instructions as to the quality, colour, patterns, &c. of the goods, and these men carry on the manufacture at their own houses, with the help of ordinary weavers. The Oostands receive six or eight *pice* a day for their wages, the common workman from one to four *pice*, the value of a *pice* being about three-half pence. Thus scantily are the shawl weavers of Cashmere rewarded, while the fabric they produce has often been sold in London at from 100*l.* to 400*l.* the shawl. But it is fair to state that the manufacture of a remarkably fine and elaborate shawl will sometimes occupy a shop for a whole year, two or three or perhaps four persons being constantly engaged on it. Plain shawls are simply woven with a long narrow and heavy shuttle, but variegated shawls are worked with wooden needles instead of a shuttle, there being a separate needle for each colour. In some of the richest shawls, scarcely a quarter of an inch is completed by three persons in one day. Sometimes, in order to hasten the process, a shawl is made in separate pieces at different looms, and the pieces are afterwards sewed together. This is done with great dexterity, so that it is not immediately detected. An overseer at each loom superintends the workmen, and if the pattern be new, he directs them as to the figures and colours, keeping before him a paper pattern of the device which is to be produced. The rough or inferior side of the shawl is uppermost on the frame, nevertheless the pattern is most accurately preserved by the workers, who sit on benches while so employed. The shawls are made both long and square, the former generally measuring 54 inches wide, and 126 long, the latter 63 to 72 inches square. They are exquisitely soft and warm, surpassing in these respects every other clothing material. In some parts of Asia these shawls are worn just as they come from the loom; but all those destined for India are carefully washed and packed near Lahore. The extent of the manufacture in Cashmere has been differently stated: some years ago there were said to be 16,000 looms in that kingdom; and if it be correct that about five shawls (including the inferior qualities) are made on an average at each loom during the year, this gives a total of 80,000 shawls as the annual produce of the kingdom. When Cashmere was tributary to Afghanistan, a considerable portion of the revenue was exacted in shawls instead of money. The beauty and value of Cashmere shawls has led to various imitations, which at length have proved successful, both in France and England. The government of the former country gave encouragement to a patriotic and zealous man, M. Janbert, who exposed himself to great risk and hardship, in bringing from the East in 1823, a flock of Thibet goats, part of which were successfully reared at St. Oven, near Paris. The climate suited them well, so that for several years the proprietor was enabled to sell a great number of male and female goats, which were called Cashmere goats. The Cashmere wool still imported from Thibet comes into Europe by way of Casan, on the eastern bank of the Volga. The mills for spinning it are very numerous in France where three principal descriptions of Cashmere shawls are manufactured, at Paris, Lyons, and Nismes. The Paris shawls are principally of the kind known as French Cashmere, in which, by the aid of the draw-loom and of the Jacquard, a surface appearance is given precisely similar to that of the oriental shawls. Both the warp and the weft are the yarn of pure Cashmere down: the figures and colours of the Indian shawls are faithfully copied, and the deception would be complete, did not the reverse side show the cut ends. What is called the Hindoo shawl, manufactured at Paris, has its warp in spun silk which reduces the price. These imitation shawls are executed by as many shuttles as there are colours employed, which are thrown across the warp according to the requirements of the pattern, and being in many cases introduced only at intervals, the yarn remains floating loose at the back of the piece, and is cut off afterwards. To contrive a method of weaving shawls that should be, like the eastern ones, both sides alike, was a difficult task, but was at last accomplished by Parisian ingenuity. In this case the yarns of the weft are not only equal in number to the colours of the pattern, but there are also as many little shuttles or pirns filled with these yarns as there are colours to be repeated in the breadth of the piece. Each of these small pirns or bobbins passes through only that portion of the flower in which the colour of its yarn is to appear and stops on the one side and the other of the cloth exactly at its limit: it then returns upon itself, after having crossed the thread of the adjoining shuttle. From this reciprocal interweaving of the various yarns of the shuttles, it happens that, although the weft is made up of a great number of different threads yet they form a continuous line in the whole breadth of the web, upon which the lay or batten acts in the usual manner. The great art consists in avoiding confusion of the shuttles,

and in not striking up the lay till all have done their part. A woman assisted by two girls is able to conduct the whole operation. But this close imitation of the oriental shawl is a very slow process, and therefore the shawls, must be necessarily costly. Lyons is famous for its Thibet shawls, the weft of which is yarn, with a mixture of spun silk. The shawls of Nismes are celebrated for their low price and the ingenuity with which spun silk, Thibet down, and cotton are all worked up together.—*Tomlinson, page* 337. The Cashmere Shawls are usually divided into three groups, the "Border Shawl;" the Rizayee or Shawl of the finest texture, and the ordinary Cashmere Shawl —*M. E. J. R.* Cashmere, and the next in quality Umritsir shawls, possess unequalled fineness, delicacy, and warmth. These shawls are brought to Bombay in large quantities direct from Cashmere,which are almost entirely exported to London. The trade is entirely in the hands of the natives.—*Faulkner.*

(2427) CASSAVA OR MANIOC. The shrub from which this substance is prepared is about six feet high, extensively grown for its farinaceous root: there are several species, nearly all natives of America, principally of Brazil, whence it derives one of its common names of Manihot or Mandioc. Two species of Manihot have been found indigenous in South Australia. The varieties commonly cultivated for their roots, are the sweet and the bitter. The Sweet cassava is the *Janiphi* (or *Jatropha,*) *Loeflingii*, of Kunth; the *Manihot Aipi*, of Pohl.—This species has a spindle-shaped root, brown externally, about six or seven ounces or more in weight, which contains amylaceous matter, without any bitterness, and is used as food, after being rasped and washed, so as to cleanse it from the fibrous matter, in the same manner as arrowroot is prepared. It is distinguished from the bitter cassava by a tough ligneous fibre, which runs through the heart of the tuber. Manihot starch is sometimes imported into Europe under the name of Brazilian arrowroot. The cassava is known in Peru as *yucca*. A dry mixed soil is best suited to its culture. So exhausting is this crop, that it cannot be raised more than two or three times successively on the same land. The roots arrive at maturity in eight or nine months after planting, but may be kept in the ground a much longer time without injury. Sweet cassava might be sliced, dried in the sun, and sent to Europe in that state. In dry weather the process succeeds remarkably well, and the dried slices keep for a considerable time. Dr. Shier ascertained that when these sliced and dried roots were first steeped and then boiled, they return to very nearly their original condition, and make an excellent substitute for the potato. The plant thrives on even the poorest soil; the mode of planting is simple. It consists in laying cuttings

CASSAVA OR MANIOC.

a foot long in square pits a foot deep, and covering them with mould, leaving the upper ends open. From two to four pieces may be placed in each square. The planting ought to be in the rainy season. The cuttings must be made from the full-grown stem. A humid soil causes the root to decay, a dry soil is therefore more adapted for its cultivation. As blossoms are occasionally plucked from potato plants, so the manihot or cassava is deprived of its buds to increase the size of its roots. The raw root of the bitter species, when taken out of the ground, is poisonous. If exposed, however to the sun for a short time, it is innocuous, and when boiled is quite wholesome. The starch of the root of the manioc is prepared in the following manner, as described by Dr. Ure:—"The roots are washed and reduced to a pulp by means of a rasp or grater. The pulp is put into coarse strong canvas bags, and thus submitted to the action of a powerful press, by which it parts with most of its noxious juice. As the active principle of this juice is volatile, it is easily dissipated by baking the squeezed cakes of pulp upon a plate of hot iron. The pulp thus dried concretes into lumps, which become hard and friable as they cool. They are then broken into pieces, and laid out in the sun to dry. In this state they are a wholesome nutriment. These cakes constitute the only provisions laid in by the natives, in their voyages upon the Amazon. Boiled in water, with a little beef or mutton, they form a kind of soup similar to that of rice. The cassava cakes sent to Europe are composed almost entirely of starch, along with a few fibres of the ligneous matter. It may be purified by diffusion in warm water, passing the milky mixture through a linen cloth, evaporating the straining liquid over the fire, with constant agitation. The starch, dissolved by the heat, thickens as the water evaporates, but on being stirred it becomes granulated, and must be finally dried in a proper stove. The Bitter cassava is the *Janipha Manihot*, of Kunth; the *Jatropha Manihot*, of Linnæus; and *Manihot utilissima*, Pohl.—This species has a knotty root, black externally, which is occasionally 30lbs. in weight. In the root there is much starchy matter deposited, usually along with a poisonous narcotic substance, which is said to be hydrocyanic acid. The juice of the plant, when distilled, affords as a first product a liquor which, in the dose of thirty drops, will cause the death of a man in six minutes. It is doubted whether this acid pre-exists in the plant; some suppose it to be generated after it is grated down into a pulp. It can be driven off by roasting, and then the starch is used in the form of cassava bread. It is principally from the starch of the bitter cassava that tapioca is prepared by elutriation and granulating on hot plates. This serves to agglutinate it into the form of concretions, constituting of the tapioca of commerce. This being starch very

nearly pure, is often prescribed by physicians as an aliment of easy digestion. A tolerably good imitation of it is made by beating, stirring, and drying potato starch in a similar way. The grated starch of the roots, floated in water, is spontaneously deposited, and when repeatedly washed and dried in the sun, forms cassava flour, called "Moussache" by the French. The juice of the bitter cassava, mixed with molasses and fermented, has been made into an intoxicating liquor, which is much relished by the negroes and Indians. The concentrated juice of the bitter cassava, under the name of cassareep, forms the basis of the West India dish, "pepper pot." One of its most remarkable properties is its highly antiseptic power, preserving meat that has been boiled in it for a much longer period than can be done by any other culinary process. Cassareep was originally an Indian preparation. The manioc or cassava is cultivated in America, on both sides of the equator, to about latitude 30 degrees north and south. Among the mountains of intertropical America, it reaches to an elevation of 3,200 feet. It is cultivated also in great abundance on the island of Zanzibar, and among the negro tribes of Eastern Africa to the Monomoesy, inclusive; on the west coast of Africa, in Congo and Guinea. It has also been introduced into Asia. The farina of the manioc is almost the only kind of meal used in Brazil, at least in the north, near the equator. An acre of manioc is said to yield as much nutriment as six acres of wheat. Meyen states, "It is not possible sufficiently to praise the beautiful manioc plant." The Indians find in this a compensation for the rice and other cerealia of the Old World. It has been carried from Brazil to the Mauritius and Madagascar. Tapioca is a preparation of Cassava and the following quantities of Brazilian arrowroot, or tapioca, were imported in the undermentioned years into Britain.

The cassava root grows abundantly in most of the West India islands and tropical America; the trouble of planting is inconsiderable, and the profit arising from its manufacture, even by the common process of hand-grating, is immense. Enterprising colonial settlers should give this a fair trial, as well as encourage the present growers to increase their crops and improve the quality of the article, so as to render it suitable for the English market. The manufacture of starch will one of these days become a productive source of colonial wealth. Since Cassava was first grown in the West, its capabilities as a starch-producer have, to a certain extent, been known, and for that purpose it has been in limited use. Mr. James Glen, of Haagsbosch plantation, Demerara, erected machines on his plantation for grinding the root and preparing the starch of the bitter cassava, and shipped the article in considerable quantities to Europe, where it was sold at a price which puts the profit upon sugar cultivation completely to the blush. His agent in Glasgow writes, that any quantity (like that already shipped) can command a ready sale at 9d. per. lb. Its use is co-extensive, or nearly so, with that of sugar. A sample of a ton, prepared at Haagsbosch in 1841, was submitted for examination to Dr. Shier, at the colonial laboratory, Georgetown, who admitted it to be a beautiful specimen of starch, although it had undergone but *one* washing. The root from which it was made, was planted eight or nine months previously, upon an acre of soil, which had never undergone any preparation of ploughing, or been broken and turned up in any way. The plants were never weeded after they had begun to spring, nor were they tended or disturbed until they were ripe and pulled up. The expense of planting the acre was five dollars, and reaping this crop would, I suppose, amount to as much more, say £2 in all. The green cassava was never weighed, but the acre yielded fully a ton of starch—equal at 9d. per lb., to £84. The experimental researches of Dr. Shier have led him to believe that the green bitter cassava will give one-fifth its weight of starch. If this be the case the return per acre would, under favorable circumstances, when the land is properly worked, be enormous. On an estate of Essequibo, a short time ago, an acre of cassava, grown in fine permeable soil, was lifted and weighed; it yielded 25 tons of green cassava. Such a return as this per acre would enable tropical colonies to inundate Great Britain with food, and at a rate which would make flour to be considered a luxury. Dr. Shier is convinced that, in thoroughly drained land, where the roots can penetrate the soil, and where its permeability would permit of their indefinite expansion, a return of 25 tons an acre might uniformly be calculated upon. What a blessing, not only for those colonies, but for the world, would the introduction be of this cheap and nutritious substitute for the potato,—*Simmonds, page* 370.

(2428) CASSIA, a genus of plants belonging to the natural order *Leguminosæ*. It consists of a large number of species, chiefly inhabiting the tropical or temperate parts of the world, and including among them the plants that produce the Senna leaves so commonly employed as a purgative. The genus Cassia belongs to the sub-order Cæsalpinieæ of Leguminosæ. Cassia Fistula and other species are now referred by some, to *Cathartocarpus*. The leaflets of several different species of Cassia constitute the various kind of senna called Senna leaves. In addition to the leaflets, the leaf-stalk and pods are frequently present, especially in the Alexandrian Senna, which contains also the

leaves and pods of *Tephrosia Apollinea*, and the leaves, but rarely the follicles, of *Cynanchum arghel*, Delile (Cassia *oleæfolium*, Nectoux), a plant belonging to the natural order *Apocynaceæ*, which possesses deleterious properties. The leaves of this last named plant constitute two parts in ten of the Senna of Alexandria. The Tripoli Senna is free from it, as is likewise the Tinnevelly Senna, which is now the best and cheapest in the markets of Britain, and should always be preferred, as much of the griping tendency of common Senna is due to the presence of the Arghel leaves. The Senna Leaves met with in the continental markets or shops are frequently adulterated with the leaves and berries of the *Coriaria myrtifolia*, a very poisonous plant.—*Engl. Cyc. page* 793. When free from adulterations, Senna furnishes a most valuable purgative medicine; but when impure, its action is accompanied with nausea, griping, and other unpleasant symptoms. It is desirable therefore to free it from impurities before administering it or subjecting it to the action of water to form an infusion.—*Eng. Cyc. page* 794.

(2429) CASSIA ABSUS.

Chychm, Egypt. | Chusmuk, also chusmeeguh, Pers.
Kushmee zurk, also Hub-oos-soudan, Arab. | Chuksoo, Hind.
| Akakalis, Greek.

This shrub (described by Roxb. Fl. Ind. vol. ii.) is extremely common in the Deyra Dhoon and on the plains of northern India. It is a small biennial or triennial, covered with glutinous hairs, legumes six seeded, seeds black. M. Delile mentions this seed as the Chychm of the Egyptians, brought by the caravans from Darfour, the powdered seeds being used as an application in cases of chronic opthalmia. Mr. Royle informs us they are used for the same purposes in India, and are known by nearly the same name, Chaksoo being the Hindostanee, Chusmuk and Chusmeeguh the Persian, Kushmeezurk and Hub-ul-Soudan, Arabic. To this is also aded *Akakalis* as a Greek name.—*Royle, p.* 184. This term is well known in the bazars.—*O'Sh. p.* 309.

(2430) CASSIA ACUTIFOLIA, (Alexandrian senna.) Is found in Arabia Felix, Upper Egypt, Arabia, and Senaar, between the Nile and Red Sea. *Cassia acutifolia*, is a small under shrub, with ovate lanceolate sharp-pointed leaflets, yellow flowers in terminal erect racemes, and compressed velvety legumes an inch long and half an inch broad. It forms an important article in the commerce of the countries where it grows. It is chiefly sent to Alexandria for shipment, whence it has gained the name of Alexandrian senna among the drug-merchants. It is considered the most valuable of all the sennas.—*Eng. Cyc. page* 793. This species constitutes the bulk of the senna consumed for medical purposes in Europe. It is much adulterated with the leaves of Cynanchum arghel, Tephrosia Apollinea, and Coriaria myrtifolia.—*O'Shaughnessy, page* 306.

(2431) CASSIA ALATA. Winged Cassia. Senna alata. Roxb. Fl. Ind. ii. p. 349.

Dao murden, Hind. | Seema Avasee, Tel.
Dadrugna, Sans. | Broad leaved cassia, E.
Semie Aghatee, Tam. | Cassia Alata, Lin.
Velaitie Aghatie, Duk. | Dveepa gustia, Sans.

The fresh leaves bruised and mixed with lime juice are deemed a powerful specific in ring-worm. Dr. O'Shaughnessy had often tried them, and with decided advantage. Ainslie mentions (p. 109) that the fresh leaves, simply bruised and rubbed upon the eruption, are also found in many instances to remove it. The whole plant is used by the Tamuls as a remedy in venereal, in poisoned bites, and as a general tonic.—*O'Sh. p.* 308. This species bears a profusion of gaudy, yellow flowers, and is much cultivated by the natives of Tenasserim for its medicinal properties in diseases of the skin.—*Mason.* It is a stunted shrub, pretty only when in flower. An ointment prepared from its fresh leaves is almost a specific in ring-worm.—*Beng. Phar. page* 383.

(2432) CASSIA AURICULATA.

Tanghedoo, Tel. | Turwer, Hind.
Mayharie and Talopodo, Sans. | Avaray puttay, Tam.

One of the commonest shrubs in the Madras Presidency, grows abundantly in the sterile tracts: also in all parts of the Deccan. The bark is used for tanning, and the stems to make native tooth-brushes. This plant is of great importance to the tanner, its virtues are well known to the native Chuckler, who can obtain a large quantity of the bark at a low rate, and with it a soft and durable leather may be turned out. On the whole, it is perhaps the best of the indigenous astringents of southern India for this purpose. The powder of the dried seeds is introduced into the eye in extreme stages of opthalmia. The seeds are also used as tonics, in the form of electuary, the dose of which is a small tea-spoonful twice daily.—*Ainslie*, ii. *p.* 32. All parts of the plant have much astringency, and seem to possess no other property.—*O'Sh. p.* 309. Its wood is known as the Tangada wood, Tangada kurra, *Tel.* and its bark as Avaraiputtai, *Tam.*

(2433) CASSIA BARK. Laurus Cassia. Lin.

Lawanga puttay, Tam. | Darchinie, Duk.

Cassia Bark is the bark of Cinnamomum (Cassia, *Blume*) Aromaticum, *Nees v. Esenbeck*, (Laurus Cassia, *Linn*,) and of other species. Cassia is mentioned by early Greek writers; in the Bible by the name *Kiddah*, and is one kind of Cassia in Diosc, i. c, 12. It is translated Cassia in Exod. xxx. 24 (*v.* Kiddah, and Kinnamon, *Bibl. Cycl.* and *Antiq. of Hind. Med.* p. 84). There are several distinct sources of Cassia, though it is often described as produced by the *Laurus Cassia* of Linnæus, a plant, said to be of Ceylon and the Peninsula of India, but which it is diffi-

cult to determine. Dr. Wight has shown that no less than three species were included by Linnæus under one name: one plant is *Litsæa Zeylanica*, Dawalkurunda of the Cingalese; another, apparently *Cinnamomum sulphuratum* of Nees, is the *C. perpetuo-florens* of Burmann; and the third, the *Carua* of Rheede (Hort. Mal. i. 57), Dr. Wight considers to be the *Cinnamomum iners* of Nees. Herman's own plant of Cassia lignea, in the British Museum, is named *Walkurunda*, and is a true Cinnamomum. Cassia bark, called *Cassia lignea* (and by the Chinese *Kwei Pe*, or Cassia-skin), we learn from the Chinese Repository, ii. 455, is exported from China to all parts of the world, sewed up in mats, usually two or more rolls in each mat, and a pound in each roll. From China it is imported into Singapore, Calcutta, and Bombay. It is imported into Great Britain from all these places, and also from Manilla, as well as from Quilon and Madras, and is kept in all shops and sold as Cinnamon, this being distinguished by the name of *true* Cinnamon, and must be specially asked for by this name. *Chinese Cassia* or *Cinnamon*, as it is also called, is, according to Mr. Reeves, produced in the province of Kwangsi, whose principal city Kwei-ling derives its name from the forests of Cassia by which it is surrounded. It is also said to be produced in Cochin-China in the dry sandy districts lying north-west of the town of Faifoe, between 15° and 16° of N. lat., and imported into Canton, &c. to the extent of 250,000 lbs.; also, that it is preferred to the Cinnamon of Ceylon. Mr. Crawford (Embassy to Siam, p. 470) says that the epidermis is not freed from the bark, as it is in that of Ceylon, that the superior kinds are retained for consumption in China, and the inferior re-exported to Singapore, &c. and to Europe. Cassia, though it bears a considerable resemblance to Cinnamon, is usually in single quills, seldom more than double, from ¼ to ½ or even 1 inch in diameter. It is thicker, rougher, more dense, and breaks with a shorter fracture, and is of a darker red colour than Cinnamon, and its powder of a reddish-brown tint. Its taste is more pungent and stronger, but not so sweet and grateful as that of the *true* Cinnamon, and its odour less agreeable. That from China is now always stripped of its epidermis, and is probably produced by the plant described below under the name of *Cinnamomum aromaticum.—Royle, p.* 542.

(2434) CASSIA BERRIES, OR DALCHINIE BERRIES, are produced in the Nuggur districts of Mysore from the same plant as the Cassia buds. The berries are an article of trade in the Nuggur division of Mysore. (Signed) J. Kirkpatrick.—*Rohde, M.S.S.*

(2435) CASSIA BUDS. LAURUS CASSIA, Lin.

Sirnagapoo, TAM.	Kasielblamen, DUT.
Tejputka phul, HIND.	Nagkessur, GUZ.
Nagaychc aloo, TEL.	Flores de cassia, PORT.

Cassia Buds (called by the Chinese *Kwei-tsze*, or Cassia-seeds), were formerly officinal under the name of Flos Lauri Cassiæ. Cassia Buds are the dried flower buds (perianth and ovary) of the Cassia tree, the Cinnamomum aromaticum, and are mostly brought from China. They bear some resemblance to a clove, but are smaller, and when fresh have a rich cinnamon flavor.—*Simmonds.* They should be chosen round, fresh, and free from stalk and dirt. They have the flavor and pungency of cassia. The exports from Canton in 1844 were 21,500 lbs.; in 1850, 44,140 lbs., valued at 7,400 dollars. The average quantity of Cassia Buds imported into the United Kingdom, in each of the thirteen years ending with 1842, was 40,231 lbs.; the average quantity entered for home consumption in these years was 6,610 lbs., and the average annual amount of duty received was £312.—*Simmonds.* They are exported from Canton in considerable quantities, have some resemblance to cloves or to nails with round heads, or are cup-shaped when the perianth bud falls off. Those that are fresh and plump are preferred. They are imported into Britain chiefly for use in confectionary, forming one of the ingredients of many old receipts. From the Chinese Repository, the opinion of Mr. Reeves, of Nees, &c., it is more than probable that both *Cassia buds* and *Cassia lignea* are obtained from the same tree. The buds have the flavour and pungency of taste of Cassia, and yield an essential oil upon distillation. The *Cinnamomum aromaticum, Nees v. Esenb*, from which Cassia Bark and Cassia Buds are supposed to be obtained, is a tree of considerable size. Branches angular, twigs and petioles covered with down. Leaves often nearly opposite, though usually alternate, oblong-lanceolate, acute at each end, triple-nerved, or with three nerves which unite into a single nerve above the insertion of the leaf-stalk, and disappear towards the apex of the leaf; the nerves are, like the twigs, covered with broken (strigulose) downiness, with curved-veinlets on the under surface. Panicles narrow, silky.—This is the *C. Cassia* of Blume, introduced from China, and the *Laurus Cassia*, t. 3. of the brothers Nees, in their paper on the Cinnamon, also of Hort. Kewensis, ii. p. 427, and the Laurus Cinnamomum of Andrew's Repos. t. 595, often quoted 596. The leaves taste mucilaginous and Cinnamonic. Dr. Lindley says that as grown in stoves they are almost insipid, mucilaginous, and somewhat astringent. Dr. Royle received a specimen of this plant (named *Cinnamomum chinense*) from the Messrs. Loddiges, who informed him that it was imported by their house from China in 1790. This is probably the source of the various plants in hot-houses. The leaves taste mucilaginous, but also aromatic. Cassia, on the authority of Mr. Marshall, has been usually thought to be only the coarser kinds of the Cinnamon of Ceylon, or that separated from the larger branches or thick roots, and that, though intended for con-

sumption in Asia, has been imported into England and sold as *Cassia lignea.* But this, as has been observed, can have seldom taken place, for it cannot be traced among the exports of Ceylon, where, moreover, all Cinnamon, whether coarse or fine, pays an export duty of 3*s.* a pound, and the Cassia, even in England, is not worth more than 1*s.* a pound.—*Royle.* At the Madras Exhibition of 1855, Cassia Buds were exhibited from Mysore, Canara and Travancore. This spice is less known than it deserves to be, and is now exported pretty largely from the Western Coast.—*M. E. J. R.* With Cassia Buds the Vyteans and Mahomedan Physicians prepare a stomachic infusion which is a favorite remedy with them in many complains.—*Ainslie's Materia Medica, page* 8. Cassia Buds are produced by the same plant from which Cassia-lignea is obtained. They are of a dark brown colour, with the form not unlike that of a small nail. The flavour and taste resemble those of cinnamon. Cassia buds are brought to Bombay from China and the Malabar Coast, and are chiefly used in medicine. According to the English Cyclopædia, the unexpanded flowers, when they have attained about a fourth of their complete size, of a species of *Cinnamomum,* are collected and sold under this name. Much diversity of opinion exists respecting the particular species of plant which yields this article. Professor C. G. Nees von Esenbeck (who is perhaps the best authority) says it is chiefly *Cinnamomum aromaticum* (Nees) and partially *Cinnamomum dulce* (Nees), *Laurus dulcis* (Roxb.), *Cinnamomum Chinense* (Blum.); while Dr. Th. F. Ludwig Nees von Esenbeck ascribes it to *Laurus Tamala* (Hamilton, 'Linn. Trans.' xiii. p. 556, the *Laurus Cassia,* 'Hort. Beng.'), and Dierbach to the *Laurus Culeba* (Lour,), which last supposition is at variance with the statement of Louriero ('Flora Cochinensis', p. 310), respecting the action of the berries of that species. Cassia Buds have the appearance of nails with heads of different sizes and shapes, according to the period of growth when collected. But an artificial process is employed by the Chinese collector, of pressing the top against a flat hard body, by which the ovary or fruit is prevented falling out. Externally they are of a dark or grayish-brown; the fruit, which is within, is of a bright brown. The taste and odour resemble cinnamon. By distillation they yield a heavy yellowish-coloured oil. It was at one time supposed that an inferior sort, nearly devoid of taste, which is met with in commerce, was the genuine, which had been previously deprived of its oil; but Martius shewed that this was a spurious kind, which is distinguished from the true by having the upper part of the calyx marked by six slits or incisions. It is moreover not so sound as the true sort, and is furnished with a longer foot-stalk. It should be remembered that the term *Cassia* used here has no relation to the genus which yields the Sennas of commerce. The uses of Cassia Buds are the same as those of cinnamon and cloves.—*Eng. Cyc. page* 794.

(2436) CASSIA ELONGATA. Senna plant. *Syn.* C. lanceolata, Royle. *Off.* The leaves—the *Tinnevelly senna,* or Senna mekhi, of the bazars. This is a native of the interior of India, according to some authorities; others believe it to be only naturalized. *Cassia lanceolata* (of Forskal, Suna mukee of the Arabians) and Cassia ethiopica, furnish other kinds of Senna. The greater part of the produce of Cassia lanceolata finds its way to India through the Red Sea, Surat, Bombay, and Calcutta. In 1838-39, the Calcutta imports were 966 maunds at 6 Rs. per maund of 82 lbs. This species has been cultivated successfully by Mr. Hughes at Tinnevelly, and Dr. Royle at Seharunpore. The plants in these situations yield a drug quite equal in value to the best imported article. In the Calcutta Garden the plant does not thrive well.—*O'Shaughnessy, page* 306.

(2437) CASSIA FISTULA, Lin. Purging Cassia. This has been unfortunately named, as it is constantly confounded with the Cassia yielded by the family of Laurels, with which the present product has nothing to do. The plant is a native of India, where it is constantly employed in medicine by the natives, and thus became known to the Arabs. The tree has been introduced into the West Indies, whence Cassia pods are now imported, as well as from India and the north of America. It is one of the most showy of trees, having something of the foliage of the Ash, with the inflorescence of the Laburnum. Leaves from 12 to 18 inches long, with from 4 to 8 pair of opposite, ovate, rather pointed leaflets, smooth on both sides, of a light green colour, from 2 to 6 inches long and 1 to 3 broad. Stipules minute. Petioles round, without glands. Racemes 1 to 2 feet long, pendulous, without bracts. "The three lower filaments longer than the others, with oblong anthers opening by two lines in the face, the other 7 clavate, with pores at the small end." (Lindley.) Ovary slender, smooth, one-celled, with numerous seeds, and without any transverse separations. Legumes cylindrical, 1 to 2 feet long, smooth, somewhat obtuse, indehiscent, marked externally with 3 longitudinal bands, one being opposite to the two others, divided into a number of spurious cells by transverse partitions. Seed one in each cell, surrounded by a soft blackish-coloured pulp. On account of this peculiarity of the legume, this plant is sometimes but unnecessarily placed in a separate genus, *Cathartocarpus.* The pods being officinal on account of the pulp, those are to be chosen which are heavy, and in which seeds do not rattle. The pulp is of a blackish colour, viscid, with a rather mawkish sweet taste, and a slight sickly odour. To separate the pulp, wash it out from the bruised

pods with boiling water, strain and then evaporate to a proper consistence. Soubeiran states that four ounces of pod give one ounce of pulp. This, analysed by Vauquelin, yielded Sugar, Gum, Extractive, Vegetable Jelley, Gluten, Parenchyma, Water. M. Henry states that the Sugar possesses the nauseous taste peculiar to the pulp, and he has announced the presence of a principle having many of the properties of Tannin. *Action. Uses.* Laxative; in large doses, Purgative.—*Royle page* 355.

(2438) CASSIA FLORIDA. Flowery Cassia. Though not so handsome as either of the preceding species, the Flowery Cassia is extensively multiplied on the Tenasserim Coast. It is a slender, graceful tree, "every branch terminating in a large panicle of deep yellow blossoms;" and when several are clustered together, waving their radiant glories in the floods of a noon-tide sun, they look like illumined hills on the eve of a Burman Carnival.—*Mason.*

(2439) CASSIA PLANTS, namely Cassia Lanceolata, C. Obovata, and other species, (*C. Senna*, Linn.) producing the Senna-leaves. Senna has been distinctly known only since the time of the Arabs; but they refer to the legumes only, though the leaves have long been employed in the East. There is, however, great uncertainty respecting the species of Cassia which yield the different commercial varieties. This is owing partly to all the Senna countries not having been thoroughly explored, and partly to species having been formed from imperfect specimens and others from leaves collected out of different samples of the Sennas of commerce. The following species seem to be clearly distinct. Forskal's *C. lanceolata*, has been changed in consequence of the great confusion which has arisen from this name having been applied by so many authors to the sharp-leaved Senna, which is imported in such large quantities both from Arabia and Egypt, and to which he restricts it.

1. *Cassia Forskalii* (C. lanceolata, *Forsk.* and *Lindley* Fl. Med, p. 259). Leaflets in 4 or 5 pairs, never more; oblong and either acute or obtuse, not at all ovate or lanceolate, and perfectly free from downiness even when young; the petioles have *constantly* a small round brown gland a little above the base. The pods are erect, oblong, tapering to the base, obtuse, turgid, mucronate, rather falcate, especially when young, at which time they are sparingly covered with coarse scattered hairs. (Lindl. *l. c.*) Collected by Dr. S. Fischer in Palm-grounds in the valley of Fatmé, flowering at the end of February. Forskal describes this as being distinguished "glandula supra basin petioli." It was found by him at Surdud and about Mor. It is called *Suna* by the Arabs, and probably yields some of the Arabian Senna of commerce.

2. *Cassia lanceolata* (Fig. 59, taken from the Author's "Illustrations of Himalayan Botany," t. 37.) This is a bushy annual, of about 2 to 3 feet in height, extremely leafy, and of most luxuriant inflorescence in a cultivated state. The stems are erect, round, smooth, a little flexuose towards the apex. The leaves alternate, abruptly pinnate. The leaflets 5 to 8 pairs, with short petioles, ovato-acute in the lower and lanceolate-acute in the upper parts of the plant, "slightly mucronulate, smooth above, rather downy beneath (especially in young leaves), with the veins turning inwards and forming a flexuose intramarginal line; petioles without glands; stipules softly spinescent, semihastate, spreading, minute." Racemes axillary and terminal, erect, rather longer than the leaves. Ovary linear, downy, falcate, with a smooth recurved style. Legumes (3) pendulous, membranous, flat, only slightly protuberant over the seeds, oblong, sometimes elliptical, nearly straight, with the upper margin, a little curved, tapering abruptly towards the base, and rounded at the apex, of a brown colour, containing from 5 to 8 white rugose seeds (2). These are figured by Gærtner, ii. t. 146. It is probably the *Cassia medica* of Forsk. p. cxi., and agrees with his specimen of "Senna Meccæ Lohajæ inveniebatur foliis 5—7 jugis, lineari-lanceolatis," p. 85, of which Forskal states large quantities are yearly exported from the district of Abu-arisch to Jidda. The species includes,

a. Tinnevelly Senna, cultivated by Mr. Hughes in the south of India; also that cultivated by *Dr. Royle* at Saharunpore, *C. lanceolata*, Royle Him. Bot. t. 37, and by Dr. Wight near Madras. v. fig. 60, B. and spec. in Brit. Mus. It is the *Cassia officinalis* of Gært. and Roxburgh, Fl. Ind. ii. p. 346, which name ought to have been retained, or the above *C. medica*, Forsk. instead of *C. elongata* being coined, especially as this was formed from the leaves of a cultivated Indian Senna found in commercial samples. It is cultivated by Dr. Gibson, near Poona. Dr. Burns writes that he has found the lanceolate Senna wild near Kaira in Guzerat. His cultivated specimens, if picked, would form good Senna.

b. Cassia lanceolata of most authors. *C. acutifolia*, Hayne, ix. t. 41. Nees and Eberm. t. 345. St. and Church. Pl. 30, as C. Senna. These best represent the form of Alexandrian Senna (v, 60, A., a small leaf), and specimen in Brit. Mus. from Senaar.—*(Kotschy.)* It is found in the valleys of the desert to the south and east of Syene or Assouan, and collected for the trade to Cairo, forming 3-5ths, of Alexandrian Senna.

c. Cassia acutifolia, called of Delile, Esenbeck and Eberm, t. 346. (fig, 60, c.) The leaflets are narrower and more tapering towards the apex than the foregoing, as might be expected in a poorer soil and drier climate. Some of the In-

dian specimens in Dr. Rottler's Herbarium closely resemble this variety; also African specimens from Tajowra to the south of the straits of Bab-el-Mandeb. Dr. Royle is unable to distinguish these by any permanent characters, nor dried Senna-leaves cultivated at Saharunpore from good specimens of *Bombay Senna* (that is ordinary Indian Senna) imported into Britain from India; nor these from *Suna Mukki* sent him by Dr. Malcolmson from Aden, and which he states are "the produce of Africa, but in appearence exactly resemble the Arabian Suna. In the market both are sold as one kind, and bring the same price."

3. *Cassia ovata* of Merat, Dict. de Mat. Med. b. 613. *C. æthiopica*, Guibourt. Is probably a distinct species, as it is said to have a gland at the base of the petiole and another between each pair of leaflets. The leaflets are in 3 to 5 pairs, exactly oval acute, slightly pubescent below; the follicles are thin, pale yellow coloured, 1-3rd smaller than those of *C. obovata*. It is said to be found both in Nubia and Fezzan, and to furnish exclusively the Senna of Tripoli, Sené de Tripoli. It is extremely like a variety of *C. lanceolata*. The figure of C. Senna in Stevenson and Churchill, Med. Bot. t. 30, quoted by Dr. Pereira as representing this plant, is referred to by Dr. Lindley as a good representation of C. auctifolia of Delile. But Merat and De Lens say of it: "Nous ne le connaissons que par les feuilles et les fruits qu'on en voit dans la commerce." M. Guibourt calls it *C. æthiopica*; but instead of referring to *C. lanceolata* of Colladon, Pl. xv. f. e. as representing this species, he says that it is exactly represented by the Sene de Nubie of Nectoux, pl. 2.

4. Cassia obovata, *Colladon*, Hayne, ix. 42. Nees and Eberm. 347. Diffuse herbaceous plant. Leaves equally pinnate, glandless. Leaflets 4-6 pairs (somewhat villous, Roxb.) obovate, obtuse, but slightly mucronate, unequal at the base, the terminal pair more cuneate and larger. Stipules triangular, narrow, and tapering, rather stiff and spreading. Flowers yellow, in racemes. Bracts ovate, cordate, acuminate, concave, single-flowered. Legumes broad, membranous, smooth, lunate in shape, rounded at each end, with an elevated crest over each side on both valves, so as to form an interrupted ridge along the middle of each valve. Seeds 6 to 8, wedge-shaped, rugose as in C. lanceolata.—A native of Africa, from Senegal (*Fl. de Senegambie*) to the Nile; found in Fezzan by Dr. Oudney (*R. Brown*) in Egypt from Cairo to Assouan, Nubia; found in the Adel country near Sultalli (*Mission to Abyssinia*); Desert of Suez; Syria; dry parts of India, as Kaira (*Burns*); Guzerat, Dekkan (*Col. Sykes*), near Delhi, and Valley of Rungush, near Peshawar (*Falconer*); high dry uncultivated lands of Mysore (*Roxburgh. Wight*). It has been cultivated in Italy (*Sené d' Italie*), and forms 3-10th of Alexandrian Senna. This species is very distinct, in its obtuse obovate leaves and crested legumes, from the preceding acute-leaved species. *C. obtusa* Roxb. was probably described from young legumes, as the author, like Dr. Lindley, has compared good specimens from Mysore with others from Africa. The *obtusata* (fig. 60. H.) of Hayne does not seem to differ sufficiently from his *C. obovata* (fig, 60. G.) It is possible, however, that there are two very similar species in Africa. Mr. H. Grant, late of the India House, has favoured the author with a specimen in flower collected by him in February at Philæ, which has upon it *both* obovate (H.) leaflets and some which are ovate and acute (G.)! Lieut Wellsted's collection contains a specimen from the coast of Arabia, of which the leaflets are obtuse, elliptic, and hairy. The sennas of commerce may be arranged as follows.

1. *Tinnevelly Senna*, first cultivated in the district of that name. in 12° of N. lat. by the late Mr. Hughes, from seed probably obtained from Arabia or picked out of the *Suna Mukki*, as was done by Dr. Royle when he cultivated Senna at Saharunpore. (*v.* Himal. Bot. p. 186, t. 37, and Trans. Med. Soc. of Calcutta, v. p. 433.) Dr. Royle also grew Senna from Tinnevelly seed sent to him by Sir C. afterwards Lord Metcalfe; but he did not find the smallest difference between the two when grown in the same situation. The Tinnevelly Senna is well-grown and carefully picked; the leaflets are of a fine rather lively green colour; thin, but large, being from one to two inches in length, truly lanceolate. This kind is "highly esteemed in England, and is quickly displacing all the other sorts in Edinburgh, and many other cities in Britain." (Christison.) Dr. A. T. Thomson says of it, it is mild in operation, certain as a purgative, and operates without griping. It is now cultivated by Mr. Hughes' successor.

Saharunpore Senna, the same kind of Senna, cultivated at Saharunpore, differed only in the leaflets being smaller, as might be expected from the more northern latitude (30°). These Dr. Royle prescribed in the hospitals at Saharunpore, and found them effective as a purge, and operating without producing inconvenient nausea or griping. Mr. Twining, after trying them in forty-five cases in the General Hospital at Calcutta, says, in his report to the Medical Board: "From these trials, I am disposed to consider the Senna now under trial equal to the best I have ever seen."

Madras Senna. Senna is now imported also from Madras, the produce of that Presidency. In the four years 1852-53 to 1855-56, 1,715 cwt., value Rupees 17,487, were exported, having been previously imported into Madras from Tinnevelly, where it is cultivated by the natives, and is of the same nature as Mr. Hughes' Senna, though not so well grown nor so carefully picked. Dr.

Christison says of it, the leaflets are longer than those of Bombay Senna, and not so taper-pointed, but otherwise differ only in being better preserved, and being more active, are more esteemed. Dr. Searle, in a communication to the India House, says of this Senna, that "now furnished to the profession by the Madras Government is in my experience quite as good as the Alexandrian," "every leaf of the Indian being of the genuine spear-shaped species."

2. *Bombay* or Common Indian Senna, *Suna Mukki* of the natives, is first imported into Bombay from the Arabian Gulf:

316,728 lbs. in 1837-38. 570,426 lbs. in 1838-39.
Re-exported to Great Britain, 262,284 lbs. in 1838-39.

That this Senna forms a large, if not the largest porportion of what is consumed in England is not only evident from the above importation, but also from a comparison with the whole quantity of the other Sennas imported as given by Dr. Pereira.

	1838.	1839.
From East Indies	72,576 lbs.	110,409 lbs.
From other places	69,538 ,,	63,766 ,,

Some of this Senna is no doubt produced in Africa, as stated above by Mr. Malcolmson: a good deal of it in Arabia, probably by *Cassia lanceolata*, and some perhaps by *C. Forskalii*. The leaflets are thin, lanceolate, usually entire, about an inch or an inch and a half in length, narrower than either the Tinnevelly or Saharunpore Senna, probably from growing in a poorer soil and drier climate. They are of a pale green colour, often with dark brown-coloured leaflets intermixed, also some pods, and many leaf-stalks, with occasionally other impurities. The good specimens of this Senna are, however, of excellent quality, and its commercial and medical value would be much increased, if the finest leaflets were picked out. It is in constant use in hospital practice in India, and generally highly approved of. Dr. Royle prefers them for all purposes to the following kind as found in commerce.

3. *Alexandrian Senna* is an excellent kind, when the genuine lance-shaped leaflets have been picked out; but that commonly employed in England, is a mixed and very impure kind, being made up of the leaflets much broken of *C. lanceolata* and of *C. obovata*, with some pods and broken leaf-stalks, and also with leaves of other plants. It should be used only after having been carefully picked, as directed in the Edinburgh pharmacopeia. Picked Alexandrian Senna is of a pale green colour, with a faint smell. The leaflets are broad-lanceolate, the two sides unequal; they are thicker and shorter than the Indian Sennas. The lanceolate Senna of Upper Egypt, Nubia, and Senaar, yields two crops annually, the plants being cut down in spring and autumn, dried in the sun, when the leaves are stripped off, packed in bales, and sent to several *entrepots*, and finally to Boulac in the vicinity of Cairo. Of the lanceolate Senna *five* parts are here mixed with *three* parts of the leaflets of *C. obovata*, brought from other parts of Egypt and even from Syria, and also with the leaves (*two* parts) of *Cynanchum Argel*. This mixed Senna is that exported from Alexandria. On the Continent a further addition is made of the leaves of *Colutea arborescens* and of *Coriaria myrtifolia*. Dr. Pereira states that, "under the name of *heavy senna* he has met with *argel* leaves, which were sold at a higher price than ordinary senna," and Dr. Christison mentions, what indeed may often be seen, that is, Argel leaves left intermixed even in what is called Picked Alexandrian Senna. This Senna is often called "Senè de la Pálthe."

4. *Tripoli Senna*, is brought from Fezzan to Tripoli. This has the general appearance of Alexandrian Senna, but is less esteemed, though it is a more pure Senna, probably because the leaflets are more broken down, and all the leaf-stalks have not been removed. The leaflets are shorter and less pointed than in lanceolate Senna—indeed, more ovate; hence this Senna is said to be produced by *C. ovata* (C. æthiopica); but it also contains leaflets of *C. obovata*, which species was found in Fezzan by Dr. Oudney.

5. *Aleppo Senna* is now seldom imported into England. It consists of the leaflets of *C. obovata*, as do some other kinds, such as Italian Senna. Dr. Ainslie says that the *obovate* is the only kind of Senna met with in India, meaning the Peninsula of India; for it is not met with in the Bengal Presidency; nor according to Dr. Searle, is it used in that of Madras at the present day. It is less effective as a purgative, and apt to create nausea and griping. On the matter of the adulteration of this drug, Commercial Senna is prepared for use by picking out the leaflets, and rejecting the leaf-stalks, also extraneous matter, as dust, date-stones, &c., as well as the leaves of other plants. The legumes, however, possess the cathartic properties of the leaves to a considerable extent, and were alone used by the original Arabs; and there is no reason to believe that the stalks are inert. The most important adulterations are, however, the leaves of other plants. Those of the *Argel* (D.) may be distinguished by being lanceolate, equal on the two sides of the midrib, thick, leathery, and paler. They operate very dubiously as a cathartic, but occasion griping and protracted sickness. (C.) Those of *Tephrosia Apollinea* (F.) are obovate downy, and the veins proceed transversely from the midrib to each margin of the leaf without forming a marginal vein. The leaves of *Colutea arborescens*, or Bladder Senna, are ovate, but equal at the base. Those of *Coriaria myrtifolia* (E.) are astringent, usually broken down, and marked on each side of the midrib with a strong lateral nerve. As

the systematic adulteration of Senna in Egypt with the leaves of other plants is objectionable, and has been so noticed by the Pharmaceutical Society, the most efficient method of stopping it would be to purchase only the pure African and Arabian Sennas which come to us by Bombay, instead of (unless it has been picked) that which is called Alexandrian, from its place of export (v. P. J. ii. p. 63.) In India, a good substitute for Senna is afforded by *Rae Suna*, one of the COMPOSITÆ. The active principles of Senna are extracted both by rectified and by proof spirit, and both by cold and by hot water; but long boiling injures its properties as a medicine. A very useful set of experiments has been made by Mr. Deane (P. J. iv. 61), from which he finds that though the best result was obtained by macerating Senna in a weak spirit, yet that cold water extracts the soluble and active portions, nearly if not quite as well as hot water; and that picked Alexandrian Senna of the best quality is superior to all the others, from the quantity of extract it contains. Of the East Indian, that from Tinnevelly is best; and that the common East Indian is better than small Alexandrian. But it has not been proved that the purgative property is in proportion to this Extract. He found that Senna 7½ oz. troy were completely exhausted by Dil. Spirit (1 part Spirit to 5 of water) 20 fl. oz., and the product four times the strength of the Inf. Sennæ of the London pharmacopœia. In its use, it is a Purgative; safe and efficient, acting chiefly on the small intestines, and producing copious loose evacuations in doses of ½dr. to 2d. or with Bohea Tea (Paris) or with Coffee, as in the French *Café au Séné*.—*Royle p.* 362.

(2440) CASSIA LIGNEA.

Seleckeh, ARAB.

Cassia lenosa, SP.
Lawanga putty, TAM.

In devoting a separate article to Cassia lignea, from that of Cassia bark or the Cassia of Malabar, I have been chiefly influenced to this by the knowledge that the Cassia lignea is derived from several species and even perhaps genera of plants, and from a desire to retain the commercial relations of this substance, a part, under the name it is usually known by in commerce. *Cinnamonum Cassia*, or *aromaticum*, the *Laurus cassia* of Linnæus, seems to be the chief source of the "Cassia Lignea" of commerce. It differs from the true cinnamon tree in many particulars. Its leaves are oblong-lanceolate; they have three ribs, which coalesce into one at the base; its young twigs are downy, and its leaves of the taste of cinnamon. Malabar cassia appears to be the produce of another species of *Cinnamomum* probably *C. eucalyptoides*, or *Malabathrum*. Dr. Wight, of the Madras Medical Service, in a report to the East India Company, expresses his belief that the Cassia producing plants extend to nearly every species of the genus. "A set of specimens (he observes) submitted for my examination, of the trees furnishing Cassia on the Malabar coast, presented no fewer than four distinct species; including among them the genuine cinnamon plant, the bark of the older trees of which, it would appear, are exported from the coast as cassia. Three or four more species are natives of Ceylon, exclusive of the cinnamon proper, all of which greatly resemble the cinnamon plant, and in the woods might easily be mistaken for it and peeled, though the produce would be inferior. Thus we have from Western India and Ceylon alone, probably not less than six plants producing cassia, add to this nearly twice as many more species of cinnamomum, the produce of the more eastern states of Asia, and the Islands of the Eastern Archipelago, all remarkable for their striking family likeness; all, I believe, endowed with aromatic properties, and probably the greater part, if not the whole, contributing something towards the general result, and we at once see the impossibility of awarding to any one individual species the credit of being the source whence the cassia lignea of commerce is derived, and equally the impropriety of applying to any one of them the comprehensive specific appellation of cassia, since all sorts of cinnamon like plants, yielding bark of a quality unfit to bear the designation of cinnamon in the market, are passed off as cassia." The Cassia tree, according to Mr. Crawfurd, is found in the more northern portion of the Indian isles, as in the Philippines, Majindanao, Sumatra, Borneo, and parts of Celebes. It is also grown on the western coast of Africa. The principal seat of its culture is, however, the Malabar coast and the provinces of Quantong and Kingse, in China. The famous Cassia of China is incomparably superior in perfume and flavor to any spice of its class. Its native place is supposed to be the interior provinces of China. The market price is said to be £5 per lb.—*Simmonds' Commercial Products, page* 393. The Malabar sort brought from Bombay is thicker, darker colored, and coarser than that from China, and is more subject to foul packing. A small quantity of Cassia is brought from Mauritius and Brazil, and a large amount from the Philippine Islands. Cassia bark fetches from 80s. to 105s. per cwt. in the London market, according to quality. The imports appear on the decline. In 1843 and 1844 Britain imported nearly two millions of pounds. The quantity imported and retained

in Britain for consumption in the past four years are shown in the following figures :—

	Imported. lbs.	Retained for consumption. lbs
1848	510,247	76,152
1849	472,693	83,500
1850	1,050,008	97,178
1851	267,582	82,467

The cheaper Indian barks, as well as the cinnamon of the East, seemed at one time to be fast driving out of the market the superior class cinnamon of Ceylon. In 1841 Java exported 400 cwts. of cinnamon; and the quantity of Cassia imported into the United Kingdom from India and the Philippine Islands, in the five years ending with 1844, was—

	lbs.
1840	329,310
1841	1,261,648
1842	1,312,804
1843	2,470,502
1844	1,278,413

40,000 lbs. were received from India in 1848; and 3,795 arrobas of cassia were exported from Manila in 1847. In 1852, 2,806 cwts. of cassia were received at Singapore from China, and 1,380 cwts. exported from that settlement to the Continent, against 903 cwts. shipped in the previous year. What the Ceylon spice-grower wants is an extended field of operation—a larger class of consumers to take off his cinnamon, and this can only be obtained by bringing it within the means of the great mass of cassia buyers. The Cassia tree grows naturally to the height of 50 or 60 feet, with large, spreading, horizontal branches. The peelers take off the two barks together, and separating the rough outer one, which is of no value, they lay the inner bark to dry, which rolls up and becomes the *Cassia lignea* of commerce. It resembles cinnamon in taste, smell and appearance. The best is imported from China, either direct from Canton, or through Singapore, in small tubes or quills, sometimes the thickness of the ordinary pipes of cinnamon and of the same length; but usually they are shorter and thicker, and the bark itself coarser. It is of a tolerably smooth surface and brownish color, with some cast of red, but much less so than cinnamon. The exports from China are said to be about five million pounds annually; price about 32s. per cwt. In 1850, 6,509 piculs of cassia lignea (nearly one million pounds, valued at 87,850 dollars, were shipped from the single port of Canton. Cassia bark is of a less fibrous texture, and more brittle, and it is also distinguished from cinnamon by a want of pungency, and by being of a mucilaginous or gelatinous quality.—*Simmonds.* Cassia lignea, analysed by Bucholz, yielded of Volatile Oil 0·8, Resin 4·0, Gummy Extrative 14·6, Bassorin with Ligneous fibre 64·3, water and loss 16·3=100. But as Sesquichloride of Iron and Gelatine both produce precipitates, that of the former of a dark-green colour (*p.*), it must also contain Tannin. Its active properties, dependent chiefly on the volatile oil, are taken up by spirit, and partially by water, as in the preparations.—*Action, Uses.* Aromatic Stimulant.—*Royle.*

(2441) CASSIA, MALABAR. Cassia has long been known to be a product of the forests of the Indian Peninsula. It is stated to have been a cause of jealousy between the Dutch and Portuguese that the latter sold some of the *Wild Cinnamon* growing in Cochin, &c. Buchanan, in his Travels in Mysore (ii. 336), mentions it as common on all the hills of the Malabar coast, also that Mr. Brown had planted it at Anjarakandy, as well as the Ceylon cinnamon (ii.545—6). He states that at Mangalore it was called *Dhal-China* (that is, Cinnamon), and exported to Muscat, Cutch, Scind and Bombay; also that the buds of the tree were called *Cabob-China*, and likewise exported to the same place. This export still continues, as it appears by the reports of the commerce of Madras and of Bombay that 107,856 lbs. of Cassia, were exported from Malabar and Canara, and that in 1844—45, there were imported into Bombay from Malabar and Canara, of Cassia, 52,686 lbs., and of Cassia Buds, 69,860 lbs. In the 4 years, 1852-3 to 1855-6, the exports from Madras ports amounted to cwt. 12,970, valued at Rupees 1,25,570. Some of these probably find their way into the English market. This plant Dr. Wight considers to be the famous *Carua* of Rheede, Hort. Mal. i. t. 57, referring it, doubtfully however, to *C. iners*. Reinwardt, a plant of Java and Penang, but which seems to be sufficiently distinguished by being devoid of the aromatic qualities of the Malabar plant. *Cinnamomum iners* is however, closely allied to another species, *C. eucalyptoides*, which is intermediate between *C. iners* & *C. nitidum* (Nees). Dr. Wight's drawing of the Malabar Cassia Plant sent to the India House (*v.* his Icones), appears to Dr. Royle to agree very closely with that of *C. eucalyptoides*, given by Nees and Ebern., in their Pflanz. Med., and which Nees v. Esenb. describes as Cinnamomum eucalyptoides of *Nees von Esenb.* Branches roundish, smooth; lower leaves ellipticoblong, upper ones subovate, acute at the base, subattenuate, obtuse at the apex-3-nerved, nearly veinless. Panicles sessile, subterminal and axillary. Flowers with silvery silkiness; segments of the perianth obovatocuneiform, deciduous from the middle—*Laurus Malabarathrica*, Roxb. Hort. Calc. p. 30. Wall Cat. n. 2583, B. "Sapor et odor foliorum fortis et acris caryophyllorum cum levi camphoræ tinctura." The berry not seen. The *Cinnamomum iners* of *Reinw.* is distinguished chiefly by the leaves being more lanceolate, 3-nerved, nearly veinless. Panicles pedunculate. Segments of the perianth deciduous below the apex. But both require

careful re-examination with good specimens, and comparison with the Malabar plant, before any one can determine whether this be identical with either or different from both. In the latter case, it ought to be called *Cinnamomum Caruæ*. The Chinese *Cinnamomum aromaticum* might, no doubt, be successfully cultivated where this thrives so well. Dr. Wight says, " a set of specimens (submitted officially to his examination) of the trees furnishing Cassia on the Malabar coast, presented no fewer than four distinct species, including among them the genuine Cinnamon plant, the bark of the older branches of which it would appear are exported from that coast as Cassia." And besides, he infers that all sorts of Cinnamon-like plants, yielding bark of a quality unfit to bear the designation of Cinnamon, are passed off as Cassia. Mr. Huxham, of Quilon, also states, that the former is coarser and thicker than the latter. Both are obtained from the same tree, the Cassia being the bark of the larger parts of the tree and the Cinnamon being peeled from the younger shoots and small branches. —*Royle, p.* 544.

(2442) CASSIA OBOVATA. Syn. *C. obtusa*, Wight and Arn. p. 288. *Senna obtusa*. Roxb. Fl. Ind. ii. p. 344. *C. Burmanni*. Wall. in Trans. Calc. Med Soc. vol. viii. p. 164. Wight in Mad. Journ. July 1837, p. 71. t. 4.—*O'Shaughnessy*. Aleppo Senna, has obovate very-blunt leaflets, and curved pods, with a very slight covering of down. The flowers are pale yellow. It is common in the same countries as the Cassia and mixed with it in commerce; it however chiefly constitutes the Aleppo Senna.—*Eng. Cyc. page* 793. It is indigenous in Mysore, Egypt, Suez, Nubia, and Central Africa. The leaves furnish the Aleppo and Italian drug. A nearly allied species, the *C. obtusa*, is common on the dry uncultivated lands of Mysore.—*O'Shaughnessy, page* 307.

(2443) CASSIA ORTUSIFOLIA. Chakowar, Jangli-powar. According to Dr. Irvine (*Gen. Med. Top. p.* 131.) the seed of this plant is used in medicine, the plant is scarce about Ajmeer, is prescribed to cleanse the blood, in an entire state: when the seeds are pounded and then swallowed, vomiting is produced, the leaves of the young plant are eaten as a vegetable, are also applied in itch cases. It is very common in the Dekhan: goats and sheep are fond of the seed, one seer of the seed costs one pice.—*Irvine.*

(2444) CASSIA OCCIDENTALIS. This is common in Bengal, small, very offensive, used in cutaneous maladies, and also aperient. Roxburgh gives it no native name.—*O'Shaughnessy, p.* 309. This small species of cassia Mr. Mason has occasionally noticed in Tenasserim, in native cultivation for medicinal uses. It was originally introduced into India from the West Indies. —*Mason.*

(2445) CASSIA OIL.

Tuj-ka-teil, Hind. | Koolfa-ka teil, Malabar.

Cassia bark yields a yellow volatile oil, called oil of cassia, the finer kind of which differs but little in its properties from that of cinnamon, for which it is generally substituted: it has a specific gravity of 1·071. The best is manufactured in China, where the wood, bark, leaves and oil are all in request. The Cassia oil is rated at 150 dollars per picul, and the trade in this article reaches about 250,000 dollars.—*Simmonds, page* 396. Cassia Oil, the Volatile Oil of Cassia-bark, obtained by distillation with water, is imported from Singapore, and is still probably all produced by the Chinese Cassia or Cinnamon, Cinnamomum aromaticum. When pure, it has a pale wine-yellow colour, which does not deepen with age. (*c.*) Sp. Gr. 1·095. It has in a remarkable degree the Cassia odour and taste. Cassia oil is imported into Bombay from China: and in Surat, the oil is expressed from both China and Malabar cassia. The latter kind, which is of a dirty brown colour, is chiefly exported to the Persian and Arabian Gulfs, Zanzibar, &c. under the name of *Koolfa-ka-teil.*—*Faulkner.*

(2446) CASSIA SOPHERA, Lin.

Poonaverie, Tam. | Sourna Mayharie, Sans.
Pydu tenghadoo, Tel.

The juice of the leaves as well as that of the fresh root of this species of Cassia is reckoned a sovereign external application in cases of ring worm, and is generally prescribed mixed with a certain portion of lime juice. The plant is the pomum Tagera of the Hort. Mal. and the Cambang cuning of the Malays.—*Ainslie.*

(2447) CASSIA SUMATRANA. Mayalee, *Burm.* Plentiful throughout the Hlaine, Pegu and Tounghoo Forests It is the Bombay Black wood.—*McClelland.*

(2448) CASSIA TORA. Fœtid Cassia.

Tukarieenie, Tam. | Prabunatha, Sans.
Kulkul, Arab. | Chackoonda, Hind.

Common all over the plains of India. In Tenasserim, the fœtid cassia is one of the most abundant weeds in the country. Its leaves are fœtid, mucilaginous, and gently aperient. They are much used for adulterating senna. The seeds ground with sour butter-milk are used with excellent effect in itchy eruptions, and the root rubbed to a pulp with lime juice has almost specific powers in the cure of ring worm. Like all the allied species of Cassia this seems to owe its virtues to its astringency alone.—*O'Shaughnessy, p.* 309.

(2449) CASSIS. A kind of black currant (*Ribes nigrum*), used in prepaing the liquor called *Ratafia.* It was once celebrated for its medicinal properties.—*Faulkner.*

(2450) CASSOWARY. This bird erroneously supposed to be a native of the Suhda Islands, is known to the inhabitants of these countries only as an imported stranger. The Malay name is Suwari, from which, most probably, the European one is taken. Most probably it will be found to be a native of Ceram and New Guinea only, and like the cockatoos, crown pigeons, and birds of Paradise, of the last island, made known to the inhabitants of the west through the Malay and Javanese, who have immemorially carried on a trade with the country of the Papuans.—*Crawfurd Dictionary, p.* 84.

(2451) CASSYTA FILIFORMIS. Lin.

Cotton elhay, TAM. | Cotton ka paat, DUK.

These are the leaves of a parasitical plant which appear to be the Acatsja Valli of the Hortus Malabaricus and is of the class Enneandria and order Monogynia. They are put into butter-milk, as seasoners, and are chiefly in use amongst the Brahmins in the southern parts of the Peninsula,—*Ainslie's Mat. Med. p.* 263.

(2452) CASTANEA INDICA of the eastern and northern Himalayan mountains, yields an edible nut called *Nikari.* (Royle p. 345.)—*O.Shaughnessy, p.* 607. *Castanea indica* (Theetkyha, *Burm.*) is a large tree, plentiful in the Rangoon, Pegu and Tounghoo districts; wood, red, equivalent to Mahogany.—*McClelland.* The chesnut, *Castanea indica,* Mason writes, "is a native of the hilly frontier of Bengal;" but the chesnut of this country, viz.

(2453) CASTANEA MARTABANICA, grows nearly down to the sea shore of Tenasserim There is an indigenous chesnut tree growing on the uplands which yields abundantly, and whose fruit is sold in the bazar, but they will not compare with the French chesnuts, nor even with the American chincapins.—*Mason.*

(2454) CASTANEA. CHINESE CHESNUTS. Fortune says that among these woods, he met with the chesnut for the first time in China. This discovery was of great importance, as he was most anxious to introduce this to the Himalayan mountains in India. Many attempts had been made to introduce it from Europe, but they had not succeeded. The seeds of such trees as sakes, chesnuts, tea, &c. retain their vitality for a very short time after they are gathered if they are not sown and allowed to vegetate. It is therefore useless to attempt to send these seeds in dry paper parcels or in hermetically sealed bottles from Europe to the North of India. The chesnuts which he had met with in the markets of China, although excellent for the desert were generally too old for vegetating; but when he discovered the locality where they grew, there was no longer any difficulty in procuring them quite fresh. There are two species cultivated on these hills. One is somewhat like the Spanish, and although probably a different variety, it produces fruit quite equal in quality, if not superior, to the Spanish chesnut. The other is a delicious little kind bearing fruit about the size and form of our common hazel-nut. Large quantities of both kinds were procured by him in the autumn, sown in Ward's cases, and sent on to India. Part were sent to Government and part to the Calcutta Agricultural and Horticultural Society. They vegetated freely during the voyage, and many hundreds of nice healthy young plants reached India in the most perfect condition. The chesnut may now be considered naturalized on the hills of India, and in a few years will no doubt make its appearance in the markets amongst other fruits.—*Fortune's Residence. Page.*

(2455) CASTING OF METALS. The natives generally prepare a model in wax which is embedded in moist clays, which, after being dried in the sun, is heated in the fire, the wax run out and the metal run in. A much better plan where accuracy is required, as in casting a brass nut or box for a large screw, is to cast the model in lead, and, having bedded it in clay, it may, when the mould is dry, be melted and run out and the metal run in. Wax models allow the moulds to shrink in drying and the thread of a screw box so formed, of course does not correspond. The best specimens of native casting Mr. Rohde has seen were a set of figures cast at Pettapore, about 30 years ago, for the Zemindar who had whole armies of such in bronze.—*Rhode M.S.S.*

(2456) CASTOR.

Joond-Bedushtur Ashbut-chegan, ARAB.	Joond bedushtar, PERS.
Beevergeil, DUT.	Costoreo, PORT.
Kastoreunt, Bibergeil, GER.	Baboowaja struga, RUS.
Castora, IT.	Castoreo, SP.
Castoreum, LAT.	Munace, TAM.
	Faulkner.

A peculiar concrete substance, analogous in its nature to musk, found in two pear shaped bags, situated beside two smaller follicles in the inguinal region of both sexes of the beaver. It is of a penetrating unpleasant odour, and a bitterish and somewhat acrid taste. Two kinds are known in commerce, one American, and the other Russian, which is exceedingly rare. Castor is used in medicine as a stimulant and antispasmodic. Writing scientifically, this is a concrete animal substances, formed in the preputial follicles of the beaver, *Castor fiber.* Both male and female beavers have sacs which contain this substance. In the male each sac is composed of an external or cellular coat, inclosing muscular fibres; within there is a vascular coat covering a scaly glandular membrane; externally this membrane is shining and silvery, internally scaly and glandular. The castor is contained in this bag; while fresh, it is liquid, yellow, and of strong colour. The beaver inhabits North America chiefly. Two kinds of castor are known in commerce, American and Rus-

sian. The American consists usually of two isolated sacs, wrinkled and connected by a ligament; the sacs are long and pear-shaped. Pereira states that the colour, and other external characters, are quite variable. The article called by the English druggists, "Hudson's Bay castor" is deemed the best kind now to be found. The *Russian* castor has become so dear and scarce that it is no longer available. *Castor* was once much relied on as an antispasmodic and a stimulant of the uterine system—dose dr. 2 in pills. A simple tincture and an ammoniated tincture are given in the British Pharmacopœiæ. In the present day it is seldom or never prescribed in any form.—*O'Shaughnessy, page* 619.

(2457) CASTOR OIL.

Chitta amadum, TEL. | Errundee-ka-tel, HIND.
Chitta manak ennay, TAM. |

Castor oil is expressed from the seeds of *Ricinus communis (Palma Christi)*, a plant with petale-palmate leaves, which is found native in Greece, Africa, the South of Spain, and the East Indies, and is cultivated in the two Indies, as well as in North and South America. In the temperate and northern parts of Europe, the plant is an herbaceous annual, of from three to eight feet high; in the more southern parts it becomes shrubby and even attains a height of twenty feet; while in India it is often arboraceous and thirty or forty feet high. The best oil is obtained by expression from the seeds without heat, and is hence called "cold drawn oil." A large quantity of oil may be produced by boiling the seeds, but it is less sweet and more apt to become rancid than that procured by expression. The *Palma Christi* grows continually for about four years, and is in constant bearing, ripening its rich clusters of beans in such profusion, that 100 bushels may be obtained annually from an acre, and their product of oil two gallons per bushel. There are several species, all of which yield oil of an equally good quality. A shrubby variety is common in South Australia, and other parts of New Holland. *Ricinus lividus* is a native of the Cape of Good Hope. It is a hardy plant, of the easiest culture, and will thrive in almost any soil, whether in the burning plains or the coldest part of the mountains. The seed should be planted in the tropics in September, singly, and at the distance of ten or twelve feet apart. They will bear the first season, and continue to yield for years. When the seed-pods become brown, they are in a fit state to pluck. It is often grown in the East intermixed with other crops. The primitive mode there of obtaining the oil is to separate the seeds from the husks, and bruise them by trying them up in a grass mat. In this state they are put into a boiler amongst water, and boiled until all the oil is separated, which floats at the top, and the refuse sinks to the bottom; it is then skimmed off, and put away for use. The purest oil is obtained, as before-mentioned, by crushing the seeds (which are sewed up in horse-hair bags), by the action of heavy iron beaters. The oil, as it oozes out, is caught in troughs, and conveyed to receivers, whence it is bottled for use. Castor oil is used for lamps in the East Indies, and the Chinese have some mode of depriving it of its medicinal properties, so as to render it suitable for culinary purposes. That which the people of Britain import from the East Indies comes from Bombay and Calcutta, and is obtained at a very low price. It is exceedingly pure, both in color and taste. In India there are two varieties of this plant cultivated, the one with large seeds, and the other with small seeds. That obtained from the large seeded variety is sometimes drawn cold, and its straw colored specimens are scarcely distinguishable in quality from the oil of the small seeded variety. It is however more usually extracted by heat and forms the common "Lamp oil" of the Bazar. In its *preparation*, the seeds having been partially roasted over a charcoal fire, both to coagulate the albumen and to liquify the oil, are then pounded and boiled in water until the oil rises to the surface. The roasting process, gives it a deeper red colour and an empyreumatic odour. The price of this oil varies in different parts of the country from Rs. 1-10-0 to Rs. 3-13-6 per maund of 25lbs. The average of nineteen large stations, in all parts of the Presidency for the Quarter ending 31st October 1854, was Rs. 2-8-6 per maund. The average exports of the last six years, Galls. 27,561 per annum. The small variety is employed to make the Castor oil used in medicine, in the usual way. The following is the process for making a fine kind of castor oil for domestic purposes. Take five seers of the small castor oil nuts, and soak them for one night in cold water. Next morning strain this water off, throw it away, and put the nuts into a second quantity of fresh water, and boil them in it, for two hours. After which, strain the water off, and throw it away as in the first instance the husk or outer covering being removed. The nuts are then to be dried in the sun, on a mat, for three days at the end of which time, they are to be well bruised in a mortar, add to the nuts, thus bruised, ten measures of water, and set them on the fire to boil, taking care to keep continually stirring the contents of the pot, until all the oil appears at the top when it is to be carefully strained off, and, after being allowed to cool, put into a bottle for use. The quantity of nuts mentioned in the above receipt ought to yield about one quart bottle full of oil. In place of the ten measures of plain water, the same quantity of Cocoanut water may be used: it is supposed to make the castor oil of a paler and finer colour.—*Rhode M.S.S.* Castor oil is largely imported into Bombay from Cutch and other ports in the Presidency, and is re-exported to England and France. The Palma Christi or

Castor-oil plant, is very extensively propagated by the Karens, who have two or three varieties. Until they were informed, however, by the missionaries, they were not at all aware of the medicinal properties of the plant; their object in planting the tree being, to obtain the seeds to mix with their dyes, and fix their colours. —*Mason.* In the West Indies the shrub grows about six feet high. The stalks are jointed, and the branches covered with leaves about eighteen inches in circumference, forming eight or ten sharp-pointed divisions, of a bluish green color, spreading out in different directions. The flowers contain yellow stamina; the seed is enclosed in a triangular husk, of a dark brown color, and covered with a light fur, of the same color as the husk. When the capsule is thoroughly ripened by the sun, it bursts, and expels the seeds, which are usually three in number. In Jamaica this plant is of such speedy growth, that in one year it arrives at maturity, and it has been known to attain to the height of twenty feet. A gallon of the seed yields by expression about two pounds of oil. The wholesale price in Liverpool, in October, 1853, was 3d. to 5d. per lb. It is exported from the East Indies in small tin cases, soldered together and packed in boxes, weighing about 2 cwt. each. In Ceylon castor oil is obtained from two varieties of the plant, the white and the red. The native mode of preparing the oil is by roasting the seed; this imparts an acridity to the oil, which is objectionable. By attending to the following directions, the oil may be prepared in the purest and best form. The modes of preparation are—1. By boiling water. 2. By expression. 3. Extraction by alcohol. In the first the seeds are slightly roasted to coagulate the albumen, cleaned of the integuments, bruised in a mortar, and the paste boiled in pure water. The oil which rises on the surface is removed, and treated with an additional quantity of fresh water: 10,000 parts of clean seed give by this process (in Jamaica) 3,250 of oil, of good quality, though amber-colored. 2. Expression is the simplest and most usually adopted process; the cleaned kernels are well bruised, place in cloth bags, and compressed in a powerful lever and screw press. A thick oil is obtained, which must be filtered through cloth and paper to separate the mucilage. In Bengal the manufacturers boil the oil water, which coagulates some albumen, and they subsequently filter through cloth, charcoal, and paper. 3. The extraction by alcohol is practised by some druggists. Each pound of paste is triturated with four pounds of alcohol, specific gravity 8.350, and the mixture subjected to pressure. The oil dissolved by the alcohol escapes very freely: one half is recovered by the distillation of the spirit, the residue of the distillation is boiled in a large quantity of water. The oil separates and is removed, and gently heated to expel any adherent moisture; then filtered at the temperature of 90 deg. Fahrenheit; 1,000 parts of the paste have by this process given 625 of colorless and exceedingly sweet oil. The cultivation of the *Palma christi*, and the manufacture of castor oil, is extensively carried on in some parts of the United States, and continues on the increase. A single firm at St. Louis has worked up 18,500 bushels of beans in four months, producing 17,750 gallons of oil, and it is stated that 800 barrels have been sold, at 50 dollars per barrel. The oil may be prepared for burning, for machinery, soap, &c., and is also convertible into stearine. It is more soluble in alcohol than lard-oil. American castor oil is imported for the most part from New York and New Orleans, but some comes from British possessions in North America. In the United States, according to the "American Dispensatory," the cleansed seeds are gently heated in a shallow iron reservoir, to render the oil liquid for easy expression, and then compressed in a powerful screw press, by which a whitish oily liquid is obtained which is boiled with water in clean iron boilers, and the impurities skimmed off as they rise to the surface. The water dissolves the mucilage and starch, and the heat coagulates the albumen, which forms a whitish layer between the oil and water. The clear oil is now removed, and boiled with a minute portion of water until aqueous vapors cease to arise: by this process an acrid volatile matter is got rid of. The oil is put into barrels, and in this way is sent into the market. American oil has the reputation of being adulterated with olive oil. Good seeds yield about 25 per cent. of oil. A large proportion of the drug consumed in the eastern section of the Union is derived by way of New Orleans from Illinois and the neighbouring States, where it is so abundant that it is sometimes used for burning in lamps, and in the East Indies, this is the common purpose to which it is put. In Jamaica the bruised seeds are boiled with water in an iron pot, and the liquid kept constantly stirred. The oil which separates swims on the top, mixed with a white froth, and is skimmed off. The skimmings are heated in a small iron pot, and strained through a cloth. When cold it is put in jars or bottles for use.

	Castor oil imported.	Retained.
	lbs.	lbs.

1831	393,191	327,940
1836	981,585	809,559
1841	871,136	732,720
1846	1,477,168	—
1849	1,084,272	—
1850	3,495,632	—

The Eastern imports into Britain, of castor oil come chiefly from the East India Company's pos-

sessions, and were as follows, nearly all being retained for home consumption :—

	lbs.		lbs.
1830	490,558	1837	957,164
1831	343,373	1838	837,143
1832	257,386	1839	916,370
1833	316,779	1840	1,190,173
1834	685,457	1841	869,947
1835	1,107,115	1842	490,156
1836	972,552	1843	717,696

In 1841, 12,406 Indian maunds of castor oil were shipped from Calcutta alone, and 7,906 ditto in 1842. In 1842, 8 cases were shipped from Ceylon, 10 in 1843, 24 in 1844, and 14 in 1845. 1,439 barrels were shipped from New Orleans in 1847. The quantity brought down to that city from the interior was 1,394 barrels in 1848, and 1,337 barrels in 1849. Within the last year or two, an attempt has been made to introduce the cake obtained in expressing the seeds of the castor oil plant as a manure, which is deserving attention, both because it is in itself likely to prove a serviceable addition to the list of fertilizers which may be advantageously employed, and because it may lead to the use of similar substances, which are at present neglected, or thrown aside as refuse. The castor oil seed resembles in chemical composition the other oily seeds. It consists of a mixture of mucilaginous, albuminous, and oily matters; and the former two of these are indentical in constitution and general properties with the substances found in linseed and rape cake, while the oil is principally distinguished by its purgative properties. The cake obtained is in the form of ordinary oil-cake, but is at once distinguished from it by its color, and by the large fragments of the husk of the seeds which it contains. It is also much softer, and may easily be broken down with the hand. In an analysis of two samples of castor cake, stated to have been obtained by different processes; and, from the large quantity of oil, one of which must have been cold-drawn.

	Cold drawn. No. 1.	Hot drawn. No. 2.
Water	8.32	16.31
Oil	24.32	—
Nitrogen	3.05	3.35
Ash	7.22	4.95
The ash contains—		
Siliceous matters	1.96	—
Phosphates	3.36	2.27
Excess of phosphoric acid ...	0.64	—

To give a proper idea of the value of this substance as a manure, the average composition of rape cake, as deduced from the analyses contained in the Transactions of the Highland Society of Scotland is here given :—

Water	10.68
Oil	11.10
Nitrogen	4.63
Ash	7.79

The ash contains—

Siliceous matters	1.18
Phosphates	3 87
Excess of phosphoric acid	0.39

It will be at once seen that there is close general resemblance between these two substances, although there is no doubt that the castor cake is inferior to rape cake; still I believe that this inferiority is fully counterbalanced by the difference in price, which is such that, compared with rape cake, the castor cake is really a cheap manure. There is only one of its constituents which it contains in larger quantity, and that is the oil. No weight is, however, to be attached to the quantity of oil in a manure. In a substance to be used as food, it is of very high importance; but so far as we at present know, its value as manure is extremely problematical.—*Simmonds.*

(2458) CASUARIA POMANDRA. Burmese, Thabyaiywetkya. This is scarce, but found in the Pegu district. Timber strong and close-grained. Wood, white coloured, adapted for fancy work and cabinet making.—*McClelland.*

(2459) CASUARINA EQUISITIFOLIA. This tree was introduced into Southern Asia about 50 years ago, and is now well established, growing freely and ripening seed in great abundance. In general appearance, it much resembles the Larch Fir,—it grows in 10 years to the height of about30 feet. It generally grows very straight, and where the main shoot is broken or lopped off, throws out secondary shoots readily and these are usually straight and erect. It thrives best in sandy tracts along the Sea shore, and it would be desirable to plant it largely on the sand Hills, North and South of Madras where some numbers have already been grown. The wood is reddish in colour, in density and appearance it somewhat resembles Trincomallee. It bears a great strain, is well adapted for posts, and is said to bear submersion in water very well. The bark contains tannin, and a brown dye has lately been extracted from it by M. Jules L'Epine of Pondicherry. The manufacturer states that the Extract is fixed by a solution of Bichromate of Potass: with *Alum* as a mordant the Casuarina gives a reddish nankeen colour, with Iron a black colour, and if these mordants are mixed, the result is grey. The Casuarina dye becomes fixed by exposure to air without mordants, a nankeen red is obtained after 30 minutes exposure. At the end of an hour, M. Lepiné states that the colour is not affected by water, alkalies, solar light, or heat. The crystallised Extract and cloth dyed with the Casuarina were laid before the Jury of the Madras Exhibition, and the reddish brown colour of the cloth stood the test of washing well. Considering the discovery to be highly creditable to M. Lepiné, the Jury awarded him a 2d Class Medal.—*M. E. J. R.* On the whole, this tree well deserves extensive cultivation on the sandy

tracts, where it grows so readily. Hort. Garden, 13, Frith Col.—*M. E. J. R.*

(2460) CASUARINA MURICATA. *Myrticaceæ.* TINIAN PINE. BEEF WOOD. *Hind.* HURI. —This, from its general resemblance is commonly called the fir tree in India. It is grown in all parts of the Deccan. It has been introduced about twenty or twenty-five years, and grows to the height of forty feet. The small cones abound with seed, and should, if required, be gathered just before ripening. If placed in the sun, the seeds fall out, and may be planted immediately in baskets, boxes, or beds of good loam. This is the only species indigenous to the Tenasserim Coast, which is the one that has been diffused over Bengal, but the species introduced into England is the one common to the Indian Archipelago, and the South Sea Islands, called in the latter place ironwood. The wood is very hard and durable, and the Tahitians in their war-days chose it for the manufacture of their furniture, and ingeniously carved war-clubs; hence they term it the club-wood. They also fashioned valuable fishing hooks from its roots. This Casuarina in the Tenasserim Provinces is found inhabiting only the loose, sandy soil of the sea-board, and never inland. In general outline it resembles the pine, but it is of a more slender figure, and more elegant in appearance. It is there a remarkable tree, growing eighty feet high and spreading out without a leaf of covering; but its numerous fine knotted branchlets, mantled with brilliant green, and hanging in drooping bunches, or floating out lightly upon the breeze like long skeins of green silk, adorn it with the most graceful drapery; and make it one of the most desirable trees for embellishing a Tenasserim park.—*Mason.* This tree was introduced into Madras about 50 years ago, and is now well established, growing freely and ripening seed in great abundance. In general appearance, it much resembles the Larch Fir—it grows in 10 years to the height of about 30 feet. It generally grows very straight and where the main shoot is broken or lopped off, it throws out secondary shoots readily while usually grow straight and erect. It thrives best in sandy tracts along the sea shore, and it would be desirable to plant it largely on the sand Hills north and south of Madras where some numbers have already been grown. The wood is reddish in colour, in density and appearance it somewhat resembles Trincomallee wood. It bears a great strain, is well adapted for posts and said to bear submersion in water very well. On the whole this tree well deserves extensive cultivation on the sandy tracts where it grows speedily.

(2461) CATAPA. Ingudi badam. Almond of Terminalia Catappa.—*Ben. Phar.* 199.

(2462) CATHA, a genus of plants belonging to the natural order *Celastraceæ. C. edulis* is the Kat or Khat of the Arabs. "It would appear," says Dr. Lindley, "to be of a stimulating character. According to Forskahl the Arabs eat the green leaves with greediness, believing them to have the power of causing extreme watchfulness, so that a man may stand sentry all night long without drowsiness. They also regard it as an antidote to the plague, and assert that a person wearing a twig of it in his bosom may go among the infected with impunity; they even believe that the plague cannot appear in places where the tree is cultivated." ('Vegetable kingdom,' p. 587) At the same time Forskahl adds, "The taste of the leaves does not seem to indicate such virtues."

(2463) CATHARTOCARAUS. (from *καθαίρω*, to purge, and *κάρπος*, fruit), a genus of plants belonging to the natural order *Leguminosæ.*—*Engl. Cyc. p.* 797.

(2464) CATHARTOCARPUS FISTULA.

Khyar-chember, ARAB.	Dranguli, Toong-gooli JAV.
Sonali, BENG.	Cassiæ pulpa, LAT.
Cakay, CAN.	Mentus, MAL.
Ahilla, CYNG.	Khyar-i-Chember, PERS.

Casse-fistulense, FR.	Konnemarm, Sarakonnemam, TAM.
Purgircassie, GER.	Rayla, TEL.
Gurmalla, GUZ, HIND.	
Polpa di cassia, IT.	

Cathartocarpus Fistula, the purging Cassia, or Pudding Pipe-Tree. This is by some included as a Cassia. It has leaves with 4-6 pairs of ovate rather acuminated glabrous leaflets; the petioles glandless; the racemes loose, bractless; the legumes cylindrical, rather obtuse, smooth. It is supposed to have been originally a native of tropical Africa, but is now extensively diffused over the globe, and is found abundantly in Hindustan, China, the East Indian Islands, the West Indies, and, South America. It is a tree from 30 to 40 feet high, with yellow flowers and long cylindrical black pods, from 9 inches to 2 feet in length. The valves of this pod are thin, hard, and brittle; and its cavity is divided by numerous thin brittle transverse dissepiments; the partitions thus formed have each a single hard flattened ovate seed, surrounded by a soft pulp. The pulp has a sweetish, flat, not unpleasant taste, and is separated by boiling the pod in water, straining the fluid, and then evaporating it to the consistence of a thick extract. This extract acts as a mild purgative on the system, and was long in great repute in Europe on that account. It is now however seldom used; and although admitted into the lists of Materia Medica of the British Pharmacopœias, is only placed there as entering into the composition of the Electarium Cassiæ and the Confectio Sennæ. The pulp, according to Henry, consists of 61 per cent. of sugar, 6.75 of gum, and 13.25 of tannin. It probably also contains Carthartine or an analogous principle.—*Engl. Cyc. page* 797. But according to Braconnet's analysis, 20 parts of the pulp consists of

sugar, 12.00, gum 1.35 astringent matter, glutten, and colouring matter in small quantities, and water 3.80. The cathartic properties are held to reside in the sugar. Several pharmaceutical preparations of cassia pulp occur in the Pharmacopœiæ of Europe. When long kept the cassia pods become dry, and rattle when shaken; these are found by experience to be destitute of purgative properties. The leaves of the tree are also purgative, the powdered seeds are aperient, in the dose of from four to six drachms. The pulp is a soft, gentle, and agreeable laxative, but requires to be taken in large doses, from four drachms to one ounce being at least required. Its most valuable use is as a base for purgative electuaries, containing more active ingredients.—*O'Shaughnessy, page* 305. "This tree," says Roxburgh, "is uncommonly beautiful when in flower, few surpassing it in the elegance of its numerous, long pendulous racemes of large, bright yellow flowers, intermixed with the young lively green foliage. It bears a striking resemblance to the laburnum. When in blossom, it is one of the most beautiful of the common jungle plants. On the Eastern side of the ghauts of the Peninsula of India, it is a small tree of great beauty when in flower, but too small to yield useful timber; in the Malabar forests, however, it attains sufficient size to adapt it for spars for native vessels. The wood which is close grained, is generally a heavy crooked timber well adapted for felloes of wheels, ploughs, &c.—*Rhode.* And is used for these purposes and for making tom-toms. According to Mr. Rhode it is one of the best for tanning but it is not in equal repute with the Chucklers with that of Cassia auriculata, the proportion of astringent extract being much smaller, and it is said to thicken the leather, but will probably be found to be well suited to the tanning of hides and butts.—*M. E.* According to Dr. Irvine, one seer of the fruit yields twenty tolas of the concrete pulp, which is sold in Ajmere at four seers for one rupee. He found the bark of the root of this tree to act as a very strong purge.—*Med. Top.*

(2465) CATHARTOCARPUS JAVANICUS, Horse-Cassia, has leaves with 12-15 pairs of ovate obtuse glabrous leaflets; glandless petioles; axillary racemes; nearly cylindrical, very long, and transversely torose legumes. It is a native of Java and the Moluccas. Its legumes are above two feet in length, and contain a black cathartic pulp, which is used as a horse-medicine in the East Indies. G. Don has described a species of *Cathartocarpus* (*C. conspicuus*), which is a native of Sierra-Leone, where the pods are called Monkey Drum-Sticks.—*Engl. Cyc. p.* 798.

(2466) CATHARTOCARPUS NODOSUS, Cassia nodosa. Knotted cassia. This species of cassia is remarkable for its large pink-colored flowers, and is seen tinting the Tavoy forests almost as beautifully as the calico tree does the steeps of the Apalachian Mountains. It is highly esteemed in Bengal, but Mr. Mason has not seen it cultivated in these Provinces except by Major Macfarquhar, and he mentioned his plants were sent him from the Botanical Garden near Calcutta.—*Mason.*

(2467) CATHARTOCARPUS ROXBURGHII. A highly ornamental tree, in form much resembling the weeping ash. It is at present only to be found in gardens, but the wood is hard and handsomely marked, and may hereafter prove a valuable addition to the timbers of India. Hort. Garden 28.

(2468) CAT-SKINS. The skins or furs of the domestic and wild cats. They are used for a variety of purposes, but chiefly for being dyed, and sold as false sable. The fur of the wild cat is more esteemed than that of the domestic cat. —*Faulkner.*

(2469) CATS EYES.

Chushm-maidah, Guz., Hind., Pers.

Cats-eye, a form of Chalcedony, of a greenish-gray colour, having a peculiar opalescence, or glaring internal reflections, like the eye of a cat: the effect is owing to filaments of asbestos. It comes from Ceylon and Malabar, and possesses considerable value as a gem. (Dana, Mineralogy.) —*Engl. Cyc. p.* 798. The cat's eye, is often seen set in rings, and is brought to Tenasserim from Burmah. Comstock says: "It is in great request as a gem, and bears a high price:" but those seen in Maulmain market are not much valued. A small one may be purchased for two rupees, and one of ordinary size for five; while ten rupees is the highest price given for the best.—*Mason.*

(2470) CATURUS SPECIFLORUS. Cattooseerageum. Vervonia Anthelmintica. —A shrub with dicœcious flower: *Linn. Roxb. Fl. Ind.* iii. p. 760.—*O'Shaughnessy, p.* 561.

(2471) CAULIFLOWER. Brassica oleracea var. An excellent vegetable, grows freely, but does not flower in Madras. In the Deccan, the seed should not be sown until the latter end of August, as it does not always head well: it requires the same care as the cabbage, and should be planted in a similar manner. Removing the plants occasionally prevents their quick growth, and Dr. Riddell thinks think if the roots, when taken up, were divided into halves, or quarters, before being put into the ground, that it would facilitate its going to head. The soil in which he [illegible] the finest heads grown was of a [illegible]cription, and the plants had little [illegible]iven to them. In England the market gardeners seldom water cauliflowers, and once in four days is amply sufficient in the Deccan: no injury will ac-

crue even if watered less frequently. The white brocoli is, he is sure, often taken for the cauliflower in this country, and he has seen heads large enough to be divided into two dishes, and then form a sufficiency to cover a dish in general use for vegetables. Brocoli, both red and white, should be cultivated in the same manner as cauliflower.—*Riddell.*

(2472) CAVIARE.

Caviar, Fr.	Caviarium, Lat.
Kaviar, Ger.	Ikra, Rus.
Caviario, It.	Caviario, Sp.

Caviare, a substance prepared in Russia consisting of the salted roes of large fish. The best, which is made from the roe of the sturgeon caught in the Wolga, in the neighbourhood of Astrachan, appears to consist entirely of the eggs: it is packed in small kegs, but the inferior sort is made into the form of dry cakes. It is highly esteemed in Russia, and also forms an article of considerable export; 30,000 barrels having been exported from Astrachan in a single season. The manufacture consists in separating the roe from its membranes, then washing in vinegar or white wine, and drying by spreading it out on a board in the air. Salt is then well rubbed in, and it is next put in a bag and the liquor pressed out. It is then packed in kegs for sale. During the three annual seasons of fasting in Russia, the consumption of caviare is very great, as it is also in Italy during the fasts of the church. It is eaten on bread, with oil and lemon juice or vinegar.—*Tomlinson, page* 354.

(2473) CAYENNE PEPPER, Guinea Pepper.

Filfill-achmar, Arab.	Peperone commune, It.
Tubia, Bali.	Lombok, Jav.
Meneshena, Can.	Lada-mira, Mal.
Gasmiris, Gyng.	Filfil-i-surkh. Pers.
Poivre d'Espagne, Fr.	Brahu-maricha, Sans.
Spanischer Pfeffer, Ger.	Mollaghai, Tam.
Lal-mirchee, Lal-mirchee, Guz, Hind.	Merapakaia, Tel.

Is a mixture of the powder of the dried pods of different species of capsicum. It is used in medicine, and also as a stimulating condiment. See Capsicum.

(2474) CATECHU, Gambier, Cutch, Terra Japonica.

Cutt, Can,	Catecu, It.
Cachou, Fr.	Gambir. Mal.
Katchu, Ger.	Catch, Port.
Cauth, Kuth, Cutch, Guz. Hind.	Sha-See, Burm.

The early history of Catechu is obscure, and though it was probably known to the Ancients, Persian works on Materia Medica in use in India do not quote any Arabic or Greek names for it. A great variety of astringent extracts are now known to be prepared from the wood, bark, and fruit of various plants. The Acacias, however, are most noted for the secretion of astringent principle in the wood, bark, and legumes of various species, which hence form articles of commerce, and are employed in tanning. But none are more valuable than the officinal species yielding Catechu. Catechu (called *Kut* or *Kutch* by the natives of the East and Cutch, and Terra and Japonica in commerce) is properly an extract prepared from the wood of the Acacia Catechu; but the term is now applied also to other extracts similar in appearance and properties. It should be confined to these, and the term Kino applied to astringent *natural* exudations. The mode of preparing Catechu, by cutting into chips the inner brown coloured wood, and making a decoction which is afterwards evaporated to a proper consistence, was first accurately described by Mr. Kerr, as practised in Behar; it is the same on the confines of Nepal, and in north-west India, on the Malabar coast, and also in Ava, from the same tree.—*Royle, p.* 350. When of good quality, Catechu is more powerful as an astringent than kino. Of all the astringent substances we know, catechu appears to contain the largest proportion of tannin, and Mr. Purkis found that one pound was equivalent to seven or eight of oak bark for tanning leather. A few years ago the terms catechu, terra japonica, and cutch were employed synonymously; they are now, however, for the most part used in trade somewhat distinctively, though not uniformly in the same sense. The manufacture of catechu from the *Acacia catechu* as practised in Canara and Behar, has been described by Mr. Kerr ("Med. Obs. and Inquiries," vol. v.), and Dr. Hamilton ("Journey through Mysore," &c., vol. iii.), while Professor Royle has explained the process followed in Northern India. According to the last-mentioned gentleman, "the kutt manufacturers move to different parts of the country in different seasons, erect temporary huts in the jungles, and selecting trees fit for their purpose, cut the inner wood into small chips. These they put into small earthen pots, which are arranged in a double row, along a fireplace built of mud; water is then poured in until the whole are covered; after a considerable portion has boiled away, the clear liquor is strained into one of the neighbouring pots, and a fresh supply of the material is put into the first, and the operation repeated until the extract in the general receiver is of sufficient consistence to be poured into clay moulds, which, in the Kheree Pass and Doon, where he has seen the process, are generally of a quadrangular form. This catechu is usually of a pale red color, and is considered there to be of the best quality. By the manufacturers it is conveyed to Saharunpore and Moradabad, whence it follows the course of commerce down the Ganges, and meets that from Nepaul, so that both may be exported from Calcutta."—*Simmonds, p.* 496. Next to timber, *catechu* or *Cutch* is undoubtedly one of the most important exports of the pro-

vince, and Pegu Cutch has obtained a reputation, which will always give it a preference in the market. *Acacia Catechu*, the tree from which it is procured, begins to appear about six miles to the north of Rangoon, and from thence it increases both in the number and size of the trees, until it constitutes the prevailing character of the forests to the north-east of Prome, where the trees are fifty to sixty feet high with a girth of seven or eight feet, and it is said to attain even a larger size in the Burmese territories lying north of the boundary. It is found plentifully in the northern part of the Tharawaddy district, but it is scarcely to be seen on the Tounghoo side of the hills. Thus it is entirely confined to the valley of the Irrawaddy. The manufacture of Cutch is scarcely known or practised below Meeaday, and that which finds its way into the market as Pegu Cutch probably comes chiefly from beyond the frontier. There is no reason why it should not be manufactured largely from the parallel of Henzadah upwards, as the tree from thence becomes inexhaustible, growing over rich rice plains in places of easy access.—*McClelland.* The catechu obtained from this tree in Pegu, fetches £4 to £5 more per ton than Gambier and other astringent extracts.—*Simm*: *page* 495. At the Madras Exhibition of 1855, catechu was seen in the form of 1. Circular flat Cakes from Travancore, covered on both sides with paddy husks. 2. Large flat Cakes from the Northern Division, varying in colour from Brick dust to dull yellow. 3. Round balls of a dark brown colour, the size of a small orange from Mangalore, where a large manufacture takes place. But these two sorts appeared identical or nearly so, varying only in shape.—*M.E.J.R.* Catechu is largely imported into Bombay from Singapore and China; two varieties are distinguished from the latter place, viz. *black* and *white* caucth.-*Faulkner.* Three chief varieties of catechu are described by Feé, and other eminent writers on pharmacy; viz. that of Bengal, Bombay, and the catechu in masses. *Bengal catechu* is in pieces of 3 to 4 ounces each, partially rounded, of dull red colour, covered with seeds on one side, fracture dull, undulated, and often marbled; taste astringent and subsequently sweet, powder grey; tannic acid 48.5 per 100. *Bombay catechu* is in pieces of 2 to 3 ounces, flattened and round, of brown colour, with seeds externally and internally, fracture shining, and rarely marbled; taste bitter, without any succeeding sweetness; powder brown grey; tannic acid 54.5 per 100. *Massive Catechu* is found in the bazars in pieces of 3 or 4 ounces, fragments of larger masses, reddish or blackish brown, uniform, shining, wrapped in large nerved leaves, fracture uniform, flavour very astringent, somewhat bitter, with an after sweetness; powder orange. Proportion of tannic acid very variable.—*O'Shaughnessy.* The best is of uniform liver brown colour; often adulterated with red clay; this is detected by incineration. Pure catechu leaves no more than 5 per 100 of earthy matter. According to Dr. Royle, Catechu is seen either in square or roundish pieces or balls, varying in colour, from a pale whitish or light reddish-brown to a dark brown colour; either earthy in texture, or lamellated, or presenting a smooth shining fracture. Some kinds are hence more friable than others; all are without smell; the taste is bitter, astringent, followed by a little sweetness. The pieces are generally of a darker colour externally than they are in the inside. Some of the kinds are covered with rice husks, others are enveloped in leaves, which Dr. Pereira has ascertained to be those of *Nauclea Brunonis*, a native of the Malayan peninsula. The *pale* variety is usually distinguished from the *dark* coloured, and said to be imported from Calcutta; but Dr. Royle obtained both kinds in the bazars there, the pale being imported from the Upper Provinces, and the dark from Pegu and Singapore. The dark-brown Catechus are obtained from Bombay; but both kinds may no doubt be prepared from the same tree, as a greater degree of, or longer continued heat, and greater exposure to light, is said to produce the dark colour. The dark are heavier, more dense in texture, and have a resinous fracture. The largest portion of good Catechu is taken up by water, especially when boiling, the infusion being of a light or reddish-brown colour, according to its strength: it reddens litmus, and is strongly astringent in taste. From forming a crude precipitate with a solution of Gelatine, Catechu is applicable to the tanning of leather, for which it is now much employed. Sir H. Davy, in analysing the Dark and Pale Catechu, or the Bombay and Bengal, as they were called, obtained from

	of Tannin	Extractive	Mucilage	insol. residuum.	
Dark Catechu	109	68	13	10	= 200
Pale do.	97	73	16	14	= 200

The Tannin of Catechu is very similar in properties to that obtained from Galls. The principle called Extractive by Sir H. Davy, has by others been called Resinoid matter, Resinous Tannin, and of late *Catechine* and *Catechuic acid.* This is most easily obtained by treating Gambier with cold water.—*Royle. p.* 351. When of good quality, catechu is a more powerful astringent than Kino. It appears to contain the largest proportion of Tannin of all the substances we know, and Mr. Purkis found that for tanning leather one pound was equivalent to seven or eight of oak bark.—*Sim.* Catechu is much used in medicine as an astringent and tonic, being usually given in combination with aromatic and earthy substances; the dose is 10 grains, repeated according to circumstances.—*O'Shaughnessy, p.* 302. Dr. Timmins, in his Report to the Madras Medical Board, mentions that he employed catechu in lieu of galls, in the treatment of 175 cases of Fever, and with equally

satisfactory results. Two cases only required quinine. The dose was the same as that of gall powder, given with infusion of chiretta.

(2475) CEDAR.

Ceder, Dut.	Cedrus, Lat.
Cedre, Fr.	Kedr, Rus.
Zeder, Ger.	Cedro, Sp.
Cedro, It.	

A name given to several distinct kinds of forest trees. The timber is resinous, has a fragrant odour, a rich yellowish-brown colour, and a bitter taste, owing to which it is not subject to worms —a circumstance which accounts for its great durability. The cedar of Lebanon so famous in Scripture, was in ancient times much employed in the construction of temples, and other religious buildings; in the formation of statues of the heathen deities, tablets, &c.—*Faulkner.* The cedar of Lebanon is usually called Pinus Cedrus, but sometimes Cedrus Libanus; the lofty Deodara, a native of the Himalayas, with fragrant and almost imperishable wood, and often called the Indian cedar, is sometimes referred to the genus Pinus, and sometimes to that of Cedrus or Larix, with the specific name of Deodara. Dr. Hooker is of opinion that the Deodar and the cedar of Lebanon are identical. The wood of several of the Conifera however is called cedar. The wood of Juniperus virginiana is called Red or Pencil Cedar, and that of J. bermudiana is called Bermuda Cedar. That of J. barbadensis, is called Barbadoes Cedar; while the Juniper of the North of Spain, and South of France, and of the Levant, is from J. oxycedrus: the White Cedar of North America, a less valuable wood than the red cedar, is yielded by Cupressus thyoides, and the cedar-wood of Japan, according to Thunberg, is a species of cypress. The name Cedar is thus applied to a number of woods in our different colonies, which are in no way related to the Conifera: thus the cedar of Guiana is the wood of Icica altissima. The white wood or white cedar of Jamaica is Bignonia leucoxylon, and the bastard cedar of India is Guazuma ulmifolia. In New South Wales again the term white cedar is applied to Melia Azaderach, and red cedar to that of Flindersia australis, as well as to the wood of the Toon tree, or Cedrela Toona.—*Holtz.* In China, a kind of Cedar probably a cypress, called nan mah, or southern wood, which resists time and insects, is considered peculiarly valuable and especially reserved for imperial use and buildings. —*Williams' Middle Kingdom, page* 275.

(2476) CEDRELA FEBRIFUGA (Soymida febrifuga?) has leaflets ovate-oblong, acuminated, quite entire. It is a native of Java. Its bark is said to have a bitter effect on some of the fevers of India than cinchona.—*Eng. Cyc. p.* 802.

(2477) CEDRELA TOONA, (*Toon*).

Tunna, Beng.	Toon marum, Tam.
Loodh, Sans.	Toona, Hind.
Thit-kado, Burm.	Tundu, Can.
Toon tree, Eng.	

Cedrela, a genus of plants, the type of the natnral order *Cedrelaceæ.* It has the following characters :—Calyx 5-toothed; petals adnate to the torus; stamens 5, distinct; capsule 5-celled; 5-valved; seeds numerous, on each side of the dissepiment ending in a wing.—*Engl. Cyc. page* 802. *Cedrela Toona,* the Toon Tree or Bastard Cedar, has lanceolate leaflets, acuminate, entire, pale glaucous beneath. It is a native of the East Indies, where it is called Toon. It has an erect trunk of great height and size, with smooth gray bark. The flowers are very numerous, small, white, fragrant, like honey. The seeds are numerous, imbricated, winged. This noble timber tree is common in Bengal; it flowers in February, and the seeds ripen in May and June. *Cedrela Toona* is found on the banks of streams in the Tounghoo district, but it is scarce.—*McClelland.* It grows in the ravines of the Concan, and is stated to be abundant, 25 miles North East of Trevandrum. It is found in the Mysore and Salem jungles in large quantities, also along the crest of the ghauts from Travancore to Goa. Wight No. 103, 126, Travancore. At the Tambur river, in East Nepal, the vegetation in some spots was exceedingly fine, and several large trees occurred: Dr. Hooker measured a Toon tree (*Cedrela*) thirty feet in girth at five feet above the ground.—*Hooker Him. Jour. p.* 193. It will be seen from this that it has a wide range throughout India and furnishes the name of a beautiful wood, common in the higher provinces, where it is made into furniture of all kinds, and is much admired for its close grain and beautiful colour, resembling, though lighter than and not so close grained as, Mahogany, to which it is deemed equivalent.—*Ains. Mat. Med. p.* 210. It is called Bastard Cedar from an aromatic resin exuding from it resembling the American Cedar. It is often sold in Madras under the general name of "Chittagong wood" and is the most valuable of the woods known by that commercial name. In Coimbatore it is a valuable timber tree of large size, and its reddish coloured wood is used for cabinet-making purposes. It or an allied species is known also in Coimbatore under the name of Wunjoolie marum; but as this is a very heavy and strong, hard wood, said to be admirably fitted for pestles and mortars and other purposes demanding great strength, but not for cabinet purposes, Dr. Wight suspects Roxburgh's toona and the Wunjoolie are different trees. A specimen of wood sent by General Cullen as of this tree showed the grain and polish remarkably well: it is however of a brighter colour, and apparently a denser quality than any met with in the market, inducing a doubt as to its being of the same species. The wood of this tree closely resembles the inferior kinds of mahogany, and is much used in India. The bark is powerfully astringent, but not bitter. The native physicians use it in conjunction with the powdered nut of the Cæsalpinia bonducella, an

intense bitter. M. Nees Von Essenbeck has published an account of some experiments on the bark, which indicated the existence of a resinous astringent matter, a brown astringent gum, and a gummy brown extractive matter, resembling *ulmine*. The bark was used in Java by Blume in epidemic fevers, diarrhæa, and other complaints. Horsfield gave it in dysentery, but only in the last stage, when inflammatory symptoms had disappeared.—*O'Shaughnessy, page* 249-250. Its flowers in conjunction with safflower (Koosumba) are used by the inhabitants of Mysore, for dyeing the beautiful red colour called there Gul-i-nari.—*Ains. Mat. Med. p.* 205. The species sent by General Cullen is said to be abundant in Travancore. It is very deserving of careful enquiry, as to locality, supply, &c. with a view to being brought into more extensive use in this Presidency. It is said to yield planks from 2 or 3 feet in diameter, and competent practical advisers think that it promises to be a good substitute for Mahogany.—*M. E. J. R.*

(2478) CELERY. APIUM GRAVEOLENS. The blanched stalks of this plant form one of the best salads, and the green leaves are used in soups, It succeeds well on the plains of India under the following treatment. Trenches should be dug 2 feet deep, and 15 inches broad, the earth taken out thrown up on each side; dig the bottom of the trench well, and put in 9 inches of decayed cow manure and leaves in equal parts, to which add 4 inches of the soil formerly taken out, with a little lime, mix well together and water, in two or three days, plant 9 inches apart. Seed should be sown early in the season, so as to ensure strong plants by the commencement of the rains; at the close of which begin to plant. *To blanch*, when the plants are one foot high they should be earthed up, with the earth on the side of the trenches to the height of 4 inches: the proper way to do this is to take a plant in the left hand, and put the soil round it with the other, taking care not to allow any to get into the heart and not to earth above it, a little lime is required to be dusted above the plants before commencing, it will prevent injury from worms; after the first earthing, the foliage ought never to be watered if possible; as it causes the plant to decay at the centre; the earthing up must be repeated as the plants grow.—*Jaffrey*. In the Dekhan, according to Dr. Riddell, Celery seed may be put down at the commencement of the rains, and, like other plants at that season, is better for being first sown in boxes or baskets, for the convenience of being removed under shelter, if the weather is bad. When the plants are about two inches high, they may be pricked out into other boxes or baskets, two inches apart, where they remain for the first four or five weeks, and then removed into beds or rows: to the latter he gives the preference at the early part of the season; after that put them into square beds of six feet, and about twelves inches apart. They then grow so close in the leaves that they protect each other's roots from the sun, and keep the beds moist, besides being very readily blanched, merely requiring a couple of half circular tiles to be put around the stem, tied with string or matting; then earth up the sides, which completes the business. In four or five days you may commence cutting, and by transplanting the off-shoots, have a succession the whole year round. The plant is very hardy, and goes to seed without any difficulty.—*Riddell.* Kurufs, *Arab.*, are the seeds of Apium graveolens, used in Indian medicine. Celeriac is a variety of celery, and is to be managed precisely in the same manner. It seldom grows above eight inches, and mostly spreads upon the ground. The root only of this is eaten: it forms rather a large white bulb, nearly the size of a parsnip and has an exceedingly fine flavour. The root of the celeriac is used for stews rather than eaten raw.

(2479) CELASTRACEÆ, *Spindle-Trees*, the Spindle-Wood Tribe, a natural order of Polypetalous Exogens, consisting of shrubs or trees principally found in temperate latitudes. The barks of *Celastrus scandens* and *Celastrus senegalensis* are said to be purgative and emetic, whilst the species of *Celastrus venenatus* are reported to inflict the most painful wounds. The fruits of *Elæodendron ruber* are eaten at the Cape of Good Hope. It has 24 genera and 260 species.—*Engl. Cyc. page* 803.

(2480) CELASTRUS PANICULATUS. C. nutans, Roxb. Malkungee. Staff Tree.

Vululuvy, TAM.

This is a native of the Circar mountains and Mysore; the deep scarlet colored oil obtained by expression from the seeds of this shrub is used in medicine: the seeds submitted to destructive distillation yield the oleum nigrum, an empyreumatic black oily fluid of the uses of which in medicine Mr. Malcolmson has given an interesting account in his excellent work on Beriberi and rheumatism. It is administered in doses of a few drops daily in emulsions, and seems to exercise a decidedly beneficial effect. A specimen of this liquid sent by Mr. Malcolmson to Dr. O'Shaughnessy, did not differ in any sensible degree from the empyreumatic products of the distillation of the common fixed oils, containing naptha and other carburets of hydrogen. Large quantities would doubtless yield paraffine and creosote.—*O'Shaughnessy, p.* 271. In Ajmere the seed is imported from Marwar, and Godwar, is there considered sudorific, and generally heating, and is swallowed whole in rheumatism. It is used in horse mesalihs.—*Genl. Med. Top. p.* 146.

(2481) CELOSIA ALBIDA, Lin. *Riddell.*

Pannay keeray, TAM.
Ghoorugoo koora, TEL.
Booroondie, SANS.—*Ainslie's Mat. Med. p.* 255.

(2482) CELOSIA ARGENTEA. WHITE COCK'S-COMB, SIRWARIE.

Sufaid Moorgh-kes, HIND.

Double variety cultivated. The single variety is very common in the rains in the cultivated fields, both white and pink, and cattle eat the plants, especially buffaloes.—*Genl. Med. Top. p.* 185.

(2483) CELOSIA ASIATICA, INDIAN CELOSIA.

Kookspuna, HIND.

A common weed in gardens.—*Genl. Med. Top. p.* 200.

(2484) CELOSIA CERUNA, DROOPING COCK'S-COMB. Cultivated as a flower.—*Genl. Med. Top. p.* 185.

(2485) CELOSIA CRISTATA, CRESTED COCK'S-COMB.

Lal and Peela Moorgh-kes, HIND.

Both white and yellow varieties are cultivated in gardens.—*Genl. Med. Top. p.* 185. This common annual is met with all over the world, is sometimes cultivated by the natives of Tenasserim. The Burman name signifies cock's comb, like the English.—*Mason.*

(2486) CELOSIA NODIFLORA,

Comatty keeray, TAM. | Kullianie, SANS.—*Agri. Ainslie, p.* 253.
Pendli pedda koora, TEL.

(2487) CELTIS ORIENTALIS (ULMACEÆ). Captain Reynolds, sent to the Agri-Hortic. Society a specimen of a primitive cloth made by the Garrows from the bark of a tree, whose leaves were enclosed in the parcel. He says "they make several such cloths of different colours from various barks, and though these manufactures would seem cheap enough, they are not usually at the expense or labour of even such rough clothing for themselves, preferring apparently to go naked; they import at least 100,000 mds. of Cotton, but to his knowledge do not weave a seer for themselves. The Garrows who come to the plains have generally some small ends of cloths; but these are bought from the Bengalees, apparently to attend the *hauts* (fairs) in, not as clothing to protect them from wind and weather." Dr. Falconer, to whom the specimens were referred, pronounced them to be those of *Celtis orientalis*, a tree which is pretty common all over India, and known under the name of Chakan in Bengal. The cloth is probably called "Yangfung" in Assam: Capt. Reynolds names it "Amfuk." Dr. Buchanan Hamilton says, the under bark of this tree, like that of the West India kind, consisting of numerous reticulated fibres, forms a kind of natural cloth, used by the Garrows for covering their nakedness. ('Lin. Trans.,' xvii, p. 209) He also describes it in his report on Assam as a kind of rug worn by the Garrows in the cold weather, and serving them as blanket by night. But the specimens of this, as well as of some others, are chiefly interesting as showing the probability of the existence of numerous plants, of which the useful properties still remain unknown—for the fibrous properties of this are not mentioned by Dr. Roxburgh; and of him, it is justly observed in th 'Journ. of the Agri-Hortic. Society,' vi, p. 18 "from this circumstance it may be inferred h was not aware of it, as he appears never to hav allowed an opportunity to pass of drawing atten tion to the useful properties of plants describe by him, but, on the contrary, to have ever bee desirous of rendering his botanical acquirement subservient to the dissemination of useful infor mation in connection with every department c the vegetable kingdom."—*Royle Fib. Pl. p.* 31

(2488) CEMENTS. At the Madras Exhibi tion of 1855, there were a good many contribu tions of Limes, Concretes, Septariæ, Dolomites Magnesite, Gypsum and other substances used i manufacturing Cements, and there seems to b an abundant supply of minerals of this class al over Southern India. The shell lime of Sooloor pett is too well known to require further notic except that it is far too pure a carbonate of lim to be used for out door plastering near the sea The Kunkurs or Nodular limes are more durabl though not so white. The Septariæ or Parker' cement stones, are very common in Southern In dia, though the beds are not extensive: they ac company the strata of blue and white Potters clay and kaolin that are so common in this Presi dency. The best hydraulic septariæ occur a Awady near Madras, Bangalore and Chingleput A very fine natural Hydraulic cement occurs o the banks of the Godavery and has been exten sively used in the construction of the Godaver and Kistna Anicuts. A very good Hydrauli Limestone occurs along with the blue slate o Cuddapah—and the Dolomites of the Cedc Districts and the Northern Circars make gooc cements. The magnesite of Salem, Bangalore and Vizianagram, would probably improve th qualities of some of the other Limestones in cer tain proportions, as it acquires great hardness o surface but is deficient in adhesiveness. Numer ous experiments have been tried with this mine ral which certainly possesses some good hydrau lic properties but has disappointed the expecta tions at first formed of its usefulness.—*M. Ex Jur. Reports.*

(2489) CENTAUREA ATROPURPUREA The sweet Sultan.

(2490) CENTAUREA. *Compositæ.* The vari ous species of this beautiful and elegant genus are easily grown from seed in any light loamy soil, they are of various heights from twelv inches to five feet, the seed may be sown in pots or small beds at the close of the rains, ther transplanted and they will blossom during th cold weather. The flowers are fragrant and o different shades of colour, purple, blue, yellow white, red, brown, &c.

(2491) CENTAUREA MOSCHATA. Musk Centaury. *Hind.* Sha-pusund. Cultivated as a flower.—*Gen. Med. Top. p.* 206.

(2492) CENTRANTHUS RUBER. *Valerianaceæ.*

Jallukree, HIND.

This is an ornamental annual, generally grown from European seed, the colours of the different species are red, blue and white, and thrive in any good garden soil. The Valerian grows wild in some of the upper parts of Bengal.—*Riddell.*

(2493) CEPHAELIS IPECACHUANA. The roots of this plant are the part used. It is a native of New Granada in Brazil. Three modifications or varieties of these invaluable roots are found in commerce and pharmacy, viz. 1. "*Grey*" *or annulated Ipecachuana.* 2. "*Grey-red*" *Ipecachuana.* 3. "*Starchy or whitish grey*" *Ipecachuana.*—*O'Shaughnessy, page* 379. The emetic effects of the root were known to the Brazilians from time immemorial, and it received from the Portuguese the name of 'rais d'oro,' or golden root. The father of the celebrated Helvetius was the first to establish its utility after numerous experiments performed in the hospitals of Paris, for which he was rewarded by Louis XIV. with a thousand *louis d'or.* The roots of the *Viola parviflora*, the *Psychotria emetica*, and several other plants, have been occasionally used to adulterate the ipecachuana. The plant is not cultivated in Brazil, and as it only flourishes in the large forests daily falling before the planters' axe, the root is rapidly becoming scarce, and proportionally high priced. —*O'Shaughnessy, page* 381. For Indian substitutes for ipecachuana, see CALOTROPIS, CRINUM, RANDIA, PÆDERIA &c. &c.—*O'Shaughnessy, page* 383.

(2494) CERASUS, a genus of plants belonging to the Amygdaleous division of the natural order *Rosaceæ*, and including the common cherry among its species. The species may be divided into the True Cherries, the Bird-Cherries, and the Cherry-Laurels.—*Eng. Cyc. page* 826. Voigt says there is a species of cerasus, or cherry "a native of Maulmain," but Mr. Mason has never happened to meet with it. He had however good authority for the statement and Griffith remarks that there is in the Tenasserim Provinces one species of the almond tribe, "which abounds in prussic acid."—*Mason.*

(2495) CERASUS CAPRONIANA. The Cherry tree. A native of Europe, the Himalayas, Caucasus, &c. In Cashmere it is called *Aloo baloo.* The kernel of this fruit contains the elements of hydrocyanic acid, and is accordingly much used for communicating its peculiar flavour to brandy and liqueurs. The fruit of *Cerasus Pudum* is used for the same purpose in the hills. The bark is called *pudmak*, and used in medicine by the native, as it is also in America. The liqueur called *Maraschino*, which is chiefly manufactured in Venice, Trieste, and Zara in Dalmatia, is prepared from a variety of cherry named the *Griot marasquin*; the fruit and seed are crushed together, one part to the hundred of honey added, and the whole mass subjected to fermentation; during this process it is distilled, and the product is rectified. To the rectified spirit sugar and water are added, in proportions guided by the taste of the manufacturer, and the resulting liqueur is stored for some months before use, to free it of empyreumatic flavour. —*O'Shaughnessy, p.* 323.

(2496) CERASUS JAPONICA, the Dwarf Almond. This is a native of Japan, and long known in English gardens as the Double Dwarf Almond, one of the most beautiful objects that appear in the month of March.—*Eng. Cyc. page* 827.

(2497) CERASUS LAUROCERASUS. (Cherry-laurel.) This is a native of Trebizond and Affghanistan, cultivated in Europe. The distilled water of the leaves is much used in Europe as a vehicle for opiates and other anodyne medicines. It is given in doses of from half an ounce to one ounce. Great care is essential in the observation of the exact formula given in the Pharmacopœia for this preparation, a deviation from which may render the distilled fluid a most dangerous poison.—*O'Shaughnessy, page* 324.

(2498) CERASUS PSEUDOCERASUS, the Chinese Cherry.—*Eng. Cyc. page* 827.

(2499) CERASUS SERRULATA, the Fine-Toothed Cherry. A native of China.—*Eng. Cyc. page* 287.

(2500) CERASUS VULGARIS, (*Prunus Cerasus*, Lin.) the common Cherry. Flowers appearing earlier than the leaves, which are light green and smooth underneath. Branches when young stiff and erect. Fruit roundish or heart-shaped, succulent, more or less firm, and sugary, It is found wild in the woods of Asia Minor, where it acquires a very large size. Dr. Royle considers the cherry to be wild in Cashmere.—*Eng. Cyc. page* 826.

(2501) CERATONIA SILIQUA, Lin.

Khirnoob Nubtee, ARAB.

Saint John's Bread (or Fruit of the Carab tree).—*Ains. Mat. Med. p.* 39. The Carab tree has been very successfully introduced at the Saharunpore gardens, and was to be distributed along the dry and sandy tracts of the North Western provinces. The pods sell in the bazar at ten rupees a seer, or five rupees a pound.—*Spry's Suggest, p.* 54.

(2502) CERBERA, a genus of plants belonging to the natural order *Apocynaceæ*, contains among other poisonous species that from which the Tanghin poison of Madagascar is procured. —*Eng. Cyc. p.* 829.

(2503) CERBERA AHORAI, properties as in C. Manghas—*O'Shaughnessy, p.* 447.

(2504) CERBERA FRUTICOSA. A large shrub, native of salt marshes, the fruit is a deadly poison.

(2505) CERBERA MANGHAS. A common plant in the East Indies, occurring in wet situations. The kernels are described by Lindley as emetic and puragative. Waiz states that the leaves are used in Java as an excellent substitute for senna. The milky sap is also said to be purgative; the properties of all parts of the plant deserve most attentive investigation.—*O'Shaughnessy, p.* 447. In many places in Tenasserim on the banks of tide-water streams, the most remarkable tree in sight is this species of cerbera, whose fruit is used very extensively by the Burmese to make an oil which they burn in their lamps, and use to annoint their heads; a use not mentioned in the books. The medicinal properties are unknown in Tenasserim, and Mr. Mason thinks their existence may be doubted. If correct, these Provinces might supply all India with senna; for the tree abounds from the mangrove swamps on the sea-shore, to the boundaries of tide-water on almost every stream, and any quantity of leaves may be obtained for the trouble of gathering.—*Mason. C. Manghas* is a native of Singapore and some of the adjacent islands. The seeds are emetic and poisonous, whilst the milky sap is purgative. The leaves and bark are used as a substitute for senna.—*Eng. Cyc. p.* 830.

(2506) CERBERA TANGHIN, the Tanghin is described as a tree with lanceolate alternate leaves. The kernel of the fruit must be a very powerful poison: it is not much larger than an almond, and yet is sufficient to destroy above twenty persons. Radama, the late king of Madagascar, abolished the use of it as an ordeal. The plant which yields the Tanghin has been called by Du Petit Thomas *Tanghinia venenifera.* Its nut filamentous and woody, albumen none, the kernel said to be a formidable poison; it was used in Madagascar for the trial by ordeal, but the practice is now discontinued.—*O'Shaughnessy, p.* 446.

(2507) CERBERA THEVETIA. A large shrub with leaves like the oleander, and bell-shaped yellow flowers; common, easily propagated by cuttings.—*Riddell.* Its milk poisonous, bark bitter and purgative, also said to be powerfully febrifuge, "two grains being affirmed to be equal to a common dose of cinchona." Perfectly naturalized in India, according to Royle.—*O'Shaughnessy, p.* 447.

(2508) CEREAL GRAINS. The cereal grains are those which are the object of a continuous culture for food. The seeds of all the Gramineæ, those of the darnel alone excepted, are capable by cultivation of becoming alimentary. The value of grains generally speaking is directly as the size of the caryopsis, and inversely as the thickness of the pericarp. When the grain abounds in perisperm it is heavy, when the envelope is thick the grain is, on the contrary, light, thus:—

100 seeds of wheat weighed,..		4,50. grs.
100	barley, ...	3,85.
100	rye, ...	2;60.
100	oats, ...	2,50.

The chemical composition of the grain influences materially the quality of the resulting bread. If the gluten be absent no fermentation takes place in the dough, if the gluten be in excess the bread is heavy and acid. Wheat flour may be considered the type of all that is suitable for alimentary purposes, and in the degree of deviation from this standard consists the inferiority of the other grains. Several diseases infest the cereal grains, generally altering the perisperm, sometimes destroying it altogether; all these maladies are produced by minute cryptogamic plants (mushrooms), of which the three following are the most frequent:—

1. *Caries,* (*uredo caries,*) attacks wheat, usually spares the pericarp, but changes the perisperm into a black fœtid powder. The component globules are devoid of pellicles. The disease is highly contagious.

2. *Carbon or smut,* (*Uredo segetum*) occurs under the epidermis, is composed of spherical globules, attacks all the cereal grains indiscriminately, and resembles black dust.

3. *Ergot or spur,* (*Sclerotium clavus*), is elongated in form, black externally, white and horny within, exceedingly deleterious in its properties, if long taken; in large doses acts specially on the womb.

But little is known as to the native country of the cereal grains. Michaud states that he has seen wheat growing wild on Mount Atlas. Sicily has, but on insufficient grounds, claimed the honour. Pallas saw wild wheat between the Don and the Volga, but in all these cases the production of a few scattered plants is fairly accounted for on the grounds of the seeds having been transported thither by birds, or with the stores of wandering merchants or commissariat trains. Feé inclines to the belief that the ocean now covers the primitive country of corn, and refers to the catastrophes which formed the Straits of Gibraltar, submerged the Atlantis of the ancient geographers, and caused America to spring from the waves, as proofs that we may easily account for our not discovering the native soil of the cereal grains. Without cultivation all the cereals degenerate, as is said to be the case with oats at the Cape of Good Hope.—*O'Sh.* The following are the Exports and Imports of Cereal grains of Madras.

Cereal grains exported from the Madras Territories by Sea

Cervus Wallichii, the Bara Singa, or Morl, is an Indian species. It is also found in Persia, where it is called Maral, Gevezu, or Gookoohee. It is the *Cervus Pygargus* of Hardwicke; also Jesrael, or Tailless Deer, and Red Deer, of India.

Cervus affinis, the Saul-Forest stag, the Stroa or Tibetan stag of Hodgson, the Bara Singha of the Hindoos. The bones are as heavy and as large as those of the Wapiti.

Cervus Sika, the Sika, is of a dark-brown colour, and has rather slender horns. It is a native of Japan.

Panolia Eldii, the Sangnai, is an Indian species.

Rucervus Duvaucellii, the Bahrainga, is another Indian species. It is called the spotted Deer of the Sunderbunds, and Barara Singha by Hardwicke. It is the *Cervus Elaphoides* of Hodgson. It inhabits reedy marshes and the islands of great rivers, never entering the mountains or forests. The tail is short, with no caudal disc and no heavy mane.

Rusa Aristotelis, the Samboo. It is the *Cervus Hippelaphus* of Ogilby, *Cervus unicolor* of H. Smith, Cerf de Coromandel of Cuvier, *Cervus Bengalensis* of Schirz, Daim Noir de Bengale of Duvaucell, the Samboo-Deer of Bennett, *Cervus heterocerus* of Hodgson. The last author describes four varieties of this animal. They are natives of various parts of India, and inhabit great forests and the mountains above them. They are not gregarious, and rut and drop their horns in spring.

Rusa Dimorphe, the Spotted Rusa, Gerver or Gower. Their colour is red-brown. They are confined to the saul-forests in India.

Rusa Hippelaphus, the Mijangan Banjoe. It is the *Cervus Hippelaphus* of Cuvier; Cerf Noir du Bengale, ou Hippelaphe, of F. Cuvier; Cerf d'Eau, ou Mejanganbanjoe, of the Malays of Java, according to Duvaucell; Rusa, or Roussaitan (Black Stag), of the Javanese and Sumatrans; *Rusa Hippelaphus*, the Great Rusa, of Smith; *C. Mollucensis* of Quoy and Gaimard, *C.* (*Rusa*) *Timorensis* of Muller. The size and proportions of this animal are about those of the Common Stag, but its hair is rougher and harder, and when adult that of the upper part of the neck, of the cheeks, and of the throat is long, and forms a sort of beard and mane. In winter its colour is of a grayish-brown more or less deep; in summer it is of a brighter and more golden brown. The croup is a pale yellow, and the tail is brown terminated by rather long hair. It is a native of Bengal, Sumatra, and the islands of the Indian Archipelago.

Rusa equinus, the Samboe. It is the Rusa of Raffles; the Eland or Elk of the Dutch sportsmen. It inhabits Sumatra and Borneo. It is of a plain brown colour.

CERVIDÆ OR CERVINA.

Rusa Peronii, the smaller Rusa, is a native of Timor and Luboc, Bavian and Ternate.

Rusa Philippinus, the Philippine Rusa, is the *C. Marianus* of Cuvier; the Cerf de Philippines of Desmarest. It is a native of the Philippines.

Rusa lepida, the Sunderall Rusa, is a native of Java. It is scarcely as large as a roebuck.

Axis maculata, the Axis. It is the *Axis* of Pliny; *C. Axis* of Erxleben; *A. major* of Hodgson, also *A. medius* and *A. minor* of the same author; Cerf Cochon of Buffon; Spoted Axis or Chittra, Langna or Pada or Spotted Porcine Deer, Thou or Spotted Porcine *Axis*, *A. medius*, or Spotted Hog-Deer, or Thou Langna of the Tarai, of Hodgson. In size and general form it nearly resembles the common Fallow-Deer. The skin is at all times of a rich fawn-colour spotted with white. Height at the shoulder 2 feet 6 or 7 inches. The distribution of the spots varies in different individuals. The ground-colour changes to nearly black along the back; the under parts are snow-white. Flanks, sides, shoulders, hind quarters, and part of the neck spotted as above mentioned. There is a broad dusky spot on the forehead, and a line of the same colour extends along the middle of the nose. The male has no canine teeth, nor has the female any horns; she is generally less in size than the male, and resembles him much in colour, but may be distinguished, it is said, by a white longitudinal line on the flanks. The young resemble the parents. It is a native of India and the larger islands of the Indian Archipelago; very abundant in Bengal, and on the banks of the Ganges. The Axis haunts the thick jungles in the vicinity of water, and the British sportsmen hunt it under the name of the Spotted Deer. It feeds in the night; and is timid, indolent, and mild, excepting when the females have young, and then the male is bold and fierce. The Axis is easily domesticated, and in England has propagated freely in captivity. The species has been kept with success both in menageries and open parks, to both of which its form and colour make it an elegant ornament.

Axis pseudaxis, the Spotted Axis. It is the *C. pseudaxis* of Gervais. It differs from *A. maculata* in having a series of spots in place of an oblique streak on the haunches.

Hyelaphus porcinus, the Lugna Para, or Shgoriah. It is the *Cervus porcinus* of Sundevall; the *Cervus niger* of H. Smith; the Porcine Deer of Pennant; the Brown Porcine Axis of Hodgson; C. Hippelaphus, var. 3, of Cuvier. This species is easily known from the Axis by being lower on its legs, and having no distinct black dorsal streak, nor white streak on its haunches. The horns are generally short, with only short snags. They live in families, or small herds, on the plains of Hindustan. They are

found in Ceylon, Mr. Ogilby says they do not ascend mountains. The *Cervus Dodur* of Royle is probably a distinct species, *Cervus pumilis* of H. Smith is perhaps a variety.

Cervulus vaginalis, the Kijang or Muntjak. It is the *Cervus Muntjac* of Zimmerman : *Prox Muntjac* of Zimmerman ; *Prox Muntjac* of Sundevall ; *Cervus plicatus* of Forster ; the Ribbed-Faced Deer of Pennant ; the Chevreuil des Indes of Allamand. The height of the Muntjak at the shoulders is about 2 feet 2 inches ; head pointed ; eyes large, with lachrymal sinuses ; ears rather large ; tail short and flattened. In the living animal there are on the face two rough folds of the skin, considerably distended and elevated, about an inch and a half apart above, and following the direction of the prominent part of the forehead they unite below, so as to mark the face with the letter V. In the dried subject the folds are contracted, and three distinct ribs appear, which suggested to Pennant the name of Rib-Faced Deer. General colour reddish-brown above ; belly and front of the thighs pure white. The male has large canines in the upper jaw : the female has none, nor has she horns. Dr. Horsfield, who has given the best account of this animal, states that, in Java, the Muntjac selects for its retreat certain districts, to which it forms a peculiar attachment, and which it never voluntarily deserts. Many of these are known to have been the favourite resort of this animal for several generations. They consist of moderately-elevated grounds, diversified by ridges and valleys, tending towards the acclivities of the more considerable mountains, or approaching the confines of extensive forests. Such districts are by no means uncommon in Java : they are covered with long grass, and shrubs and trees of moderate size, growing in groups or small thickets and they generally intervene between cultivated tracts and the deep forests. Their vegetation is peculiarly adapted to afford this animal a very abundant supply of nourishment ; their surface is covered with long grass (*Saccharum* (Holcus) *spicatum*), well known to persons who have visited the interior of Java by the name of Allang-Allang, and the groves and thickets abound with *Phyllanthus emblica*, Linn. : these two plants constitute its principal food. They also produce many species of *Hibiscus*, *Grewia*, *Urena*, and other malvaceous plants, all of which are greedily eaten by the kijang . . . The kijang is impatient of confinement, and is not fitted for the same degree of domestication as the stag. It is however occasionally found in the enclosure of natives and Europeans, but requires a considerable range to live comfortably : it is cleanly in its habits, and delicate in its choice of food. The flesh affords an excellent venison, which is often found on the tables of Europeans. The natives eat the males, and always present them in a conspicuous place in their feasts ; but in consequence of some peculiarities in the habits of the females, they have an aversion to them as food."

Cervulus moschatus, the Kegan or Kakr. It is the *Cervus Moschus* of Desmarest, *C. Ratwa*, *Styloceros Ratwa* of Hodgson, *Prox Rutwa* of Sundevall, *P. albipes* of Wagner, *P. styloceros* of Wagner, the Musk-Deer of Nepaul ; the jungle sheep. It is of a bright reddish-yellow colour, with the chin and gullet whitish. The hair is not ringed as in the following species. The Ratwa are natives of India, where they live in forests, in the mountains, or at their bases. They live six or eight together. The horns fall in May. The females have bristly tufts ending in a knot instead of a horn.

Cervus Reevesii, the Chinese Muntjak, is of a grayish-brown colour, with short pale ringed hair. It is a native of China. Dr. J. E. Gray says (" Brit. Mus. Cat.") :—" The Earl of Derby has these three kinds (the three last species) at Knowsley, but they breed together, and it has hence become impossible to discriminate the males from the original species."

Cervulus Pygargus, the Ahu. It is the *Cervus Pygargus* of Pallas, *Cervus Ahu* of Griffith, the Siaga of the Tartars, Dikaja kosa of the Russians, Tailless Roe and Tailless Deer of Pennant and Shaw. It is a native of Central Asia.—*Eng. Cyc. page* 862.

(2518) CETACEA, an order of Aquatic Mammals with fin-like anterior extremities, the posterior extremities being absent, or rather having their place supplied by a large horizontal caudal fin or tail ; without an external ear, without hair on their external integument, and the cervical bones so compressed as to leave the animal without any outward appearance of a neck. This order comprises the Whales, the largest animated forms in existence. Some of the genera composing it are phytophagous, or plant-eaters ; others are zoophagous, or animal-eaters.

Balæna mysticetus (the Right Whale). It is the *B. Grœnlandica* of Linnæus ; *B. vulgaris* of Brisson ; *B. Rondeletii* of Willughby ; the Right Whalebone, Common, or Greenland Whale of English writers. One variety is called the Nord Kapper or Nord Caper, another the Rock-Nosed whale. The habitat usually assigned to this whale is most extensive : thus, Mr. Lesson states that it inhabits all the seas of the globe, especially the two poles ; but it is not improbable that the Whalebone Whale or Black Whale of the South Seas (*Balæna australis*, Desmoulins, *B. antarctica*, Less.) which has every appearance of being distinct, and moreover of being infested with parasitical cirrhipedes (*Tubicinella*, *Coronula*, &c.) of different species from those which infest the Greenland Whale, has been mistaken for the last named Cetacean. Multitudes of the Southern *Balæna* were seen by Captain James Ross, R, N., in very high southern latitudes during his last expedition.

Balæna marginata, the Western Australian Whale, has very long and slender baleen, with a rather broad black edge on the outer or straight side. From the character of the baleen Dr. Gray considers this a distinct species.

Balæna australis, the Cape Whale. It is the Right Whale of South Sea Whalers, the southern Whalebone Whale of Nunn, the common Black Whale of Sir James Ross. It inhabits the south seas, and is of a uniform black colour,

Balæna Japonica, the Japan Whale. It is an inhabitant of the coasts of Japan, which it visits periodically. Its head is covered with barnacles Only the baleen has been seen in England. The species has been described from Chinese drawings.

Balæna antarctica, the New Zealand Whale. A species described by Dr. J. E. Gray as *B. Antipodarum*, from a very accurate drawing of a specimen taken in Jackson's Bay, New Zealand. It is the Tuku Peru of the natives.

Megaptera Kuzira, the Kuzira. It inhabits the Japanese seas.

Physalis Iwasi, the Japan Finner. It is very rare; one was cast ashore at Kii in 1760. It was 25 feet long.

Physalis antarcticus, named from the baleen of a New Zealand species by Dr. J. E. Gray.

Physalis Brasiliensis, Bahia Finner. Named from baleen; brought from Bahia.

Physalis australis, Southern Finner, inhabits the seas of the Falkland Islands.

Catodon macrocephalus, Northern Sperm-Whale. This is the *Physeter macrocephalus* of Linnæus; the Sperm-Whale, the Spermaceti Whale, the Blunt-Headed Cachalot of English writers. It is the *Physeter Trumpo* of Bonnaterre; the *Catodon Trumpo* of Gerard; the *Physeter gibbus* of Schreber; *Cetus macrocephalus* of Oken. Small fishes are occasionally swallowed in quantities by this whale, and one has been known to eject from its stomach a fish as large as a moderate-sized salmon; but the principal food of the Sperm-Whale appears to consist of squids or cuttle-fishes, "Sepiadæ."

Catodon Colneti, the Mexican-Sperm-Whale, is an inhabitant of the North Pacific, the South Seas, and equatorial oceans, and often referred to the last species.

Catodon polycyphus, the South Sea Sperm-Whale, is found in the Southern Ocean, and is also spoken of as the Cachalot, or Sperm-Whale.

Kogia is the generic name given by Dr. J. E. Gray to a form of whale with a shorter head, which has been taken at the Cape of Good Hope. It has been sometimes regarded as the young of the Sperm-Whale.

Beluga Kingii is the representative of the white whale, B. Catodon, in the Southern Hemisphere. It has been taken off the coasts of Australia.

Neomeris Phocænoides is the name given by Dr. J. E. Gray to species of Dolphin found in the Indian Ocean, the *Delphinus melas* of Temminck.

Phocæna communis, the Common Porpoise, or Porpesse. It is the *Phocæna Rondeletii* of Willughby, *Delphinus Phocæna* of Linnæus.

Grampus Sakamata. Described by Schlegel in 'Fauna Japonica' as *Sakam kuzira*. It has been found off the coasts of Japan.

Grampus Sieboldii is a native of the coasts of Japan, where it is called Naiso-Gota.

Grampus Macrorhynchus is the Black Fish of the South Sea whalers. It inhabits the South Seas.

Delphinapterus Peronii. It is the Right Whale-Porpoise of the whalers. It is black, with the exception of the beak, pectoral fins, and under part of the body, which are white. It is found on the Brazil Bank, off New Guinea, and the higher southern latitudes. There are two skulls in the museum at Paris. They live in large shoals, and the flesh is esteemed a delicacy.

Delphinus. The English name for this genus is Dolphin, but as Dr. J. E. Gray observes:—"most maritime persons call these animals Bottlenoses, Bottleheads, Flounderheads, Grampuses, Porpoises, Porpesses or Porpusses, sometimes adding Whale to the name. They generally confine the name of Dolphin (most used by landsmen) to the Scomberoid Fish (*Coryphæna*), which changes colour in dying." We subjoin a synopsis of the characters with the localities of the species of this large genus.

Delphinus Heavisidii, the Hastated Dolphin, inhabits the South Sea—Cape of Good Hope.

Delphinus obscurus, Dusky Dolphin, inhabits the Southern Ocean—Cape.

Delphinus Abusalam inhabits the Red Sea.

Delphinus Eutropia inhabits the Pacific Ocean —Chili.

Delphinus Novæ Zelandiæ, the New Zealand Dolphin, inhabits New Zealand and Cape Gable.

Delphinus Forsteri, Forster's Dolphin, inhabits the Pacific Ocean between New Caledonia and Norfolk Island.

Delphinus Sao inhabits Madagascar.

Delphinus longirostris, the Cape Dolphin, inhabits the Southern Ocean—Cape of Good Hope.

Steno Malayanus. It is the Dolphin à Ventre Roux of the Paris Museum; *Delphinus plumbeus* of Cuvier. It is a native of the Indian Ocean.

Steno frontanus. It inhabits the Indian Ocean and the Pacific.

Platanista Gangetica. It is the Sou sou of India, the Susu of Buffon, the Platanista of Pliny, Dauphine du Gange of Cuvier, Delphinus Sinensis of Blainville.

Halicore Dugong, Indian Dugong. It is the *Trichechus Dugong* of Gmelin; *Dugungus Indicus* of Hamilton; Le Dugong des Indes of French writers. *Halicore Dugong* is an inhabitant of the Indian Ocean. The haunts of the Dugong, which does not appear ever to frequent the land or fresh-water, are generally in the sea-shallows, where the water is not more than two or three fathoms. The flesh of the Dugong is delicate, and is said to be superior to that of the Buffalo or common Ox. It is considered by the Malays as a royal fish, and the king has a right to all that are taken. Sir Stamford Raffles states that this species afforded much satisfaction on the tables as the flesh proved to be most excellent beef.

Halicore Tabernaculi, the Dugong of the Red Sea, is considered by Ruppell a distinct species. He gave it its specific name under the impression that it was with the skin of this species that the Jews were directed to veil the Tabernacle. He saw it swimming among the coral banks on the Abyssinian coast near the Dalac Islands. The fishermen harpooned a female, which he dissected, 10 feet long. The Arabs stated that they live in pairs or small families, that they have feeble voices, feed on *Algæ*, and that in February and March bloody battles occur between the males, which attain the length of 18 feet. The female brings forth in November and December. The flesh, teeth, and skin are esteemed by the Arabs.

Halicore australis. It is a native of the north-west coast of Australia. It is the Manate of Dampier and the Whale-Tailed Manate of Pennant. Two upper jaws and three skulls of this species are in the British Museum.—*Eng. Cyc.* p. 913.

(2519) CETACEUM, *Latin.* Spermaceti. A concrete, fatty substance, found in several parts of the body of the *Catodon macrocephalus*, a species of whale called also the great-headed cachalot. The head is the chief repository of this secretion, especially a cavity in the upper jaw, in which it exists mixed with oil. The spermaceti whale occurs in the Pacific, Indian, and Chinese seas. The liquid first drawn from the head of the animal is a mixture of spermaceti and sperm oil; from this the solid matter is separated by filtration through bags, and subsequent compression. After this it is melted in water, skimmed, and re-melted with a little potash water, to remove the last traces of the oil; lastly, it is permitted to concrete slowly, during which it crystallizes in brilliant white masses. Pure spermaceti is white, tasteless, inodorous, crystalline, insoluble in water, slightly soluble in boiling alcohol; it forms a soap with potash. It is composed of carbon 81.66, hydrogen 12.86, oxygen 5.47. Spermaceti was once much used internally as a demulcent and emollient, especially in troublesome catarrhs and dysentery. It is at present employed solely as an external application, being an ingredient in numerous cerates and ointments.—*O'Shaughnessy, page* 687.

(2520) CEVADILLA.—Seeds of Veratrum Sabadilla and Helonias officinalis.

(2521) CEYLANITE. The dark blue, or blackish varieties of spinelle, called Ceylanite or pleonaste, are often offered for sale by the Shans in Tenasserim, under the same name as the sapphire.—*Mason.*

(2522) CEYLON. The late Sir George Anderson sent the following list of the principal TIMBER TREES in CEYLON, drawn up by ADRIAN MENDIS, Mohandiram of Moorrotto, and Master Carpenter, Royal Engineer's Department.

NAMES.	Locality Provinces.	Weight per cubic foot. lbs.	Durability. years.	USES, &c.
A				
1 Andere. Acacia vera.	Eastern.	71	15	Cross-bars of fishing dhonies, and pins for wooden anchors.
2 Madetiye. Adenanthera pavonina.	Western.	56	30	Common house buildings. Produces a red seed which is roasted and eaten.
3 Kebelle. Oblique agimea.	Northern.	40	20	Common house buildings.
4 Cottamba. Almond.	W. & Southern.	38	30	Common house building; and fruit eaten for food.
5 Welipiyanna. Anissaphyllum zeylanicum.	Western and Northern.	35	40	Common house buildings.
6 Cocatiye. Aponogeton crispum.	Western.	56	30	Do. do.
7 Puwak. Arecea nut.	Western Eastern and Southern.	57	60	Pins for furniture and pingo sticks. The nuts esteemed a luxury, are chewed with beetel leaves, tobacco and chunam.
8 Patta Del. Artocarpus, sps.	Southern.	34	30	Boats and buildings. Fruit (3+2½ in.) boiled and eaten as food.

	Names.	Locality Provinces.	Weight per cubic foot. lbs.	Durability. years.	Uses, &c.
9	Cos. Jack. Artocarpus integrifolia	South Eastern and Western.	42	25—80	Fruit weighing from 5 to 50lb. used in various ways for food. Timber in general use for building, boats, and all kinds of furniture.
10	Del. Artocarpus pubescens.	E. S. & Western.	40	25—50	Boats and buildings. The fruit (9 in.+ 2½ in.) is used as an article of food.
11	Aludel. Artocarpus pubescens.	Western.	51	35—70	Fishing boats and house buildings. The fruit (9 in.+ 3 in.) is boiled and eaten as food by the natives.
	B				
12	Bairiye.	Northern and Western.	57	10—30	Found chiefly near the mouths of the rivers—used for anchors and in house building.
13	Mee Bassia longifolia.	Northern.	61	25—80	Keels for dhonies, bridges, and house buildings. A useful medicinal oil is obtained from the nut of this tree.
14	Petan. Bauhinia tomentosa.	Eastern.	57		Boxes, chests, walking sticks, cornice work, &c.
15	Lunu Midelle. Common Bead tree.	Western.	15	8—20	The small sticks and branches used in common buildings, and outriggers for dhonies and fishing boats; the timber for panels of carriages, buoys, targets, &c.
16	Hal Milile. Berrya ammonilla.	Northern and Eastern.	48	10—80	Casks, tubs, carts, waggons and house building. The best wood for oil casks in the Island.
17	Tal. Palmira. Borassus flabelliformis.	Northern and Eastern.	65	80	Reepers, rafters. From its leaves the native ola books are made. Toddy is drawn from the flowers, from which jaggery is manufactured. This is used occasionally for hardening mortar, as also for medicinal purposes.
18	Calukeale. Butea frondosa	Central.	38	30	Common house building.
	C				
19	Calu Mediriye. Calamander.	Southern and Western.	57	80	A scarce and beautiful wood; the most valuable for ornamental purposes in Ceylon.
20	Waldombe. Calophyllum acuminatum.	Western.	39	20	Common house buildings.
21	Gorrukeenee. Calophyllum calaba.	Western.	44	25	Poles for bullock carts, and house buildings.
22	Dombe. Sweet scented Calophyllum.	Western.	40	5—10	Masts, and cross sticks of yettra dhonies and fishing boats; and poles of bullock carts.
23	Mahadan. Calyptranthes cumini.	Northern and Western.	36	20	Common house building, wheels, &c. The berries are eaten when fully ripe.
24	Battedombe, Clove-tree leaved Calyptranthes.	Western.	45	20	Common house building.
25	Alubo. Jambolana Calyptranthes.	Central.	49	20	Common house building.
26	Kahatte. Careya arborea.	W. and Southern.	38	10—20	Axles for bullock bandies, and buildings.
27	Davette. Carallia zeylanica.	Western.	42	25	Roofings for common buildings.
28	Kittool. Nepera. Caryota urens.	W. and Southern.	71	30—90	Reepers and window bars. The toddy drawn from the flowers is a sweet and cooling drink; and is also converted into jaggery.
29	Dawol kuroendoo. Cassia cinnamomum.	Central.	39	20	Common house building.
30	Arremene. Sumatra Cassia.	Central.	57	50	Furniture and house buildings.
31	Hedde woke. Choecarpus pungens.	Western.	58	50	Common house building.
32	Burute. Satin. Chloroxylon.	Southern and Eastern.	55	10—80	Oil presses, waggon wheels, bullock carts, bridges, cog wheels, buildings and furniture.
33	Mal burute. Flowered Satin Chloroxylon.	Northern and Eastern.	57	80	Furniture. This wood is perhaps the most valuable in Ceylon next to Calamander.
34	Nelly. Cicca distica.	Central.	49	30	Buildings, wheels, &c. Used in wells, the wood is said to purify the water. The berries are made use of for sweet-meats, and also for medicinal purposes.
35	Cocoanut. Cocos nucifera	Sea coast generally.	70	20—50	Buildings, fancy boxes and furniture. The fruit furnishes almost all the staple articles of food in a tropical climate—milk, curry, water, oil:—the flower yields toddy, from which arrack, jaggery and vinegar is manufactured; the husk coir for ropes, mats, &c.; the leaves are woven into cadjans; and every part of the tree is useful in a multitude of ways.

Names.	Locality Provinces.	Weight per cubic foot. lbs.	Durability. years.	Uses, &c.
36 Wea warene. Cratæva religiosa.	Central.	62	60	House buildings and pestles.
37 Hal Mendora. Branch flowered Cynometer.	Western.	56	8—20	Bridges and house building.
38 Gal mendora. Branch flowered Cynometer.	W. and Southern.	57	15—60	Bridges and buildings. The best kind of wood for under-ground purposes.
D				
39 Nendoon. Dalbergia lanceolaria	W. and Southern.	56	60—80	Buildings and furniture,
40 Daminne.	Eastern.	44	40	Gun-stocks, and common house buildings.
41 Gode parre. Toothed Dillenia.	Western	51	60	Roofs for houses.
42 Horre. Turbaned Dipterocarpus.	Western.	45	15	Roofs of common buildings.
43 Doon. Dipterocarpus, sp.	Central..	29	50	House buildings.
44 Dive parre.	Western.	44	20	Common house buildings.
E				
45 Caluvere. Ebony,	N. and Eastern.	71	80	A fine black wood, used largely for buildings and furniture.
46 Kadoembeiriye. Bastard Ebony.	Western.	45	40	Furniture. The heart of this wood is occasionally met with of extraordinary beauty.
47 Kiri walla. Lance leaved Echites.	Northern.	35	30	Used principally for inlaying ornamental furniture and cabinet work.
48 Rook attene. Echites Scholaris.	Western.	26		Coffins.
49 Timbery. Embryopteris glutinifera.	Northern.	45	20	Common house buildings. The juice of the fruit is used to rub over fishing lines for the purpose of hardening and preserving them.
50 Walboamboo. Eugenia laurina.	Central.	36	15	Common house buildings.
51 Naw, Iron wood.	Western.	72	10—60	Bridges and buildings, &c.
52 Kiripelle. Indian fig tree. Ficus indica.	Southern.	30	20—30	Common furniture and house buildings.
53 Hunukirille, Grela paniculata.	Southern.	44	25	House building.
54 Belygobel. Telia leaved hibiscus.	Western.	38	20	Carriages, palanqueens and hackeries—found near rivers.
55 Nerreloo. Illicebrum latrum.	Central.	56	40	Common house building.
56 Dive ratembela. Jancein asoca.	Northern.	58	25	Common house building.
57 Katie kale.	Eastern.	42	25—50	Common house building, and in the construction of yettra dhonies.
58 Murute. Lagerstræmia regina.	W. and Southern.	42	30—40	Water casks and buildings.
M				
59 Hulanhick Melia sp.	Central.	39	50	House building.
60 Rameneidelle. Millingtonia, sp.	Western.	48	20	Common house buildings. The sticks make excellent fences.
61 Sappoo. Michelia champa.	Central.	42	20—50	Carriages, palanqueens. &c. also in buildings.
62 Sooriva Mara. Mimosa.	Central.	42	20—30	Buildings and common furniture.
63 Moone Mal. Mimusops elengi.	Southern.	61	50	House building and furniture.
64 Paloo. Mimusops hexandra.	Eastern.	68	10—70	Oil presses, bridges and buildings. The berries are eaten when ripe.
65 Morre. Eye ball.	Central.	62	25	Common house building. Berries eaten when ripe, Furnishes the best fire-wood for lime and brick-kilns, next to Gal morre, Nephelium.
66 Etteiriye. Ash leaved Murraya.	Eastern.	61	10—70	Handles of mamoties, hammers and bill-hooks; and rafters for cadjan roofs.
N				
67 Helembe. Nauclea parviflora.	W. and Northern.	42	40	Common house building.
68 Nebede.	Sou. and Western.	51	20	Common house buildings.
69 Gal morre. Nephelium, sp.	Central.	65	30	House building. Berries are eaten when ripe by the natives. Supplies the best kind of fire-wood for brick and lime kilns.
O				
70 Koang. Ceylon Oak.	Southern.	42	5—10	Native oil presses and wooden anchors. Berries are eaten by the natives.

Names.	Locality Provinces.	Weight. per cubic foot. lbs.	Durability. years.	Uses, &c.
71 Melle. Olax Zeylanica. P	Eastern.	64	40	Common house building.
72 Patkeale.	Western.	42	40	Common house building.
73 Penebarroo.	Eastern.	61	50—90	Rafters, &c. Fences made of the sticks of this tree are the most durable of all.
74 Sooriya. Persian.	Central and Western.	49	20—40	Admirable for carriages, hackeries, and gun-stocks;—also useful for blocks and buildings.
75 Velenge. Pterospermum ruberifolium. R	Central.	36	5—70	Poles of bullock carts, beetel trays, and gun stocks.
76 Hirikaddol. Rhizophora.sp.	W. and Northern.	49	35	Common house building. From the bark a dye is extracted.
77 Cadol. Leafy mangrove. Rhizophora.	Northern and Western.	65	40	Found chiefly near the mouths of the rivers:—the wood is used for common house buildings, and from the bark a dye is extracted for colouring leather, nets, sails, &c.
78 Pehimbive. Rhus disipium.	Central.	68	50	Buildings.
79 Otte. Rottleria, ps. S	Western.	36	10	Common house building.
80 Lawoloo. Sapota, sp.	Western.	39	10	Common house buildings. Berries are eaten by the natives.
81 Pamburoo. Simonia citrifolia.	Southern.	48	40	House building, &c. When variegated it is a beautiful wood and is used for furniture and cabinet work.
82 Daanga. Long flowered Spathodea.	N. and Western.	23		Buoys for fishing nets, &c.
83 Telemboo, Sterculia fœtida.	Central.	26	30	Common house buildings.
84 Suvande.	Western.	56	30	Common house buildings.
85 Siyembela. Tamarindus Indica.	North Eastern and Western.	80	80	Oil presses, furniture and buildings. The fruit is a well known and agreeable article of diet.
86 Teak Ceylon. Taikke Ceylemey. Tectona grandis	Western.	55	15—60	Bridges and buildings.
87 Teak Cochin. Taikke Cotchiye.	Cochin.	44	15—90	Carts and waggons, bridges, buildings, and arrack casks. The wood of these casks imparts a fine colour and flavour to the arrack.
88 Teak Maulmein. Taikke Molmine.	Maulmein.	42	15—90	Do. do. do. do.
89 Ukbeiriye.	Southern.	51	80	Common house buildings.
90 Hal. Vateria indica.	Western.	26	10	Packing cases, cielings, coffins, &c.
91 Caha Milile. Vitex trifoliata.	Southern and Western.	56	15—80	Water casks, pade-boats, waggon wheels, bullock carts, bridges and house building.
92 Mecan Milile. Vitex trifoliata.	Western.	56	20—90	Bridges, pade-boats, carts and waggon wheels, water tubs, and house buildings.
93 Sappoo Milile. Vitex trifoliata.	Western and Southern.	49	10—40	Water casks, cart and waggon wheels, pade-boats, bridges and house buildings.
94 Samedera. Vitmannia trifoliata.	Western.	26	60	Buoys, &c.
95 Walukeene.	W. and Southern.	39	10	Masts of dhonies.
96 Tarrene. Webera cerifera.	Northern.	57	30	Roofings, and in the construction of fishing boats and dhonies.

(2523) CEYLON MOSS. (*Gracelaria*, or *Gigartina, lichinoides*), a small and delicate fucus, is well known for the amylaceous property it possesses, and the large proportion of true starch it furnishes. The fronds are filiform; the filaments much branched, and of a light purple color. It grows abundantly in the large lake or back-water which extends between Putlam and Calpentyr, Ceylon. It is collected by the natives principally during the south-west monsoon, when it becomes separated by the agitation of the water. The moss is spread on mats and dried in the sun for two or three days. It is then washed several times in fresh water, and again exposed to the sun, which bleaches it, after which it is collected in heaps for exportation. Professor O'Shaughnessy has given the best analysis of this moss, which he described under the name of *Fucus amylaceus*; 100 grains weight yielded the following proportions:—

Vegetable jelly	54·50
True starch	15·00
Ligneous fibre	18·00
Sulphate and muriate of soda	6·50
Gum	4·00
Sulphate and phosphate of lime	1·08
Total...	99·00

—with a trace of wax and iron. *Decoction of Ceylon Moss.*—Ceylon moss ground to fine powder two drachms, water one quart, boil for twenty minutes, strain through muslin. Use.—Mucilaginous and demulcent. By increasing the proportion of the ground moss to half an ounce, the filtered solution on cooling becomes a firm jelly, which when flavoured by cinnamon or lemon peel, sugar and a little wine, is an excellent article of light food for sick children, and convalescents.—*Beng. Phar. p.* 276.

(2524) CHAK OR CHUK. An extract: very sour: eaten in Ajmere to give appetite and promote digestion. It is probably the extract of "chuka" or sorrel: one tola is sold for one anna.—*Gen. Med. Top. page* 132.

(2525) CHAKOON SEEDS. Seeds of Cordia myxa. Chakoon ointment is prepared from the seeds of the cordia myxa: it is an excellent native application to ringworm.—*Beng. Phar. p.* 382

(2526) CHALICIDES, Daudin's name for a family of Lizards, which, like the Seps-Lizards, are very long and serpent-like; but whose scales, instead of being imbricated or disposed like tiles, are rectangular, and form, like those of the tail in the ordinary lizards, transverse bands which do not intrench upon each other. Some, says Cuvier, have a ridge on each side of the trunk, and the tympanum still very apparent. There is a species with five toes in the East Indies, the *Lacerta Seps* of Linnæus.—*Eng. Cyc. p.* 921.

(2527) CHALK.

Velaitie chunna, DUK.
Khurree muttee, HIND.
Gilsafeed, PERS.
Carbonate of Lime, ENG.
Tyn-abyaz, ARAB.
Rattahoonoo, CYNG.
Craie, FR.
Kreide, GER.
Kurroo, GUZ.
Creta, IT.
Creta, Calcis Carbonas, LAT.
Capoor-engrees, MALAY.
Creda, PORT.
Mjel, RUS.
Greda, SP.
Simie-chunamboo, TAM.
Sima-soonum, TEL
—*Ainslie's Materica Medica, p.* 9. *Faulkner.*

This is found in the Dhone Talook at Kurnool. It is a massive opaque substance, of a white-gray, or yellow colour, having an earthy fracture. It varies much in hardness, but is generally soft to the touch, and adheres to the tongue. Its uses are well known in furnishing lime for manure and cement in polishing metals and glass, and in painting and white washing.—*Faulkner.* Chalk, is well known in Europe, as an extensive secondary formation, of a dull white earthy appearance; tasteless, but adhering to the tongue; usually friable, sometimes hard; Sp. Gr. 2.3; but either variety may be employed, though the softer is usually preferred for medical use. Its chemical characters are the same as those of Marble. In the arts it is commonly known by the name of *Whiting*, which is Chalk ground in a mill, and the grosser impurities separated by sinking in water, while the pure Chalk, being suspended, is allowed to settle, and made into small loaves. For medical use, it is similarly but more carefully prepared by the process of lævigation, and in drying is made up into small conical masses.—*Royle.*

(2528) CHALK BLACK. A grayish, or bluish-black kind of clay, of a slaty texture, used in drawing and painting. Localities, France, Spain, Italy, &c.—*Faulkner.*

(2529) CHALYBÆUS, a genus of Birds, separated by Cuvier from the Cassicans of Buffon; *Barita* of Cuvier. The bill has the same form as that of the Cassicans, but it is a little larger at the base than that organ is in the last named genus, and the nostrils are pierced in a large, membranous space.—*Eng. Cyc. p.* 929.

(2530) CHALYBÆUS PARADISÆUS. This richly-plumed bird is the *Paradisea viridis* of Gmelin; Le Calybe de la Nouvelle Guinee of Buffon; Le Grand Chalybe of Le Vaillant; Oiseau de Paradis Vert of Sonnerat; *Paradisea chalybea*, Blue-Green Paradise Bird, of Latham; *Cracticus chalybeus* of Vieillot; Barita viridis of the first edition of the 'Regne Animal' (where it was placed under the Cassicans, *Barita*), and Chalybœus *paradisæus* of the last edition. It is the Mansinème of the Papuan tongue, according to Lesson, who, writing, states that "the *Chalybœus* lives solitary in the forests of New Guinea. He often saw it perched in the great trees, where it seeks for fruits. Its manners appeared to have great analogy to those of the crows."—*Eng. Cyc. page* 930.

(2531) CHAMACEA OR CHAMIDÆ, a family of Conchiferous *Mollusca*, the third of the Acephalous or Headless *Testacea*, according to Cuvier, who places them between his *Mytilacea* (Mussel-like Testaceans), and his *Cardiacea* (Cockle-like Testaceans.) Under the Linnæan genus *Chama*, many heterogeneous forms were assembled; and as G. Sowerby observes, "in his arrangement regular and equivalve shells are placed with such as are irregular and equivalve." Brugniere first divided this genus, and Lamarck carried out the reformation. The latter makes the Chamidæ to consist of the genera *Diceras*, *Chama*, and *Etheria*, placing *Tridacna* and Hippopus under his Tridacnées, the first section of his second order Conchiferes Monomyaires. Cuvier made the Camacees consist of the genera *Chama*, *Tridacna*, *Hippopus*, *Chama* (Brug.), *Diceras*, and *Isocardia*. The number of recent species given in Deshayes's edition of Lamarck (1835) is seventeen, including *Chama albida* (Camostrée of De Roissy; *Cleidothærus* of Stutchbury). Broderip, in the paper above alluded to, describes eleven additional species with varieties not noticed by Deshayes, who has however some observations on the following species, *Chama Lazarus*, *C. gryphoides*, *C. unicornis*, *C. asperella* (the living analogue of *C. echinulata* in Lamark's

fossil list), and *C. albida*, well worthy the attention of the student. *Chama gryphoides* (*C. gigas*, Linn.) is famous for its enormous size. Individuals have been known to weigh above three-hundred pounds. The byssus by which it adheres to rocks is so tough that in order to procure the shell it must be cut with an axe. The animal may be eaten, but its flesh is very tough: to be seen in most museums. One of the valves is sometimes used as a font for baptism in the country churches of Europe. The species of Chamadæ are apparently confined to the warmer seas, the Mediterranean being the locality of the lowest temperature where any of them have been hitherto found.—*Engl. Cyc. page* 931.

(2532) CHAMÆROPS. Of the Asiatic species of this palm, the C. excelsa produces materials for the *So-e* of China. The brown fibre surrounding its trunk is very strong, and employed by the Chinese, in many domestic purposes, for bed bottoms used by all the population, and for ropes and cables for their junks: it grows in northern and central China.—*Seeman.*

(2533) CHAMÆROPS EXCELSA. This species of *Chamærops* is particularly valuable to the northern Chinese who use its large, brown, hair-like bracts for many purposes. Ropes and cables for their junks are made out of this substance, and seem to last, even under water, for a very long time. It is probably better and stronger for those purposes than the fibre of the cocoanut, which it resembles to a certain extent. Bed-bottoms are wrought out of this, and are largely used in the country by all classes of the natives. Agricultural labourers and coolies are fond of wearing hats and cloaks made out of the same substance, which in wet weather keeps out a great deal of rain; and there are many other purposes to which this useful tree is applied. Besides all this, it is most ornamental in the country where it grows. In the 'Botanical Magazine' for March, 1850, Sir Wm. Hooker thus writes of it:—"A palm, *Chamærops excelsa*, (?) sent to the Royal gardens by Mr. Fortune, has braved, unharmed, and unprotected by any sort of covering, the severe winter now passed." (1849-50).—*Fortune's Tea districts, page* 59.

(2534) CHAMÆROPS OR HEMP PALM. The north-eastern part of China produces a very valuable tree known by the name of the hemp-palm, from the quantity of fibrous bracts it produces on the stem just under the blossoms. This Hemp-palm (Chamærops sp.) is a tree of great importance to the Chinese in a commercial point of view, on account of the sheets of fibre which it produces yearly on its stem. Seeds of this hemp-palm, so valuable on account of the fibre which it yields, and Cryptomeria Japonica, a fine timber tree, were obtained by Fortune in large quantities on the hills near Tein-tung. —*Fortune's Res. among the Chinese, page* 154.

(2535) CHAMÆROPS KHASIANA. The fan-palm, ("Pakha," Khas.), grows on the cliffs near Maunloo on the Khasia hills: it may be seen on looking over the edge of the plateau, its long curved trunk rising out of the naked rocks, but its site is generally inaccessible: while near it grows the *Saxifragis ciliaris* of English Gardens, a common plant in the north-west Himalaya, but extremely scarce in Sikkim and the Khasia mountains. This species of Chamærops is very closely allied to, if not identical with *P. Martiana* of Nepal, which ascends to 8000 feet in the western Himalaya, where it is annually covered with snow: it is not found in Sikkim, but an allied species occurs in Affghanistan, called P. Ritchiana. The dwarf palm of Southern Europe is a fourth species.—*Hooker Him. Jour. Vol.* II, *page* 280.

(2536) CHAMÆROPS RITCHIANA; Griffith, (Sindee, "*Phees*") grows in masses, on the barren hills and passes below five thousand feet, leading up to the table land of Beloochistan and Afghanistan. Its leaf bud or cabbage is eaten. Its wood is used as fuel: its scurf with saltpetre as tinder for matchlocks, and its leaves "phurra" are fabricated into baskets, fans, brushes, sieves, sandals, pouches, platters, and ropes for water wheels.—*Seeman.* The Chamærops, called *Palmetto*, is among those best known of the palms in Europe. *C. Ritchiana*, called *Maizurrye* in Pushtoo, and *Pfees* in Sindhee, is a most useful plant. Of it are made sandals, baskets, mats, &c., and its moonyah or fibre makes twine and ropes in Sindh. It is of extensive use in Affghanistan for making cordage; in the same way that the Hemp Palm, also a species of Chamærops, was found by Mr. Fortune to be employed in Northern China; and as *Chamærops humilis*, or Palmetto, is in the North of Africa and South of Europe, for making baskets, brooms, mats, and cordage. Indeed, paper and pasteboard are made of its fibres by the French in Algeria.— *Royle Fib. Pl. page* 95.

(2537) CHAMELEONS, CHAMELON-TRIBE, CHAMELEONIDÆ, the name for a well-defined family of Saurians (Lizard-like Reptiles), whose differential and essential characters may be summed up as existing in the form of their feet, the toes of which are joined or bound up together in two packets or bundles opposed to each other—in their shagreen-like skin, in their prehensile tail, and in their extensile and retractile vermiform tongue. Their reproduction is by means of eggs, which are numerous at each deposit, oval, and enveloped in a white, tough, parchment-like skin. The Chameleons spend their lives in trees, clinging to the branches by means of their feet and tail. There they lie in wait for the insects which may come within their reach: and it is highly probable that, in such situations, their faculty of changing their colour becomes highly important in aiding them to con-

ceal themselves. They move about with great regularity and a kind of affected gravity. The powers of abstinence possessed by this singular race are very great, and hence most probably arose the old fable of their living on air, which was for a long time considered to be "the chameleon's dish." The power possessed by these creatures of changing colour has been a subject of wonder and exaggeration from an early period. But this extends only to the various shades of green and greenish yellow, according to the darkness of the colour of the objects below them. This family embrace but the one genus, *Chamæleo*. Dr. J. E. Gray places the *Chamæleonidæ* in the tribe *Dendrosaura*, of the sub-order Pachyglossæ, of the order *Saura*, or Lizards. The tribe *Dendrosaura* embrace only this family, and have the following characters :—scales of the belly, sides, and back, granular. Tongue elongate.—*Eng. Cyc. p.* 937.

(2538) CHAMÆLEO BIFURCUS, the Large-Naped Chameleon. A native of Madagascar.—*Eng. Cyc. p.* 937.

(2539) CHAMÆLEO CUCULLATUS, the Hooded Chameleon. An inhabitant of Madagascar.—*Eng. Cyc. p.* 937.

(2540) CHAMÆLEO LATERALIS, the *Side-Crested* Chameleon, is a native of Madagascar. Back and belly with a toothed crest. Sides simple.—*Eng. Cyc. p* 937.

(2541) CHAMÆLEO NASUTUS, the Sharp-Nosed Chameleon. A native of Madagascar.—*Eng. Cyc. p.* 937.

(2542) CHAMÆLEO PARDALIS, the Bourbon Chameleon. Scales unequal, larger tubercles. Muzzle simple. A native of Bourbon.—*Eng. Cyc. p.* 937.

(2543) CHAMÆLEO PARSONNII, Parson's Chameleon. A native of Madagascar.—*Eng. Cyc. p.* 938.

(2544) CHAMÆLEO RHINOCERATUS, the Rhinoceros-Chameleon. Scales unequal. Muzzle (of male) with a central prominence. A native of Madagascar. Specimens of this and the last species were presented to the British Museum by Sir Edward Belcher.—*Eng. Cyc p.* 937.

(2545) CHAMÆLEO TIARIS, the Fringed Chameleon. Found in the Seychelle Islands.—*Eng. Cyc. p.* 937.

(2546) CHAMÆLEO VERRUCOSUS, the Warty Chameleon, inhabits Madagascar.—*Eng. Cyc. p.* 937.

(2547) CHAMÆLEO VULGARIS, the Chameleon. It is the *C. Mutabilis*, Meyer; *C. cinereus*, Aldrovandus; *C. Parisiensis*, *C. Zeylandicus*, and *C. Mexicanus*, Laurent; *C. carinatus*, *C. subcroceus*, *C. calcaratus*, Merrem; *C. Zebra*, Bory; *Lacerta chameleon*, Linnæus. It is a native of the East Indies, and is the species which is most frequently taken to England.—*Eng. Cyc. p.* 937.

(2548) CHAMOIS LEATHER, SHAMMY LEATHER.

Chamois, FR.	Camoscio, IT.
Samischleder, GER.	Semschanui, Koshi, RUS.

Strictly speaking is the dressed skin of the chamois goat; but common goat, kid, or sheep skin is generally substituted for it. It is much valued on account of its softness, pliancy, and capability of bearing soap without sustaining injury. It is used for washing the varnished parts of carriages cleaning silver and plated ware &c.—*Faulkner*. It is now manufactured in India.

(2549) CHAMP is the name given to a valuable kind of timber, produced in the East Indies by *Magnolia excelsa*.

(2550) CHAMOMILE. Anthemis nobilis and variety plena. An Aromatic herb, leaves used in garnishing, the flowers used as bitters, and in fomentations. Of easy culture, raised from seed, held in estimation, both in domestic and scientific medicine.—*Jaffrey*.

(2551) CHAMPAC, BARK. Champacæ Cortex. Bark of Michelia Champaca, used in Medicine.

(2552) CHAMPAGNE. One of the most deservedly esteemed and dearest of the French wines. It is named from the province of France, of which it is the produce. There are two distinct classes of this wine, viz. *white* and *red*, each either still or sparkling; but there is a great variety in the flavour of the produce of different vineyards.

(2553) CHANK SHELLS.

Sankha, Sangoo, TAM	Shenkoo, SANS.
Senkhum, TEL.	Sukk, DUK.

These shells are the several species of the genus Turbinella. Common conch shells, are fished up by divers in the Gulf of Manar, on the coast opposite Jaffnapatam in Ceylon in about 2 fathoms water, and at Travancore, Tuticoreen, and other places. Large fossil beds of chanks have also been found. They form a considerable article of trade in India, where they are in extensive demand all over the country. They are sawn into narrow rings or bracelets, and are worn as ornaments, for the arms, legs, fingers &c. by the Hindoo women; many of them are also buried with the bodies of opulent and distinguished persons. Those which, from being taken with the fish, are called green chanks, are most in demand. The white chank which is the dead shell thrown upon the beach by strong tides having lost its gloss and consistency, is not worth the freight up to Calcutta. The value of the green chank depends upon its size. A chank opening to the right called in Calcutta the right handed chank, is so highly prized, as sometimes to sell

for 400 or 500 or even 1,000 Rupees. The zungum caste of Hindoo religious mendicants and those of the Veeranroosty caste, blow them as horns.—*Rohde M.S.S.* The commercial returns show an exportation from Madras of ten to twenty-four lacs of these shells in one year.

	No.	Value.

(2554) CHARCOAL. Carbo Ligni.

Koyla, DUK.	Carbo-ligni, LAT.
Fuhm-chobie, ARAB.	Arang, MAL.
Lippe-anghoroo, CYNG.	Zeghal-i-chobie, PERS.
Charbon de bois, FR.	Adapoo-currie, TAM.
Reine Kohle, GER.	Poiboogooloo, TEL.
Koo-e-la, GUZ	Carbon de lena, SP.
Carbone di legna, IT.	Bogoo, TEL
Karri, TAM.	Kolsah, HIND.

Good charcoal consists of wood burned with as little exposure to the action of the air as possible. It is black, brittle, easily pulverised, perfectly insipid, solid, and inodorous. It possesses remarkable antiseptic properties, as it resists the putrefaction of animal matter, and destroys the smell and colour of many substances. It is mostly used as a fuel, and in the manufacture of gun-powder.—*Faulkner.* For the forge, the best is that prepared from Bamboo and from stems of palmyra leaves (Tel. Tate Gummaloo). The Tamarind yields a good charcoal for the same purpose, as do most hard woods. For gun-powder, the root of the milk hedge Euphorbia Neriifolia, and of the Calotropis gigantea is preferred. At the Government Powder Mills, Madras, that of the gram bush, Dolichos uniflorus: and in that of Bengal, the Cajanus Indicus or Pigeon Pea, is used. It is of great importance to this country that more economical modes of preparing charcoal should come into general use, the destruction of firewood in the neighbourhood of iron works is grossly wasteful: indeed between the loss in preparing the charcoal and the loss of heat in preparing the iron, the consumption of the fuel is probably at least ten times as great as it ought to be, inducing great loss and in many cases rendering useless extensive beds of most valuable ore. The common native mode of preparing charcoal is to set on fire a heap of small wood and after allowing it to burn for some time to quench it either by water or by heaping earth upon it: charcoal so prepared is of little value in reducing iron ore. The charcoal of the Acacia sundra is said to be the best for this purpose. The Parkinsonia is said to yield a good charcoal for gun-powper.—*Rohde M.S.S.* The *Charcoal* for gun-powder considered the best, is manufactured from the Sesbania Ægyptica. The best charcoal for a dentifrice, is that of the Betel-nut. The gun-powder charcoal used at the Damoodah coal works is made from an *Acacia*: the Seiks, employ *Justicia Adhatoda*, which is also in use all over India: at Aden the Arabs prefer the *Calotropis*, probably because it is most easily procured. The grain of all these plants is open, whereas in England, closer-grained and more woody trees, especially willows, are preferred.—*Hooker Him. Jour. Vol.* 1. *page* 9.

(2555) CHARLOMBI, the Tamil name of a Ceylon tree which grows to about fifty feet high, and twenty inches in diameter. It is very close-grained and light, and resembles some kinds of mahogany. It is used in house-work, &c.: the fruit which it produces is of little value.—*Edye, Ceylon.*

(2556) CHART.

Zeekarten, DUT.	Carte marine, IT.
Cartes marines, FR.	Cartas de marear, PORT. and SP.
Seekarten, GER.	

A plan or map of a sea or coast, constructed for the purpose of ascertaining the position of a ship with reference to the land, and of shaping a course to any place. They are distinguished into several kinds, as plain, globular, and Mercator charts.—*Faulkner.*

(2557) CHAULMOOGRA ODORATA.

Chaolmoogra, Petarcura. HIND.; Taliennoe. BURM.

This a native of Sylhet. There are a few trees of this plant about Rangoon, and it is also met with on the banks of streams in the Tounghoo Forests, but must be considered scarce. Wood, white coloured, adapted for fancy work and cabinet making —*McClelland.* The seeds are employed extensively in the treatment of cutaneous diseases and have been recommended in Tape worm. The seeds are various in shape, nearly oval, smooth, grey, hard. Embryo white. The seeds yield by expression about 10 per cent. of a thick fixed oil, of unpleasant flavour, and rather offensive smell; one drachm given to a dog caused violent vomiting in 15 minutes. They are much used by the natives in the treatment of cutaneous disorders, being beaten up with ghee into a soft mass, and applied three times daily.--*O'Shaughnessy.* Chaulmoogra odorata is officinal in the Punjab and to be met with throughout Hindostan. The expressed oil of the seeds is in use in lower Hindostan, in cutaneous diseases.—*Honigberger, p.* 255. Chaulmoogra ointment, prepared from the seeds of Chaulmoogra odorata, is a favorite and good application among the native practitioners for the treatment of several cutaneous diseases, especially herpes and tinea.—*O'Shaughnessy, Beng. Phar. page* 382.

(2558) CHAURAPUPPOO.

Charul also Chirouji, HIND.

This is the kernel or seed of the Buchanania

latifolia. The chironji is the seed removed from the small stone of the "achhar" or fruit: it is brought to Ajmeer from Kotah: and to Madras from Cuddapah, the seed is very palatable and nutritious, especially when roasted; is used also in medicine, and considered heating: one seer and a half costs a rupee. The fresh fruit is very agreeable.—*Gen. Med. Top. page* 131.

(2559) CHAY-ROOT. CHOY-ROOT.

Emboorel, Ramiserem-vayr, TAM.	Tsheri-vello, Saya-wer, TEL.

This is a small slender root, yielding a scarlet dye, obtained from a plant (*Oldenlandia umbellata*), cultivated on the coasts of Coromandel and Malabar, and in Ceylon. The colouring principle exists only in the bark of the root, and is employed to dye the durable reds for which Indian cotton yarns and chintzes have long been famous. Chay root forms a considerable article of export from Ceylon, but it is not much esteemed as a dye in England, owing probably to its deteriorating in quality during the voyage. A decoction of the leaves is prescribed by native doctors for consumptive and asthmatic affections. —*Faulkner.* At the Madras Exhibition of 1855 eight specimens were exhibited from Guntoor, Masulipatam, Nellore, Tanjore, Tinnevelly, Travancore, and Madura. The plant is a small biennial weed, growing in light sandy ground near the sea where its roots strike very deep—the colouring matter resides entirely in the bark of the root, the inner portion is white and useless. The root is of great importance to the Indian dyer, yielding a red dye similar to munjeet, which is used to a great extent in the southern parts of Hindostan. The celebrated red turbans of Madura are dyed with the Chayroot, which is considered superior of its kind, but this is probably owing to some chemical effect which the water of the Vigay River has upon it, and not to any peculiar excellence of the dye itself. Wild chay is considered to yield one-third more colouring matter than the cultivated root, this probably arises from too much watering, as much rain injures the quality of the root. Roots of two years growth are preferred when procurable. It is currently reported that chay-root rapidly deteriorates by being kept in the hold of a ship, or indeed, in any dark place.—*M. E. J. R.* It is much cultivated in light sandy soils near the sea, particularly about Masulipatam. The root is used to dye the best and most durable red cotton cloth. The wild is supposed to yield one fourth more colouring matter than that which is cultivated, and if old is worth double as much. It is not much used in Europe where it is said that it can produce no effect which cannot be more cheaply produced by madder. The usual mode of cultivation is by sowing the seed (which being very minute is collected with the sand on the surface of the field where it is grown), in land previously prepared, and watering it until it is year in the ground, it is then dug and sells at Rupees the Candy of 500 lbs, if left longer the ground it increases in value, and does require further watering. On first sowing it usual to mix cowdung in the water with whi it is watered which serves to bind the surface the soil and prevent the seed from being blo away; much rain injures its quality, it is said be injured by keeping in a dark room. T Malabars test the value of the root by mixi some of the pounded root and quick lime: good, the mixture soon assumes a fine red col if the color becomes pale or brown or if change of color take place it is considered of value. If a white colour prevail in the inside the bark, and on the wood we may be pret certain that the root is spoiled, a green colour a sure indication of its goodness.—*Rhode M.S. Chay-root*, says Simmonds, from the pla called chay, the *Oldenlandia umbellata*, extensively cultivated as a dye plant in t East, especially on the Coromandel coast, at N lore, Masulipatam, Malabar, and other parts India. The outer bark of the roots furnish the coloring matter for the durable red for whi the chintzes of India are famous. Chay-ro forms a considerable article of export from Ce lon. The wild plant there is considered prefe able; the roots, which are shorter, yielding on fourth part more coloring matter, and the rig to dig it is farmed out. It grows spontaneous on light, dry, sandy ground on the sea coast the cultivated roots are slender, with a fe lateral fibres, and from one to two feet lon The dye is said to have been tried in Europ but not with very advantageous effect. D Bancroft suspects it may be injured by the lon voyage, but he adds that it cannot produce a effect which may not be more cheaply obtain from madder. This red dye, similar to munjee is used to a great extent in the southern part of India by the native dyers. It is n held in very good estimation in Europe b seems to deserve a better reputation than it a present possesses. Attention was drawn to it a *a dye-stuff in 1798*, by a special minute of th Board of Trade recommending its importation but Dr. Bancroft, who made some experiment with a sample of damaged chay-root, considere it inferior to madder and hence discouraged it further importation.—*Simmonds.*

(2560) CHEROOTS. CIGARS. Consist c the dried leaves of the Tobacco plant, forme into small rolls for the purpose of smoking Havannah cigars are usually reckoned the bes in Great Britain and the continent. In Indi Manilla cigars are most esteemed. Imitatio Manillas, Chinsurah cheroots and Trichonopol cigars are the kinds manufactured in India; th former are made in Calcutta. These several va rieties are imported into Bombay.—*Faulkner.*

(2561) CHEESE.

Kaas, Dut.	Caseus, Lat.
Fromage, Fr.	Paneer, Pers.
Kase, Ger.	Queijo, Port.
Paneer. Guz & Hind.	Sur, Rus.
Formaggio, Cacio. It.	Queso, Sp.

An article of food formed of the curd of milk, separated from the whey, which is pressed, and then left to dry. It is frequently coloured with annotto, the juice of orange, carrot, the flower of marigold, hawthorn-buds, turmeric, &c. There are various kinds of cheese, deriving their names chiefly from the place of manufacture, such as single and double Gloucester, Stilton, Cheddar, Dunlop, Dutch, &c. Surat is famed for a mild description of cream cheese.—*Faulkner.* In England, the principal season for cheese-making is from May to September, and it is carried on in nearly every county of England, but there are particular districts which have acquired great repute for the cheese produced therein. The process is in nearly all cases the same. In Cheshire cheese the salt is well mixed with the curd, and not merely rubbed on the outside. This, which is the most celebrated English cheese, is made in quantities amounting to nearly 14,000 tons annually. The rich cheese called Stilton is made in Leicestershire: it is not sufficiently mellow for use under two years old. Double and single Gloucester cheese is also well known. The former is made of the milk and cream, the latter of the milk and half the cream. Bath and York are famous for cream cheeses. Good cheeses are produced in large quantities in Holland. In Gouda cheese, which is considered the best made in that country, muriatic acid is used instead of rennet. Hence it is never infested with mites. Parmesan cheese from Parma, in Italy, is skim-milk cheese, owing its rich flavour simply to the fine herbage on the banks of the river Po. Swiss cheese, especially that of Gruyere, is pleasing to some tastes. It is flavoured with herbs. English imports of cheese have hitherto been chiefly from Holland. —*Tomlinson, page* 359.

(2562) CHEERONGIE OIL. Chirongia sapida or Buchanania latifolia.

Saraypuppoo nooney, Tel.	Cheeronjie, or Charoolie ka tel, Hind.

The kernels of this tree are eaten by the natives, to promote fatness, they abound in a straw colored, sweet tasted and limpid oil which is seldom extracted. The tree grows plentifully in Mysore and Cuddapah.—*Mad. Ex. Jur. Rep.*

(2563) CHEHOOR, a pale brownish colored cordage of Beerbhoom, coarse and of moderate strength.—*Royle.*

(2564) CHEIRANTHUS CHEIRI. *Cruciferæ.* Wall Flower. Named from Cheir, the hand, Anthos a flower. This flower derives its name from the circumstance of its growing wild on old walls and ruins in England. It is of a light yellow colour, but, when cultivated in gardens, assumes a much richer and darker tint, mixed with brown. The double variety, of a yellow colour, and striped with deep orange, is seldom known to blossom here.—*Riddell.*

(2565) CHEIROPTERA (χείρ, a hand, πτερόν, a wing), the name of a natural family or division of Mammiferous Animals; the Bats or Flitter-Mice of the English; Fledermauser of the Germans; *Vespertiliones* of the Latins; Pipistrelli and Nottoli of the Italians; Chauvesouris of the French. The animals belonging to this wing-handed family embrace those which come under the genus *Vespertilio* of Linnæus. Gudhul, also chum Gudhul, *Hind.*—Shub-para, *Pers.* They all have the faculty of sustained flight, and their organisation and habits point them out as a separate and well-defined group, distinguished by a folding extension of the membranous skin, which, rising from the sides of the neck, is spread between their fore feet and their fingers. The following are Asiatic genera of this tribe.

Vespertilio pictus. The ears are shorter than the head, oval, wider than they are high. Earlet oval-shaped. The fur is reddish, passing into bright yellow upon the back, and of a tarnished yellow on the belly. Citron-coloured rays mark the course of the fingers in the wings, which are chestnut-brown. Locality, Ceylon.

Cheiromeles, Horsfield. Two incisors above and two below; the upper ones large.

Cheiromeles torquatus, Horsfield, 'Researches in Java;' *Molossus Cheiropus* Auct; *Dysopes Cheiropus*, Temminck. Length, 5½ inches. Expansion nearly 2 feet. Localities, Siam and Western Asia.

Rhinopoma Hardwickii, the Indian Rhinopome.

Megaderma Lyra, *Lyre*-Nosed Broad-Winged Bat. Java, India, Madras and Bengal.

Megaderma Spasma, the Cordate Bat. Java and Singapore.

Rhinolophus morio, the Black Horseshoe-Bat. Singapore.

Rhinolophus tragatus, Nepaul Horseshoe-Bat. Nepaul.

Hipposideros fulvus, Foxy Horseshoe-Bat. India, Madras.

Hipposideros murinus, House-Coloured Horseshoe-Bat. India, Madras.

Hipposideros bicolor, *Rhinolophus bicolor*, Two-coloured Horseshoe-Bat. Java.

Hipposideros apiculatus, Apicillated Horseshoe-Bat. India, Madras.

Hipposideros larvatus, Masked Horseshoe Bat. Java.

Hipposideros penicillatus, Pencilled Horseshoe-Bat. Madras.

Hipposideros vulgaris, Javanese Horseshoe-Bat. Java.

Hipposideros nobilis, Noble Horseshoe-Bat. Java.

Hipposideros armiger, Hodgson's Horseshoe-Bat. Nepal.

Petalia Javanica, Kuhl's Petalia. Java.

Vespertilio muricola, the Wall-Bat. Nepaul.

Trilotitus Blepotis, the Blepote. Timor.

Trilotitus Horsfieldii, the Lowo-Manir. Java, India.

Kerivoula picta, the Kerivoula. Java.

Kerivoula formosa, the Nepaul Kerivoula. Nepaul.

Kerivoula Sykesii, Sykes's Kerivoula. India, Calcutta.

Kerivoula trilatitoides, the Javanese Kerivoula. Java.

Kerivoula Hardwickii, Hardwicke's Kerivoula. Java.

Scotophilus fuliginosus, the Sooty Scotophile. Nepaul.

Scotophilus Hodgsonii, the Indian Bat. India, Calcutta.

Scotophilus labatus, the Lobed Scotophile. India.

Scotophilus Maderaspatanus, the Madras Bat. Madras.

Scotophilus Temminckii, Temminck's Noctule. Calcutta, and Java.

Scotophilus falcatus, the Falcated Noctule. India.

Scotophilus Leachii, Leach's Noctule. India.

Scotophilus fulvus, the Foxy Noctule. Java and Madras.

Noctrilinea Malaccensis, the Singapore Noctule. Singapore.

Noctrilinea labiata, Large-Lipped Noctule. Nepaul.

Murina suillus, the Pig-Nosed Bat. India.

Taphozous perforatus, the African Taphozous. Africa and Mauritius.

Taphozous longimanus, the Long-Armed Taphozous. India, Calcutta.

Taphozous melanopogon, the Black-Bearded Taphozous. Caves of Kenneri, Hindustan.

Taphozous saccolaimus, the Javanese Taphozous. Java.

Centurio senex, the Wrinkled-Faced Epaulet Bat. Amboyna.

Nyctinomus plicatus, the Groove-Cheeked Bat. Java and Bengal.

Nyctinomus Ruppellii, Ruppell's Groove-Cheeked Bat. Fernando Po and Singapore.

Pteropus Edwardsii, the Wurba-Gool. India, Nepaul, and Molucca.

Pteropus edulis, the Kalong. Sumatra.

Xantharpyia amplexicaudata, the Xantharpye. Amboyna.

Cynopterus marginatus, the Margin-Eared Cynoptere. India, Java, and Nepaul.

Cynopterus Horsfieldii, Horsfield's Cynoptere. Java, and India.

Cynopterus brevicaudatus, the Short-Tailed Cynoptere.

Cynopterus affinis, the Indian Cynoptere. Himalaya.

Macroglossus minimus, the Kiodote. Java.—*Eng. Cyc. p.* 976.

(2566) CHELONE. *Scrophulariaceæ*.—Flowering plants named from *Chelone*, a tortoise, to the back of which the helmet of the flowers is fancifully compared, the flowers are scarlet, orange, white and purple, the species thrive in any good garden soil, and may be increased by dividing the roots.—*Riddell.*

(2567) CHELONIA (χελωνη, a Tortoise), Tortoises and Turtles, a numerous and highly interesting order of Reptiles, generally considered the first by herpetologists. They are also termed *Testudinata* (from *Testudo*, the Latin name for a Tortoise), and are distinguished at the first glance by the double shield in which their body is normally inclosed, whether they are terrestrial, fresh water, or marine. They were all comprised by Linnæus under his genus *Testudo*.—*Eng. Cyc. p.* 978. The following are Asiatic species of Gymnopus.

Gymnopus Duvaucelii (*Trionyx Gangeticus*, Cuv., *T. Hurum*, Gray).

Gymnopus ocellatus (*Trionyx ocellatus* Hardwick; *T. Hurum*, the young, Gray).

Gymnopus lineatus (*Trionyx Ægyptiacus*, var., Hardw; *T. Indicus*, Gray).

Gymnopus Javanicus (*Trionyx Javanicus*, Schiveigg).

Gymnopus subplanus (*Trionyx subplanus*, Geoff).

Gymnopus Euphraticus (*Trionyx Euphraticus*, Geoff.).—*Eng. Cyc. page* 1003. Though many of the other *Chelonia* are highly useful to man, especially as articles of food, none are of such great utility as the Thalassians. The advantages to be derived from them were not lost upon the ancients; and though Mercury is said to have taken the first hint for the structure of a lyre from the dried carapace and tendons of a tortoise (a *Gymnopus*, probably), found by the god after an inundation of the Nile, and which sounded when he struck 'the chorded shell,' the benefits arising from the Thalassians, are, if not so refined, of a much more substantial and varied nature.

The inhabitants of those countries where the turtles grow to a large size do not merely derive from them a supply of food, but they convert their carapaces into boots, into huts, into drinking-troughs for their domestic animals, and baths for their children. The *Chelonophagi* of old, who inhabited the shores of India and the Red Sea converted the enormous shells of the turtles which they caught into roofs for their houses and boats for their little voyages, as Strabo and Pliny testify.—*Eng. Cyc. page* 1004. As an article of food the Green Turtles (Tortues Franches of the French), are so highly prized that they have become a considerable article of commerce. The fat of many species, when fresh, is used with success in lieu of butter and oil in cookery ; and in those species which have a musky odour (*Chelonia Caouana* and *C. Caretta* for instance), is used for embrocations, leather-dressing, and as lamp-oil. The Imbricated Turtles furnish that valuable article, tortoise-shell, or rather the best sorts of it, so highly prized in ancient and modern times, and so ornamental and useful in the arts. The eggs of all the species, particularly those of the Green Turtles, are excellent. The following list of Asiatic *Chelonia*, arranged according to their geographical distribution, is from Dr. J. E. Gray's 'Catalogue of the Tortoises and Crocodiles, &c., in the collection of the British Museum.' When a species is found in two of the larger divisions of the list on account of its extensive range, it is preceded by an asterisk.

(2571) CHENOPODIUM BOTRYS, (Jerusalem oak.) South of Europe, and Siberia, and Upper India ; whole plant very fragrant, said to be a powerful expectorant, and very useful in catarrh and humoral asthma.—*O'Shaughnessy, page* 524.

(2572) CHEPOOROO VALELLOO, a grass grown in Kimedy, from the roots of which neat table mats and teazing brushes are made. At the Madras Exhibition of 1855, a few neat table mats were exhibited from Kimedy, and some teazing brushes made from the roots of this grass. These are likely to command a ready sale, if they could be brought prominently to notice. The botanical name of the plants from which they are made is not yet ascertained.

(2573) CHICORY, CICHORIUM INTYBUS. WILD ENDIVE. Chicory, a root of the endive or dandelion family, used for adulterating coffee. It is cultivated largely in Germany, and is exported to Britain from Hamburg in large quantities. It is also grown in Yorkshire, Lincolnshire, and Suffolk, and in several of the places in Southern Asia. The seed is sown in April, and the harvest is gathered in September. The roots are pulled up and washed : they are then cut across into pieces about the size of a walnut and dried at a kiln. To prepare it for use it is roasted in the same manner as coffee, which changes it into a blackish brown colour. The powdered chicory resembles coffee but is finer in the grain and of a lighter brown colour. When put into water it melts almost entirely away. It soils the fingers more than coffee, and on this account may be distinguished therefrom. The presence of chicory may be detected in coffee by putting a spoonful of coffee gently into a tumbler of clear cold water : if pure it will float on the surface ; if not, the chicory will separate and discolour the water as it subsides. In its fresh state chicory is said to be a good tonic, and to have the effect of an aperient. The dandelion tribe is so widely diffused that it is probably intended by nature for the benefit of man and animals. The presence of chicory in coffee is said to give *body* to that beverage, to deepen its colour, and to assist that soft and pleasing aroma which

makes coffee acceptable. This however is very doubtful. It may also diminish, in some degree, the constrictive effects of coffee. Of course the only safeguard for the consumer is to grind his own coffee and add the chicory himself. It is stated that in 1840 for 36,000,000 lbs. of coffee, 12,000,000 lbs. of chicory were sold. A correspondent in *Chambers's Edinburgh Journal* (No. 304, N.S.) states that chicory must be regarded altogether as an adulterant: that the best coffee all over the continent is obtained by *roasting high*. "The rule is to roast as high as possible without burning; and the higher the roasting which the bean will stand, the better will be the coffee. When the beans are too ripe, the fine pale green colour has vanished and they are sooner burnt; and likewise, when unequal in size one portion will burn before the other is highly enough roasted. To make the beverage good, a large quantity of ground coffee must be used, and the pot must never by any means be allowed to boil. Abundance of sugar is likewise necessary." Prussian chicory is considered as the best. British chicory when roasted is much paler in colour and of inferior value. A factitious colour is given to it by means of Venetian red (sesquioxide of iron). The great demand for chicory has led to its extensive adulteration; first, by what is called *Hambro' powder*, which consists of roasted and ground peas, damaged corn, &c. coloured with Venetian red: and secondly, by *coffee flights*, the thin membrane which separates from coffee seeds in the act of roasting. Parsnips, turnips, &c. are also sliced and roasted as substitutes for chicory. Chicory is also used for adulterating snuff, and for coloring porter.—*Tomlinson, page* 361.

(2574) CHICKRASSIA, a genus of plants belonging to the natural order *Cedrelaceæ*.—*Eng. Cyc. page* 1013.

(2575) CHICKRASSIA TABULARIS. CEDRELACEÆ.

Chittagong wood, ENG.	Aglay marum, TAM.
Chetakum kurra, TEL.	

Chickrassa Swietenia, Roxb. Fl. Ind. ii. p. 399). This tree occurs in the mountainous countries to the East of Bengal. It was discovered by Mr. Nimmo on the Toongur Hills, in 1838. It is the Swietenia Chickrassa of Roxburgh and Ainslie and furnishes the Chittagong-wood of commerce. In Coimbatore, in common with one or two other light red coloured woods, it currently passes under the general name of cedar and bastard cedar, and is extensively employed in cabinet making: this has quite a cedar-like smell.—*Wight.* This wood is not known to Mr. Rohde as a product of the Northern Circars, but it is imported there among the "Chittagong woods." Beautifully veined and mottled pieces are occasionally met with, but its complaints during the season of the hot winds and dry northerly winds of November and December in the Northern Circars render articles made of it containing wide planks and framing, as armouries, very disagreeable bed-room companions. The Chittagong wood is used at Madras for all purposes for which ordinary Mahogany would be used in Britain as furniture, panels of carriages, &c.; one variety is sufficiently tough to be employed for felloes of wheels. Mr. Rohde concludes that all the wood imported under the name of "Chittagong" is not the produce of the same trees, the only wood of the Circars at all resembling it is the "pinn ayeinpa" of Ganjam and Northern parts of the Vizagapatam districts. Indeed it would be difficult, so far as his recollection enables him to state, to distinguish one from the other, though he believes it to be from a species of neem,—*Melia Azadarachta. Rohde.* In Madras the wood is extensively used in cabinet making, under the denomination of "Chittagong wood" being imported from that province, but it is abundant in the mountainous parts of the Peninsula of India. It makes beautiful and light furniture, but is apt to warp during the season of hot land winds.—*M. E. J. R.* The bark is powerfully astringent—*O'Shaughnessy, p.* 250.

(2576) CHIKSA. This is a perfumed powder composed of a variety of odoriferous substances, generally mixed up, when used, with sweet scented oil (phoolail ka tel).—*Herklots.*

(2577) CHILLIES, CAPSICUM. CAYENNE PEPPER.

Mirch, DUK.	Lombok, JAV.
Mirchee, GUZ. & HIND.	Chubui, MAL.

The scientific relations of the plants producing these fruits will be found under the article Capsicum, and we will here attend chiefly to the commercial relations. Chillies or capsicums are long roundish taper pods, divided into two or three cells, full of small whitish seeds. When this fruit is fresh, it has a penetrating acrid smell; to the taste it is extremely pungent, and produces a most painful burning in the mouth. When dried they form a large article of local and foreign traffic, and form the basis of Cayenne pepper; but in vinegar, when green or ripe, they are an acceptable pickle. In Bengal the natives make an extract from the chillies, which is above the consistence and color of treacle. The consumption of chillies in Southern and Eastern Asia is immense, as both rich and poor daily use them, and it is the principal ingredient in all chutnies and curries; ground into a paste, between two stones, with a little mustard, oil, ginger, and salt, it forms the only seasoning which the millions of poor in those countries can obtain to eat with their rice. They are worth in the Bombay market about 40s. the candy of 600 lbs. Immence quantities of the capsicum are used by the native population of the West Indies, Africa and Mexico; the consumption there as a condiment being almost universal, and perhaps equal in quantity to salt. Ten barrels of these peppers

were shipped from Montego Bay, Jamaica, in the first six months of 1851. The wholesale price of chillies in the London market is from 14s. to 25s. the cwt., and there is a duty of 6d. per pound on them. Cayenne fetches 9d. to 2s. the pound. Chilli is the Mexican name for all varieties of *Capsicum*. They are natives of the East and West Indies, and other hot climates. *C. annuum* is the species commonly noticed, but there seems to be numerous varieties, which by many are reckoned species. Thus *C. frutescens* is a shrubby plant, which grows to a larger and more bushy size; *C. minimum*, supplies the variety called bird-pepper: *C. baccatum* has a globular fruit, and furnishes cherry or berry capsicum. They are all of the simplest culture, but culture appears to increase the size, and to diminish the pungency of the fruit. Their acridity is owing to an oleaginous substance called capsicin. Cayenne pepper is used in medicine chiefly in the form of tincture, as a rubefacient and stimulant, especially in cases of ulcerated sore throat. It acts on the stomach as an aromatic condiment, and when preserved in acetic acid it forms chilli vinegar. Red pepper may be considered one of the most useful vegetables in hygiene. As a stimulant and auxiliary in digestion it has been considered invaluable, especially in warm countries. A kind called the tobacco red pepper, is said to possess the most pungent properties of any of the species. It yields a small red pod, less than an inch in length, and longitudinal in shape, which is so exceedingly hot that a small quantity of it is sufficient to season a large dish of any food. Owing to its oleaginous character, it has been found impossible to preserve it by drying, but by pouring strong boiling vinegar on it a sauce or decoction can be made, which possesses in a concentrated form all the essential qualities of the vegetable. A single drop of this sauce will flavor a whole plate of soup or other food. The "wort" or Cayenne pottage may be termed the national dish of the Abyssinians, as that, or its basis "dillock," is invariably eaten with their ordinary diet, the thin crumpet-like bread of teff or wheat flour. Equal parts of salt and the red cayenne pods are powdered and mixed together with a little pea or bean meal to make a paste. This is called "dillock," and is made in quantities at a time, being preserved in a large gourd-shell, generally suspended from the roof. The "wort" is merely a little water added to this paste, which is then boiled over the fire, with the addition of a little fat meat and more meal to make a kind of porridge, to which sometimes is also added several warm seeds, such as the common cress or black mustard, both of which are indigenous in Abyssinia.—("Johnston's Abyssinia.")—*Simmonds, p.* 429.

(2578) CHIMONANTHUS. The fragrant Chimonanthus, which is now a favourite in England, where it blooms in the open air at Christmas, is quite common in China—*Fortune's Tea Districts, page* 79.

(2579) CHIMPANZEE, the name by which one of those forms which approach nearest to man is most generally known. The term has been applied to the *Simia Satyrus* of Linnæus, the Oriental Orang.—*Engl. Cyc. page* 1015.

(2580) CHINA-BARK, a name given to the bark of *Buena hexandra*, a plant belonging to the natural order *Cinchonacea*. It is used as a febrifuge, but is less powerful than the barks obtained from the species of *Cinchona*.—*Eng. Cyc. p.* 1023.

(2581) CHINA BOX.—Murraya exotica.

(2582) CHINA-GRASS, RHEEA, OR RAMEE FIBRE, URTICACEÆ. *Boehmeria nivea.*

Chû or Tchou Ma, CHINA.	Gambe, in EAST CELEBES.
Tsjo, Karao, JAPAN.	Kunkhoora and Kunchoora, RUNGPORE
Caloee, SUMATRA.	Rheea, ASSAM.
Ramee, MALAY.	Pan, in SHAW.
Inan, in BONOA.	

The species among the Nettles of Eastern and Southern Asia, which is most famous for its fibre, is that formerly called *Urtica*, but now *Boehmeria nivea*. Kæmpfer, in his 'Amœnitates Exot.,' gives *Mao*, *Tsjo*, *Karao*, as the Japan names of the plant; and Thunberg says of it, copying from him: "Cortex pro funibus conficiendis, et filis validis ad texturas, expetitur;" and "E seminibus oleum causticum exprimitur." It is only within the last few years that Sir W. Hooker has published, in the 'Kew Journ. of Botany,' vol. i, p. 25, and vol. iii, p. 313, that he has obtained satisfactory information, through Sir George Staunton and Dr. Wallich, that the so-called China-grass is the fibre of this *Urtica nivea* of Linnæus, the *Boehmeria nivea* of Gaudichaud. Though the beautiful fabric known as China-grass cloth has long been known, its fibre has only in comparatively recent times attracted much attention, and the plant producing it was long unknown. When imported, however, into England, it sold for £60 to £80, and even for £120 a ton. It can be, at most times, had at Ningpo for about 6 dollars a picul of 133 pounds. The above high prices following every demand, have prevented this fibre from coming into general use for our manufactures. But a small black, almost invisible spot, which occasionally occurs on the fibre has also prevented its use for fine purposes. Full descriptions of the mode of preparing the fibre are given in Chinese works. One of these accounts was translated and transferred to the 'Journ. of the Hortic. Soc. of London,' in vol. iv, part iv, under the head of the Cultivation and Preparation of the *Tchou Ma*, or Chinese Flax; and from the importance of the material this is republished below. By this account we learn that the plant is cultivated with considerable care; that it may

be obtained from seeds, but more quickly by parting the roots, as it throws up numerous shoots; that these may be cut down, and that fresh ones will spring up, so that three several crops are obtained in the season. Great care is also taken in the scraping, peeling, steeping, and bleaching of the fibre. We also learn that the first crop yields strong and coarse fibres, and the second and third crops, delicate fibres for the finer fabrics. This China-grass fibre has of late years attracted considerable attention in Europe, and no less than three Prize Medals were given at the Exhibition of 1851, for finely prepared specimens of it, to the Messrs. Wright, Messrs. Hives and Atkinson, and Messrs. Marshall and Co., of Leeds. These looked like fine white silk or asbestos, some dyed of different colours, and some woven into cloth. The Jury Report of Class IV mentions that "the process of Messrs. L. W. Wright and Co., for the preparation of China-grass, &c., for which a patent was obtained in 1849, consists, essentially, in a very ingenious arrangement for boiling the stems in an alkaline solution, after they have previously been steeped for twenty-four hours in water of a temperature of 90°. The fibre is then thoroughly washed with pure water, and finally subjected to the action of a current of high-pressure steam till nearly dry. Dr. Roxburgh, when making his experiments on Fibres at the beginning of this century, took much pains with one of a species of Urtica, *Caloee or Ramee* (*Urtica tenacissima*, Roxb.) giving it this name because he considered it one of the strongest fibres he had ever met with. He first became acquainted with it in consequence of four plants having been sent to him by Mr. Ewer from Bencoolen, in Sumatra. He afterwards wrote that "some thousand plants have been reared from these four, so readily does it grow and multiply;" in fact, that "it may be grown from cuttings as readily as the willow." He further describes it as thriving anywhere, but most luxuriantly in shade, where there is much moisture. In four months it attains the height of eight or ten feet, when its shoots flower and can be cut down. Other shoots then spring up, which are also soon fit to be cut; and so on successively for almost any period. If left alone, the plant will in a short time produce a complete jungle. He, however, experienced considerable difficulty in separating the fibre. The Malays, he learned, merely steep the shoots in water for ten or twelve days, peel off the bark, and dry it in the sun. Besides its strength, he considered that the beauty, fineness, and softness of the fibre, are also greatly in its favour. In Sumatra it is called *Caloee*; but the Malays call it *Ramee*, and use the fibre for sewing thread, for twine, and for making fishing nets. Marsden states, that the shoots are cut down, dried, and beaten, after which the rind is stripped off; but Dr. Roxburgh did not find this method to succeed with him. He was afterwards informed by a friend at Canton that the grass cloth of China was made from the fibres of this plant. In the year 1810 three bales of this Caloee fibre were sent to the India House, having been produced in the Botanic Garden at Calcutta. In December, 1811, one of these bales was sent to Messrs. Sharpe, then of Mark Lane. On the 4th Feb., 1812, they reported, that having brought the Caloee fibre to the state of Hemp for the use of cordage, a thread was spun, of the size of those spun in the Royal Rope-yards, which bore 252 lb., whereas the weight required to be borne in the Royal yards by Russian Hemp of the same size is only 82 lb. Other bales were subsequently received on several occasions, and in 1815 one was sent to Dr. Taylor, of the Society of Arts. The Society voted one of their medals to Capt. J. Cotton, of the East India Company, for his efforts in introducing this fibre into England. A bale of this fibre having been given to Mr. Lee, he observed that the fibre appeared to have been peeled off the plant while it was in a green state, and that this rendered it of less value. He conceived that it would be more easily cleaned if the plants were taken dry, without water-steeping or dew-retting. But when cleaned the fibre is strong, soft, and fine, and of more value than the best Russian Hemp. Two more bales were sent in December, 1814, to the Court of Directors by Dr. F. Buchanan, who had succeeded Dr. Roxburgh, with a letter, dated 16th December, 1814, in which he mentions that the Caloee plant is by no means a new species of Urtica, as Dr. Roxburgh supposed. It is the *Urtica nivea* of Willdenow and the *Ramium majus* of Rumphius." Rumphius observes, respecting the separation of the fibre, that it is more easily effected when the stem is in a dry state: "Caulium cortex tenuis est, inque fila findi potest præsertim in siccata planta;" and, again, "Caules autem isti sponte siccari debent tum facile separatur ipsorum cortex, qui in fila commode findi potest." "Alii adultos sumunt viridis herbæ caules, ipsorumque deglubunt exteriorem viridem, et succosum ad interiorem album qui ligno incumbit, quum in tenuissima findunt fila." (l. c., p. 214.) He further says, "It is diligently cultivated in all places inhabited by the Orang Badjos." ('Flora Amboin.,' v, to. 79, fig. 1.) and that "the plant under the name of Kankora has from time immemorial been cultivated in the Dinagpur and Rongypur districts of Bengal, and its fibres used for a few purposes that require great strength with little thickness, but the expense of cleaning the fibrous part has always prevented it from coming into general use." He therefore proposed discontinuing the cultivation. But if we refer to Roxburgh's 'Flora Indica,' iii, p. 591, then, certainly, in manuscript, we find that he was quite aware of his plant being

identical with that of Rumphius, though it appeared to him to differ from the description of the *U. nivea* of Willdenow. We observe that it was considered at that time that Indian fibres could never be introduced into Britain, as the freight could not be calculated on at less than £12 per ton, of fifty cubic feet. Now about 30,000 tons weight are imported. The Court, in a dispatch dated 8th May, 1816, in sending out some of Lee's machines and referring to this plant, observed: "The Caloee is a plant that appears to be comparatively in its infancy as to cultivation, but being a perennial, the expense attending other fibrous plants is not incurred; and if this process, instead of scraping and peeling, will furnish its fibre clear of its mucilaginous coat, you may rejoice in the acquisition of the invention: for we have found the fibre stronger than Russian Hemp of the best description: and by some further improvements of this person's invention it has been brought to a thread, preferable to the best material in Europe for Brussels lace." So that at that time one of the most important applications of this fibre was well known. The above very valuable plant *Rheea* of Assam; *Kunkhoora* of Rungpore, (*Urtica tenacissima.*) was for some time lost sight of. But attention having been directed, by Major Jenkins and the officers employed with him in Assam, to the fibrous plants of that valley, Major Hannay and Capt. Dalton were induced to cultivate a small portion of land with this fibre; and the former having prepared ten bales of a fibre which he called Rheea fibre, and five bales of another called Bon Rheea, and eleven of these having been sent to the Court of Directors of the East India Company, were referred to Dr. Royle to report upon. This he did to the following effect: "The Rheea fibre forwarded by the Government of Bengal as the produce of Assam in order that its properties and value may be correctly ascertained in Britain appeared to him likely to prove one of the most valuble products of India, for in strength it far exceeds the best Hemp, and in fineness it rivals superior kinds of Flax. Its culture is well known to the natives of Assam as well as of the districts of Rungpore, of Dinagepore, also in Burma, Siam, and of other Eastern countries and islands. It can now be produced and sold with profit at as cheap a rate as Russian Hemp. This opinion is probably at present incorrect, from Dr. Royle misunderstanding a passage in Major Hannay's report. If any machine could be invented for facilitating the separation of the fibre from the woody part of the stalks, the Rheea would speedily undersell all other fibres, as from four to five crops of fibre can be obtained from the same plants within the year. "The Rheea fibre, though a new import from Assam, is well known under another name, being identical with the highly valued article of commerce, known by the

CHINA-GRASS OR RHEEA.

name of China-grass, the Chu-Má of the Chinese, and from which the famed Grass-cloth of China is manufactured. The proof is very complete of the identity of the plants from which these two differently named fibres are obtained. One of the educated Chinese introduced into Upper Assam on the establishment of the Tea Manufactory in that valley, recognised the *Rheea* as identical with the *Chai Má* of his own country. 'I went, says Major Hannay, this morning to the old Chinese Doctor of Medicine here, with a good grass cloth handkerchief in my hand; on seeing which he immediately said it was the *Hengchung Hapo* of China, and identical with the *Rheea* of the Doms of Upper Assam, the stuff being whitened by bleaching. I can trust to what this old man says, as he is an intelligent man and a great reader: his account was corroborated by another intelligent Chinese, formerly one of the Government head teamakers.' The Rheea of Assam had been ascertained by botanists to be the same plant as the *Urtica tenacissima* of Dr. Roxburgh, who, half a century ago, was informed by a friend at Canton that the plant which he had obtained as the *Caloee* of Sumatra, and to which he had given the above botanical name, was that from which the Chinese grass cloth was made. Lately, Dr. Macgowan, settled at Ningpo, sent specimens of the Chû Mâ to Calcutta. These Dr. Falconer found to be the same plant as the *Boehmeria nivea* of botanists, described under the name of *Urtica tenacissima* by Roxburgh and which will be found under its proper head. He says: 'The specimens from China correspond exactly with those grown in the Botanic Garden, with which I have compared them.' (May 5, 1849.) Sir W. Hooker has also identified these two plants as being identical, and has described the former as yielding what is called *China-grass*. Further, manufacturers in Britain have found the two fibres to be the same for all practical purposes." Mr. Sangster, who has paid much attention to this fibre, writes, that "our engineer, who prepared all our China-grass, is satisfied that your samples are equal to the best sorts from China." So Mr. Marshall, of Leeds, who is the largest consumer of China grass in this country, is satisfied that the Assam is the same for all practical purposes. "The identity of the Rheea fibre with China-grass, or the Chû Má, and consequently its value having been proved, it is important to find that it is a plant very widely diffused in the East. Dr. M'Gowan writes from Ningpo ('Agri-Hortic. Soc., vi, p. 241), that 'the Chû Ma is found at the base of the hills from Cochin China to the Yellow River, and from Chusan to the farthest west that researches can for the present extend.' We find that it is known in Celebes and Borneo, cultivated in Java and Sumatra, and many other of the islands of the East, where it seems to be known chiefly by the names *Rami* and *Caloee*. It is known in Siam and at Singapore; the string made of it is called

CHINA-GRASS OR RHEEA.

tali rami, and the fishing nets manufactured with it are conspicuous for their elegance and strength. Col. Burney, in 1836, obtained it from Pivela and Youkyouk, in the Shan province of Ava, where it is called *Pan*, and where Mr. Landars afterwards found it. Plants sent by the Colonel to Moulmein and to Tavoy succeeded well, but required much water. It has long been known as cultivated by fishermen in the Bengal districts of Rungpore and of Dinagepore, where it is called *Kunkhoora*. Col. Jenkins first sent it from Cochin in 1836; and it is found in different parts of Assam, where it is called *Rheea*, and from whence specimens have frequently been sent to the Agri-Hortic. Society of Calcutta, and whose 'Journal,' vols. iii to viii, contain numerous notices respecting it. In Assam, Rungpore, and Dinagepore, this plant seems to be very generally cultivated, though only in small quantities by the Dooms or fishermen, near their huts. The climate of Assam, and of these districts, being moist, is very suitable to the plant. Manure is useful, moisture essential for quick growth, as well as shade and protection from storms to allow it to grow to the height of eight feet, from which a six-feet fibre may be extracted. Hence it is most common in the districts along the foot of hills. It is grown from the separated roots, and may be cut down several times, so that four or five crops may easily be obtained during the year, and the aggregate produce of an acre of ground be about twelve maunds. The different crops vary in strength and fineness. All the officers of the district state that the culture is perfectly understood, and though cultivated only in small quantities by the fishermen for their own use, it is susceptible of easy and rapid extension, if the cultivators had any inducement to grow it. The expense seems to be about five rupees a maund; for Major Hannay, referring to the fact of £20 a ton having been offered for any quantity in Calcutta, observes that, as 'it costs at least five rupees per maund, you will see that it can scarce be sent to Calcutta at the price offered.' He says, also, that if any cheaper method of separation from the stalk could be discovered it would undersell all other fibres." From the mode of expression adopted as above by Major Hannay, Dr. Royle was led to think that the whole expense for the production of the fibre was five rupees a maund. But in another place he says, the expenses of cultivation are ten rupees a maund. Capt. Jenkins ('Journ. Agri-Hort. Soc.,' viii, p. 379) also says, the present cost is ten rupees a maund; but as the plant can be grown with the least possible trouble, and the preparation of the Flax from it is a very facile process, he states, that "there is no doubt the Flax can be grown at half this price." The dearness is no doubt owing partly to only small quantities being produced for the use of the fishermen, who do not for their purposes require very large quantities. Mr. Henley, in a letter in the 'Journ. Agri-Hort. Society,' says, that "it must necessarily be a much more expensive article than either Sunn or Jute, inasmuch as a labourer can prepare one and a half to two maunds of Jute per day's work, whilst of the *Kunchoora* he cannot manufacture more than as many seers." It is evident that some improved method of separation is the most essential requisite. "Various attempts have been made to make this fibre more generally known, and to bring it into demand as an article of commerce. It has frequently been sent by Col. Jenkins, and the officers employed in Assam, to the Agri-Horticultural Society of Calcutta. Mr. Henley, and others, have sent small quantities to the markets of England, but without attracting much attention, or selling it at remunerative prices. Samples were sent by Major Hannay, Capt Reynolds, Baboos Deena Nath, and Lokenath, to the Exhibition of 1851, when honorable mention was made of their exertions. A Prize Medal was, however, awarded for some beautifully white and silky looking fibre sent by the Singapore Committee, from M. Weber, of Java, as the produce of a plant which he called *Boehmeria candicans*, and also *Linum usitatissimum* on the same label. The former is probably only another name for this plant, as it is said to be the *Rami* or *Ramee* of the Malays. The plant is cultivated by the Dutch in Java, and its fibre has been introduced into Holland, and gold medals awarded to Messrs. Meerburg, of Leyden, for specimens of sail-cloth, ropes, cables, &c., and also for some finer kinds of cloth and table-cloths. The plant producing this fibre was called *Boehmeria candicans*, and also *B. utilis*, by Professor Blume, but it is probably only a variety of *B. nivea*, or perhaps a nearly allied species. Major Hannay who has long paid attention to this fibre, and to whom much praise is due, was induced to grow and prepare the present samples together with some grown by Capt. Dalton (six bales of Don Rheea and five of Bon Rheea), in consequence of applications from England by merchants who, however, did not offer a sum (£20 a ton at Calcutta) which would pay for the expenses of culture and preparation. Since the sample arrived in Britain, Dr. Royle endeavoured to make the fibre known, and its value appreciated. Specimens of both the Rheea and the Wild Rheea were sent to the Society of Arts, and an account of them published in their 'Journal' for the 9th of December, 1853. Specimens were also sent to Mr. Marshall, of Leeds; likewise to the Commercial Association of Manchester, to Belfast, to Paris, and to the Chamber of Commerce at Dundee. Its fibres have been shown to, and specimens given to numerous individuals well acquainted with such subjects. The letter of Mr. Marshall is most satisfactory, as he is him

self a spinner of the finest yarns, and the largest if not the only consumer of China grass:" Dear Sir,—We have examined the samples you sent to us, and I now give you the result. No. 1. Cultivated Rheea.—This is evidently just the same fibre we are using, imported from China, under the name of China-grass. It is not so fine in quality as the best descriptions we obtain from China, which are still longer than this sample, and of a green colour. We should class it with the middle or coarse quality, and estimate its value, delivered in England, at £48 to £50 per ton. It appears to be clean and regular in colour, and free from dead fibres, which are often a great detriment; and would be an useful quality of fibre, of which we could take a regular supply. No. 2. Rheea fibre, sent to the Exhibition of 1851, is the same as No. 1, but coarser in quality. No. 3. Fibre from Java, we think this is the Rheea fibre prepared, but can hardly judge from so small a sample: it seems to be a good, clean fibre, and worth further inquiry. No. 4. Wild Rheea fibre, is very coarse; only fit for rope-making. I hope this report will be satisfactory to you. It would certainly be an important advantage to us, as consumers of China-grass or Rheea fibre, to be able to obtain a supply from Assam. If it could be supplied at lower rates than those I have mentioned, that would, of course, much encourage the consumption of it in this country. I have stated what we consider the *full* value at present in our market here. At present there is not much consumed in England, but a good supply from a nearer market than China might enlarge the demand. I am, sir, very truly, J. G. MARSHALL. Leeds; *Dec.* 10, 1853.—Major Hannay, in one of his papers to the Agri-Horticultural Society of Calcutta, mentions that some specimens of his Rheea fibre having been sent direct to Leeds were valued at £50 a ton. Mr. Sangster, of the firm of Wright and Co., to whom one of the Prize Medals was awarded, has no doubt of the identity of the Assam produce with that of China, and therefore of its being of equal value. Mr. Dickson, who has had much experience with different fibres and the finer kinds of Flax, pronounced it to be a splendid fibre. Mr. Norrie, of Dundee, who has also examined many of these Indian fibres, finds it a very superior article, which can be brought to different qualities of fineness to suit the market it is sent to. It can be prepared to a quality suitable for the Dundee market, and also to a much finer quality, suitable for the markets requiring it finer; but says it must be kept soft and silky, which no mere mechanical means will do. These are very different opinions from one given a few years ago by a practical man, who stated that it might answer for carpet warps. Within the last years many have applied to Dr. Royle for information respecting this fibre, and how it could be obtained. One house in Belfast applied through the Secretary of the Commercial Association of Manchester, for fifty tons of the fibre, and one gentleman, who paid attention to China-grass, and has carefully examined the Rheea fibre of Assam, addressed a letter to the Court of Directors of the East India Company, stating that he wished to obtain it to the extent of fifty tons monthly for a Continental house. As to the utility of The Rheea Fibres for Rope-making,—though Dr. Royle has no doubt that when the peculiarities of the Rheea fibre, or China-grass, are more generally known, its excellent qualities will be fully appreciated, as it will come into more general use as a rival to the finer kinds of Flax; yet at present there are, he believes, but few spinners who thoroughly understand its management, or have machinery to do it justice. It is not likely therefore to realise its full value in the market at present. Hence it was desirable to have its strength tested as a substitute for Hemp, as it might not all be required to supply the place of Flax. Mr. W. Cotton had a bale of Rheea fibre, and also one of the Wild Rheea, twisted into five-inch rope, and prepared by the warm register in Messrs. Huddart's rope-manufactory at Limehouse; the strength of each was carefully tried and compared with similar rope made of Russian Hemp. The experiments were most satisfactory, neither rope breaking until the Rheea fibre bore above nine tons weight, and the Wild Rheea, within a few pounds, nearly as much. Though it is to be hoped that the Rheea fibre will prove too valuable to be only employed for rope-making, '*Bon Rheea or Jungle Rheea*, the Wild Rheea, on the contrary, is well calculated, and was indeed sent, for this purpose. No information has been sent respecting the plant yielding it, but it is no doubt one of the Nettle tribe, and from being called Bon or Jungle Rheea, it has been inferred that it is the Rheea in a wild state. But though we have no proof of this, it is satisfactory to find that Major Hannay describes it as 'uncultivated, but very common in all parts of the province:' and again, 'common in most of our forests; by proper management, any quantity of young shoots can be obtained, and as the divided roots afford numerous shoots, and the plant can be propagated by slips as well as by seed, its cultivation for its fibre might be carried on with facility.' He further says, 'it is cultivated largely by the Hill tribes on the west of Yeunan, and by the Singpoos and Dhoanncas of our own north-eastern frontier, to a small extent only for a coarse cloth, but chiefly for nets.' It is recognised by the Nepaulese as the Leepeeah of Nepal. Capt. A. Thompson, of the firm of Thompson and Co., rope-makers, of Calcutta, says of it, that it is all that can be desired for either canvas or lines, and only requires to be known to be generally used for that purpose." "Having ascertained in the most satisfactory manner that the fibres in ques-

tion are possessed of the requisite degree of strength, and the Rheea fibre of fineness in addition, the next point to determine is how to make their good qualities so known in the market, that the fibres may not be condemned as new things and of no value. Dr. Royle has been informed by the best judges, that, having taken the best means to determine the real value of the articles, they must next be sent into the market for three or four years in sufficient quantities to attract the notice of the best manufacturers; and for this purpose from ten to twenty tons annually would be sufficient: others say twice a year, but this in the case of India would be needlessly troublesome. "The next difficulty is to induce the natives of the districts containing these valuable fibres to extend their ordinary cultivation of the Rheea or of the Hemp, or to collect the Wild Rheea in increased quantities, and to prepare them all as carefully as possible for the English market. The officiating Commissioner of Revenue in Assam recommends that, as the culture of the Rheea fibre is sufficiently well understood, 'the best way to encourage its extension would be to secure to the ryots a sure market at remunerating prices.' Capt. Dalton, Collector of Debrooghur, states, 'that the best method would be for Government to offer a premium of so much a ton on all that is produced for three or four years.' Both recommendations might be united in one, if the officers who take so zealous an interest in the improvement of their districts were authorised to purchase (unless they find individuals willing to do so) from ten to twenty tons of these fibres in their respective districts, taking care that they were as carefully and cleanly prepared as possible, and as closely resembling as possible the specimens of Petersburgh Hemp which Mr. W. Cotton has been good enough to send for transmission to India. The improved appearance of the Rheea fibre sent by Major Hannay is owing to specimens sent out to him by Mr. W. Sangster. I would include in this direction for the Rheea fibre also the districts of Rungpore and of Dinagepore, where the same fibre is cultivated under the name of Kunkhoora, and where labour is more abundant than in Assam." In conformity to the orders of the Court of Directors, directions were sent by the Governor-General of India, with printed copies of the papers, to the Commissioners in Assam and Rajeshaye, and to Singapore. Colonel Jenkins, in his reply, dated 2d August, 1854, reports that Capt. Dalton, Collector of Luckimpore, did not expect to be able to obtain more than two or three tons, as the cultivation of the Rheea is at present confined to a few villages of fishermen, and that Major Hannay some time since abandoned the experimental cultivation which he had commenced, on account of the low prices then offered, which would not pay the cultivators.

CHINA-GRASS OR RHEEA.

But it is stated—"As the large introduction of this article amongst our articles of commerce is likely to be a matter of great importance, I would beg to recommend that Government should buy up any quantity, up to ten tons, procurable each season for the next three years." This has been sanctioned by the Indian Government. Capt. Dalton writes: "The lowest price at which it is likely to be procurable is six annas a seer, or about £42 sterling a ton. When it is more extensively cultivated, and the best method of preparation thoroughly understood, so that, as in the reeling of silk, women and children may be employed as well as men, it ought not to cost more than four annas a seer, or £28 a ton." He continues: "The process described in Dr. Royle's paper, quoting from Major Hannay, is that commonly used by the natives of the province. Major Hannay practised a different method, which he calls the Indo-Chinese, which is not only the most cleansing, but also the cheapest." (*v. p.* 363.) Major Hannay, besides describing this method as below, states that he had been requested to forward to England some of the Rheea as stripped from the stalk, and without any further scraping or cleaning. But he is of opinion that if the Rheea is not immediately deprived of its gummy and mucilaginous matter, it would most probably rot before reaching England. This, however, would only be the case if it were not perfectly dry, and this may be difficult to effect in a moist climate like that of Assam. "A cleaning factory established in the Rheea-growing districts, and capital employed to encourage the ryots to cultivate, would be the most likely means to cheapen the article in the market and increase its subsequent consumption." Ten bales of the Dom Rheea, had however, been sent off to this country. Dr. Oxley, in reply to the requisition for some of the fibre from Singapore, writes (19th July 1854) that the *Ramee* is indigenous all over the Malayan Archipelago; it grows freely at Singapore, but is not cultivated or planted to any extent, and therefore it could not be obtained in any quantity, though it is used by the Malays as twine, their common name for which is "*tali ramee*." They make their fishing lines of it, and prefer their own lines to any of European manufacture. The refuse in preparing the fibre is admirably adapted for making paper, and is used for this purpose in Java. As this fibre is remarkable for fineness, flexibility, and strength, it seems well worthy of cultivation, especially if any cheaper method of cleaning can be devised, as it is an object of attention in Java, whence it is imported into Holland, and various goods made of it, as we have already stated, by the Messrs. Meerburg, at Leyden. The Ramee, that is, the *Rheea* of Assam, yielding four or five cuttings in the year, amounting to about twelve maunds of valuable fibre, must, therefore, be well worth cultivation in many localities from Assam to Arra-

can, also in Pegu, and down to Singapore, and perhaps also on the Malabar Coast. We therefore republish modes of cultivation and of preparation. The first, from Chinese works, is very similar to the directions from similar sources given by Dr. M'Gowan, of Ningpo (*v.* 'Journ. Agri-Hortic. Soc.,' vol. vi, p. 209); while the second is that which Major Hannay so successfully practises in Assam. The following extract on the Chinese cultivation of the Tchou-ma, or Chinese Flax (Urtica nivea) is translated from the Chinese, by M. Stanislas Julien, and retranslated from the French. It possesses much interest, in addition to what it derives from its Chinese origin, in consequence of its being not impossible that attempts may be made to introduce the cultivation of Tchou-ma into Great Britain. Its delicate fibre forms the Flax from which the finest of the Chinese linen fabrics are manufactured. Amongst the products of Chinese industry which were exhibited a few years ago in the Rue St. Laurent, were some pieces of a fine silky tissue, called by the Chinese *Hia-pou* or summer cloth, and made of the fibres of the plant called by botanists *Urtica nivea*. Some seeds of this plant were sent from Canton in 1843, by M. Hebert, but they never arrived; and I was at that time told that they would probably not grow in our climate. I am sorry that I was not then able to translate the papers which I now lay before the public. After reading the following account of the cultivation of the plant in question, it will be readily seen, by those who are competent judges of the matter, that the supposed want of success was owing to nothing but ignorance of the care and delicate treatment which are necessary for the culture of the plant now before us. The way in which its valuable threads are peeled, steeped, and bleached, is, as will be seen, described by the Chinese authors, with a precision and minuteness amply sufficient to enable any person to pursue this new branch of industry in our own country. Until a new supply of seeds is received from China, roots or young plants of the *Urtica nivea* may be obtained from the Garden of Plants, and be propagated in the way mentioned below; and thus may a substance be given to our manufacturers, which will, in their hands, be made into a tissue as soft as silk, and as fine as, but stronger and tougher than, the best French cambric.

Cultivation of the Tchou-ma (*Uritica nivea*). ('Imperial Treatise of Chinese Agriculture,' lib. xxviii, fol. 3.) For the purpose of sowing the *tchou-ma* in the third or fourth month, a light sandy soil is preferred. The seeds are sown in a garden, or where there is no garden, in a piece of ground near a river or a well. The ground is dug once or twice, then beds one foot broad, and four feet long are made; and after that the earth is again dug. The ground is then pressed down, either with the foot or the back of a spade. When it is a little firm, its surface is raked smooth. The next night the beds are watered, and on the following morning the earth is loosened with a small-toothed rake, and then again levelled. After that half a *ching* (four pints and a half) of moist earth and a *ho* (one pint) of seeds are taken and well mixed together. One *ho* of seeds is enough for six or seven beds. After having sown the seeds it is not necessary that they should be covered with earth; indeed, if that were done, they would not germinate. The next thing to be done is to procure four sticks, sharp at one end, and to place them in the ground in a slanting position, two on one side of the bed and two on the opposite side; they are for the purpose of supporting a sort of little roof two or three feet high, and covered with a thin mat. In the fifth or sixth month, when the rays of the sun are powerful, this light mat is covered with a thick layer of straw. If this precaution were not adopted, the young plants would be destroyed by the heat. Before the seed begins to germinate, or when the young leaves first appear, the beds must not be watered. By means of a broom dipped in water the roof of matting is wetted so as to keep the ground underneath moist At night the roof is removed in order that the young plants may catch the dew. As soon as the first leaves have appeared, if parasitical plants appear they must be immediately pulled up. When the plant is an inch or two high, the roof may be laid aside. If the earth is rather dry, it must be slightly moistened to the depth of about three inches. A stiffer soil is now chosen and thrown into beds, to which the young plants are to be transferred. The following night the first beds, in which the young plants are, are to be watered, the next morning the new beds are to be watered also. The young plants are then dug up with a spade, care being taken to keep a small ball of earth round their roots, and are picked out at a distance of four inches the one from the other. The ground is often hoed. At the end of three or five days the earth must be watered, and again at the end of ten days, fifteen days, and twenty days. After the tenth month the plants must be covered with a foot of fresh horse, ass, or cow dung. (Extract from the General Treatise on Agriculture, intituled 'Nontching-tsiouen-chou.') When the *tchou-ma* is cultivated for the first time it is raised from seed. The roots of the seedling plants give of themselves new shoots. At the end of a few years the roots cross each other and intertwine, when the stems must be separated and replanted. At the present day it is very common in the countries of An-king and Kien-ning, to disentangle the roots with a knife, and to replant them. Those who cannot procure seeds follow the plan adopted for obtaining young mulberry trees from layers. This plan is a very quick one. In those countries, however, where there are no roots of the *tchou-ma*,

and where it is not easy to procure them from other places, the seed is had recourse to. As soon as the young plants are a few inches high they are watered with a mixture of equal quantities of water and liquid manure. Immediately after the stems are cut the ground must be watered, and this ought to be done at night or on a cloudy day; for if the plants were watered in the sunshine, they would rot. Great care must be taken not to make use of pig's dung. The *tchou-ma* may be planted every month; but it is necessary that *the ground be moist. Transplantation and Propagation of the Tchou-ma.* ('Imperial Treatise on Agriculture,' lib. lxxviii, fol. 5.) When the tufts of the *Tchou-ma* are strong enough, the earth around is dug, and new stocks are detached and transplanted elsewhere. The principal stock then grows more vigorously. At the end of four or five years, the old stock becoming excessively strong, they are divided and replanted in other beds. Some persons are satisfied with bending the long stems down and obtaining layers in the ordinary way. When a bed becomes too crowded, another must be formed, and then another. In this way the plants may be propagated to any extent. A stiff soil that has been well worked in autumn is chosen and manured with fine muck. In the following spring the plants are transplanted. The best time for carrying on this operation is when vegetation commences; the next best is when the new shoots appear; and the worst is when the stems have attained a considerable size. The new plants are placed a foot and a half from each other, and when they have been well surrounded with earth they are watered. In summer as well as in autumn advantage must be taken of the time when the earth has just been moistened by rain. The offsets can be transplanted to places near at hand; but it is essential to have a ball of earth around each plant. To propagate the *tchou-ma*, portions of its roots two or three inches long are detached by a knife, and are placed by twos and threes in little trenches that are about a foot and a half from each other. The roots are then surrounded with good earth and watered; the watering is renewed three or five days afterwards. When the new stems have attained a certain height, the earth must be often hoed. If the earth is dry it must be watered. If the plants have to be carried to a distance, their roots ought to be surrounded by the soil in which they have been growing, well enveloped in leaves of the reed. They are placed, in addition to this, in a mat folded so as to exclude them from air and light. They may then be carried without danger to a distance of many hundred miles. The first year, when the plants are a foot high, they are gathered; they are gathered again in the second year. The fibres of the cut stems are fit for spinning. In the tenth month of every year, before cutting the offsets which pass beyond the roots, the earth is covered with a thick layer of cow or horse dung. In the second month the manure is raked off, in order to allow the new plants to come up freely. At the end of three years the roots become excessively strong. If part of the plants which come up in close tufts were not removed, the others would be smothered. *Gathering the tchou-ma*—The *tchou-ma* may be gathered three times a year. When the stems are cut, the little shoots springing from the rootstock should be about half an inch high. As soon as the large stems are cut, the suckers spring up with more vigour, and soon furnish a second crop. If the young shoots be too long, the large stems ought not to be cut; but the ground shoots would not become vigorous, and would be prejudical to the development of the larger stems. The first crop is got in towards the commencement of the fifth month; the second in the middle of the sixth, or at the beginning of the seventh month; and the third and last in the middle of the eighth or the beginning of the ninth month. The stems of the second crop grow much faster than the others, and are by far the best. After the crop, the stocks of *tchou-ma* are covered with manure and immediately watered. *Peeling the Fibres of the Tchou-ma*—When the stems are all got in they are split longitudinally with knives of iron or of bamboo. The bark is first removed; then the lower layer (which is white, and covered with a shrivelled pellicle which comes off by itself) is scraped off with a knife. The interior fibres are then seen; they are to be removed and softened in boiling water. If the *tchou-ma* be peeled in winter, the stems must be previously steeped in tepid water in order that they may be the more easily split. The first layer of *tchou-ma* is coarse and hard, and is only good for making common materials; the second a little more supple and fine; the third, which is the best, is used for making extremely fine light articles. *Steeping and Bleaching the Tchou-ma*—The stems are tied up in little sheaves and placed on the roof of a house, in order that they may be moistened by the dew at night, and dried again by the sun in the day. In the course of from five to seven days they become perfectly white. If the weather be cloudy or rainy the stems are placed under cover in a current of air. If they are wetted by the rain they immediately turn black. Another author says, after peeling the fibres they are tied in skeins, arranged in a circle, and steeped for a night in a pan of water; they are then spun on a wheel. This done, they are again steeped in water containing the ashes of burnt mulberry wood. Having taken them from the pans they are divided into packets of 5 oz. weight each: the packets are placed for a night in a tub of a mixture consisting of a cup or pure water and an equal quantity of powdered chalk to each packet.

The next day the chalk is got rid of, and the fibres are boiled in water containing straw ashes, by which process they become white and supple. Being now dried in the sun they are again boiled in pnre water; they are then stirred about in more water, which finishes the cleansing process, and lastly they are dried in the sun. This done, the fibres are joined end to end on the wheel so as to make long threads, which form the warp and the woof, and are manufactured into stuff in the usual way. Another author says, after having spun the fibres of *tchou-ma*, they are boiled in lime water, and when cool, carefully washed in pure water. Then by means of a bamboo sieve, placed on the surface of the water, they are spread out in equal layers in order that they may be as it were half wetted below, and half dried above. As night approaches, they are taken out, strained and dried: the same process is repeated the next and following days, until the threads are perfectly white. They are then, but not before, fit for being made up. According to another process, the *tchou-ma* is first soaked, then spun and made up, instead of being soaked after the spinning. Other persons again take the fresh fibres, expose them at night to the dew, and in the day to the sun; then spin and weave, bleaching last of all. Others, lastly, following those who employ the plant *Ko*, cut the stems, soften the fibres in the steam of boiling water, then weave, and do not bleach at all. Fibres thus prepared give a material that is more supple and fibrous. *Mode of gathering the best seeds of Tchou-ma*—When seeds of *tchou-ma* are wanted for the purpose of sowing, those which are found on the main shoots are to be preferred. In the ninth month, after the period *choang-kiang* (after the 2d of October), the seeds are collected and dried in the sun; they are then mixed with damp sand, and put in a bamboo basket, carefully covered with straw. This precaution is needed, for, if the seeds are frozen, they will not grow. The seeds of the lateral shoots are not fit for sowing. Before sowing, the seeds are thrown into water, and those that sink are used, while the others are of no use. The seeds are sown before the first half of the first month, The best seeds are those which are spotted black. After they are sown they are covered with ashes. If they are sown thick the plants coming from them will be weak and sickly; they will be strong and healthy, on the contrary, if the seeds are thinly sown. As soon as the leaves appear the plants are watered with liquid mauure. In the seventh month the seeds are collected, put on canvas, and hung in a strong current of air; this aids and hastens germination. ('Journal of the Horticultural Society of London,' vol.iv, part iv.) The following is the INDO-CHINESE METHOD *for preparing the Rheea Fibre, as practised in Upper Assam, By Major Haunay. To cut the Rheea*,—The Rheea is fit for cutting when the stems become of a brown colour for about six inches upwards from the root. Hold the top of the stalk in the left hand, and with the right hand strip off the leaves by passing it quickly down to the root, and cut off with a sharp knife, taking care to be above the hairy network of the roots, as these should be covered up with manure immediately to ensure another crop quickly; lop off the tender top to the stalk, and make the reeds up into bundles of 200 or 250, if the stripping process is not to be carried on in the field or garden; but it is best to strip off the bark and fibre on the spot, as the burnt ashes of the stem afford a good dressing for the roots along with dry cow dung. *To strip off the Bark and Fibre*,—The operator holds the stalk in both hands nearly in the middle, and pressing the forefinger and thumb of both hands firmly, gives it a peculiar twist, the inner pith is broken through; and then passing the fingers of his right and left hand rapidly, alternately, towards each end, the bark and fibre is completely separated from the stalk, in two strands. *Making up into Bundles*,—The strands of bark and fibre are now made up into bundles of convenient size, tied at the smaller end with a shred of fibre, and put into clean water for a few hours, which he thinks deprives the plant of its tannin or colouring matter, the water becoming quite red in a short time. *Cleaning Process*,—The cleaning process is as follows: The bundles are put on a hook fastened in a post, by means of the tie at the smaller end, at a convenient height for the the operator, who takes each strand separately of the larger end in his left hand, passes the thumb of his right hand quickly along the inner side, by which operation the outer bark is completely separated from the fibre, and the riband of fibre is then thoroughly cleaned by two or three scrapings with a small knife. This completes the operation, with some loss, however, say one fifth, and if quickly dried in the sun it might at once be made up for exportation; but the appearance of the fibre is much improved by exposure (immediately after cleaning) on the grass to a night's heavy dew, in September or October, or a shower of rain during the rainy season. After drying, the colour improves, and there is no risk from mildew on the voyage homewards.—*Royle Fib. Pl. page* 344.

(2583) CHINA ROOT, SMILAX CHINA.

Khusb-sinie, ARAB,	Chob-cheenee, GUZ. and HIND.
Sook-china, BENG.	Esquina, PORT.
China-alla, CYNG.	Raiz-china, Cocolmeca, SP.
China-wortel, DUT.	Paringay-puttay, TAM.
Squine, Esquine, FR.	
China-worzel, GER.	

A large tuberose knotty root, of a dark reddish brown colour on the outside, and reddish white within; produced by the Smilax China. It is produced in China and the West Indies; that from the former place is considered the best. It

was formerly employed in medicine, but has of late years been neglected by European practitioners. China root is imported into India from China, and small quantities are occasionally exported to England and the Persian Gulf.—*Faulkner.* It may be employed in the preparation of the simple and compound decoctions of Sarsaparilla, when sarsaparilla is not obtainable. —*O'Sh. Beng. Phar. p.* 279. The native practitioners of India, like the Japanese, supposed this root to have considerable virtue in old venereal cases, particularly in what the Tamools call "Mayghum Vaivoo," a complaint in which the limbs are stiff and contracted. What is found in the bazars of the Peninsula is brought from China, where it grows in the province of Onansi, in great abundance; the plant however is said to be common in Bengal. The Abbe Richon, in his "voyage to Madagascar and the East Indies," tells us that the Chinese often eat this substance instead of rice, and that it contributes to make them lusty.—*Ainslie's Mat. Med. p.* 10.

(2584) CHINA-WARE, or porcelain, once so extensively exported from China, is now almost confined to the commonest and cheapest descriptions of stone-ware, by far the greatest portion of which goes to India The patterns made by the Chinese seldom change, while the European manufacturers both consult and lead the taste and fancy of their customers, and it is owing to this, in some degree, that the demand for the Chinese fine ware has ceased, though the Mongols, Siamese, Hindus, and islanders in the Archipelago are still chiefly supplied from China.—*Morrison.* When the productions of the East were first carried round the Cape of Good Hope, the porcelain of China bore an enormous price, and the profits of manufacturing it having been ascertained, the European nations began to make it, and soon out-rivaled the Chinese. China-ware is sold in sets, consisting of a table set of 270 pieces, at from 12 to 75 taels; a breakfast set of 20 pieces, at three taels; a long tea set of 101 pieces, at 11 to 13 taels; and a short tea set of 46 pieces, at from 5 to 6 taels. Flower-pots, vases, jars, fruit baskets, table ornaments, &c., are made of porcelain to any pattern by the Chinese. It is now sent to Bombay and other parts of India, and also to the United States.—*Compendium.*

(2585) CHINTZ.

Sits, Dut.	Chint, Pers.
Indiennes, Fr.	Chitas, Port.
Zitze, Gez.	Siz, Rus.
Chint, Gus. Hind.	Chites, Zaraza, Sp.
Indiane, It.	

A peculiar style of fast-printed calicos, of many different colours impressed upon a white, or light coloured ground.—*Faulkner.* In the Madras Presidency, the principal sites of this manufacture are the towns of Masulipatam, Arnee and Sydapet. Those of Masulipatam are called "Kalankauree," literally "firm colour:" they are of various hues. Each piece is 2 cubits in breadth, and 12 in length, priced at from 4 to 12 Rupees each, and are used for under garments by Hindoo females. Those of Arnee and Sydapet are ordinary, and 8 by 2 cubits, sold at 1 to 3 Rupees each; they are used for pillow covers and other purposes, as well as the undergarments of humbler native women At the Madras Exhibition of 1855, the Chintzes from Masulipatam were of great variety as to color, size, quality of the dye and price: the whole collection was interesting, very well colored and the dyes good, and there was a Palempore by Aga Ismail of Masulipatam embroidered in gold of a chaste and elegant pattern —*M. E. J. R.*

(2586) CHIOCOCCA (from χιων and Κόκκος), a genus of plants belonging to the natural order *Cinchonaceæ. Chiococca Javanica*, the Java Snow-Berry, is a parasitical shrub, with oblong lanceolate leaves, acuminated at both ends, glabrous, velvety, and shining above; corymbs terminal, trichotomous. This native of Java, is found on the mountains, upon trees.—*Eng. Cyc. p.* 1031.

(2587) CHIRETTA, CREYAT ROOT.

Kalapnath, Kalamegh, Muha tita, Beng.	Creyatta, Guz. & Hind.
Kiriat, Can.	Kairata, Sans.
Attadie, Cyng.	Kiriat, Tam.
Kreat, Duk.	Nella Vemoo, Tel.
Create, Fr.	*Faulkner.*

Chiretta, or Creat, or Chirayta, for all three pronunciations are in use, is closely allied in its medicinal properties to gentian for which it is a perfect substitute. Like gentian, it promotes digestion, improves the appetite, and gives a tone to the system, without producing much stimulant effect, or causing constipation. It contains a resin and yellow bitter matter, on which the activity of the plant depends. Its use is admissible in all inflammatory states of the intestinal canal and in febrile diseases. The Chiretta of the bazars, however, is the produce of the several following plants.

Adenema hyssopifolium. Hind. Chota Chirayta, is common in various parts of Southern India, is very bitter, also somewhat laxative, and much used by the natives as a stomachic.

Agathotes chirayta (Don); Ophelia chirayta, (Grisebach); Gentiana chirayta (Fleming); Beng. and Hind. *Chirata*; grows in Nepaul, the north of India, and Morung Hills. All parts of the plant are extremely bitter and are identical in composition with the common gentian. It is highly esteemed as a tonic and febrifuge all over India. The Ophelia chiretta is a common and abundant plant in the bazar, supplied chiefly by the lower ranges of the Himalayas.

Andrographis (Justicia, Roxb.) *paniculata*, Beng. Kalamegh, Hind. kalupnath or muha tita is the genuine or original chiretta.

Chironia centauroides of Roxburgh (Erythræa Roxburghii (Don), is another and powerfully bitter species found in India.

Cicendia hyssopifolia (Syn. Exacum hyssopifolia): common in various parts, of the East Indies, the whole plant is bitter and somewhat laxative: is used by the natives as a stomachic.

Exacum bicolor grows, rare, on the Neilgherries, below Kotagherry, and abundant a mile below Nedawuttum, where it flowers during the autumnal months. This species enamels the swards of the Western Ghauts with its beautiful blossoms, has the same bitter stomachic principles for which the Gentiana lutea is so much employed, and it is believed may be used with advantage in lieu of Gentian, for medicinal purposes. It is known in Mangalore as country creat and sold there at 1 anna 6 pie per lb. The infusion of *E. bicolor*, is a mild pure bitter.

Exacum tetragonum. It is another species of this genus, called *Ooda chiretta* or purple *chiretta*.

Ha'enia.

Ophelia angustifolia (Don), O. Swertia (Royle), is called *pukarree chiretta*, is substituted for the true kind.

Ophelia elegans, Wight, grows plentifully in several parts of the Madras presidency, is considered febrifuge by the Native physicians, who prefer it to the Himalayan Chiretta. It grows plentifully in the Jeypoor Zemindary of Vizagapatam, and is annually exported, as *Silaras* or *Selajit*, to the value of about Rupees 2,500. The infusion of O. elegans has a powerful bitterness.

Villarsia indica; *aristata*; *and nymphæoides*, occur in every part of India.

Chiretta, may be regarded as a type of the simple bitters, so many of which have been employed in Europe as febrifuges. For such purposes it is employed in India, and it will do whatever a simple bitter can in stopping intermittents. This is of course not very much at least in the tropics, notwithstanding the opinions of physicans of a past age, for instance Boerhaave, who had great faith in gentian. Chiretta is an extremely useful tonic, and of much service in convalescence from fever. It is one of the few articles of the Indian Materia Medica, which is in every respect an adequate substitute for the corresponding European article, and there is no occasion for any gentian being imported into India, although Twining, with the fondness for particular remedies which is engendered by exclusive modes of practice, imagined that extract of Chiretta had not the peculiar virtues which he attributed to Gentian in dysentery. Chiretta is a useful vehicle for other remedies and not long ago infusion of Chiretta with powder of gall-nuts was tried as a fever remedy in dispensary practice with indifferent success. Probably Chiretta by itself would have been quite as efficacious. Chiretta is given in infusion and tincture like Gentian. It is the basis of the celebrated drogue amere, a compound of mastic; frankincense, resin, myrrh, aloes, and creat root, steeped in brandy for a month, and the tincture strained and bottled. Chiretta is met with in a dried state, tied up in bundles, with its long slender stems of a brownish colour, having the roots attached, and which have been taken up when the plant was in flower. The whole plant is bitter. Being universally employed throughout India as gentian is in Europe. it is procurable in all native druggists shops.—*Faulkner*. The Extracts of Chiretta agree in being valuable bitter tonics. Both these and gentian contain a peculiar principle termed the gentisic acid. The dose is ten to thirty grains twice or three times daily, usually prescribed with sarsaparilla, hemidesmus or iron.—*Beng. Phar. p.* 290. The wine of Chiretta, is cordial, bitter and tonic in a dose of two fluid drachms. A compound tincture of Kreat is prepared by Kreat root six ounces, myrrh and aloes, each one ounce, French Brandy two pints, macerate for three days and strain. This preparation is equivalent to the celebrated "drogue amere." Its effects are tonic, stimulant, and gently aperient. It is a valuable preparation in the treatment of several forms of dyspepsia and torpidity of the alimentary canal: in a dose, of one fluid drachm to half an ounce.—*Beng. Phar. p.* 429.

(2588) CHIRITA SINENSIS, the "manneen-chung of the Chinese, is a dwarf species of *Lycopodium*, highly prized by that people.—*Fortune's Tea Districts, p.* 8.

(2589) CHIRONIA. GENTIANEÆ.—This genus of plants are all indigenous to the Cape of Good Hope, the flowers are rose coloured, white, yellow and purple, the plant grows to the height of two feet, and for ornamental purposes, should be continued by cuttings. They require a light loamy soil.

(2590) CHIRONIA CENTAUROIDES of Roxburgh (Erythræa Roxburghii, Don) is a powerful bitter, found in India.—*O'Shaughnessy, p.* 460. Nye, *Hind.* is the name given to this herb and leaves, used as a chiretta.

(2591) CHIRONGIA GLABRA, Buch.

Muruculu pullum, TAM.

This fruit, Dr. Buchanan says, is eaten in Mysore, but Ainslie believed that it is not much esteemed.—*Ainslie*.

(2592) CHIRONGIA SAPIDA, Roxb.

Tumbi pullum, TAM.

This fruit is not much sought after: it grows in the woods and is eaten by the poor people.—*Ainslie, p.* 234.

(2593) CHITRA.

Lal chitra HIND. | Blistering plumbago, ENG.
Plumbago rosea, LAT. |

Its root is employed in medicine, but rarely.—*Ben. Phar. p.* 211.

(2594) CHITTAGONG is a large town of Mahomedans and of Mugs, a Burmese tribe, who inhabit many parts of the Malay peninsula, and the coast to the northward of it. The town stands on the north shore of an extensive delta, formed by rivers which issue from the lofty mountains separating this district from Birmah. These mountains are fine objects on the horizon, rising 4,000 to 8,000 feet ; they are forest-clad, and inhabited by turbulent races, who are coterminous with the Cookias of the Cachar and Tipperah forests ; if indeed they be not the same people. The mountains abound with the splendid timber-trees of the Cachar forests, but like these are said to want teak, Sal and Sisso ; they have, besides many others, magnificent Gurjur trees (*Dipterocarpi*), the monarchs of the forests of these coasts.—*Hooker Him*: *Jour*: *Vol.* 2 *p.* 345. Chittagong, formerly possessed a factory subordinate to the one at Dacca, and still manufactures inferior fabrics of strong texture. The rough towels made here, are of an excellent quality : they are stout, and durable, and would be found to be superior to the Baden towels, now so much used in dressing rooms in Britain. This station could also supply specimens of an inferior sort of isinglass, a considerable quanity of which is prepared here, and sold to Chinese traders. *Dr. Taylor.* The natives of Chittagong are excellent shipbuilders and active traders, and export much rice and timber to Madras and Calcutta. The town is large and beautifully situated, interspersed with trees and tanks ; the hills resemble those of Silhet, and are covered with a similar vegetatation : on these the European houses are built. The climate is very healthy, which is not remarkable, considering how closely it approximates in character to that of Silhet and other places in Eastern Bengal, but very extraordinary, if it be compared with Arracan, only 200 miles further south, which is extremely unhealthy. The prominent difference between the physical features of Chittagong and Arracan, is the presence of mangrove swamps at the latter place, for which the water is too fresh at the former. To the south, undulating dunes stretch along the coast, covered with low bushes, of which a red-flowered *Melastoma* is most prevalent, and is considered a species of *Rhododendron* by many of the residents. But in addition to Melastoma, there occur the Jasmine, Calamus, Ægle Marmelos, Adelia, Memecylon, Ixora, Linostoma, Congea, climbing Cæsalpinia, and many other plants, and along their bases large trees of Amoora, Gaurea, figs, Mesua, and Micromelon.—*Hooker Him. Jour. Vol.* II. *page* 347.

(2595) CHIVENDI, the Tamil name of a Ceylon tree which grows to about eighteen inches in diameter, and twenty feet in height. It is used in house work and for other purposes. —*Edye, Ceylon.*

(2596) CHIVES. Allium schænoprasum. A variety of the onion held in much estimation for its leaves and small bulbs, and used in soups and salads. This vegetable will grow in any common garden, soil requires plenty of water and protection from the vertical rays of the sun. *Jaffrey.* Propagated either by slips or dividing the roots : this may be done at any season, but best after the rains. Nine or ten inches of space must be allowed between each bulb.—*Riddell.*

(2597) CHLORANTHUS, a genus of plants belonging to the natural order *Chloranthaceæ.*—*Engl. Cyc. page* 1051.

(2598) CHLORANTHUS OFFICINALIS, is a smooth shrub 3-4 feet high, with opposite straggling branches, tumid at the articulations fistular when young. All the parts are powerfully aromatic ; the roots, if quickly dried, retain their properties for a long time. The plant is a native of Java, in the moist woods, at an elevation of 1,500 feet above the level of the sea. The mountaineers of Java employ the roots in infusion as a remedy for spasms ; also when united with Anise or *Ocymum* it is given in small pox. In fevers and a suppression of the functions of the skin it is said to be of the greatest service. It is no doubt a powerful and active stimulant.—*Engl. Cyc. page* 1052.

(2599) CHLORANTHUS BRACHYSTACHYS, is also a native of the coast of Java. Its properties are like those of the last species.—*Engl. Cyc. page* 1052.

(2600) CHLOROXYLON SWIETENIA, *Cedrelaceæ*, Ill. 56 bis. Satin wood tree.

Kodawah porsh, TAM. | Dhoura, HIND.
Billu kurra, TEL. |

This tree grows abundantly in the mountainous districts of the Madras Presidency, in the jungles of Goozerat and the Deccan, but seldom attains a large size. Occasionally planks of 10 to 15 inches in breadth may be procured. The wood is very close grained, hard and durable, of a light orange colour, takes a fine polish, and is situated for all kinds of ornamental purposes, but is somewhat apt to split. For picture frames, it is nearly equal to American maple. The timber bears submersion well, in some instances it is beautifully feathered. There is this peculiarity, satin wood loses its beauty by age, unless protected by a coat of fine varnish.—*M. E. J. R.* The Billu Kara of the Circars, says Mr. Rohde, is a most serviceable hard wood well suited for naves of wheels and were it procurable in any quantity for all frame work requiring strength and durability. The Peradenia bridge, a single arch of

205 feet on the road to Kandy, was designed and principally executed in this wood, it is chiefly procured in the jungles on the Eastern side of Ceylon where it attains a diameter of 18 inches of sound wood. The flowered or feathered satin wood when first polished is one of the most beautiful woods in the world. Mr. Rohde has seen specimens surpassingly beautiful, these logs are not distinguishable from ordinary satin wood till sawn, and twenty or forty may be cut without one of any beauty being found—the feathered satin wood seems very liable to sever when dry and old: articles of satin wood get darker and lose much of their beauty by age, unless protracted by a coat of fine varnish.—*Rohde.* The satin wood, so highly esteemed in Ceylon where it attains a large size, until very lately Dr. Wight has never seen it exceed a good sized shrub in India. Planks have been obtained 15 inches broad from the Animullay Forests. The wood is very close grained, takes a fine polish and is fit for all kinds of ornamental purposes. In Ceylon where it is abundant and well known, it is very highly esteemed, and their shell boxes are made of it.—*Wight.* An essential oil is found in *Chloroxylon Swietenia.*

(2601) CHOLOROXYLON DUPADE. Indian dammer wood.

Goglam, TEL. | Ghooglat, HIND. | Koongillium, TAM.

(2602) CHOCOLATE.

Chocolade, DUT.	Chocolate, PORT.
Chocolat, FR.	Schokolad, RUS.
Schokolate, GER.	Chocolate, SP.
Cioccolata, IT.	*Faulkner.*

This agreeable and nutritious substance was introduced into Europe from Mexico by the Spaniards, in 1520, and its source and mode of manufacture was by them long kept secret. Linnæus was so fond of chocolate that he gave the specific name of *Theobroma* (θεὸς, and βρῶμα, the food of gods) to the cacao-tree which produced it. The Mexicans call the tree *chocolalt*; hence our word *chocolate* applied to the prepared seeds. The *Theobroma Cacao*, or chocolate-nut-tree, is a small tree, of which whole forests occur in Demerara. The Mexican cacao, however, is yielded by another member of this family. The capsules of the fruit of this tree are large, somewhat resembling a cucumber, and containing from twenty to thirty seeds, arranged in five regular rows, enveloped in a pulp, which has a sweet and not unpleasant taste, and is frequently used as food in places where the trees are grown. The trees are evergreen, and bear fruit and flowers all the year through; but the usual times for gathering the fruit are June and December. The fruit, which is produced in the West India Islands, Berbice, and Demerara, is much smaller than that of South America. By far the largest quantity of seeds received in England is from the West Indies, and of these the Trinidad nuts are considered the best. The species of this tree are somewhat numerous, and the fruits thereof vary in size, form, and the number of the seeds which they contain. "The general number is from twenty-five to thirty in each fruit; being more abundant as well as of better quality in the cultivated than in the wild plants. They vary much in bitterness, and in the quantity of oil they yield, not only according to the species from which they are obtained, but the manner in which they are treated, after being gathered and taken out of the pulpy fruit. In some instances they are buried in the earth in heaps, and allowed to ferment for thirty or forty days; a process which greatly improves them, and destroys the germinating power of the seed. The different kinds met with in commerce derive their names either from the place where they grow, or from some corruption of the native designation. The average size of good beans is that of a sweet almond, but somewhat thicker. The most esteemed of the known sorts is that termed *Soconuzco* or Mexican, with very small beans, with a remarkably fine flavour, and scarcely any acrid taste. These beans are always buried. This sort never comes to Europe. The next most valuable comes from the Esmeraldas, and has a very agreeable flavour: the chocolate prepared from it has a golden colour: it is seldom met with out of Mexico. The Gautemala cocoa consist of very large beans, very convex, often angular, and very much pointed at the one end. They contain much oil, and are mild, with a pleasant flavour. The beans from Guayaquil, which are three times as large as those of Soconuzco, are less prized than those of Guatemala. The Caraccas or New Granada cocoa, which is among the more highly prized kinds that reach Europe, is obtained from the *Theobroma bicolor*, called by the natives Bacao, and cultivated at Carthago. The beans are of medium size, and very oily. But chocolate made of these alone is not very agreeable, and another kind is commonly mixed with them, which are much smaller and harder. Berbice cocoa beans are not unfrequently mingled with those of Granada. These are also smaller and thinner, but in other respects difficult to distinguish: the shell separates very easily from the kernel, which is reddish brown, and has a strong smell but a pleasant flavour. The Surinam and Essequibo cocoas are not unlike that from New Granada, but are harder, thicker, and not so sweet. All the foregoing are *earth-dried*, the following are called *sun-dried*, being merely collected in heaps and then turned over in the sun: they are consequently much cheaper. Brazilian, called also of Para, and of Maranham, is very extensively employed: the beans are small, smooth, long, somewhat flattened, externally reddish brown with a bitter astringent taste: it is only worth the amount of the former. The West Indian, called *Cocoa des isles*, or *des*

Antilles, is still less valuable, and is employed to form the low-priced cocoas and chocolates." The colouring matter above alluded to amounting to 2·01, was a reddish dyestuff, somewhat akin to the pigment of cochineal. According to Lampadius, the kernel of the West India cacao consists of:—

Fat oil, ...	53·10
Azotized substances (theobromine),	16·70
Starch, ...	10·91
Gum and colouring matter, ...	9·76
Lignine, ...	0·90
Water and loss, ...	8·63
	10·000

The *butter of cacao*, or fatty matter of the nut, is of the consistence of tallow, of a white colour, and of a mild agreeable taste. It is not apt to become rancid by keeping. It is said to be very nutritious, and to act as an anodyne. It is particularly recommended for making ointments. Its proportion, as well as that of the other ingredients, varies greatly in the different sorts. as will be seen by comparing the above analyses. The manufactured chocolate, is made to assume a variety of forms, to which various names are attached, according to the object proposed by the mode of manufacture. The chief of these forms, are chocolate *nibs*, *soluble* chocolate and *chocolate*, properly so called, and lastly *flake cocoa*.—*Tomlinson, p.* 370. See CACOA.

(2603) CHŒNOSTOMA POLYANTHUM. SCROPHULARIACEÆ.—These are pretty dwarf plants, of a white and light yellow colour, well adapted for borders, and thrive in any garden soil.

(2604) CHOKHA. The root of a plant that is brought from Delhi to Ajmere, it is heating: taken internally as a narcotic, is bitter. It is chiefly used mixed with sulphur and oil to cure the itch in camels.—*Gen. Med. Top. p.* 131.

(2605) CHOMONDRI, or Chalembry, the Tamil name of a Ceylon tree, the wood of which is of a very dark colour, and durable. It grows to between twelve and twenty inches in diameter, and twenty feet in height. It is used by the native carpenters for general purposes. It produces a fruit which is used as medicine.—*Edye, Ceylon.*

(2606) CHONEMORPHA MACROPHYLLA. APOCYNACEÆ.—Takes its name from *chone* a funnel and *Morpha* form; a very handsome climbing shrub, with large white flowers, well adapted for a screen or covering a wall.—*Riddell.*

(2607) CHOOKEH. RUMEX VESICARIUS. *Sorrel.* This is of common native growth, and where water is abundant may be had for eight months in the year; it is sown in drills or on the edges around other beds; the leaves are sold in bundles from one to two pice a seer. There is also another species called the Indian Red Sorrel.—*Riddell.*

(2608) CHOOLAEE, *Hind.* This name is indifferently given to Spinacia Tetrandra, Tetrandous Spinach and Amarantus polygamus. The former is a common sort of native greens, and, when boiled, resembles spinach; it is procurable nearly all the year round. The latter is much cultivated by the natives. It is sown broad-cast in beds from June to March. The leaves are sold in the bazar at one pice the seer. Used as a greens and also in curries.—*Riddell, Jaffrey.*

(2609) CHOOPREE ALOO, *Hind.* Tubers roundish, very large, white inside and much esteemed; the skin thin and smooth like a potato. The stems require strong sticks to creep over; it bears a large roundish fruit, like an oak apple in appearance, which is also edible.—*Riddell.*

(2610) CHORIZEMA SPECTABILIS. LEGUMINOSÆ. This ornamental flowering plant was first found on the West Coast of New Holland by Labillardiere, some of the species have scarlet coloured flowers, others yellow and red: they grow best in a rich loamy soil, and may be raised from cuttings, as well as seeds, which they produce in abundance.—*Riddell.*

(2611) CHOR PUTTA, OR SURAT, *Urtica crenulata*, a gigantic stinging nettle, a native of the hills and valleys on the east of Bengal; Luckipore, Pundua Hills and Assam. This nettle affords a quantity of fine white fibre of no great strength, but not durable. The Hill tribes fabricate it into coarse cloths.—*Royle Fib. Pl.*

(2612) CH'HOTA KULPA, *Hind.* Borago Indica.—Indian Borage. This is a common plant and grows wild in many parts.—*Riddell.*

(2613) CHOTIE SAYME KE PULLIE, *Hind.* Dolichos Lablab.—Native Bean. This is a smaller species of the Dolichos Lablab; the legume and seeds are both eaten; it is sown in the rains and sells from one pice or two a seer. —*Riddell.*

(2614) CHOWAT KURNAT. This fibrous material from the Baram River, is supposed to be from a species of Artocarpus, its bark and bark cloth were sent to the Exhibition of 1851.—*Royle Fib. Pl. page* 341.

(2615) CHOWNREE, A swish or fly flapper made of horse hair, the hair of the tail of the Yak of Thibet, or the fine shavings of Sandal-wood, and used by domestics and horsekeepers to brush flies away. They are sometimes made of the stems of sweet smelling grass.—*Herklots.*

(2616) CHOWNSUT KHUMBEH, or Chownsut Sutoon, as it is commonly called, is quite close to the tomb of Nizam-ood-deen

Aolcea near Delhi, and is a singular structure. As the name implies, it is composed of 64 pillars. They are of white marble, supporting a square roof of the same material, which occupies a tolerably wide area. It is a building of great purity, its pale aspect of white throughout being interrupted by no other color. The lattice work that surrounds it is of very delicate execution and well polished. This building seems to be erected to the memory, if not actually over the remains, of a celebrated poet and historian, Ameer Khoosroo, a native of Samarcand and a prince. He was a contemporary and friend of Sheikh Nizam-ood-deen Aoleea, not far from whose tomb, this building is raised.—*French's Tour, page* 13.

(2617) CHROME IRON ORE. CHROMATE OF IRON. A compound of oxide of chrome with protoxide of iron. It is met with massive, and in octahedral crystals of a blackish colour, and imperfect metallic lustre, and is used in the manufacture of chromate of potash. Localities, Unst in Shetland, France, and Baltimore in America; Salem district in the Madras Presidency. At the Madras Exhibition of 1855, a very fine sample of chrome ore weighing about 5 cwt. was exhibited by Mr. Fischer of Salem. The ore has been so largely exported to England as to have lowered the commercial value of the mineral.

(2618) CHRYSANTHEMUM a genus of plants belonging to the natural order *Compositæ* and the sub-order *Corymbiferæ* or *Asteraceæ*. The species are very numerous in the temperate parts of the earth.—*Eng. Cyc. page* 1058.

(2619) CHRYSANTHEMUM INDICUM. CHRISTMAS FLOWER. "*Gool Davodee.*" The origin of the name is from two Greek words Chrysos, gold, and Anthos, flower. There are several varieties common in all gardens. They commence flowering generally in November, and continue for several months The colours are mostly yellow, orange, and a purplish colour mixed with white. They are propagated by seed roots, and suckers, and grow well in any tolerably good soil.—*Riddell.* The beautiful, yellow, fragrant flowers of this plant are made into garlands, and offered at the shrines of Vishnoo விஷ்ணு and சிவம், Sheva.—*Ainslie.* If grown in pots they require a good rich soil to which pounded bricks should be added and a little lime, to preserve the foliage from mildew, to which they are subject. Owing to their succeeding so well in India, the introduction of some of the finer varieties from England is worthy of consideration.—*Jaffrey.*

(2620) CHRYSANTHEMUM SINENSE, is most extensively cultivated in European gardens.—*Eng. Cyc. page* 1052. The chrysanthemum is the Chinese gardener's favourite 'winter flower,' although it is generally past its full beauty at the Chinese new year. There is no other plant which he takes so much pains with or which he cultivates so well. His camellias, azaleas, and roses are well grown and well bloomed: but, in all these, the English excel him in England. In the cultivation of the chrysanthemum, however, he stands unrivalled. The plants themselves seem, as it were, to meet him half way and grow just as he pleases; sometimes Fortune found them in the form of animals, such as horses and deer, and at other times they were made to resemble the pagodas, so common in the country. Whether they were trained into these fanciful forms, or merely grown as simple bushes, they were always in high health, full of fresh green leaves, and never failed to bloom most profusely in the autumn and winter. The method of cultivating the chrysanthemum in China is as follows. Cuttings are struck every year from the young shoots, in the same manner as is done in England. When they are rooted they are potted off at once into the pots in which they are to grow and bloom; that is, they are grown upon what would be called by English gardeners "the one-shift system." The soil used in potting is of a very rich description. About Canton it is generally obtained, in the first instance, from the bottom of lakes or ponds, where the Nelumbium or water-lily grows. It is then laid up to dry and pulverise for some months, when it is mixed with old night-soil taken from the manure tanks found in every garden. A heap of this kind after being laid up for some time and frequently turned over, is in a fit state for potting the chrysanthemum. Manure-water, taken also from the tanks is liberally supplied during the growing season, and its effects are visible in the luxuriant dark-green leaves which cover the plants. In forming the plants into nice compact bushes, which, with due deference to Chinese taste, Fortune thinks much prettier than animals and "Seven-storied pagodas," their system is as follows:—The plants are trained each with a single stem; this is forced to send out numerous laterals near its base, and these are tied down in a neat and regular manner with strings of silk-thread. By having the plants clothed with branches in this way, and by keeping the leaves in a green and healthy state, the specimens never have that bare and broomheaded appearance which they often present in England when they are taken into the greenhouse in winter. In China, as in England, the chrysanthemum flowers during the winter months. When in bloom it is in great request among the people, and is used in the decoration of court-yards, halls, and temples. It is everybody's plant, and blooms alike in the garden of the lowly chinese cottager and in that of the red-buttoned mandarin.—*Fortune's Tea Districts, p.* 125.

(2621) CHRYSOBALANUS ICACO. *Rosaceæ.* This the cocoa plum-tree of the West Indies, has been lately introduced into India.

(2622) CHRYSOBERYL. A gem of a green colour, sometimes with a yellow or brownish tinge, and occasionally presenting internally an opalescent blueish-white light. When transparent and free from flaws, it is much prized. Localities, Ceylon, Connecticut, and Brazil. The finest specimens are obtained from the latter place.—*Faulkner.*

(2623) CHRYSOLITE. An ornamental stone of a bright yellow colour, sometimes tinged with green or brown; transparent, and possessing double the power of refraction. The best specimens are obtained from Egypt.—*Faulkner.*

(2624) CHRYSOPHYLLUM ACUMINATUM. *Sapotaceæ.* Star Apple. Peetakara. Hind. This tree grows to a large size, thirty feet or more, the branches round, and leaves having a ferruginous down upon them when young. The flower is of a pale yellow, and the fruit ripens in October, about the size of a large crab apple: the pulp is of a yellowish colour and firm inside, the outer rind being of a dark brown. It requires no particular soil. There are several trees in the Residency garden at Hyderabad.—*Riddell.*

(2625) CHRYSOPOGON (ANDROPOGON) ACICULARIS. The most common grass on the Tenasserim Coast is a species of the modern genus Chrysopogon, concerning which, Roxburgh well remarks; "Its seeds are exceedingly troublesome to those who walk where it grows, as they stick in the stockings, and produce a disagreeable itching."—*Mason.*

(2626) CHRYSOPRASE. A rare pale-green calcedony, found in Upper Silisia, and Vermont, which owes its colour to the presence of nikel.—*Faulkner.*

(2627) CAUCHOONDA. Hind. Tricosanthes Anguina.—The Snake Gourd. This is sown in the rains, and grown generally over a high pandall, that the fruit may have space to hang down from; a small stone or weight is then tied to the end to increase its length, which varies from a foot and a half to three feet or more. Raw, it resembles a cucumber in flavour, but is better dressed in a stew or curry.—*Jaffrey.*

(2628) CHUCKOONDA, Beta Vulgaris. Common Beet.

(2629) CHUKA KE BINJ. Rumex acetosa: Sorrel. The seed is considered cooling and astringent: It is cultivated in Ajmeer.—*Gen. Med. Top. p.* 130.

(2630) CHUKKAR, a sikh weapon, resembling a quoit in size and shape, thrown from the finger, with a rotatory motion.—*Herklots.*

(2631) CHULCHILHERA, Lichen of the Himalayas. This is the *Borrera ashneh* of Royle; with ammonia it gives a reddish brown colouring matter, and is used accordingly as a dye stuff. Dr. O'Shaughnessy has examined this and several other Indian lichens, and repeated upon these the processes described under the heads of cudbear and litmus, but without success in the production of any valuable colour.—*O'Shaughnessy, page* 672.

(2632) CHUMPOUTE. The Berry of a small plant, brought to Ajmeer via Pali, used in scents and also in medicine: one seer is sold for one rupee.—*Gen. Med. Top. p.* 131.

(2633) CHUMBRANUK. A single valve of the muscle shell without the fish: used in Ajmere as an aphrodisiac.—*Gen. Med. Top. p.* 132

(2634) CHUNDRUS, Opal resin. The fine shavings of it are used in medicine to stop hæmoptysis, made up into a medicine called "Khairwa." It is much used in varnishes. In Ajmere one maund costs thirty-five rupees.—*Gen. Med. Top. p.* 132.

(2635) CHUNAM, Quick Lime.

Chúnná, Chunnam, Guz and Hind.	Chunamboo, Tam. Choonnoo, Tel.

In oriental commerce, a term applied to quick lime, made from calcined shells, also applied to plaster. The plaster of Madras, has long been famed for its marble like polish. Chunam is prepared at this place either from shells or lime-stones. The shells generally used at the Presidency are fossil, but of recent species. They are found in extensive beds, a few feet below the surface on the banks of the Pulicat Lake and other low marshy places on the sea coast, which are covered by the sea at high water. These are calcined with charcoal, one Parah of charcoal being allowed to every two Parahs of Chunam. The kilns generally used are calculated to hold altogether 60 parahs, that is 40 of shells and 20 of charcoal. A small arch, 1 feet 3 inches in height the same in breadth and raised 5 feet above the surface of the ground, runs longitudinally through the kiln, the top of this arch is a grating of brick on edge which is partially covered with broken tiles so that neither the shells nor charcoal can drop through them but small apertures are left for the escape of the ashes and for the necessary circulation of air. Over this bed a layer of charcoal is first placed throughout, about 3 inches in thickness and fire applied: when sufficiently kindled, the mixed shells and charcoal are laid in small heaps of not more than ½ of a parah each at about 1 foot 6 inches apart, and when the fire has been communicated to them the intermediate spaces must be filled up, with more shells and charcoal, to a level, and when the fire has thoroughly extended to them also, another row is to be laid in a heap upon this mass as was done in the first instance, and in the subsequent operations are to be repeated in the same manner until the kiln is filled. The transverse arches are to promote the requisite current of air and the windward ones are invariably to be kept open whilst those on the opposite side must be closed. The kilns used at Madras are built of brick or

clay and require renewal every three years. The shells will be sufficiently calcined in 12 hours, and 24 more are required to cool them so as to admit of their being moved and the charcoal sifted from them. It is found that chunam thus prepared and slaked to a powder is increased to double its original bulk when in the form of shells. The following is the method of plastering with Chunam, at Madras. If for *one coat*, the plaster is composed of one part of Chunam and one and a half of river sand thoroughly mixed and well beaten up with water. This operation is usually performed by women who stand round a small stone trough prepared for the purpose into which the ingredients are thrown and gradually moistened with water, as the process of mixing proceeds. The women use a wooden stick shod like a rice pounder. The plaster when mixed is taken out of the troughs and made into conical heaps where it remains till required and may be kept without injury for several months, but when left for any time a small cistern or hollow is made at the top of the heap into which water is occasionally poured. Before applying the plaster the wall is trimmed with a trowel and swept perfectly clean and then slightly sprinkled with water. The wall being ready, the plaster is put into small wooden boxes at convenient places among the bricklayers by whom it is mixed up with jaggery water, $\frac{3}{4}$lb. of jaggery or coarse sugar being allowed to every parah of quick lime, until it is brought to the required consistency: it is then laid on with a trowel above half an inch thick and levelled with a flat wooden rule, being afterwards smoothed with a wooden rubber till it acquires an even surface. During the process of rubbing, the plaster is occasionally sprinked with a little pure lime mixed with water to give it a hard surface. If for *two coats* of Chunam, the first coat is applied, as already described with the exception that the surface is left rough and no pure lime is applied during the process of rubbing. A day or two after the first coat is applied and while moist, the second is laid on. The plaster used for the second coat consists of three parts of lime and one of white sand. These are mixed as before and afterwards ground by women on a flat stone with a small stone roller till they are reduced to a fine paste. This is laid on a wooden rubber and applied with care over the first coat about $\frac{1}{8}$ of an inch thick. It is then rubbed down perfectly smooth with a small trowel and afterwards polished with a crystal or smooth stone rubber and as soon as it has acquired a fine polish a little very fine (Ballapum) potstone powder is sprinkled on it to increase the whiteness and polish, and the polishing continued. The second coat ought to be applied and finished in one day for it usually hardens too much during the night to be polished the following day except in damp weather. The practice is to continue polishing the plaster until it is quite dry, and a number of bricklayers are employed in order that it may be well polished the first day. Moisture continues to exude from the plaster for some days after it is completed: this must be carefully wiped off with a soft cloth and the wall kept perfectly dry till the moisture entirely ceases. For *three coats* of Chunam, the first coat is as above but it is left a fortnight or three weeks to dry before the second coat is applied. The plaster for the second coat consists of one part of lime and one of fine river sand freed from the coarser particles and from clay by sifting. It is well mixed and beaten up in a clean trough, and applied over the first coat about $\frac{1}{4}$ of an inch in thickness, the first being previously moistened with a little water. It is next rubbed down in the same manner as the first coat but acquires a much smoother surface, the plaster being of a finer quality. A day or two afterwards when it has had time to dry, the third coat is applied. It consists of 4 parts of lime, and one of fine white sand. These, after being well mixed, are reduced by grinding to a very fine paste quite free from grittiness. This is put into a large earthern jar of the size nearly of half a hogshead, and mixed with the whites of eggs, (Tyre) sour-milk, and ghee, in the proportion of 12 eggs, $1\frac{1}{2}$ measures of Tyre, and a $\frac{1}{2}$ lb. of ghee to every parah of Plaster. These are all thoroughly mixed and rubbed between the hands till the ingredients are thoroughly incorporated and the composition reduced to an uniform consistent paste a little thicker than cream and perfectly free from grittiness. The Plaster is now fit for use and is put on with a wooden rubber about $\frac{1}{8}$ of an inch thick and gently rubbed till it becomes perfectly smooth. Immediately after this, another coat of still finer plaster is applied consisting of pure lime ground to a very fine powder and afterwards mixed with water in a clean tub, till it is of the consistency of cream. This is put on about $\frac{1}{16}$ of an inch thick with a brush and rubbed gently with a small trowel till it acquires a slight degree of hardness. It is then rubbed with a rock crystal or stone rubber till a beautiful polish is produced not forgetting to sprinkle the wall with fine pot-stone (Ballapum) powder during the process of polishing. If the plaster is not entirely dry on the second morning, the operation of polishing ought to be continued until it is quite dry. The moisture as above directed must be carefully wiped off and the wall kept quite dry till all appearance of moisture cease. The result of the process depends chiefly on the Plaster for the upper coat being reduced to a very fine paste perfectly free from grittiness, and on its being after it is applied to the wall, rubbed constantly with great care till it is quite dry and has acquired a very fine polish. The wall ought then to be frequently wiped with a fine clean cloth to remove the

moisture and it may be occasionally dusted with Ballapum powder. The stone used in polishing it is rock-crystal or a white quartz pebble about 3 inches long and 1½ broad, the face of which has a very fine polish. The wall is rubbed with this for one or two days, the moisture being carefully wiped off every morning, and Potstone (Ballapum) powder sprinkled on it several times during the day. When the lime is prepared from Sea shells, these are first cleaned and washed and then calcined with charcoal, care being taken to exclude every thing likely to injure the whiteness of the lime : very white sand only is employed, as common sand destroys the brilliancy of the plaster. When white sand is not procurable white rock crystal or quartz pebbles reduced to a fine powder may be substituted. Mortar for building consists of one part of chunam and two of sand. Immediately before being used the mortar is mixed with Jaggery water, 1lb. of Jaggery being allowed to every parah of lime. It is used in a much more fluid state than is the practice in Europe. When shell lime is used in situations requiring a hydraulic cement it should be mixed with burnt clay in powder, fresh burnt tiles more or less broken are in general conveniently procured. In building the pier at Masulipatam. Captain Buckle employed a cement consisting of 1 part of lime, one of the tile dust and two of sharp river sand and it appeared to answer well. Jaggery was used in the usual proportion of 1lb. to a parah of chunam. Limestone abounds in most districts of Southern Asia but the qualities of the different varieties are best ascertained by experiment. When found in large blocks of very compact stone, the breaching of it forms a considerable item in the expense. Such stone as yields very hydraulic lime is not suited to the purposes of ordinary building, unless the precaution is taken of keeping the work constantly wet. The best form of kiln for burning stone with charcoal is given by Captain Smith in his translation of Vicat, Plate 1, fig. 11 and 12. When wood is used the spheroidal form of kiln is recommended. It will be found to facilitate the expulsion of carbon, if the stone is well moistened in water previous to placing it in the kiln. It should be remarked that nothing but clean sand should be added to the hydraulic limes; such limes should be used immediately after slaking. When used in situations requiring hydraulic cement, no more water should be used in slaking it than is sufficient to reduce it to a fine dry powder, Magnesian limestone has been found at Salem and in the Tanjore district, where it has been used with success by Captain Cotton in forming the *annicuts* : the cement formed with it was stronger than that formed with other lime. It appears that it should not be immersed immediately on being used; the mode used in the preparation of this cement is given in Capt. Cotton's report, published at page 28, Engineer professional papers. Much controversy has occured in regard to the advisability of using the lime while hot : the generally received opinion is that it should be so used; but in regard to the pure limes free from clay and iron that is without hydraulic properties, this course is questionable. It was not permitted in Rome, and lime mortar kept moist has been found suitable for building after the lapse of several hundred years, lime used *hot* is seldom thoroughly slaked. A common practice in this country is to mix the slaked lime and sand, form it into heaps, on the summit of which is formed a hollow which is kept constantly filled with water. Shell lime, so kept and subjected to the usual beating when used, seems to Mr. Rohde at least as good as that first burned : hydraulic limes, including of course all which become hard under water ought no doubt to be used hot.—*Rohde M.S.S.*

(2636) CHURRA. A Sanatorium hill station on the N. E. frontier of India. The mean temperture of Churra (elev. 4000 feet) is about 66°, or 16° below that of Calcutta; which, allowing for 2½° of northing, gives 1° of temperature to every 290 to 300 feet of ascent. In summer the thermometer often rises to 88° and 90°; and in the winter, owing to the intense radiation hoar-frost is frequent.—*Hooker Him. Jour. Vol.* II. *page* 284.

(2637) CHURRUS. A resinous intoxicating substance which exudes on the leaves, slender stems, and flowers of the hemp plant (*cannabis sativa*); (WHICH SEE) separated and in masses, it forms *churrus*. Its odour is fragrant and narcotic; taste slightly warm, bitterish, and acrid. It is used for smoking, which causes torpor and intoxication; its effects sometimes prove fatal. Churrus is to be met with in Indian bazars.—*Faulkner*. In collecting this resinous exudation of the flowers of the hemp, a man covers himself with a blanket or leathern dress, runs through a field of hemp early in the morning and the dew and gum of the plant which adheres to the blanket is scraped off. It produces in the inebriate sensuous voluptuous emotions.—*Herklots*.

(2638) CHUTNEE. The Chutnees of India are warm condiments used in every family, either prepared fresh daily, from ripe vegetables or preserved. The following is a recipe for the *Delhi or Celestial Chutnee*. Take of green mangoes; raisins; mustard seed; salt; green ginger; and garlic; each one seer : onions (none or) half a seer; dried red chillies half to one seer : moist or soft sugar, one to two seers; white wine vinegar four bottles. The ginger, garlic and onions are to be peeled, and together with the chillies are to be cut into thin slices previously to being pounded; the mustard seed to be washed and dried, then gently bruised and winnowed; the raisins to be washed and freed from the stones; the sugar to be made into a thick syrup; the mangoes to be picked of their rinds,

cut into thin slices (some boil them in three bottles of the vinegar, adding the fourth when mixing them up with the other ingredients) and pounded; the remaining articles are to be separately pounded, and then the whole is to be incorporated, put into a stone jar, well closed, and placed in the sun for a month or two. If put into a glass bottle, it is occasionally to be put out in the sun. It will keep good for years. 2. *Love-apple Chutnee*: Take of love-apple (solanum lyco-persicum, *Lin.*) a large plateful, the rinds and seed to be rejected, and only the pulp used; dried salt-fish cut very fine (as if rasped), a piece about two inches square; six onions cut into thin longitudinal slices; eighteen green *chillies* chopped fine, dried tamarind two *pice* weight (or once ounce), mashed up in about three or four ounces of water (stones and fibres to be rejected); salt, a teaspoonful; *ghee* or butter, five *pice* weight (or two ounces and a half). First put the *ghee* into a tinned copper vessel placed on the fire, when it is melted add the onions, and as the latter begin to assume a reddish hue add the *chillies*, stirring them well for five minutes: then add the salt fish, and continue stirring the whole; when the *ghee* has nearly evaporated add the love-apples, and stir it about for a good while; lastly, add the tamarind water and salt, and mix the composition well until it acquires a pretty dry consistence (like that of *brinzal-chutnee* or *sambal*). This *chutnee* is only for immediate use, and will not keep above a day or two.

(2639) CIBOTIUM BILLARDIERI, (the Dicksonia antarctica, of Labillardiere), containing the edible pith or bread fruit eaten by the natives. Many other species of ferns are esculent. Typha bread is prepared in Scinde from the pollen of the flowers of the Typha elephantina, and in New Zealand from another species of bulrush (Typha utilis)—*Simmond's Com. Products, page* 380.

(2640) CICCA DISTICHA. PHYLLANTHUS LONGIFOLIUS, Jacquin.—*Roxb. Fl. Ind.* iii. *p.* 672.

Cheramella, or Hurriphul, Beng.	Urfalayoorie, Duk.
Hurfarori, also chelmeri, Hind.	Cherambola, Port.
Arnellie pullum, Tam.	Cheremin, Malay.
	Chillimillie, Tel.
	Country Gooseberry.

A small tree, leaves pinnate, from one to two feet long, scattered about the ends of the branches. Its flowers small, and of a reddish colour. It yields a roundish sub-acid fruit about the size of a large marble.—*Ainslie, p.* 222. The fruit is universally used as an article of food, raw or cooked, or in pickles or preserves. Leaves are sudorific, and seeds cathartic.—*O'Shaughnessy, page* 551. This tree, which is larger than the jujube, is planted by the Burmese all over the Tenasserim Provinces, who value its fruit highly. It bears some resemblance to a gooseberry both in appearance and taste; and Mr. Mason has heard it called "the Otaheite gooseberry." The tree in Tenasserim is diœcious.—*Mason.* Wood inferior.—*Hort. Garden* 31.

(2641) CICENDIA HYSSOPIFOLIA. Nat. Ord. Gentianeæ. (*Syn.* Exacum hyssopif.)

Chota Chyretta. Hind

This plant has been used as one of the kreats; It is common in various parts of the East Indies and in Southern India, the whole plant is bitter, and used by the natives as a stomachic, being also somewhat laxative.—*O'Sh. p.* 460.

(2642) CICER ARIETINUM. Lin.

Cadalay, Tam. & Can.	Chennay, Hind.
Chena, Guz	Cadalacca, Mal.
Hurbareh, Duk.	Bengal gram, Chick Pea, Eng.
Sanigheloo, Tel.	Cheunaka. Sans.
Himis, Arab.	
Nakhood, Pers.	

This valuable pulse is much prized in India particularly in the more northern provinces of Hindoostan, where it is common, and is that generally given to horses. When parched, it tastes not unlike the toasted cashew nut. Professor Link in his travels informs us that it constitutes the chief food of the lower class in Spain, where it is called Garvanzos.—*Ainslie, p.* 237. The chick pea, or Bengal gram, is grown extensively by the Burmese, especially in Burmah, and large quantities are imported into the Tenasserim Provinces from Rangoon.—*Mason.*

(2643) CIDER or CYDER.

Cidre, Fr.	Sidor, Rus.
Zider. Apfelwein, Ger.	Sidra, Sp.
Cidro, It.	

The wine of the apple. It is made in Great Britain, on the Continent of Europe, and in the United States.—*Faulkner.*

(2644) CICHORIUM INTYBUS. Chicory. Wild succory, Κιχωριον, Diosc. Europe. Leaves radical, oblong, deep green, deeply lobed, lobes toothed, cauline leaves small, sessile, and very entire; inodorous, taste very bitter. An Indian species called *Kasni*, scarcely differs from the *C. Intybus*. The roots contain nitrate and sulphate of potash, mucilage, and some bitter extractive principal. An infusion of succory mixed with syrup causes a thickening of the liquid, and a substance is formed termed by the discoverer, M. Lacarteria—Saccho-Cichorine Gum.—*O'Sh. page* 408. Wild Chicory vegetates luxuriantly during the summer in Cashmere, and in the Punjab during the cold season. The Hakims use the Succory-seeds, which are consequently kept in the bazars.—*Honigberger, p.* 256. See Chicory.

(2645) CICUTA VIROSA occurs in Cashmere, where it is called Zehr-i-googul or poison turnip, and in Persian, Salep-i-Shaitan, or Devil's Salep.—*Royle, p.* 426.

(2646) CIGARS.

Pogaku, Tel. | Choota. Hind.

The most celebrated of these manufactured in the Madras Presidency are the Trichinopoly and the Lunka, or those formed of Tobacco grown on the lunkas or islands in the Godavery.—*Rohde M.S.S.* See Cheeroots.

(2647) CINCHONA, a genus of Monopetalous Exogenous Plants, the different species of which have a great reputation in medicine. It constitutes the type of the natural order *Cinchonaceæ.—Engl. Cyc. p.* 1075.

(2648) CINCHONA. [*Cosmibuena*, Ruiz and Pav.] Of the true Cinchonas Lindley describes 24, and under the heads of Lasionama, Cosmibuena, Remija, Hymenodictyon, Exostema, Manettia and Pinkneya, 11 articles are also mentioned. The true Cinchonas, are trees which thrive best at moderate elevations (1000 to 1300 toises), several attain a great height, and the trunk may become as thick as a man's body. M. Fee presents us with a copious tabular view of the geographical distribution of the family He assigns 18 to Peru, 4 to Brazil, 1 to Coromandel, and he enumerates also 15, the localities and characters of which were not perfectly ascertained at the time of the publication of his book. The true cinchonas extend from 20° south to 11° north latitude, at elevations varying from 1200 to 10,800 feet, the mean temperature being estimated at 68°. The enormous consumption of these barks may be estimated by the fact that Pelletier in one year consumed 200,000 lbs. of yellow bark, in the preparation of *Sulphate of Quinine.* The persons engaged in the collection are called *Cascarilleros.* They judge of the fitness of bark by slices of it rapidly reddening when exposed to the air: longitudinal incisions are made with sharp knives along the branches through the entire thickness of the bark, which is then removed by the back of the instrument. The harvest takes place during the dry season, the bark is then placed to dry before the sun. If the pieces are thin they roll up longitudinally into thin cylinders like quills. The larger pieces may retain their original form, shewing thus that the old distinction of *quill, round* and *flat* barks, as characteristic of *species*, are altogether delusive. As the bark of moderately grown trees is the richest in the powerful alkalies, too great *quilling* or its total absence, are unfavourable characters of barks, as showing that the branches were either too young or too old. The superior barks are also very heavy. The best colour is the orange, the worst white; and in proportion to the prevalent tint is the article esteemed by the dealers into whose hands it first passes. The leading varieties of the barks found in the druggist's shops, are denominated the *pale*, the *yellow*, and the *red*. The first of these is now comparatively rare in commerce, and is also known as *Crown* bark; it reaches Europe in chests covered with skins, and containing about 200lbs.; the pieces are about 9 inches in length, smell trifling, slightly aromatic, taste acidulous, pleasantly bitter, rather astringent; some scarcely 1-10th inch in thickness, singly or doubly quilled; the epidermis is cracked, grey-

substance of pale fawn colour, when dry orange; when moistened, the powder is paler than the bark itself. The *red* bark reaches Europe in chests of from 100 to 160 lbs.; the internal part is of a dark rust colour, and the powder a deeper colour still; the pieces are of various sizes, and usually flat, smell weak and peculiar, taste bitter, but more astringent and nauseous than in the *pale* bark. The *yellow* bark is the most employed and esteemed in Europe. The tree grows at an altitude of about 7000 feet in the mountains of Loxa and Quito. The bark reaches Europe in chests of from 90 to 100 lbs., the bundles consisting of pieces about 10 inches long, some quilled, but the greater number flat. The epidermis is greyish brown, often as thick as the bark itself, (about ½ of an inch). The inner bark has a yellow colour passing into orange. In odour it resembles the pale variety. The taste is more bitter, and scarcely at all astringent or rough; when moistened the colour passes to a bright orange, the fracture is woody and fibrous; the colour of the powder is still brighter than the bark itself. It has been clearly shewn by Lindley that these specific names are all erroneously applied—that the *pale* barks are furnished by C. condaminea and C. micrantha —the *yellow* bark chiefly by C. lanceolata—the source of the red bark is still doubtful, while those of the commercial varieties of white Loxa Calisaya, Carthagena, Cusco, and many others are yet altogether unknown.

1. GREY, OR PALE BARKS. a. *Of the grey or pale Loxa bark or Crown bark.* This bark has long been known in Europe, and is admitted to belong to the Cinchona condaminea; it occurs in solid pieces of variable thickness, 12 to 18 inches long, covered with clear or deep grey epidermis, with transverse fissures and wrinkled between ¼ and two lines thick; light, fibrous inner surface pale yellow or reddish, fracture clear or slightly fibrous; powder deep brown, odour peculiar, taste bitter and astringent, adulterated sometimes with willow bark, and with other kinds of cinchona. Imported in packages holding 60 to 90 lbs., or chests of 100 lbs.

b. *Of the grey Cinchona of Lima. Syn* "Silver," or "grey Cinchona" in England and Germany. "Huanuco, or Guanuco bark." Of variable thickness, but seldom exceeding an inch epidermis thin, cracked or flaky, variable in colour according to the parasitic plants by which it is covered, but generally pale grey, with transverse fissures, easily broken or cut, clean, resinous, and more or less compact; odour weak taste astringent and bitter.

2. YELLOW BARKS. *Royal yellow bark Royal bark. Calisaya.* This bark was first brought to Spain in 1789, and was monopolized for the Royal family. The name Calisaya is that of a province in South Peru, where the tree pre-

3. THE RED BARKS. These barks stain the fingers red, contain both *Quinine* and *Cinchonine*, and are at the same time bitter and astringent to an extreme degree. *The common red bark.* (*warty* or *plein*, Guibourt)—*China rubra* of Bergen. Introduced into England in 1779; imported in chests, quills or flat pieces; the bark is frequently warty, the colour of the fine quills is faint red brown: in thick pieces this darkens to chesnut, sometimes with a purple tinge,(Pereira); fracture of quills smooth, of larger pieces fibrous, taste strongly bitter, and rather aromatic. Feé and Pereira deem the tree to be unknown, and the supposition of the bark belonging to the Cinchona oblongifolia to be erroneous; Lindley participates in these opinions.—*O'Sh. page* 391.

(2649) CINCHONA EXCELSA. Roxb. Hymenodictyon excelsum, Wall.

Pundaroo, TEL.

Pundaroo is the Teling name of a large tree which grows in the mountainous parts of the Northern Circars, of Peninsular India: the bark of which, Dr. Roxburgh informs us, possesses both the bitterness and astringency of the Peruvian bark, and when fresh, even in a stronger degree. —*Ain's. Mat. Med. p.* 194.

(2650) CINERARIA AZUREA, *Compositæ*. This genus of flowering plants known by the name of Cape Aster produces abundance of showy flowers of orange coloured, yellow, purple and red varieties. They grow from two to three feet high, the leaves being covered with a soft white down. They are grown from seed and thrive in any good garden soil.—*Riddell.*

(2651) CINNABAR, VERMILLION, RED SULPHATE OF MERCURY.—BI-SULPHURET OF MERCURY.

Zunjefer, ARAB.	Cinnabrium, Hydrargiri-bisulphuretum, LAT.
Paak Shengherf, DUK.	Sedilengam, MAL.
Cinaber, Vermilioen, DUT.	Shengherf, PERS.
Cinnabre, FR.	Kinowar, RUS.
Zinnober, GER.	Inghoolum, SANS.
Hingda, or, Hingra, GUZ.	Cinabrio, SP.
Hingda, Durdar, HIND.	Shadilingum, Enghilicum, TAM.
Hingoor, HINDO.	
Cinabro, IT.	

This is found in commerce native and manufactured. *Native cinnabar* is red, heavy, brilliant; the best is of a high colour, brilliant, and free from earthy or stony matter. It is found in various places, chiefly in quicksilver mines, being one of the ores of that metal. *Artificial cinnabar*—When two parts of mercury and one of sulphur are triturated together, the mercury gradually disappears, and the whole assumes the form of a black powder. When this is heated red hot, it sublimes, and if a proper vessel be placed to receive it, a cake is obtained of a fine red colour, which, when reduced to a fine powder is known by the name of *Vermillion* (*Thomson's Chemistry*). Artificial cinnabar is largely manufactured in Calcutta, and in small quantities at Surat, from both of which places it is brought to Bombay, these are the only kinds procurable in the bazars there. Vermillion is imported into Bombay from China; and is occasionally re-exported to England.—*Faulkner* Cinnabar occurs abundantly in Shensi, and all the quicksilver shwin yin "water silver," i. e. hydrargyrum, not imported into China, is there obtained from this ore, it is said, by a rude process of burning brushwood in the wells, and then collecting the metal after condensation.—*William's Middle Kingdom, p.* 245. Manufactured cinnabar is found in all the Tenasserim bazars, but it is imported there. The native doctors use it considerably to salivate their patients, which they do most effectually by causing them to inhale its fumes. The Burman name appears to be derived from the Sanscrit.—*Mason.* Cinnabar or bisulphuret of Mercury is sold in Calcutta in red, striated, crystalline lumps, also in powder; it is often adulterated by red lead and brick dust. It is entirely volatile from a slip of talc, while these impurities remain behind. Compound Cinnabar Ointment, is Captain Aitkin's well known and useful "ringworm ointment."—*Beng. Phar. p.* 382.

(2652) CINNAMOMUM, a genus of Plants belonging to the natural order *Lauraceæ*. It is confined to Eastern and Southern Asia.—*Engl. Cyc. page* 1087. Lindley includes in the genus Cinnamomum, all the following twelve species.

Names.	Habetat.	Product.
C. aromaticum,.....	China,.....	Source of Chinese cinnamon according to Nees.
C. Culilawan,.....	Amboyna,.....	Culilawan bark.
C. javanicum,.....	Java and Borneo,.....	Bitter and aromatic bark, strongly recommended by Blume in spasmodic colic, and the after-pains of labour.
C. Kiamis,.....	Cochin China,.....	Said to produce one kind of Massoy bark.
C. Loureirii,.....	Cochin China,.....	Flowers of Cassia, and a very inferior cinnamon.
C. nitidum,.....	India, Java, Ceylon,...	Furnished the greater part of the old "Folia Malabathri."
C. rubrum,.....	Cochin China,.....	Similar to C. Culilawan.
C. Sintoc,.....	Neelgherries,.....	Similar, to do. but more bitter.
C. Tamala,.....	India,.....	Tej-pat leaves, or Folia Malabathri of Indian shops.
C. xanthoneuron,.....	Moluccas,.....	Similar to C. Culilawan, but extremely like Massoy bark.
C. zeylanicum,.....	Ceylon,.....	True cinnamon.
C. zeylan.; var. Cassia,	India,.....	Cassia lignea.—*O'Shaughnessy. page* 544.

Dr. Wight, in Icones, gives figures of the following 14 species :—

C. albiflorum,	140	C. nitidum,	124
C. aromaticum,	136	C. obtusifolium,	139
C. Culilawan,	137	C. ovalifolium,	125
C. dubium,	135	C. perpetuoflorens,	141,127,134
C. dulce,	138	C. recurvatum	133
C. iners,	122,122,130	C. villosum,	127
C. multiflorum, β	126,131	C. Zeylanicum,	123,134 7,126,9

It will be seen from the above that the genus contains several species, some of which yield Cinnamon and others Cassia, two aromatic barks which appear to differ from each other in little, except in the degree in which the aromatic principle exists in them. These products have been noticed at some length under the head Cassia. It was long supposed that a Ceylon plant called *Laurus* Cinnamomum yielded true Cinnamon, and another, called *Laurus Cassia*, produced the inferior Cassia bark of the coast of Malabar ; but, according to Nees von Esenbeck, at least two distinct species yield the Cinnamon of the shops, and it is altogether uncertain which out of several yields Cassia. Cinnamon has been known to European nations from very high antiquity. The Greeks procured it, together with the name, as Herodotus (iii. 111) remarks, from the Phœnicians, who are by some supposed to have formed the name Kinnamomon from kagu-manis, or Kaschu-manis, two Malayan words signifying sweet wood ('Annals of Philosophy', 1817); and Cassia itself may have originated in the same word Kaschu, 'wood.' That which is now chiefly consumed in England is the aromatic bark of a small tree found in the Island of Ceylon. With regard to *Cassia lignea*, or Cassia Bark, it seems altogether uncertain what it is that yields it ; whether it is some peculiar species, as it has long been supposed to be, or inferior samples of Cinnamon gathered in unfavourable seasons, or from trees growing in bad situations. The differences in Cassia-Bark are of such a nature as to render the last the most probable conjecture ; it possesses less aromatic oil, a circumstance likely to occur to trees in unfavourable situations ; and in proportion as the oil disappears there is an increase in mucilaginous and resinous matter. But on the other hand there are so many inert or comparatively inert species of *Cinnamomum*, that Cassia may very well belong to one of them. There is *C. dulce* in China, *obtusifolium*, *iners*, *Bazania*, and others, any of which may possibly yield such a bark. The question is however one more of curiosity than real consequence. The only important thing about Cassia was the supposing it to be furnished by what is really a most valuable species, and that error is now removed. Cinnamon of the genuine Ceylon kind is cultivated in Guyana, the island of St. Vincent, the Cape de Verd, Brazil, the Isle of France, Pondicherry Guadaloop, and elsewhere, and it is said that plants obtained from Paris by the Pasha of Egypt have thriven when transported to Cairo.

There is however no probability that the tree will succeed as an article of commerce in any country that has not the hot damp insular climate and bright light of Ceylon. With regard to Cinnamon and cassia Barks as they occur in commerce, we are most indebted to Nees von Esenbeck, who has paid great attention to the subject. According to him, the finest or Ceylon Cinnamon is procured from the three-year-old branches of the *Cinnamomum Zeylanicum* (Blume), which is found native in the island of Ceylon only ; the cultivation however has been extended to Java and to South America. Though found in various parts of the island, it is most abundant in the south-west part, near Colombo, and yields the best Cinnamon when growing in a sandy quartz soil. The time for stripping off the bark is from May to October. The bark, after being removed from the branches, is tied up in bundles for twenty-four hours, during which time a sort of fermentation takes place, which greatly facilitates the separation of the outer part of the bark from the cuticle and epidermis, which is very carefully scraped off the Ceylon Cinnamon. It is then rolled up into quills, or pipes, about three feet in length ; the thinner or smaller quills being surrounded by larger ones — a mark which always distinguishes Cinnamon from Cassia. It is then conveyed to Colombo, where it is sorted by Government inspectors into three kinds, of which the two finest alone were allowed to be exported to Europe, while the third, or inferior kind, was reserved to be distilled along with the broken pieces of the other two for the purpose of obtaining the oil of cinnamon. The select Cinnamon is formed into bales of about 92½ lbs. weight, containing some pepper or coffee, and wrapped in double cloths made of hemp, and not, as stated by some writers, of the cocoa-tree. This fine Cinnamon occurs in pieces about forty inches in length, generally containing from six to eight rolls or quills in each, one within the other, of the thickness of vellum paper, of a dull golden-yellow colour, smooth on both outer and inner surface. It is very fragrant, agreeably aromatic, taste pleasant, warm, aromatic, slightly astringent. Analysed by Vauquelin it yielded volatile oil, tannin in large quantity, an azotised colouring-matter, a peculiar acid, mucilage, and fæculum. The root of the Cinnamon tree yields a kind of camphor, and the leaves yield an oil which resembles oil of cloves, which it is often used to adulterate. This is quite distinct from the oil of cinnamon obtained from the bark. The ripe berries yield by decoction a solid volatile oil, similar to the oil of juniper. Cassia, according to Marshall and others, is the bark of the old branches and trunk of the *Cinnamomum Zeylanicum* already mentioned, while others assert that it is the bark of an entirely different species, namely, of the *Cinnamomum Cassia* (Nees

fratres, et Blume), a native of China, but cultivated in Java. This last view is much the more probable; for not only is no Cassia exported from Ceylon (except the rejected or third sort of Cinnamon, which is introduced into England incorrectly under that name), but almost all the Cassia which reaches Europe comes from Canton. Re-agents produce very different effects both on the infusion and oil of these two barks, which is a rational ground for believing them to be obtained from different species. Cassia is easily distinguished from Cinnamon. The bales in which it arrives are much smaller, containing only from two to four pounds, bound together by portions of the bark of a tree. The quills are thicker, rolled once or twice only, and never contain thinner pieces within; the diameter of the bark is much thicker than that of Cinnamon, and harder, the outer rind less carefully removed (large patches of the cuticle and epidermis often remaining upon it), the colour deeper, of a brownish fawn-colour (that raised in Guyana is yellowish), with the odour of Cinnamon, but fainter and less grateful; the taste more acridly aromatic, pungent, less sweet, at the same time more powerfully astringent and mucilaginous. Cassia is often substituted for Cinnamon, and it is also frequently adulterated with Cassia Lignea (which is the bark of a degenerate variety of the *Cinnamomum Zeylanicum*) Blume, growing in Malabar, Penang, and Silhet, with the bark of Cinnamomum *Culilawan*, and with portions which by distillation have been deprived of their volatile oil. Oil of Cinnamon is obtained chiefly from the fragments which fall from the quills during the inspection and sorting at Colombo. These fragments are coarsely powdered, and after being immersed for forty-eight hours in sea-water, are distilled, when a milky fluid comes over, which separates into two parts, a light oil which floats, and a heavy one which sinks in the water. Eighty pounds weight of Cinnamon yield about two ounces and a half of light oil, and five ounces and a half of heavy oil. About 100 gallons of oil of Cinnamon are annually obtained at Colombo. As the oil which is met with in commerce is a mixture of these two, the specific gravity is variable, 1·035 to 1·090. In time a spontaneous separation takes place, and there are formed beautiful transparent crystals of a stearoptin, or Cinnamon-Camphor. Sometimes benzoic acid is formed. Oil of Cassia is also obtained by distillation; at first it is whiter than oil of Cinnamon, afterwards it becomes yellow, but never of such a fiery yellow as Cinnamon-oil. The odour is agreeable, but not so delicate and Cinnamon-like taste, acrid, burning but different from Cinnamon. Specific gravity 1·0608, it reddens litmus paper. At a low temperature crystals show themselves, which disappear with an increase of heat. Some consider these a camphor, others benzoic acid. Benzoic acid unquestionably exists in this oil.

Oil of Cinnamon is adulterated with oil of Cassia-buds, with the oil of the *Cerasus lauro-cerasus*, or Cherry-Laurel, and it is also said with oil of bitter-almonds, an exceedingly dangerous intermixture.—*Eng. Cyc. p.* 1090.

(2653) CINNAMOMUM AROMATICUM, *Nees v. Esenb.*, from which Cassia Bark and Cassia Buds are supposed to be obtained, is a tree of considerable size. Branches angular, twigs and petioles covered with down. Leaves often nearly opposite, though usually alternate, oblong-lanceolate, acute at each end, triple-nerved, or with three nerves which unite into a single nerve above the insertion of the leaf-stalk, and disappear towards the apex of the leaf; the nerves are, like the twigs, covered with broken (strigulose) downiness, with curved veinlets on the under surface. Panicles narrow, silky. This is the *C. Cassia* of Blume, introduced from China, and the *Laurus Cassia*, t. 3. of the brothers Nees in their paper on the Cinnamon, also of Hort. Kewensis, ii. p. 427, and the Laurus Cinnamomum of Andrews's Repos. t. 595, often quoted 596. The leaves taste mucilaginous and Cinnamonic. Dr. Lindley says that as grown in stoves they are almost insipid, mucilaginous, and somewhat astringent. Dr. Royle received a specimen of this plant (named *Cinnamomum chinense*) from the Messrs. Loddiges, who informed him that it was imported by their house from China in 1790. This is probably the source of the various plants in hot-houses. The leaves taste mucilaginous but also aromatic.—*Royle, p.* 543. According to the Cyclopædia, *C. aromaticum* (Esenbeck), is the species which by some is believed to produce the Cinnamon of China and Cochin China. This plant, which is not uncommon in the hot houses of Europe, has long been reputed the kind that yields cassia but that opinion is also involved in doubt. It is said to grow in the dry sandy districts, lying north-west of the town of Faifoe, between 15° and 16° N. lat. The leaves are very much larger than in the true Cinnamon, they usually hang down from the stalks, have never more than three ribs, and never are in any degree cordate at the base; sometimes they are taper-pointed, sometimes blunt. The aromatic fruits called Cassia-Buds are also yielded by this species. [Cassia Buds.]—*E. C. p.* 1088. Some writers suppose the *Cinnamomum aromaticum*, the *Laurus cassia* of Linnæus, to be the chief source of the "Cassia Lignea" of commerce. Malabar cassia appears to be the produce of another species of *Cinnamomum* probably *C. eucalyptoides*, or *Malabathrum*. Dr. Wight, of the Madras Medical Service, in a report to the East India Company, expresses his belief that the Cassia producing plants extend to nearly every species of the genus Cinnamomum. "A set of specimens submitted for his examination, of the trees furnishing Cassia on the Malabar coast, presented no fewer than

four distinct species; including among them the genuine cinnamon plant, the bark of the older trees of which, it would appear, are exported from the coast as cassia. Three or four more species are natives of Ceylon, exclusive of the cinnamon proper, all of which greatly resemble the cinnamon plant, and in the woods might easily be mistaken for it and peeled, though the produce would be inferior. Thus we have from Western India and Ceylon alone, probably not less than six plants producing cassia, add to this nearly twice as many more species of cinnamomum, the produce of the more eastern states of Asia, and the Islands of the Eastern Archipelago, all remarkable for their striking family likeness; all, he believes, endowed with aromatic properties, and probably the greater part, if not the whole, contributing something towards the general result, and we at once see the impossibility of awarding to any one individual species the credit of being the source whence the cassia lignea of commerce is derived, and equally the impropriety of applying to any one of them the comprehensive specific appellation of cassia, since all sorts of cinnamon like plants, yielding bark of a quality unfit to bear the designation of cinnamon in the market, are passed off as cassia." The Cassia tree according to Mr. Crawfurd, is found in the more northern portion of the Indian isles, as in the Philippines, Majindanao, Sumatra, Borneo, and parts of Celebes. It is also grown on the western Coast of Africa. The principal seat of its culture is, however, the Malabar coast and the provinces of Quantong and Kingse, in China. The famous Cassia of China is incomparably superior in perfume and flavor to any spice of its class. Its native place is supposed to be the interior provinces of China. The market price is said to be £5 per lb.

(2654) CINNAMOMUM CULILAWAN is a native of Amboyna especially in Leitimoo near the villages of Saya, Rutton, and Ema. The bark when dry is aromatic like cloves, but less pungent and sweeter. It has some astringency, and owes its medicinal activity to a combination of volatile oil resin, and bitter extractive. It is useful in dyspeptic complaints, diarrhœas, &c. The natives of Amboyna use it both as an internal medicine and as a stimulating liniment.—*Eng. Cyc. page* 1089.

(2655) CINNAMOMUM EUCALYPTOIDES. Branches roundish, smooth; lower leaves elliptico-oblong, upper ones subovate, acute at the base, subattenuate, obtuse at the apex, 3-nerved, nearly veinless. Panicles sessile, subterminal and axillary. Flowers with silvery silkiness: segments of the perianth obovato cuneiform, deciduous from the middle—*Laurus Malabarathrica*, Roxb. Hort. Calc. p. 30. Wall. Cat. n. 2513, B. "Sapor et odor foliorum fortis et acris caryophyllorum cum levi camphoræ tinctura." The berry not seen.

(2656) CINNAMOMUM INERS. Nees. LAURINEÆ, Icon. 122 bis.

Sembela or pooli pilia, TAM.

This is a tall tree, rather slender in proportion to its height. The wood is fine, even grained and supposed very good, but apparently has never been used by the carpenters of Coimbatore, as none of them are acquainted with it.—*Wight.* Cassia has long been known to be a product of the forests of the Indian Peninsula. It is stated to have been a cause of jealousy between the Dutch and Portuguese that the latter sold some of the *Wild Cinnamon* growing in Cochin, &c. Buchanan, in his Travels in Mysore (ii. 336), mentions it as common on all the hills of the Malabar coast, also that Mr. Brown had planted it at Anjarakandy, as well as the Ceylon cinnamon (ii. 545—6). He states that at Mangalore it was called *Dhal-China* (that is, Cinnamon), and exported to Muscat, Cutch, Scind and Bombay; also that the buds of the tree were called *Cubob-China*, and likewise exported to the same place. This export still continues, as it appears by the reports of the commerce of Madras and of Bombay that 107,856 lbs. of Cassia, were exported from Malabar and Canara, and that in 1844—45, there were imported into Bombay from Malabar and Canara, of Cassia, 52,686 lbs. and of Cassia Buds, 69,860 lbs. Some of these probably find their way into the English market. This plant Dr. Wight considers to be the famous *Carua* of Rheede, Hort. Mal. i. t. 57, referring it, doubtfully however, to *C. iners*, Reinwardt, a plant of Java and Penang, but which seems to be sufficiently distinguished by being devoid of the aromatic qualities of the Malabar plan. *Cinnamomum iners* is however, closely allied to another species, *C. eucalyptoides*, which is intermediate between *C. iners* and *C. nitidum* (Nees). Dr. Wight's drawing of the Malabar Cassia Plant sent to the India House (*v.* his Icones), appears to Dr. Royle to agree very closely with that of *C. eucalyptoides*, given by Nees and Ebern., in their Pflanz Med. and which Nees v. Esenb. describes as Cinnamomum eucalyptoides of *Nees von Esenb.* The *Cinnamomum iners* of *Reinw.* is distinguished chiefly by the leaves being more lanceolate, 3-nerved, nearly veinless. Panicles pedunculate. Segments of the perianth deciduous below the apex. But both require careful re-examination with good specimens, and comparison with the Malabar plant, before any one can determine whether this be identical with either or different from both. In the latter case, it ought to be called *Cinnamomum Carua*. The Chinese *Cinnamomum aromaticum* might, no doubt be successfully cultivated where this thrives so well. Dr. Wight says, "a set of specimens (submitted officially to his examination) of the trees furnishing Cassia on the Malabar coast, presented no fewer than four distinct species, including among them the genuine Cinnamon

plant, the bark of the older branches of which it would appear are exported from that coast as Cassia." And besides, he infers that all sorts of Cinnamon-like plants, yielding bark of a quality unfit to bear the designation of Cinnamon, are passed off as Cassia. Mr. Huxham, of Quilon, also states, that the former is coarser and thicker than the latter. Both are obtained from the same tree, the Cassia being the bark of the larger parts of the tree and the Cinnamon being peeled from the younger shoots and small branches.—*Royle, p.* 544.

(2657) CINNAMOMUM JAVANICUM, is a tree with a trunk 20 feet to 30 feet high, growing in Java and Borneo. The bark is of a deep cinnamon-brown colour, more bitter than Culilawan bark, and the leaves, when rubbed, have a very sharp aromatic odour. Blume says the bark deserves the attention of medical men on account of its powerful anti-spasmodic properties.—*Eng. Cyc. page* 1089.

(2658) CINNAMOMUM LOUREIRII; grows on the lofty mountains of Cochin China, to the west towards Laos, Japan. The flowers of Cassia are produced by this species. The old and young branches are worthless, but the middle-sized shoots are superior to that of Ceylon, and are sold at a much higher price.—*Eng. Cyc. page* 1089.

(2659) CINNAMOMUM NITIDUM, is a shrub or small tree growing on the continent of India. It is the plant which furnished the principal part of the 'Folia Malabathri' of the old pharmacologists.—*Eng. Cyc. page* 1089.

(2660) CINNAMOMUM RUBRUM, grows in Cochin China, and contains an essential oil, like the last species, smelling of cloves, but not so agreeable.—*Eng. Cyc. page* 1089.

(2661) CINNAMOMUM SINTOC, grows on the Neilgherry mountains in Hindustan, and the higher mountains of Java. It is a tree 80 feet high. The bark is in quality very like the true Culilawan, but not so agreeable; it is more bitter and drier, and more powdery when chewed.—*Eng. Cyc. page* 1089.

(2662) CINNAMOMUM TAMALA, is a native of India, wild in Derwanee and Gongachora, cultivated in the gardens of Rungpoor. The taste of the leaves when dried is aromatic; they are sold in the shops under the name of folia Malabathri Tamalapathri of India.—*Eng. Cyc. page* 1089.

(2663) CINNAMOMUM XANTHONEURON, is a tree growing on the Papuan Islands and the Moluccas. The bark has great fragrance when fresh, but loses this quality in time. It is so extremely like Massoy bark as to be confounded with it.—*Eng. Cyc. page* 1089.

(2664) CINNAMOMUM ZEYLANICUM. BLUME. Laurus Cinnamomum. Cinnamomum tree. This is a native of Ceylon, and Java, and is cultivated in various parts of the world. Branches somewhat 4-cornered, smooth, leaves ovate or ovato-oblong, 3 nerved, flowers hoary or silky, segments oblong, deciduous in the middle, fertile stamens 9 in 3 rows, anthers 4-celled, 3 capitate, abortive stamens next the centre. Trunk 15 to 20 feet high, by 1½ feet in diameter. This is the source of the true cinnamon, and indeed nearly all parts of the tree are of value and importance.—*O'Shaughnessy, page* 539. The leaves of the Ceylon Cinnamon-tree, are of an oblong figure, generally more or less heart-shaped at the base; of a thick leathery texture, very smooth and shining on the upper side. The tree is supposed to produce a considerable number of varieties to which native names are given, but it is uncertain whether these are not, in part at least, distinct species. In addition to the aromatic oil contained in its bark, the root of the Cinnamon-tree yields camphor; the liber, oil of cinnamon; the leaves, oil of cloves; and the fruit a peculiar terebintaceous ethereal oil. When the branches are peeled, the finest sticks of Cinnamon are said to be obtained from the liber of the middle sized branches, an inferior sort from the youngest shoots, and that which is produced by the thickest branches is considered of very little value. It is said to require a rich sandy soil mixed with vegetable earth. Some degree of shade is necessary to the young plants, which therefore are not cultivated in open plains, but in spaces in the woods where a few large forest-trees are left scattered about to shade them. In about six or seven years from the time they are sown, young cinnamon bushes are from four to six feet high: they are not however generally barked before the ninth year. The cinnamon peeling begins in May, at the end of the rains, and lasts till November; the operation of peeling consists in nothing more than slitting the bark longitudinally and then cutting it across, so that it can be readily turned back from the wood, and it is the more easy in consequence of the shoots which are cut for peeling not being more than three years old.—*Eng. Cyc. page* 1088.

(2665) CINNAMON.

Darsini, ARAB	Cinnamomum, Canella, LAT.

Cinnamon is the Bark of Cinnamomum Zeylanicum, *Nees von Esenbeck*, (*Laurus Cinnamomum*, Linn.), and *True Cinnamon* of the shops. Cinnamon is the *Kinnemon* of Exod. xxx. 23 (see Bible. Cycl. ii. p. 210), and the κινναμωμον of Herodotus, a name which he states the Greeks learned from the Phœnicians. The name seems derived from the Cingalese

Cacynnama (dulce lignum), or the Malay *Kaimanis*, which Mr. Marshall says is sometimes pronounced *Kainamanis*. (*v. Antiq. of Hind. Med.* 84 and 141.) The Cinnamon tree of Ceylon is about 30 feet high. The root has the odour of Cinnamon as well as that of Camphor, and yields this principle upon distillation. The twigs are somewhat 4-cornered, smooth, shining, and free from any downiness. The leaves are liable to variation, ovate, or ovate-oblong, terminating in an obtuse point, triple or three-nerved, that is, there are three principal nerves, which sometimes remain separate to the very base, but usually approach each other a little above the base, but without uniting; there are, moreover, in many cases, two shorter nerves external to these. Leaves reticulated on the under side, smooth, shining, the uppermost the smallest, with a good deal of the taste of cloves. The leaf-buds are naked. Panicles terminal and axillary. Flowers usually bisexual, rather silky. Perianth 6-cleft segments oblong, the upper part deciduous. Fertile stamens 9, in 3 rows, and 3 inner with 2 sessile glands at the base. Anthers ovate, 4-celled the 3 interior opening outwards. 3 abortive capitate stamens (staminodia) in the interior of all. Ovary 1-celled, with a single ovule. Stigma disk-like. Drupe (or berry) 1-seeded, seated in the cup-like six-lobed base of the perianth. Seed large, with large oily cotyledons: embryo above.—Native of Ceylon, now cultivated elsewhere, as on the Malabar coast, in Java, Cayenne, &c.— *Nees von E. as Laurus Cinnamomum* 128. *Sl. and Ch.* 121.

Ceylon Cinnamon.—Cinnamon is cultivated in plantations situated on the south-west of the island of Ceylon, between Negombo and Matura, where the soil is nearly a pure quartzose sand, the climate damp, showers frequent, and the temperature high and equable. (*Dr. Davy.*) Trees may be cut when six or seven years old. Branches three years old, or which are from half an inch to three inches in diameter, are selected and lopped off, commencing in May and continuing till October. The bark is divided by longitudinal incisions, of which two opposite to each other are made in the smaller shoots, several in the larger, and then peeled off in strips. After twenty-four hours, the epidermis and the green matter under it are scraped off after the strips of bark have been placed on a convex piece of wood. The bark soon contracts into the form of quills, which are about forty inches in length, of which the smaller are introduced within the larger ones, and form the ordinary rolls of Cinnamon. They are dried first in the shade and then in the sun, and sorted into Cinnamon of different qualities, known in commerce as first, second, and third Cinnamon. It is imported chiefly from Ceylon; some also from Tellicherry on the Malabar coast, probably grown at Anjarakandy. (*v. Royle, p.* 371, and *Buchanan's Mysore, p.* 546.) Some is also exported from other parts of the Madras presidency, where it was long since introduced by Dr. Anderson, and grown at Tinnivelly, &c. *v. Roxb. Fl. Ind.* ii. *p.* 296. It has been exported from Quilon *v. Royle, p.* 544. Besides Cinnamon, Oil of Cinnamon is produced and from the ripe fruits a fatty substance called *Cinnamon Butter* is expressed, which *Royle* supposed to be the *Comacum* of Theophrastus. (*Antiq. of Hind. Med.* p. 546.) He finds it noted in Rheede, *Hort. Mal.* i. p. 110. Ceylon Cinnamon of the best quality is in long and slender cylindrical bundles, about forty inches in length, composed of numerous quills rolled up within one another, each about the thickness of cartridge paper, smooth, pliable, breaking readily with a splintery fracture, and easily powdered. The colour of the bark is a dull, yellowish-brown, now usually called a Cinnamon-colour. The surface is intersected by pale glistening fibrils. It has a pleasant, grateful odour, a warm, sweetish, and very agreeable taste. Besides the three qualities of Ceylon Cinnamon, it is also imported of different qualities from the Malabar Coast; and Dr. Wight has ascertained that the Cassia of the Indian Peninsula is sometimes exported as Cinnamon. *v. Royle, p.* 544. But the Cinnamon plant itself has been introduced into so many places, that small quantities are occasionally imported from them, as for instance from Cayenne. Some of these are employed for adulterating the superior and more expensive Ceylon Cinnamon. The inferior kinds are thicker and less grateful, and more resembling Cassia. Analysed, Cinnamon is found to contain Volatile Oil (about 6 parts in 1000), Tannin (of the nature of Catechu Tannin), Mucilage, Resin, Colouring matter, Cinnamic acid, and Ligneous fibre. Oil of cinnamon is imported into Britain from Ceylon, being obtained by macerating the powdered rejected bark in a saturated solution of salt, and then distilling. The water which passes over is milky, from holding the Oil in suspension; but this soon separates. About 8 ounces are obtained from 80lb. of recently prepared Cinnamon. Some of it is heavier and some lighter than water. For a long time the Dutch depended solely for their supply of this bark for the home market on the produce of the wild cinnamon trees in the King of Kandy's territories there. At last, from the increasing demand, they resorted to the growth and more careful culture of the tree themselves. About the year 1794, the cultivation had succeeded so well that they were enabled to meet the demand for the spice from trees of their own growth, independent of any supplies from the Kandian monarch's territory. In 1796, when this island fell into British hands, the local government endeavoured, after the former fashion of the Dutch, to restrain the production of this article of commerce within due bounds, by destroying all

above a certain quantity. General Maitland, in 1805, and his successors in the government, seeing the folly of such a ridiculous policy, very wisely fostered and promoted the extended cultivation of cinnamon plantations. In the island of Java, and in Cochin-China, cinnamon culture has within the last few years made considerable progress. The leaves of the cinnamon tree, when first developed, are of a bright red hue, then of a pale yellow, and lastly of a dark shining green; when mature, they emit a strong aromatic odour if broken or rubbed in the hands, and have the pungent taste of cloves. The young twigs of the true cinnamon tree are not downy, like those of the cassia bark. The plant blooms in January and February, and the seeds ripen in July and August. The blossoms grow on slender foot-stalks, of a pale yellow color, from the axillæ of the leaves and the extremity of the branches. They are numerous clusters of small white flowers, having a brownish shade in the centre, about the same size as the lilac, which it resembles. The fruit is a drupe, about the size of a small hedge strawberry, containing one seed, and of the shape of an acorn, which when ripe is soft and of a dark purple color. The roots are fibrous, hard, and tough, covered with an odoriferous bark; on the outside of a greyish brown, and on the inside of a reddish hue. They strike about three feet into the earth, and spread to a considerable distance. Many of them smell strongly of camphor, which is sometimes extracted from them. The trees in their wild state will grow ordinarily to the height of 30 feet. The trunk is about three feet in circumference, and throws out a great number of large spreading horizontal branches, clothed with thick foliage. When cultivated for their bark, the trees are not permitted to rise above the height of ten feet.

Eastern Archipelago and its general range. According to Mr. Crawfurd, Cinnamon, the Kayu-manis, or sweet-wood of the Malays, the true cinnamon of Ceylon, is certainly not a native plant of any island of the Asiatic Archipelago, nor are the cinnamons of Cochin-China and China. Most of the large islands, however, produce one, or perhaps several species, with little aroma, and consequently of little value. A cinnamon of this description is produced in Java, Sumatra, Borneo, and Luzon, but is described as most abundant in Mindano. Of late years, however, the cinnamon of Ceylon has been cultivated with some success in Java, and in the British settlements in the Straits of Malacca, and as the climate is suitable and the plant a hardy one, requiring but a moderate fertility of soil, it seems to be one of the exotics most likely to succeed. —*Crawfurd Dic: page* 100. But although, (according to Mr. Crawfurd) the true cinnamon is not a native of the islands of the Eastern Archipelago, Marshall, in his description and history of the tree, ("Annals of Philos," vol. x.) assigns very extensive limits to its cultivation. He asserts that it is found on the Malabar coast, in Cochin-China, and Tonquin, Sumatra, the Soolo Archipelago, Borneo, Timor, the Nicobar and Philippine islands. It has been transplanted, and grows well in the Mauritius, Bourbon and the eastern coast of Africa; in the Brazils, Guiana, in South America, and Guadaloupe, Martinique, Tobago, and Jamaica: but produces in the West a bark of every inferior quality to the Oriental. Rumphius has remarked, that the trees which yield cinnamon, cassia, and clove bark (*Cinnamomum Culilaban*), though so much alike, are hardly ever found in the same countries. The term clove bark has been applied to the barks of two different trees belonging to the natural order *Laurineæ*. One of these barks is frequently called "Culilaban bark." It consists of almost flat pieces, and is obtained from *Cinnamomum Culilaban*, a tree growing in Amboyna, and probably other parts of the Moluccas. The other bark, known as clove bark, occurs in quills, which are imported from South America. Murray says it is produced by the *Myrtus caryophyllata*, a tree termed by De-Candolle *Syzigium caryophylleum*. It appears, however, that this is an error, for both Nees and Von Martius declare it to be the produce of *Dicypellium caryophyllatum*; and the last quoted authority states that this tree is the noblest of all the laurels found in the Brazils, where it is called "Pao Crao." It grows at Para and Rio Negro.

Cultivation—Cinamon may be propagated by seeds, plants, or layers; roots also, if carefully transplanted, will thrive in favourable localities, and yield useful shoots in twelve months. It is usually cultivated from suckers, which should not have more than three or four leaves, and require continual watering. If raised from seed, the young plants are kept in a nursery for a year or two, and then transplanted; but the trees from seeds are longer in arriving at maturity. The plants are kept well earthed about the roots to retain the moisture, and cocoa-nut husks are placed above them, which in time form an excellent compost. A cinnamon plantation, even in a favorable locality seldom yields much return until eight or nine years have elapsed. The mode of cultivation pursued by the natives differs from that followed in the plantations of the Europeans. The native system is to allow the cinnamon to grow large before cutting; the European practice is to cut it young. The result is that the native produces quantity, but coarse; the European produces quality, but less in quantity. Native growers, consider the bush or tree decidedly weakened by its being kept down by constant cutting twice a year; and that their plants are stronger and better. The two systems might be judiciously blended. In cutting the cinnamon sticks for peeling, as the

Europeans do it twice a year, there is always risk of losing much valuable young wood, which is destroyed in slashing into the bushes with *cattles* (bill-hooks) to take out that which is in a fit state for peeling, all of which is so much loss from the next cutting; and on this ground we should be inclined to advocate cutting once a year. There are, we know, other considerations than the mere growth of the sticks to be taken into account. Of these may be named the time when the bark peels best from the stick, which of course must depend upon age as well as season, the excited or unexcited state of the shoots, and their several effects upon the quality of the spice. Weeding the plantations does not seem to be of so much consequence, if the shrub gets plenty of free air all round it. Cinnamon land continues to yield abundantly crop after crop, not for years but for scores of years. The greater portion of the late preserved plantations in Ceylon were planted by the Dutch, one hundred years ago, and the bushes are stated to be as vigorous as ever, and quite likely to go on yielding crops till the year 2000. This productiveness can only be accounted for on Liebig's principle of returning to the soil a portion of what we take from it. In the operation of peeling cinnamon, the tops and lateral branches are cut off, and left by the peelers on the ground close to the bushes. These, no doubt, furnish a considerable quantity of manure to the plants. The general appearance of the plantation is that of a copse, with laurel leaves and stems, about the thickness of hazel; occasionally a tree may be seen which, having been allowed to grow for seed, has reached a height of forty or fifty feet, with a trunk eighteen inches in diameter. When in full bloom, the cinnamon bushes have a very beautiful appearance, the small white petals affording a most agreeable contrast with the flame-colored extremities of the upper, and the dark green of the inferior foliage, with the blossoms of various lovely parasitical plants. The cinnamon tree flourishes only in a small portion of the island of Ceylon. It is chiefly confined to the south-west angle, formed by the sea coast, from Tangalle in the south to Chilaw on the west. It is in a climate of agreeable temperature, which is at once hot and moist; hot from its tropical position, and moist from the frequency and plentifulness of rains. The general level of the country is low, in the midst of fresh-water lakes, divided from the sea by a narrow riband of land. And the water in the soil of the cinnamon gardens is of extraordinary purity, so as to be for that reason much in request in the neighbouring city as a beverage. This exact combination of influences does not occur anywhere else in the island, at least not in the same degree. The cultivation principally centres round Colombo, the capital and principal port. On the hills and valleys, in the neighbourhood of Kandy, which have a temperate climate, the tree flourishes well: a rather elevated situation, with shelter, contributing to the luxuriance of the plants. The best soil for it appears to be a pure quartz sand, which in some places rests on black moss or mould. From the surface to the depth of a few inches, this sand is as fine in its nature and as pearly white in its appearance as the best table salt; but below that depth and near the roots of the bushes, the sand is greyish. A specimen of this soil being carefully dried by Dr. Davy, was found to consist of 98·5 silicious sand, 0·5 vegetable matter, and 1·1 water —in 100 parts. This circumstance impresses one very strongly on visiting the cinnamon gardens; it seems so strange to see a plain of pure quartz sand whitened in the sun, and yet covered over with a luxuriant growth of trees. In richer soils the aroma does not seem to develop itself in the same concentrated form. A mixture of loam and peat, with sand, is said, however, to form a good soil in some localities. These plantations may well suggest a doubt as to the truth of the proposition so unqualifiedly laid down by some authors, that "earth destitute of organic matter cannot sustain vegetation." Certainly it is not organic matter which supports the cinnamon trees of Colombo.

Peeling.—The best cinnamon is obtained from the stalks or twigs, which shoot up in a cluster of eight or ten together from the roots, after the parent bush or tree has been cut down. These shoots are cut once in about three years, close to the ground. Great care is requisite, both as to the exact size and age; for if the bark is too young it has a green taste, if too old it is rough and gritty. These shoots yield an incomparably fine cinnamon bark. When cut for peeling they are of various sizes and lengths, depending on the texture of the bark. These rods afford the hazel-like walking sticks so much esteemed by strangers, and which, though difficult to be procured during the prevalence of the oppressive cinnamon regulations, may now be very easily obtained from proprietors of grounds producing that spice. Cinnamon is barked at two periods of the year, between April and December. Those suckers which are considered fit for cutting, are usually about three-fourths of an inch in diameter, and five feet or more long. The first operation is to strip them of the outside pellicle of bark. The twigs are then ripped up lengthwise with the point of a knife, and the liber or inner bark gradually loosened, till it can be entirely taken off. While drying they are cut up into long narrow rolls, called "quills," then stuck into one another, so as to form pipes about three or four feet long, which are afterwards made up in round bundles. During the first day the cinnamon is suspended under shelter upon open platforms, and on the second day it is placed on wicker-work shelves, and exposed to

the sun until sufficiently dry to be examined and sorted for shipment. It is brought home in bags or bales of 80 or 90 lbs. weight, and classed before export into three sorts; first, second, and third quality. The different kinds of cinnamon bark may be thus classified, according to quality.

1. That which ranks above all others in quality, is known by the Singhalese name of *penne* or *rasse kuroondu*, sharp sweet, or honey cinnamon.

2. *Naya kuroondu*, snake cinnamon.

3. *Kapoorn kuroondu*, camphorated cinnamon, from the very strong smell of camphor which it possesses. This variety is principally obtained from the plantations of the interior.

4. *Kahate* or *canalle kuroondu*, astringent cinnamon. In this species the bark peels off very easily, and smells agreeably when fresh, but it has a bitter taste.

5. *Savel kuroondu*, mucilaginous or glutinous cinnamon. This sort acquires a very considerable degree of hardness, which the chewing of it sufficiently proves. It has otherwise little taste, and an ungrateful smell; but the color is very fine, and it is often mixed with the first and best sort; the color being much alike, excepting only that in the good sort some few yellowish spots appear towards the extremities.

6. *Dawool kuroondu*, or drum cinnamon. The wood of this tree, when grown hard, is light and tough, and the natives make some of their vessels and drums of it. The bark is of a pale color.

7. *Nika kuroondu*, wild cinnamon, whose leaf resembles that of the nicasol (*Vitex Negundo*). The bark of this tree has neither taste nor smell when peeled, and is made use of by the natives only in physic, and to extract an oil from to anoint their bodies.

8. *Mal kuroondu*, flowering cinnamon, because this tree is always in blossom. The substance of the wood never becomes so solid and weighty in this as in the other named species, which are sometimes nine or ten feet in circumference. If this ever-flowering cinnamon be cut or bored, a limpid water will issue out of the wound; but it is of use only for the leaves and bark.

9. *Toupat kuroondu*, trefoil cinnamon, of which there are three varieties, which grow in the mountains and valleys of the interior about Kandy.

10. *We kuroondu*, white ant's cinnamon. The first-named four of these are, however, alone varieties of the *Cinnomonum verum*. Good cinnamon is known by the following properties:—It is thin and rather pliable; it ought to be about the substance of royal paper, or somewhat thicker. It admits of a considerable degree of pressure, and bends before it breaks; the fracture is then splintering. It is of a light color, approaching to yellow, bordering but little upon the brown; it possesses a sweetish taste, at the same time it is not stronger than can be borne without pain, and is not succeeded by any after-taste. The more cinnamon departs from these characteristics, the coarser and less serviceable it is esteemed; and it should be rejected if it be hard, and thick as a half-crown piece; if it be very dark colored or brown; if it be very pungent and hot on the tongue, with a taste bordering upon that of cloves, so that it cannot be suffered without pain. Particular care should be taken that it is not false-packed, or mixed with cinnamon of a common sort.

Malacca Cinnamon.—The following remarks, by Mr. Dunewille, of Malacca, as to the suitability of the Straits' Settlements for cinnamon culture, are interesting, although in some instances a repetition of previous observations:—It appears, from experience, that the soil of Ceylon is more favourable to the growth of cinnamon than to that of any other aromatic plant, and I find the climate of Ceylon, if at all, differs but in a very slight degree from that of the Straits. I therefore conclude that the spice, if cultivated in the Straits, will prove superior to that of Ceylon, if one may judge from the various spices that grow here almost wild, and it would moreover yield a better return than in Ceylon. My supposition is confirmed from having seen the spice which was prepared last year in Pringet by the Honorable Resident Councillor of Malacca, and which I found to be equally as good in every respect as that grown and cultivated in the maritime provinces in Ceylon. A sandy soil is that which is generally selected for cinnamon, but other soils may be chosen also, such as a mixture of sandy with red soil, free from quartz, gravel, or rock, also red and dark brown soils. Such land in a flat country is preferable to hilly spots, upon which, however, cinnamon also grows, and are known by the name of the "Kandian Mountains." The soil that is rocky and stony under the surface is bad, and not adapted for the cultivation of cinnamon, as the trees would neither grow fast, nor yield a remunerative return. When a tract of land of the above description is selected, the whole of the ground should be cleared, leaving a few trees for shade, to which the laborers might return for rest and relaxation; these may be from 50 to 60 feet apart. The trees felled should be well lopped, burnt and cleared away, the stumps should be removed with roots, after which they may be allowed to remain, in order to save expense of carriage, merely by observing some degree of order in the disposition, by forming regular rows of which the intervening spaces are planted with cinnamon. The ground being thus cleared, holes may be dug at eight to ten feet apart, and of one foot square; the distance from each plant will depend upon the nature of the soil:—that is, the poorer the soil, the nearer to each other should the trees be planted, and *vice versa*. When

this operation is over, should the holes be intended for cinnamon roots, or stumps, the latter must be carefully removed with as much earth as can be carried up with them and placed in the holes, taking care not to return the earth removed originally in digging the holes, which are to be filled with the soil scraped from the surface, which has been previously burnt, exposed, and formed into manure. Should no rain have fallen after the placing of the roots in the holes, the stumps should be well covered, and watered morning and evening, until such time as the sprouts shoot out fresh buds, which will be in a fortnight or so from the time they were transplanted, when the watering may be discontinued. In a month the new shoots will be three or four inches high; this much depends upon the weather. If the holes be intended for young plants or seedlings, the plants must be removed with boles of earth from the nurseries, and placed in the holes, taking the same care as with the stumps, both in watering and covering, in the event of its being dry weather. When the seedlings take root, the coverings should not be removed until the plants throw out a new pair of leaves from the buds, which is a sign of their having taken root. When a plantation is formed of old stumps, all the branches should be cut down within six inches from the ground; this should be done with one stroke of a sharp instrument, in order to avoid the splitting of the stem. From these stumps cinnamon may be cut and peeled within eighteen months from the time of transplanting. Often this is done after the lapse of twelve months from the time of transplanting. From seedlings one cannot expect to gather a crop before two or three years from the time the plants were transplanted, when there will be but one or a single tree, which when cut down as already shown, four or six inches to the ground, ought to be covered with fresh earth gathered from the space between the rows, and formed in a heap round the plant. The next crop will be three or four times as much as the first, from the number of sprouts the stem will throw out, and so on every year, the crop increasing according to the number of sprouts each stem will throw out yearly from the cuttings. In the course of seven or eight years, the space left between the rows will only admit the peelers and others to go round the bushes, weed, clear and remove cuttings, as the branches from each bush will almost touch each other at their ends. It is essentially necessary to take every care not to allow any creepers or other weeds to grow, the former interfere with the growth of the bushes by entangling, because it not only takes out so much of the support feeding the cinnamon trees, but interferes with the peelers during the cutting season, and prevents the branches growing up straight with a free circulation of air. The plantation ought to be kept clean and free from weeds; the cinnamon requires no manuring, but when the plantation is weeding the bushes should be covered with the surface soil and raising the ground round the bush by making a heap of the earth, which answers well in lieu of manure. This operation must be attended to as soon as the cinnamon sticks are removed for peeling. The plantation requires weeding three or four times a year during the first two or three years, then twice a year will answer the purpose; as by that time the trees will form into bushes and destroy the seeds of the weeds on the ground. The forming of a nursery is necessary, for which a space of ground, say an acre, should be selected in a rich bit of soil free from stones. Clear the whole brushwood, only leaving the large trees for shade, remove all stones, stumps, and roots, dig the place well six or eight inches deep, then form into long beds of three or four feet wide, put the seeds down nine or twelve inches apart, cover them eight or twelve inches above the ground by a platform, and water them every other day until the seeds grow up and give one pair of leaves, then leave off watering (unless great dry weather prevail, when it ought to be continued) but not uncover until the plants grow up six or eight inches high, and can bear the sun; these seedlings will be ready for transplanting after three months from the time they were sown. The forming of nurseries is done at the close of the year, before December. When this is done first, the party commences clearing and preparing the land during the dry season, which is from the beginning of December up to the end of March following. April will set in with heavy rain (it is generally so in Ceylon), and it will continue wet weather till the end of August, very often till September and October, and you have the benefit of four or five months rain. The cinnamon seeds are to be gathered when they are fully ripe, they must be heaped up in a shady place, to have the outside red pulp rotted, when it turns quite black, then have the seeds trampled or otherwise freed from the decomposed pulp, without injuring the seeds, and well washed in water (just as is done to cherry coffee, before they are made into parchment in the whole shell). Finally, have the seeds well dried in the air without exposing them to the sun, and then put them in on the ground prepared for their reception. In washing the seeds, those that float on the surface should be rejected. If cinnamon seeds after washing be exposed to the sun, even for twenty minutes, the shells will crack in two, and this prevents the seeds from growing. There are five different sorts of cinnamon, viz.:—

1st	is	called	Panny Meers	Carundoo.
2nd	,,		Tittha	,, ,,
3rd	,,		Kahatte	,, ,,
4th	,,		Wallee	,, ,,
5th	,,		Savell	,, ,,

Of these, the first kind is the best of all, the 2nd and 3rd, although inferior, are peeled likewise, the 4th and 5th are spurious. The distinction in the cinnamon can be known both by taste, and by the shape of the leaves on the tree, and experienced "Challya" men will judge the cinnamon by first sight. The quality of the bark depends upon its situation in the branch, that peeled from the middle of the bush or branch being the *most superior*, and classed as 1st sort, that taken from the upper end is the 2nd quality, while the bark removed from the base of the branch, or the thickest end, is the inferior, and called the 3rd sort. From the cinnamon bark refused in the sorting store of all kinds, in separating the first, second and third qualities and in making bales for exportation, the refuse is collected, and by a chemical process cinnamon oil is extracted, which sells very high, with an export duty of 3s. or 1½ rupees on each ounce, exclusive of the British duties payable in England for importation, which is at present one shilling and three pence per pound. No export duties exist in the Straits Settlements. Of the cinnamon roots camphor is made, which sells well both in Ceylon and other parts of the world. Cinnamon, as a medicine, is a powerful stimulant, but it is not much used alone. It is generally united with other tonics and stimulants, but its ordinary use is to mask the disagreeable odor and taste of other medicines. The oil of cinnamon is prepared by being coarsely powdered and macerated in sea water for two days and two nights, and both are put into the still. A light oil comes over with the water, and floats on its surface; a heavy oil sinks to the bottom of the receiver, four hours before the light oil separates from the water, and whilst the heavy oil countines to be precipitated for ten, twelve, or sometimes fourteen days. The heavy oil, which separates first, is about the same color as the light oil, but sometimes the portion which separates last has a browner shade than the supernatant oil. The same water can be used advantageously in a second distillation. Professor Duncan informs us that 80 lbs. of newly-prepared cinnamon yield about 2½ ozs. of oil, which floats upon the water, and 5½ of heavy oil. The same quantity of cinnamon, if kept in store for many years, yields 2 oz. of light oil and 5 oz. of heavy oil. Cinnamon oil is obtained from the fragments of bark which remain after peeling, sorting, and packing. It is distilled over with difficulty, and the process is promoted by the addition of salt water, and the use of a low still. The oil thus obtained by distillation is at first of yellow color, but soon assumes a reddish brown hue. It has an odor intermediate between that of cinnamon and vanilla, but possesses in a high degree both the sweet burning taste and the agreeable aromatic smell of cinnamon. It is heavier than water, its specific gravity being 1·035. The ripe fruit of this tree yields a concrete oil called cinnamon suet, which was formerly employed to make candles for the Kandian kings. An oil, called clove oil, is also distilled from the leaf, which is said to be equal in aromatic pungency to that made from the clove at the Moluccas. The following were the quantities sold, and the average prices realised during the Dutch rule in Ceylon:—

			s.	d.	
1690	3,750	bales sold at	4	8	all round.
1709	3,750	,,	4	6	,,
1710	3,500	,,	4	4	,,
1720	5,000	,,	4	4	,,
1740	4,000	,,	9	3	,,
1760	5,000	,,	8	5	,,
1780	2,500	,,	12	6	,,
1784	2,500	,,	17	4	,,

The last quotation appears to have been the highest ever obtained for cinnamon, for 17s. 8d. average would give about 22s. for the first sort In later years we find the deliveries and prices to have been as follows:—

			s.	d.	
1824	5,934	bales sold at	6	6	all round.
1828	3,918	,,	6	0	,,
1830	5,649	,,	7	8	,,
1842	1,018	,,	—		,,
1845	3,245	,,	—		,,

The comparative exports of cinnamon from Ceylon in the first six months of 1853, as compared with the same period of 1852 are as follows:—

	1853. lbs.	1852. lbs.
Quarter ending 5th January ...	99,778 ...	93,291
,, 5th April ...	73,815 ...	135,248
Total.....	173,593 ...	228,539

The diminished export was caused by the prospective abolition of the export duty, which came into operation on the 1st July last. The quantity that will be sent to the English market by the close of the year (1853) will be something prodigious compared with the average consumption. From October 10, 1852, to July 22, 1853, the shipments were 496,326 lbs.

1844 ...	1,057,841 ...	105,784			

The question of the export duty on cinnamon has, during the last twenty years, occupied a considerable space in Ceylon correspondence and the Island journals. This duty was first imposed in 1832, on the abolition of the Government monopoly, and was then fixed at the rate of 3s. per lb. on all qualities. From the 19th April, 1835, it was fixed at 3s. per lb. on the best, and 2s. on the second quality. It was reduced in

January, 1837, to 2s. 9d. on the first and second sorts, and 2s. on the third ; and in June, 1841, to 2s. on all qualities ; in 1843, to 1s. ; and in September, 1848, to 4d. per lb. Such a rate of export duty could be maintained only on an article for which there was a considerable demand, and which could not be supplied from other places, and this was for a long time the case. The circumstances are now different, and the abolition of the duty, which has so repeatedly been brought under the notice of the Treasury, has at length been determined on. The quantity of cinnamon, &c., taken for consumption in the United Kingdom, scarcely amounts to 2,800 bales per annum. The sale and consumption is nearly stationary, and cinnamon is only in demand for those finer purposes for which cassia, its competitor, cannot be used. Whilst Britain imported the large amount of 700,095 lbs. in 1850, only 28,347 lbs. went into consumption. The consumption has declined in the last two years to about 21,500 lbs. Cinnamon is now imported into the United Kingdom duty free. The land under cultivation with cinnamon in Ceylon is about 13,000 acres, principally in the western and southern provinces. The number of gardens being eleven at Kaderane, seven at Ekelli, seven at Morotto, six at Marandham, and two at Willisene.

Khasya Hill Cinnamon.—In the Khasia Hills, the trade in Cinnamon is of recent introduction, and was much encouraged by Mr. Inglis, to whose exertions, the people there are so greatly indebted ; the cinnamon is the peeled bark of a small species of *Cinnamomum* allied to that of Ceylon, and though inferior in flavour and mucilaginous (like cassia), finds a ready market at Calcutta. It has been used to adulterate the Ceylon cinnamon ; and an extensive fraud was attempted by some Europeans at Calcutta, who sent boxes of this with a top layer of the genuine to England. The smell of the cinnamon loads was as fragrant as that of the fish was offensive. —*Hooker Him. Journal, Vol.* II. *page* 309.

Straits of Malacca Cinnamon.—Several enterprising planters have recently commenced the cultivation of this spice at Singapore and Malacca. The plants already promise well. Indeed there can be little doubt of its thriving, as the tree has been long grown in gardens and pleasure grounds in those settlements, as an ornamental plant, and has always flourished. The Ceylon article is being supplanted in the continental markets by a cheaper one, of China and Malabar growth.

Java Cinnamon.—The Javanese, tempted by the fatally high prices caused by the excessvie duties on our Colonial spice, smuggled a quantity of seed, and with it a cinnamon cultivator, out of the island, and have since paid considerable attention to its growth. The Dutch have at present more than five millions of plants, equal to upwards of 5,000 acres, the greater part of which are in tolerably full bearing. The cinnamon trees in Java begin to blossom in the month of March. They do not all flower at the same time, but in succession. The fruit begins to ripen in October in the same manner, so that the crop lasts from October to February. In Ceylon the blossom begins to appear in November. The seeds when plucked ought to be fully ripe, and after being separated from the outer pulpy covering, should be dried in the shade. They can be kept for two or three months in dry sand or ashes, but must not be exposed to the sun, as they would split, and thus be rendered useless. The plants in nurseries must be well sheltered from the sun and heavy rains, but the plants are strengthened by the covers being removed at night when heavy rains are not expected to fall, and in the day time when only light rains prevail. The mode of planting out, cultivation, preparing the bark, &c., appears to be the same in Java as that practised in Ceylon. The only difference is that while in Ceylon the cinnamon, when ready for market, is packed in " gunny" or canvass bags, in Java it is put into boxes, made of wood free from any smell or flavor which would injure the spice. The inferior cinnamon, however, is packed in straw mats. The following is a return of the extent of cinnamon culture in Java :—

	In 1840.	In 1841.
Residencies in which cinnamon is cultivated,	10 ...	10
Number of plantations, ...	48 ...	49

Cinnamon crop, in Dutch lbs	57,074 ...	38,219
,, refuse, ...	23,283 ...	82,803

The number of trees peeled in 1842 was taken at 1,824,599, and the crop reckoned at 108,905 lbs. In the residency of Bantam, four trees suffice to produce a pound of cinnamon, whilst in the other residencies eleven trees must generally be stripped to furnish the same quantity ; in 1839 one pound could scarcely be obtained from thirteen trees. This cultivation increases each year, and the quantity of the produce improves, whilst the expenses diminish. However, the Dutch Government has judged it proper not to extend it, although the soil of Java appears favourable to this culture. From 200,000 to 300,000 lbs. of true cinnamon, not freed from its epidermis, is exported annually from Cochin-China.

Simmonds, p. 393.

London Market.—"Four kinds of cinnamon are distinguished in the London markets; namely Ceylon, Tellicherry, Malabar, and Java cinnamon. The latter however, is rarely met with. A fifth kind, called Cayenne, occurs in French commerce. "1. Ceylon cinnamon.—This is the most esteemed kind. The fasciculi or compound quills, of which the bales are made up, are about three feet six inches long, slender and shivery, and are composed of several smaller quills, inclosed one within the other. The bark is thin (the finest being scarcely thicker than drawing-paper,) smooth, of a light yellow-brown, or brownish-yellow colour, moderately pliable, with a splintery fracture, especially in the longitudinal direction. The inner side, or liber, is darker and browner, and contains, according to Rees, small medullary rays filled with a red juice, and which he regards as the peculiar bearers of the aroma. The odour of the bark is highly fragrant. The flavour is warm, sweetish, and agreeable. Inspection and tasting are the methods resorted to for ascertaining the qualities of cinnamon. Ceylon cinnamon is characterized by being cut obliquely at the bottom of the quill, whereas the other kinds are cut transversely. In the London market, three qualities of Ceylon cinnamon are distinguished; viz, first, seconds, and thirds, inferior kinds thicker, darker, browner, and have a pungent, succeeded by a bitter, taste. "2. Tellicherry or Bombay cinnamon, is grown on one estate only, at Tellicherry, by Mr. Brown, and is wholly consigned to Messrs. Forbes and Co., only 120 or 130 bales are annually imported. In appearance, it is equal to the Ceylon kind, but the internal surface of the bark is more fibrous, and the flavour is inferior. It is superior to the Malabar variety. "3. Madras or Malabar cinnamon, is of inferior quality. It is coarser and inferior in flavour to the other kinds. In thickness, it approximates to cassia lignea. Its quality has annually deteriorated since its introduction into the market. It does not meet with a ready sale, and it is expected that its importation will cease. "4. Java cinnamon. This is said to be equal in quality to the Ceylon sort. "5. Cayenne Cinnamon. This is unknown in the London market. Its volatile oil is more acrid and peppery than the oil from Ceylon cinnamon."—*Hassel's Food and its adulterations, p.* 399.

(2666) CINNAMON OIL.

Tuj-ka-teil. Dalcheenee-ka-teil. HIND.

Is generally prepared from the coarsest part of the bark, by maceration in sea-water, and then distilling with a slow fire. It is one of the most powerful stimulants in the *Materia medica*. The finest has the flavour of cinnamon, and the inferior a considerable mixture of the clove taste. Cassia oil is sold in Bombay under the designation of cinnamon oil; no importations of the latter kind into Bombay being on record during the last few years.—*Faulkner.*

(2667) CINNAMON STONE. A precious stone of a red colour, with occasionally a brown or orange tinge; translucent, rarely transparent, and lustre resinous. They are procured in Ceylon and Brazil.—*Faulkner.*

(2668) CINNAMON TREE, WOOD. The Wood of the Cinnamon tree is used for fuel, and for some articles of furniture: the roots are said to contain a large quantity of pure and very volatile Camphor, highly esteemed in Ceylon. It has been introduced into Sicily, the Cape de Verd Islands; Brazil; the Mauritius, Pondicherry; Guadaloupe, St. Vincents, and Cayenne, the produce of the last locality being inferior only to that of Ceylon.—*O'Shaughnessy.*

(2669) CISSAMPELOS. Nemooka, HIND.

The extract of Pareira is a valuable astringent diuretic in doses of twenty grains dissolved in water thrice daily. The extract of nemooka affords a good substitute for this useful article. An infusion of neemooka is also made. In its use, and dose, it is the same as the infusion of Pareira, for which the nemooka is an efficient substitute—*Beng. Phar. p.* 302.

(2670) CISSUS QUADRANGULARIS. Lin. Seed and leaf of the four-angled cissus.

Perundei codie and elley, TAM.	Nulleroo vitooloo and akoo, TEL.
Nillur kee binj and paat, DUK.	Vajira vullie. SANS.
Harjora, *Hind.*	*Ainslie's Mat. Med. p.* 260.

Stems four angled, winged and jointed; it has all the properties of a parasite; the stems are succulent, and beaten up into a paste, are given by the natives for asthma.—*Riddell.*

(2671) CISTUS, CISTACEÆ. ROCK-ROSE.—This genus of ornamental plants are mostly used for ornamenting rock-work, though some grow to the height of four feet: they do well in most garden soils, and may be cultivated either from seed or by cuttings.—*Riddell.*

(2672) CITRIC ACID.—*Lat.* Acidum Citricum. Is obtained from lime juice by a chemical process, and is met with in beautiful and variously modified crystals. It is employed by calico printers; in the form of lime-juice it is used as an acidulous drink, and in preventing scurvy.—*Faulkner.*

(2673) CITRON. The citron is cultivated in Tenasserim, and Mr. Mason has met with citron trees in the jungles apparently indigenous. The fruit however, is much inferior to the Bengal citron.—*Mason.* See CITRUS MEDICA.

(2674) CITRONELLA OIL, is described by Simmonds as a product of the Citronella grass much grown in the southern province of Ceylon, and about Galle; several estates in the neighbourhood of which city, are cultivated with it. The exports of this oil, from Ceylon, in the three years 1850 to 1852 were,

Year.	ounces.	Value.
1850	80,048	£3,344
1851	114,959	3,742
1852	131,780	2,806

Simmond's Comm. Products, page 573. See ANDROPOGON.

(2675) CITRUS, a genus of Aurantiaceous Plants, one of whose species yields the orange, another the Lemon, and others the Citron, Shaddock, Lime, and similar fruits. Among the other genera of the natural order to which it belongs, it is known by its stamens being numerous and irregularly combined into several parcels, and by its fruit having a leathery rind which can be easily separated from the pulpy part that lies beneath. Independently of the historical facts that citrons and lemons at least were obtained from the Persians, it is certain from the researches of Wallich and other Indian botanists that it is among the lower ranges of hills in Nepaul, and extending most probably into China also, that the wild plants of the genus *Citrus* find a home. It is added that the Sweet Orange itself comes from the southern provinces of China and the Malayan Archipelago, but it is by no means clear that the plant in those countries is really wild. It is however beyond all question also of eastern origin.—*Engl. Cyc. page* 1120.

(2676) CITRUS ACIDA. Acid Lime. Lin.

Neemboo, HIND.

A variety of Citrus Limonum.

(2677) CITRUS AURANTIUM. Orange.

Elimitchum pullum, TAM.	Cherroo Narrange, MALAYALUM.
Neemboo, HIND. DUK.	Nemma pundoo, TEL.
Lemon, ARAB.	Jambira, SANS.
Jerook, MALAY.	

Aglfastier, in his "Padaurtasindaumanic (a treatise on the qualities of aliments), says a great deal in praise of this fruit, particularizing its virtues in putting a stop to bilious vomitings and its good effect in maniacal cases. It is much used by the Natives in making sherbet; and is termed Cherroo Narrange in Malayalum.—*Ainslie, p.* 224.

Citrus Aurantium, Var. Orange.

Dubbakai, pullum, TAM.	Dubba pundoo, TEL.

The Dubbakai is a large coarse, and rather austere fruit of the orange kind, very common in the Northern Circars.—*Ainslie, p.* 224.

Citrus Aurantium, Lin.

Kolinjie pullum. TAM.	Jerooc Manis, MALAY.
Naringhie, DUK.	Kounla, HIND.
Kichilie pundoo, TEL.	Swadoo Naringa, SANS.
Madra Narrange. MAL.	

This variety of the orange fruit (of which there are various sorts) is in high estimation amongst the Tamool Medical Practitioners, who suppose that it purifies the blood, improves the appetite and cures Catarrh.—*Ainslie.* The wood of the Orange tree is not available of any size, or in any quantity—*M. E. J. R.* This tree is now extensively cultivated all over the Deccan. The finest sorts are the Cintra, Cowlah, and a small sweet orange which grows on a tree more like a creeper. The principal method of culture is by budding, the stocks generally being either seedlings or cuttings from the sweet lime. The best Cintra, with a thin close rind, is produced upon the seedling stock, and it is said that the fruit grown upon the sweet lime stock is generally loose and soft: this is very perceptible with some of the oranges. The best time for budding is in the cold season.—*Riddell.* The leaves are rather bitter, and contain essential oil. A still more fragrant oil, called oil of *neroli* by the perfumers, is afforded by the flowers. The berries while unripe are gathered, dried, and turned in the lathe to the size of peas, and are used in issues on account of their fragrant odour. The rind or peel of the orange is bitter and aromatic, and affords a very useful stomachic tincture and syrup. The juice of the ripe fruit contains sugar, malic and citric acids, citrate of lime, mucilage, albumen, and gum. Like the lemon juice it makes an excellent cooling drink, and is an invaluable specific in the treatment of scorbutic diseases. The seeds of the orange yield oil by expression.—*O'Shaughnessy.*

(2678) CITRUS BERGAMIA, large lime. Large varieties of the acid lime are diffused all over the Tenasserim Provinces; and Europeans usually call them citrons; but the trees are easily distinguished by their leaves, as the leaf of the citron is simple, while that of the large lime is winged.—*Mason.*

(2679) CITRUS DECUMANA, *Lin.* Shaddock or Pumplemose.

Poomlimas pullam. TAM	Poomplemoos, MALAY.
Chukotrah. DUK.	Paravata. SANS.
Chukkoturu, HIND.	

This is the shaddock of the West Indies and though now seldom seen on fashionable tables in India, is certainly a fine fruit. It is cooling and aperient and in taste somewhat resembles a fine orange.—*Ainslie, p.* 231. It is the largest of the orange tribe, and is universally cultivated in Southern Asia in gardens; the varieties are red and white—the former preferred by some persons. The tree grows to a large size in a rich soil, and requires much pruning: the best time for doing this is when the crop of fruit is off. Fruit as fine as any seen has been produced

at Ellichpoor from the seed of a pumplemose brought from Bombay. The tree, when planted, should have a space of twelve feet all round it: the blossom is used for flavouring sweetmeats.—*Riddell.*

(2680) CITRUS GALGALA. At Lahore, a species of lemon the size of a doubled fist, called Galgala, is pickled for domestic use and much eaten by the natives.—*Honigberger, p.* 258.

(2681) CITRUS JAPONICA, the "Kumquat," is extensively grown by the Chinese in pots and at one season of the year is literally covered with its small, oval, orange-coloured fruit. This as well as various other species of the orange is mixed with the forced flowers, and together produce an excellent effect. I think if the "kum-quat" were better known, it would be highly prized for decorative purposes during the winter months. It is much more hardy than any other of its tribe; it produces its flowers and fruit in great abundance, and it would doubtless prove a plant of easy cultivation. In order, however, to succeed with it as well as the Chinese do, one little fact should be kept in view, namely, that all the plants of the orange-tribe which bear fruit in a small state are grafted.—*Fortune, p.* 122.

(2682) CITRUS LIMETTA, Bergamot lime, or Sweet lime. This species is chiefly remarkable for the abundance of essential oil afforded by the rind, and which constitutes an important article in commerce, under the name of oil of Bergamot. It is much used by perfumers.

(2683) CITRUS LIMONUM. Lemon tree.
Jambira, Sans; Nimbooka, Neboo, Lembo, Beng. Hind.

Of the Lemon or Lime, there are so many varieties that they can hardly be described separately. The large and small yield abundance of acid juice, and the tree is easily cultivated by layers, which soon throw out root fibres. The lime, which is of the smaller description, does not bear fruit so quickly as the larger sorts, but if carefully pruned, and watered, will continue fruiting all the year round, and be very productive. The *Sweet Lime, Meeta Neemboo,* is a sweet variety, and grows to the size of a large orange. It is easily propagated by seed. The juice of the fruit is very grateful to persons with fever, although rather tasteless. It will also grow from cuttings. The young shoots make a very good stock for orange grafts.—*Riddell.* The *Essential Oil of lemons,* is yellow, light, very volatile. It is prepared by rasping the lemons until the oil-vesicles are removed. These are then pressed between glass plates, and the expressed juice allowed to stand till the impurities subside. This oil is composed of 10 atoms carbon and 8 atoms hydrogen, (citrene). If a current of muriatic acid gas be passed through it at a low temperature, it concretes into a solid mass of neutral crystals, containing 1 atom of muriatic acid, and forming a salt called muriate of citrene. This oil is used chiefly to give flavour to various medicinal mixtures, and is seldom or never employed by itself. Its rind called *Lemon peel* is of a pale yellow colour, rough, dotted, odorous, and bitter; it is used principally, like the oil, for imparting its aromatic taste to medicines, and as a gentle stomachic stimulant. Its juice, the *Lemon juice* of commerce, contains nearly 2 per 100 of citric acid, water 97½, the remainder being gum, malic acid, and extractive matter. It is a most grateful and useful material for the preparation of cooling drinks. Mr. Pereira gives a good formula for these beverages, which are particularly useful in fever cases;—two lemons sliced, two ounces of sugar, two pints of boiling water, mixed and allowed to settle and cool. In scurvy, lemon juice has long been esteemed as a certain specific. As it is difficult to preserve the juice on long voyages, citric acid and the essential oil have been in most cases substituted for the juice itself.—*O'Shaughnessy.*

(2684) CITRUS MEDICA, Citron. (Μηλεα μεδικη of Dioscorides.)

Comuttee madalum pullum, Tam.	Lemon Sussu, Malay.
Turenj, Pers and Duk.	Matooloonga, Sans.
Madipala, Tel.	Kurua-neeboo; Bejoura, Hind.
Utrej, Arab.	*Ainslie, page* 223.

The Citron grows to a large size, the outer rind very rough and covered with excrescences, and when ripe of a deep yellow colour and fragrant; used to form a preserve, and the juice is made into lemonade. It is propagated by cuttings, layers, or seed.—*Riddell.*

(2685) CITRUS MONOPHYLLA. This species of Citrus grows wild along the western Ghauts of the Peninsula of India.—*Riddell.*

(2686) CITRUS TOROSA. This is a species of Citrus at Tavoy with a leaf that looks like two leaves joined together, the wings on the petiole being as broad, or even broader, than the leaf itself. The fruit is small and there are two varieties, one with a smooth, and another with a rough skin. Mr. Mason does not find it noticed in any of our Indian Floras, but Dr. Pickering met with a similar tree on the Samoan Islands, a member of the Philippine Flora.—*Mason.*

(2687) CITRUS TRIFOLIA. This Citrus is a native of China, and is about the size of a marble.

(2688) CITRUS VULGARIS, Bitter, Seville orange. *Syn.* C. Bigarradia, (Duhamel.) The leaves differ from those of the sweet orange by the petiole only. The flowers are alike in both species. The rind of the fruit is bitter, acrid, and hot to the taste, the pulp acid and bitter, the seeds excessively bitter. The bark of the tree participates in these qualities. The rind of the fruit is used in making the celebrated liqueur *curacoa.*—*O'Shaughnessy.*

(2689) CIVET.

Civet, Dut.	Zabad, Arab.
Civette, Fr.	Ruse, Malay.
Zibeth, Ger.	Dedes, Jav.
Zibetto, It.	Kasturi, Sans.

Civet, a substance used in perfumery, has a powerful scent, resembling musk and ambergris. It is obtained from the civets (Viverra), a genus of carnivorous animals, approaching nearest in their form and habits to the fox and the cat. But the distinctive character of the civets consists in an opening near the tail, leading into a double cavity of considerable size, furnished with glands for the secretion of this odorous substance. When the secretion is in excess, the animal frees itself from it by a contractile movement, which causes the civet to ooze from the bag. This is carefully collected and sold (not without adulteration with butter or oil, to increase its weight) at a very high price.—*Eng. Cyc.* In Malay and Javanese this perfume is known by the native names of rase and dedes, but the Sanscrit Kesturi and the Arabic zabad corrupted jabad, are also used as synonyms. In the Eastern Archipelago, this article is produced by two distinct species of Viverra, rase and zibetha, which are kept in a half domesticated state for the purpose of yielding it. The first is a native of Java, and the last of the other large Eastern islands, where the natives of rank are great consumers of this perfume, a not generally acceptable one to Europeans.—*Crawfurd Dic. p.* 100. A variety of this termed Poollughoo Shuttum, *Tam.* Javad, *Duk.* Civet Cat Perfume. Ghendamaly alubeeyum, *Sans.*, is an inferior sort of Musk bag procured from a species of civet cat, zibetha, found in many parts of lower Hindoostan. This animal is called in Tamil, Poollughoo poonay, and in Telugoo, Poonghoo pillie. The article is chiefly used by the people as a perfume and in the preparation of certain liniments.—*Ains. Mat. Med. p.* 192. These animals are carefully kept and tended in North Africa, for the sake of the perfume: they are also common in South America and in the forests of Japan. Civet contains free ammonia, resin, fat, and extractiform matter, and a volatile oil to which its odoriferous properties are due. It is imported into England from the Brazils and from Guinea. When genuine, it is worth from 30 to 40 shillings an ounce.—*Tomlinson, page* 375.

(2690) CIVET, MALACCA. Viverricula Malaccensis.

Viverra malaccensis, ...	Gmelin.
„ *Itasse*.....	Horsfield.
„ *Gunda*, ...	Buchanan Hamilton MSS.
„ *indica*,.....	Geoffroy.
„ *bengalensis*, ...	Gray: Illustr.
„ *pallida*	Gray: Illustr.
Genetta manillensis, ...	Eydoux.

The Indian civet-cats secrete an odoriferous substance identical with civet, though not the civet of commerce. This species is not infrequently found in the villages, and its secretion enters into the Burmese Materia Medica.—*Mason.*

(2691) CIVET, ZIBETH.

Viverra Zibetha, ...	Linne.
„ *undulata*, ...	Gray.
„ *melanurus*, ...	Hodgson.
„ *orientalis*, ...	„
„ *civettoides*, ...	„

This is another species of civet cat, not so abundant as the preceding, which the Burmese call "the horse-cat," from the mane on its neck. —*Mason.*

(2692) CLADANTHUS. Compositæ. Cladanthus Arabicus.—These are small dwarf plants, bearing yellow flowers, and grow in any soil.—*Riddell.*

(2693) CLARET. A term generally used to designate the red wines, the produce of the Bordelais The most esteemed are, Lafitte, Latour, Chateau-Margaux, and Haut-Brion. In France, *Claret* is a general name for all rose coloured wines, and what the English call Claret is styled Bourdeaux.

(2694) CLARKIA. Onagraceæ—These are handsome annuals which make a showy display in flower borders, their colours are rose, white and purple, they ripen seed in abundance which may be sown in any good soil.

(2695) CLAY, a compound, or perhaps only a mixture, of the two earths, alumina and silica, with water. Clay is an essential ingredient in all fertile soils. The following are some of the common varieties of clay :—

1. *Pipe-clay.* Namum, *Tamil*, ; Khurra, *Dukhanee.* This is of a greyish white colour, with an earthy fracture, and a smooth greasy feel; it adheres to the tongue, and is very plastic, tenacious and infusible. When burnt it is of a cream colour, and is used for tobacco-pipes and white pottery. This is found in abundance in several parts of lower India and is used for nearly the same purposes that it is in Europe. The different castes of Hindoos, too, employ it for making the distinguishing marks on their foreheads, and (moistened with water) it is often applied round the eye, in certain cases of ophthalmia, as well as to parts of the body that are bruised.

2. *Potter's clay* is of various colours, chiefly reddish or grey, and becomes red when heated. Mixed with sand it is formed into bricks and tiles. This is abundant in Southern Asia.

3. *Stourbridge clay* resembles potter's clay to a certain extent, but is far more refractory in the fire. It is of a dark colour, owing probably to the presence of carbonaceous matter. It is extensively used in making crucibles, glass pots, &c.

4. *Brick-clay* or *loam* also abundant in Southern Asia. It varies greatly in appearance, texture and composition, its colour depending on the proportion of oxide of iron contained in it.

5. *London clay* is a very extensive deposit of a bluish clay. Near the surface, however, it has often the usual clay colour.

6. *Plastic clay* skirts the London clay within the London chalk basin, and it appears also at the Isle of Wight. This formation comprises a variable number of sand, clay, and pebble beds, alternating irregularly, and lying immediately upon the chalk. The sand-beds of this formation supply the deep well in and about London with soft water.—*Tomlinson, page* 376.

7. *Porcelain clay* is very abundant in Southern and Eastern Asia. The clays of Tenasserim have not been analyzed, but there are clays at the bases of some of the granite mountains, where the felspar has decomposed so much, that the paths are thick with a coarse quartzose sand, and a few grains of mica that remain. As porcelain clay is produced by the decomposition of felspar, such is probably the clay in the localities to which reference has been made.—*Mason.*

8. *Fire clays* are procurable at Streepermatoor, Tripasoor, Chingleput, Metapolliam, Cuddapah.—*Dr. Hunter.*

(2696) CLEARING NUT. Strychnos Potatorum.

(2697) CLEMATIDEÆ. The name is derived from Clema, a vine branch, from the climbing properties of the family. This tribe is acrid and poisonous; the leaves and fresh stems, if bruised and applied to the skin, cause vesication. Royle describes 10 Himalayan species. There is one, the *Clematis gouriana*, abundant among the ruins of Gour, and which doubtless participates in the properties of the others. In France the *Clematis vitulba* is used by mendicants to cause artificial sores for the furtherance of their impostures. In Cochin China, according to Louriero, the *Clematis sinensis* is used as a diuretic and diaphoretic. At the Mauritius the *Clematis mauritiana* is employed to blister the cheek for the relief of tooth-ache. No species of Clematis is admitted in the British pharmacopeiæ —still from the experiments of Storck, Wendt, and Mueller with several species, in the treatment of syphilis, scrofula, and rheumatsim, there seems much reason to hope for beneficial effects from the cautious trial of the Indian kinds. Storck used an infusion of 2 scruples of the dried leaf in a pint of boiling water, the dose 4 ounces thrice daily.—*O'Shaughnessy, p.* 160.

(2698) CLEMATIS. Griffith says there is one species, the virgin's bower, of this northern genus in the Tenasserim Provinces "with simple fleshy leaves."—*Mason.*

(2699) CLEMATIS GOURIANA. The Gouriana or Traveller's joy, flowers white, at the close of the rains, and gives out a very strong perfume, it is a hardy plant grows in any soil. The whole species are adapted for trellis work and easily increased by dividing the plants. The colours are various, white, blue, lilac, yellow, &c. —*Riddell.*

(2700) CLEMATIS WIGHTIANA.

(2701) CLEOME. There are about fifty species of the genus *Cleome* described; many of them are now referred to the genus *Polanisia*. Most of them are worth cultivating on account of their beauty. The shrubby species do best in a rich light soil. In England, they may be propagated by ripened cuttings in a moderate heat under a hand-glass, or by seed. The seeds of the annual species should be sown on a hot-bed in spring, and when the young plants are of sufficient size they may be planted out in the open border but not before the middle of May. The biennial species must be kept in the stove; they may be propagated by cuttings, as the shrubby species.—*Engl. Cyc. p.* 1132.

(2702) CLEOME PENTAPHYLLA. This and other species of this genus are very pretty and grow well in a light rich soil, the colours of the flowers are white, red, purple and yellow, cultivated easily from seed.—*Riddell.* Mr. Jaffrey mentions, Cleome pentaphylla, syn. Gynandropsis, *Valay-keeray*, T., as a common weed in cultivated places; a variety with rose colored flowers, is cultivated in flower gardens. The leaves of the wild varieties are used as greens in soups, &c.—*Jaffrey.* Cleome pentaphylla, grows plentifully at Lahore, but the seeds are little used by the Hakims, they use them in convulsions, those of Cleome viscida are said to be anthelmentic.—*Honigberger, p.* 258.

(2703) CLEOME VISCOSA. VISCID CLEOME. Hoorhooriga, HIND.

This is a very common annual weed in Rajwarra especially at Ajmeer; the plant has a very strong nauseous smell, the seeds are eaten in curries.—*Genl. Med. Top. p.* 201.

(2704) CLERODENDRON. One of this genus grows in the Terai, forming a large shrub beneath every tree, generally intermixed with ferns, as polypodium, Pteris, and goniopteris, and its sweet odour is born far through the air. Clerodendron leaves bruised, are used to kill vermin, fly-blows &c. in cattle, and the twigs form tooth-picks. Its flowers are presented to Mahadeo, as a god of pence; milk, honey, flowers, fruit (ambrosai) &c. being offered to the pacific gods, as Vishnu, Kishna, &c. while Mudar (Calotropis, Asclepias) Bhang, Cannabinus sativus, Datura, flesh, blood, and spirituous liquids, are offered to Siva, Doorga, Kali and other destroying deities.—*Hooker Him. Jour. Vol.* 1, *p.* 387.

(2705) CLERODENDRON, DOUBLE FLOWERED CLERODENDRON. The Burmese cultivate a fragrant double clerodendron, which appears to be a variety of the next species.—*Mason.*

(2706) CLERODENDRON, FRAGRANT CLERODENDRON. In the most arid parts of the Tenasserim forests, during the hottest months of the dry season, the path of the traveller is perfumed by the fragrant flowers of a large leaved species of clerodendron. Major Macfarquhar

sent specimens to the Agricultural and Horticultural Society of Calcutta a few years ago, but they were unable to determine the species satisfactorily.—*Mason.*

(2707) CLERODENDRON INFORTUNATUM, is a bark used by the Arabian and Indian doctors.—*Honigberger, p.* 258.

(2708) CLERODENDRON NUTANS, NODDING CLERODENDRON. The Karen mountain glens of Tavoy and Mergui are embellished with one of the most elegant flowering shrubs that ever beautified a landscape—it is the nodding clerodendron. The flowers are tinged with rose, but nearly white, growing in long panicles at the extremities of the branches from which they make a graceful curve, and hang down perpendicularly from ten to fifteen inches, like an inverted cone, so that the soft greening foliage seems canopied with rosy-white vails. The flowerets are few, the divisions of the panicle being remote, and each bearing only three or five flowers. The divisions and subdivisions being all rectangular, and each blossom hanging from its pedicel like an ear drop, order and beauty are inseparable associations with this rare plant. It deserves a place in every conservatory, yet from Loudon's Encyclopedia of plants before me, it had not reached England when that was printed; and it is not in Wright and Eaton's Botany of North American plants, indigenous and cultivated. The shrub blooms in the dry season, and rarely exceeds in its native soil, more then ten feet in height.—*Mason.*

(2709) CLERODENDRON SQUAMATUM, SCARLET CLERODENDRON. The Burmese compounds are ornamented with this species of clerodendron, which bears a large cone of superb scarlet flowers, and, although said to be originally from China, it appears to be naturalized on this Coast.—*Mason.*

(2710) CLIMATE. Meyen, in his division of the horizontal range of vegetation, into zones, extends,—1. *The equatorial zone* to fifteen degrees on both sides of the equator. In this division we shall find the Cape Verd Islands. Sierra Leone, Ascension and St. Helena, the republic of Liberia, the European and native settlements in the Gulf of Guinea and on the Western Coast of Africa; Abyssinnia, Zanzibar on the East Coast, Mocha and Aden in the Red Sea, the northern portion of Madagascar, the Seychelles, the Madras Presidency, Northern India, Ceylon and the Nicobar Islands, Sumatra, Siam, Malacca, Singapore and the Straits Settlements, Cochin China, the Philippine Islands, Borneo, Celebes and the Moluccas, Java and Madura, Banca, the Johore Archipelago, Timor and the eastern group of Islands, with New Guinea, a large portion of Northern Australia, the Marquesas, Society's and other Oceanic islands. In South America the Republics of Peru, Bolivia, Ecuador, New Granada and Venezuela, British, French and Dutch Guiana, and a large portion of the empire of Brazil; Trinidad, Barbados, and most of the islands in the Carribean Sea. This zone has a mean temperature of 78½ to 82½ Fahrenheit.

2. *The tropical zone* reaches from the 15th deg. on each side of the equator to the tropics in 23 lat. The mean temperature is 73½ to 78½ deg. Summer temperature 80½ to 86 deg.; winter temperature in the eastern coast districts, 59 deg. In this region is comprised the following countries:—Sandwich Isles, Canton, in province of China, Burmah, Calcutta, and a portion of the Bengal Presidency, the Bombay Presidency, Madagascar, Mauritius and Bourbon; the southern portion of Brazil, Cuba, St. Domingo, Mexico, and Central America.

3. *The sub-tropical zone* extends from the tropics 23 to 34 deg. of latitude. There are a number of tropical fruits in this region. The winters are mild and vegetation is green throughout the year. In the northern division of the zone palms and bananas grow on the plains. In this region is comprised all the extreme northern portions of Africa, coasting the Mediterranean, comprising Algiers and the Barbary States, Egypt, part of Persia, Cabool and the Punjab; the greater portion of China, Lower California, Texas, the South-Western States of America, the Bermudas, the Cape Colony and Natal, New South Wales, Southern and Western Australia—the Government settlements in the Northern Island of New Zealand, the largest portion of Chile, Paraguay, Uruguay and the Argentine Republics, the Provinces of Brazil from St. Paul to Rio Grande, Madeira and the Canary Isles. To define accurately the conditions of temperature which a plant requires to maintain it in a flourishing condition, we must ascertain within what limits its period of vegetation may vary, and what quantity of heat it requires. This most remarkable circumstance was first observed by Boussingault, but unfortunately we do not as yet possess sufficiently accurate accounts of the conditions of culture in the various regions of the earth, to enable us to follow out this ingenious view in all its details. His theory is, that the time required by a plant to arrive at maturity is as the inverse ratio of the temperature; therefore, knowing the mean temperature of any place, and the number of days which a plant takes to ripen, the time required at any other point more or less elevated, can easily be ascertained. Peter Purry, a native of Switzerland, who settled in Charleston in the eighteenth century, in a memorial to the Duke of Newcastle, then Secretary of State, sets out with this postulate, that "there is a certain latitude on our globe, so happily tempered between the extremes of heat and cold, as to be more particularly adapted than any other for certain rich productions of the earth; among which are silk, cotton, indigo," &c.—and he fixes on the latitude of 33 deg. whether north

or south, as the one of that peculiar character. The following Table, showing the climate, duration and production of certain plants cultivated in tropical America, is from the proceedings of the Agricultural Society of Grenada. The second column gives the altitude in English yards above the level of the sea. The third, the mean temperature by Fahrenheit's thermometer. The fourth, the average time required to commence bearing. The fifth, the number of plants in a spanish "fanegada" of 170 varras, about 150 square yards. The sixth, the average duration of each plant. The seventh, the average produce of each plant in the year :—

	2 Level of the Sea, to	3 Mn.Temp. Deg. Min.	4 Time required.	5 No. of plants.	6 Years.	7 Average produce.
Cacao (*Theobroma Cacao*), ...	587 yds.	81·17 46·00	6½ yrs.	1156	40	1¼lb. per tree.

Wheat (*Triticum aestivum.*)...	567 1170 2520	42·30 38·70 32·99	80 „ 100 „ 120 „	57,800	Annual.	37 for every seed planted.

The plantain bears at 1,529 yards, in a temperature of 61 deg. Fahrenheit, and requires fifteen months, but its cultivation is of little benefit in so high a latitude. It is the same with the cassava root. The cane at 1,160 altitude, in a temperature of 66 deg., gives no sugar; and indigo at 1,620 affords no coloring matter.—*Simmonds, page* 10. Dr. Royle gives the following arrangement of the countries of which the plants will grow in the different parts of India.

Tropical & East-Indian Islands, Tropical Africa, Brazil, Guiana, West-Indies, and Florida.	Travancore, Cochin, Malabar, Ceylon, Malayan Peninsula. Chittagong, Bengal, Lower Assam.
East and West Coast of Africa.	Coromandel Coast, Northern Circars, Concan.
Southern States of North America, Egypt, north of Africa, Syria.	Gujerat, Behar, Doab, Delhi, Malwa.
Mexican Highlands, Lower Mountains of Spain	Mysore, Hilly ranges in Deccan, Rajpootana.
South of Africa, Extra-Tropical New Holland, South America beyond 23½° S. lat.	Saharumpore and Northern Doab.
Mediterranean Region.	Deyra Doon, and Himalayan Valleys to moderate elevations.
Chino-Japanese Region, Middle Andes, Peru, and Mountains of Brazil.	Neilgherries, Upper Assam, Himalayan Mountains.
North of Europe, North of Asia, and North America.	Himalayan Mountains, Regions of Oaks and Pines.
Arctic regions, Mountains of Europe, Elevated Andes.	Himalayas above Region of Forest.

[*Royle Prod. Res. of India.*

At another place he states that the northern like the southern part of India, enjoys two crops during the year, one called the *khureef*, or rain crop, sown in June, and reaped in October, the other sown in October, and reaped in March and April, called the *rubbee* crop. The latter, embracing the months which approximate in temperature to that of the seasons of cultivation in older countries, corresponds with them also in the nature of the plants cultivated, as for instance, Wheat, Barley, Oats, and Millet, Peas, Beans, Vetch, Tares, Chick-peas, Pigeon-peas, and Lentils; Tobacco, Safflower, and Succory; Flax, and plants allied to Mustard and Rape, as Oil Seeds; Carrot, Coriander, Cummin, and other seeds of a similar kind, as *ajwain*, *sonf*, *soya*, *aneeson*. In the rainy season, a totally different set of plants engages the agriculturist's attention, as Rice, Cotton, Indigo, and Maize, with Sorghum, joar, koda, most of the tropical legumes, as well as several of the Cucumber and Gourd tribes, together with the Sesamum for Oil, and the varieties of the Egg plant, as a vegetable. The Sun and Sunnee, two cordage plants, are also cultivated at this season.—*Royle's Productive Resources of India.* Mr. Fortune says that in China, the staple summer crops are those which yield textile fibres. A plant well known by the name of jute in India, a species of Corchorus—which has been largely exported to Europe of late years from India is grown here to a very large extent. In China this fibre is used in the manufacture of sacks and bags for holding rice and other grains. A gigantic species of hemp (Cannabis) growing from ten to fifteen feet in height is also a staple summer crop. This is chiefly used in making ropes and string of various sizes such articles being in great demand for tracking the boats up rivers and in the canals of the country. Every one has heard of China grass-cloth—that beautiful fabric made in the Canton province and largely exported to Europe and America. The plant which is supposed to produce this (Urtica nivea) is also abundantly grown in the western part of this province and in the adjoining province of Kiangse. Fabrics of various degrees of fineness are made from this fibre and sold in these provinces, but I have not seen any so fine as that made about Canton: it is also spun into thread for sewing purposes, and is found to be very strong and durable. There are two very distinct varieties of this plant common in Chekiang—one the cultivated, the other the wild. The cultivated variety has larger leaves than the other; on the upper side they are of a lighter green, and on the under they are much more downy. The stems also are lighter in colour, and the whole plant has a silky feel about it which the wild one wants. The wild variety grows plentifully on sloping banks, on city walls, and other old and ruinous buildings. It is not prized by the natives, who say its fibre is not so fine, and more broken and confused in its structure than the other kind. The cultivated kind yields three crops a year. The last great crop which I observed was that of a species of juncus, the stems of which are woven into beautiful mats, used by the natives for sleeping upon, for covering the floors of rooms and for many other useful purposes. This is cultivated in water, somewhat like the rice-plant, and is therefore always planted in the lowest part of these valleys. At the time of my visit, in the beginning of July, the harvest of this crop had just commenced, and hundreds of the natives were busily employed in drying it. The river's banks, uncultivated land, the dry gravelly bed of the river, and every other available spot was taken up with this operation. At grey dawn of morning the sheaves or bundles were taken out of temporary sheds, erected for the purpose of keeping off the rain and dew, and shaken thinly over the surface of the ground. In the afternoon, before the sun had sunk very low in the horizon, it was gathered up again into sheaves and placed under cover for the night. A watch was then set in each of the sheds; for however quiet and harmless the people in these parts are, there is no lack of thieves, who are very honest if they have no opportunity to steal. And so the process of winnowing went on day by day until the whole of the moisture was dried out of the reeds. They were then bound up firmly in round bundles, and either sold in the markets of the country, or taken to Ningpo and other towns where the manufacture of mats is carried on, on a large scale. The winter crops of this part of China consist of wheat, barley, the cabbage oil-plant, and many other kind of vegetables on a

smaller scale, Large tracts of land are planted with the bulbs of a liliaceous plant, probably a Fritillaria, which are used in medicine. This is planted in November, and dug up again in April and May. In March these lily fields are in full blossom, and give quite a feature to the country. The flowers are of a dingy greyish white, and not very ornamental.—*A. Res. among the Chinese, page* 259.

(2711) CLIMBERS. At Tonglo, in Sikkim, at an elevation of several thousand feet, Dr. Hooker found great scandent trees twisting around the trunks of others, and strangling them: the latter gradually decay, leaving the sheath of climbers as one of the most remarkable vegetable phenomena of these mountains. These climbers belong to several orders, and may be roughly classified in two groups.—(1.) Those whose stems merely twine, and by constricting certain parts of their support, induce death.—(2.) Those which form a net-work round the trunk, by the coalescence of their lateral branches and aerial roots, &c.: these wholly envelope and often conceal the tree they enclose, whose branches appear rising far above those of its destroyer. To the first of these groups belong many natural orders, of which the most prominent are—*Leguminosæ*, ivies, hydrangea, vines, Pothos, &c. The inosculating ones are almost all figs and *Wightia*: the latter is the most remarkable, for its grasping roots.—*Hooker Him. Journ. Vol.* I, *page* 163-164.

(2712) CLINTONIA ELEGANS. This and other species are pretty border plants, colours white and blue: they flower and give seed abundantly and thrive in any good soil.

(2713) CLITORIA TERNATEA, Ternate Clitoria. (Crow's beak),

Upurajita, Beng.	Neela gheeria, khurne, Sans.
Upuragita, kowa, kowa-theti, Hind.	Kalizer-ke-jur, Hind.

This may be cultivated as a flowering plant, and there are several varieties. The most common are the blue and white. They blossom all the year round, and being shrubby twining plants, are well suited for covering trellis work. They are of easy growth, and the blue flowers are used sometimes for colouring boiled rice. Are propagated by seed, and in any soil.—*Riddell.* In some parts of Southern Asia, it is a common wild creeper during the rains, and Dr. Hooker mentions that a beautiful blue-flowered *Clitoria* creeps over the path to Syong on the Khasia Hills, with the ground-raspberrry of Darjiling.—*Him. Jour. Vol.* II, *page* 291. In Tenasserim the clitoria ternatea, with its deep blue flowers, is seen tangled with other climbers, wandering over trees, and arbors, in all parts of the country.—*Mason.* Dr. Ainslie informs us that the sweetish, somewhat warm white root of this plant (which is common all over India) is given in substance ground into powder in croup cases, that it sickens and sometimes vomits, the dose being half a pagoda weight for a child of two or three years. Dr. O'Shaughnessy used the root extensively in order to test its alleged emetic effects, but never observed the occurrence; an alcoholic extract acts however as a brisk purgative in from 5 to 10 grain doses. But griping and tenesmus are often produced, and during the operation of the medicine the patient is feverish and uneasy. He does not recommend its use.—*O'Shaughnessy, page* 315.

(2714) CLOTH AND CORDAGE MATERIALS. See Fibrous Materials.

(2715) CLOTHS. Long cloths or punjums of various qualities were formerly manufactured to a great extent in the Northern Circars, as well as in other parts, the greater proportion consisted of 14 punjums or cloths, containing fourteen times 12 threads in the breadth, which varied according to local custom from 38 to 44 inches. 14lb. was considered the proper weight of such cloths, the length 36 cubits, half lengths being exported under the denomination of salampores. The manufacture of the finer cloths which went up to and even exceeded 50 punjum has long been discontinued.—*Rohde M.S.S.*

Cloths, Long.—Very superior kinds of cloths were formerly manufactured at Vizagapatam and sold at from 70 to 350 Rs. each, but the large supplies of Long cloths from England selling at the more moderate prices of from 6 to 40 Rs. per piece, has quite destroyed that old manufacture.

Cloths, Men's.—These cloths are manufactured all over the country, but those of the Madura District have Lace borders: they are sold as high as 70 Rs. for a suit of two pieces. Conjeveram is noted for its silk bordered cloths which are sold for not more than fifteen Rupees a pair.

Cloths, Native Female, Cotton.—This description of cloths forms an article of manufacture in every district, and are in constant use by all classes of the country. Madras manufactures a nicely coloured woman's cloth called "oolloor sailay," sold for seven Rupees and upwards. Arnee is noted for its manufacture of a superior quality of white Cotton Cloths of various patterns. Those of Sydapet in Chingleput, a country town in the out-skirts of Madras, are of ordinary quality and of different colours. Ganjam also fabricates a common sort, with a few of more value, worked with Lace borders but not sold for more than 50 Rs.

Cloths, Native Female, Silk.—The principal places for the manufacture of Native Female Silk cloths are the towns of Benares, Berhampore, and Tanjore. Those of Benares are generally of superior quality with rich lace borders, and they are sold at from Rupees 50 to 350 or up-

wards. Berhampore cloths are wholly of Silk but nicely finished. Tanjore cloths are also neatly finished with nicely worked borders, both of Lace and Silk of various colours: they are sold at from Rupees 15 to 150.

Cloths, Silk, called *Pethambaram.*—These are chiefly brought from Benares, and Nagpore: they are also made at the town of Combaconum. The Benares cloths are highly prized for their superior quality: they measure 12 by 2½ cubits a piece, two pieces make one suit of an upper and under garment. Hindoos wear these cloths during their devotions and holiday time. They are sold from Rupees 50 to 350 or even more. The fabrics of Combaconum are good, although not equal to those of Benares.

Cloth, White, is manufactured all over Southern India, but those of Manamadoo in the district of Trichinopoly is very superior in quality and used by the more respectable of the inhabitants as clothing under the name of "Manamadoo Sullah." That at Arnee in the district of Chingleput, known as "Arnee Sullah," is of different quality.

Cloth, Woman, Cotton, Coloured.—These Cotton colored cloths are largely made in the Madura district. They are of various sizes, with or without Lace worked borders. Those with Lace vary in price from Rupees 15 to 200 each; they are generally purchased by respectable natives, by whom they are highly prized. These fabrics are known in the market as:—

Vankey, Lace bordered.	Joonnady, Lace bordered.
Thomboo, do. do.	Amboooresa, do. do.

Cloth, Woman's Silk.—These are brought chiefly from Benares and Nagpore; but they are fabricated also at Berhampore, Tanjore, Combaconum, and Conjeveram, in the Madras Presidency. Those of Benares and of the Mahratta countries are celebrated for their superiority and are highly prized for their Lace borders: their size is 16 by 2½ cubits, and they are sold at Rupees 50 to Rupees 300 and upwards; those made at Berhampore, Tanjore, and Combaconum are not equal to the Benares cloths, but are well made and sold at from Rupees 15 to 70 each. The woman's cloths of Tanjore and Madura manufacture, and men's head-cloth, also from Madura, are good articles, and will compete with the production of any other Loom in the world.

(2716) CLOVES.

Kerenful, ARAB.	Woh-kayu-lawang, JAV.

	Lawangum. TEL.
	Thenghio, CHIN.—*Faulkner,*

The cloves of commerce are the unopened flowers, the flower buds of the Clove-tree, *Caryophyllus aromaticus* (*Eugenia caryophyllata*), which was originally a native of the Moluccas, but is now cultivated in several parts of the East and West Indies. They have the form of a nail, and when examined are seen to consist of the tubular calyx with a roundish projection, formed by the unopened petals. It is a very handsome tree, growing to the height of about twenty feet. The trunk is straight, and rises four or five feet before it throws out branches. The bark is smooth, thin, of a grey color, and the wood of the trunk too hard for ordinary cabinet work. The leaves are opposite, smooth, narrow, pointed, of a rufous color above, and green on the under side. They have a very aromatic odor when bruised between the fingers. The flowers produced in branched peduncles, at the extremity of the bough, are of a delicate peach color. The elongated calyx, forming the seed vessel, first changes to yellow, and, when ripe, to red, which is from October to December, and in this state it is fit to gather. If left for a few weeks longer on the trees, they expand, and become what are termed "mother cloves," fit only for seed or for candying. The ground under the tree is first swept clean, or else a mat or cloth is spread. The nearest clusters are taken off with the hand, and the more distant by the aid of crooked sticks. Great care should be taken not to injure the tree, as it would prevent future bearing. The cloves are then prepared for shipment by smoking them on hurdles near a slow wood fire, to give them a brown color, after which they are further dried in the sun. They may then be cut off from the flower branches with the nails, and will be found to be purple colored within, and fit to be baled for the European market. In some places they are scalded in hot water before being smoked, but this is not common. The tree may be propagated either from layers or seed. Layers will root in five or six months if kept moist. A strong dark loam, a gravelly, sandy, or clayey soil, but one not retentive of moisture, seems that best suited for its successful culture. It does not thrive well near the sea, nor in the higher mountains, the spray of the sea and the cold being found injurious. The plants at first require the shade of other trees, such as the mango, cocoa-nut, &c. Although generally a hardy plant, it suffers from excessive drought. They should be planted about twenty feet apart. In its native country the tree begins to yield fruit in the sixth year, but a crop can seldom be looked for in other quarters under eight years. It is very long lived, sometimes attaining the age of 130 years. There appears, according to Mr. Crawfurd, to be five varieties of the clove, viz—the ordinary cultivated clove; a kind called the female clove by the natives, which has a pale stem; the kiri or loory clove; the royal clove, which is very scarce, and the wild clove. The three

first are equally valuable as spices, the female clove being considered fittest for the distillation of essential oil. The wild clove, having scarcely any aromatic flavor, is valueless. The produce which may be expected from the tree seems to be uncertain; it may, however, be averaged at five or six pounds. A clove tree, well weeded and taken care of, will produce from five to twenty pounds. On the other hand, a tree that is neglected will not give above two or three pounds. At intervals of from three to six years they usually produce one extraordinary crop, but then a year now and then intervenes, when they yield none at all; in others they will afford a double harvest. The clove tree was originally confined to the five principal Molucca islands and chiefly to Macheam. From these it was conveyed to Amboyna, a very short time only before the arrival of the Portuguese. By them the cultivation was strictly restricted to Amboyna, every effort being made to extirpate the plant elsewhere. It has now, however, spread to Java, Singapore, and the Straits' Settlements, Ceylon, the Mauritius and Seychelles, Bourbon, Zanzibar, Cayenne, Dominica, Martinique, St. Kitts, St. Vincent, and Trinidad. Cloves contain a volatile oil, associated with resinous, gummy, and astringent matter, which is yielded in larger proportion than by any other plant. Neuman obtained by distillation two ounces and two drachms from sixteen ounces of cloves. On an average cloves yield from 17 to 22 per cent. of oil, including the heavy and light oils. The oil is aromatic and acrid, and has been used as a condiment and a stimulant carminative. It is also extensively used by distillers and soap makers. It is said that the clove does not thrive well on the soil of Java, the plantations of which trial had been made not having succeeded to the extent expected, although they were directed by skilled persons from Amboyna; the places they made choice of did not differ materially as to soil and climate from those of the Moluccas. M. Teysman, Director of the Botanical Gardens at Batavia, seems to have bestowed much attention on the subject. The exports however from the island have been considerable. In 1830, there were 803 piculs shipped; in 1835, 4,566; in 1839, 2,334; in 1843, 2,027 piculs of 133 lbs. In Singapore, about ten years ago, there were then about 15,000 clove trees planted out, a few of which only had come in bearing. If these plantations had proved equally productive with those of the sister settlement of Pinang, it would have been able to export 60,000 lbs. of cloves, its own produce; but this expectation, it will be seen, has not been realised. In the season of 1841-42, there was 1,000 piculs of cloves shipped from Pinang, but none were exported in the two previous years. The quantity of land under cultivation with cloves there, in 1843, was 463 orlongs in Prince of Wales' Island, and 517 in Province Wellesley. The number of trees planted out in the former island was 72,779; in the latter province 7,639. There were in the island 25,161 plants in nursery. The average consumption of cloves in the United Kingdom, in the four years ending 1841 was 49,000 lbs. The largest quantity of cloves imported during the past twenty-five years was 1,041,171 lbs., in 1847. The quantities imported and entered for home consumption in the last five years have been as follows:—

	Imports.	Home consumption.
1848	117,433 lbs.	..... 126,691 lbs.
1849	274,713 „	..... 133,713 „
1850	749,646 „	..... 159,934 „
1851	253,439 „	..... 138,123 „
1852	313,949 „	.. .. 175,287 „

In 1848 were received 60,000 lbs. of cloves from British India.—*Simmonds' Comml. Product, p.* 401. The trees in bearing were—In Prince of Wales Island, 28,739; not bearing, 44,040; produce in 1843, 87 piculs, 50 catties; gross value, 3,399 dollars; estimated produce of cloves for 1844, 469 piculs. In Province Wellesley —Trees in bearing, 1,073; not bearing, 6,566; produce in 1843, 1 picul, 13 catties; gross value 45 dollars. The export of cloves from Pinang was, in 1849, 24,000 lbs.; in 1850, 52,400; in 1851, 27,866; in 1852, 45,087. From tabular statements drawn up in 1844, by Mr. F. S. Brown, Chairman of the Pinang Chamber of Commerce, it appears that there were, in 1843, in that island and Province Wellesley adjoining, 96 clove plantations, containing 80,418 clove trees; besides many young trees in nurseries ready to be planted out. The produce of cloves there, in 1842, was 11,813 lbs., and this was a very short crop, it having that year proved a complete failure; the average crop for some years previous had been 46,666 lbs. Pinang only began to export this spice in 1832. Of the clove trees in Pinang there were then only 29,812 in bearing, leaving 75,767 in that settlement alone to come to maturity; estimated to yield about 300,000 lbs. No success has attended repeated trials of cloves in Singapore. Until the trees reach the age of bearing, they grow and look extremely well; but any expectation of a crop that may have been raised by their hitherto fine condition, ends in disappointment, for just then the trees assume the appearance of sudden blight, as if lightning-stricken, and then die. 125 clove plants and 350 seedlings were sent to Singapore from Bencoolen, by Sir T. Raffles, in the close of 1819; but although every care was paid them—while the nutmegs which accompanied them throve amazingly well—little or no progress has been made with clove culture. Two or three hundred-weight were shipped in 1845, but since then hardly any mention is made of the spice. In a petition presented by the spice planters of Pinang and Province Wellesley, to

the authorities at home, in 1844, praying that the duty on British Colonial nutmegs, mace, and cloves might be reduced to 1s. 9d., 1s. 2d., and 3d. respectively, on importation into England, in order to compete with foreign produce, it was stated that a few years hence Prince of Wales Island might be expected to produce 60,000 lbs. of nutmegs, 200,000 lbs. of mace, and 300,000 lbs. of cloves; whilst Singapore, if equally successful in the culture of the same, would yield yearly 137,000 lbs. of nutmegs, 45,000 lbs. of mace, 60,000 lbs. of cloves. In short, the planters needed only encouragement to produce in the course of a few years a full supply of those valuable spices for the whole consumption of Great Britain. Dr. Ruschenberger, who visited Zanzibar in 1835, thus speaks of the clove plantations there:—"As far as the eye could reach over a beautifully undulated land, nothing was to be seen but clove trees of different ages, varying in height from five to twenty feet.—*Simmonds' Com. Prod. p.* 400. Mr. Crawfurd tells us that the clove is remarkable for its limited geographical distribution. It is only in its native localities, the five small islets on the western coast of the large island of Gilolo, that it is easily grown, and attains the highest perfection. There, it bears in its seventh or eighth year, and lives to the age of 130 or 150. Rumphius informs us, that shortly before the arrival of the Portuguese it had been carried to and reared in Amboyna, where, however, it does not bear until its fifteenth year, and where the average duration of its life does not exceed 75 years. He informs us further that large islands are not favourable to its growth—that it succeeds indifferently even in such islands as Gilolo and Ceram, and that the natives of Celebes and Java who had attempted to grow it in their own country had obtained plants which bore no fruit. Europeans, however, have succeeded somewhat better. The clove has been long transferred by them from the Moluccas to Sumatra,—to the islands in the Straits of Malacca,—to Bourbon,—to Zanzibar, on the eastern coast of Africa, and to Cayenne. In some of these places the culture has virtually failed, even where that of the nutmeg has succeeded, and everywhere the produce is of inferior quality to that even of Amboyna. A suitable soil seems to be as indispensable, as a suitable climate. The soil of the Molucca Islands is volcanic, which is not the case with any of the countries to which the tree has been transferred, except the Island of Bourbon, and here the suitable climate seems to be wanting. The clove appears, from Pigafetta's statement, to have been private property, and entirely free in culture and trade; Malays, Javanese, Chinese, Macassars, and Arabs, all competing for it in an open market. The annual quantity produced, according to him, in the five islands, seems to have been from 1500 to 2000 bahars; and the bahar is an Arabian weight, computed in the Moluccas at about 590 pounds. The companions of Magellan themselves loaded two ships with cloves at a single island, Tidor, after a stay, from their arrival to their departure, of no more than forty-four days. The Portuguese made their first appearance in the parent country of cloves in the year 1512: and having been expelled by the Dutch in 1605, they had the principal share of the clove trade for ninety-three years,—a period of rapine, violence, and bigotry. Their main object was the exclusive monopoly of spices, by the expulsion of all rivals. Their successors pursued the same object in a manner still more rigorous. They extirpated the clove trees in their native islands, and endeavoured to limit their growth to the five Amboyna islands, in which the clove is an exotic. Periodical expeditions for the extirpation of young plants that might spontaneously have sprung up, or been propagated by birds, formed part of this system. The clove monopoly still exists, but in a very tottering condition. The periodical exterminating expeditions have been merely nominal during the present century; and for the last thirty years, although the monopoly be persevered in, in the five Amboyna islands, where the parks, as they are called, are the property of the government, the culture and trade are legitimate everywhere else.—*Crawfurd Dictionary, page* 104. The clove tree may be seen in a few gardens on the Tenasserim Coast, and cloves are abundant in the bazars. At the Madras Exhibition of 1855, Cloves were forwarded from Travancore, Tinnevelly, Canara, and Cochin. The plumpest and heaviest were from General Cullen's Gardens near Oodagherry, 1800 feet above the sea, these had a strong aromatic odour, and were of a dark brown colour; they were quite entire, and when pressed with the nail, the oil exuded. The specimens from S. Warrier, Dewan of Cochin, and those from Tinnevelly District were almost equally good.—*M. E. J. R.*

(2717) CLOVE OIL.

Woorula-teil, CYNG.	Oleo de garafano, IT.
Huile de girofle, FR.	Kiramboo taylum, TAM.
Lavang ka teil, HIND.	Lawangha taylum. TEL.

Is procured from cloves by distillation. When new, it is of a pale reddish-brown colour, which becomes darker by age. It is extremely hot and fiery, and sinks in the water. The smell is agreeable, and not unlike that of *Koolfa*, or *Malabar Cassia oil*. The kind met with in Bombay, is chiefly made at Surat.—*Faulkner.*

(2718) CLOVER, INDIA CLOVER. The most valuable grass in the country of Tenasserim is not a proper grass, but, like the English clover, is a leguminous plant. It is a species of hedysarum, "which in India," says Dr. Wight, "supplies the place of the species of *Trifolium* and *Medicago* in Europe." In other words, the farmer finds it a good substitute for clover and

lucerne; and there is another leguminous plant at Tavoy, *Smithia sensitiva*, which is said to make "excellent hay."

(2719) CLOVER SEED.

Klaver-zaad, Dut.	Trifolium. Lat.
Semence de trefle, Fr.	Trilistnik, Rus.
Kleesaat, Klee, Ger.	Trebol, Sp.
Trifoglio, It.	

The produce of a plant (*Trifolium*), of which there are two principal kinds: *red clover*, a biennial; and *white* or *Dutch clover*, a perennial. They are largely produced in Great Britain, on the Continent, and in the United States.—*Faulkner.*

(2720) CLUPEIDÆ, a family of Fishes of the section *Abdominales*. The *Clupeidæ* are placed by Cuvier between the *Salmonidæ* and the *Gadidæ*: in fact they form the fifth and last division of his section 'Malacopterygiens Abdominaux.'—*Engl. Cyc. p.* 2.

(2721) CLUSIA, a genus of plants belonging to the natural order *Clusiaceæ* or *Guttiferæ*, named after Charles de l'Ecluse, or Clusius, one of the most celebrated botanists of the 16th century.—*Engl. Cyc. Vol.* II. *p.* 4.

(2722) CLUSIACEÆ, or Guttiferæ, *Guttifers*, a small natural order of Exogenous Plants, inhabiting the hotter parts of tropical countries in both the Old and New World. Their fruit is succulent, juicy, and in many cases resembling a large apple or orange. The Mangosteen (*Garcinia Mengostana*) is probably the most delicious of any known; but it has never been seen in a fresh state in Europe, for the tree will hardly exist out of its native humid heated atmosphere in the Indian Archipelago. The most remarkable product of this order is an acrid, purgative, yellow gum-resin. In one of its forms this is the Camboge or Gamboge of commerce. This substance is well known as a yellow pigment, as also a purgative medicine. The plant which yields the Gamboge of commerce is still unknown. The London College of Physicians in their 'Pharmacopæia' refer it to some species of *Garcinia*, others refer it to species of *Cambogia*, *Xanthochymus*, *Hebradendron*, and *Stalagmitis*. The East India Tacamahaca is yielded by a species of *Calophyllum*. The Butter or Tallow-Tree of Sierra Leone is the *Pentadesma butyracea*. The fruits of many species are esteemed, besides the Mangosteen. The Mammee Apple, or Wild Apricot of South America, is said to be very delicious. Its seeds are anthelmintic; its flowers yield on distillation a spirit known as Eu de Creole, and wine is obtained by fermenting its sap. The large berries of the Pacouryava (*Platonia insignis*) of Brazil are highly prized on account of their delicious flavour. The fruits of several species of Garcinia besides the Mangosteen, are brought to table in the countries where they grow, but they are regarded as very inferior. The blossoms of *Mesua ferrea* are remarkable for their fragrance, and are sold in the bazars of India under the name of Nagkesur.—*Engl. Cyc. Vol.* II. *p.* 5.

(2723) CLUYTIA COLLINA, *Euphorbiaceæ*, Roxb. c. 169.

Woadoogoo marum, Tam. | Kadishen, Tel.

A small tree, frequent in the Walliar jungles. Flowers in hot season, seed ripens in December and January. Flowers diœcious, calyx five-parted, petals five, stamens five, capsule three-celled, three-seeded.—*Roxb. p.* 732. Bark or outer crust of capsule said to be exceedingly poisonous.—*O'Shaughnessy, p.* 552. Wood red coloured, exceedingly hard and durable but of small size. Notwithstanding its hardness, being very even grained, it is easily worked and is from its fine close grain a pretty wood.—*Rohde M.S.S.*

(2724) CLUYTIA PATALA. A much larger tree than Collina a native of moist valleys amongst the Circar mountains. It flowers during the hot season. The wood of this tree is of the colour of dried rose leaves, also hard and durable.—*Rohde, M.S.S.*

(2725) COAL.

Steenkull, Dan.	Lithanthrax, Lat.
Steenkoolen, Dut	Carvoes de terra, ou de pedra, Port.
Charbon de terre. Fr.	Ugolj, Rus.
Steinkohlen, Ger.	Carbones de tierra, Sp.
Welaety-kooela Guz. Hind.	Stenkol, Sw.
Carbonfossili. It.	

Coal, is an opaque combustible mineral substance of a black or brown colour, and in all cases giving indications of having been derived from a vegetable source. Coal differs considerably in its physical properties, and it has obtained various names in the markets. The mineralogist generally divides it into two varieties. First, Coal without Bitumen; Second, Coal with Bitumen. The first variety is known by the general name of *Anthracite*. It has however various local names. It is sometimes very hard, and has a high-lustre, and is often iridescent. Besides being used for fuel it is often made into inkstands, small boxes, and other articles of use. This is more especially the case with the Anthracite of America. It is the most common form of Coal in the Welsh beds. The Bituminous varieties of Coal present greater differences of structure and appearance, and have a larger number of names, the quantity of Bitumen, or substances resembling it differ very much in different specimens of coal. It is generally softer and less lustrous than Anthracite, although occasionally specimens exhibit a very brilliant fracture. Its specific gravity is less than that of Anthracite, seldom exceeding 1·5, whilst the specific gravity of Anthracite ranges from 1·3 to 1·75. The kinds of this coal are known by various names. The following are

analyses of the different kinds of Coal which occur in the Newcastle beds:

	Splint Coal.	Caking Coal. No. 1.	Caking Coal. No. 2.	Cherry Coal.
Density,	1·302	1·247	1·280	1·266
Carbon,	74·961	83·588	87·809	84·694
Hydrogen,	6·254	5·150	5·159	5·054
Nitrogen and Oxygen,	4·873	8·743	5 139	8·176
Ash,	13·912	2·591	1·393	1·576
Relative heat by the same weight of Coal,	110·310	114·980	122·560	116·630
Relative heat by the same volume of Coal,	108·990	111·310	110·030	112 070

Pitching or *Caking Coal* is known by its velvet or grayish-black colour. When first thrown on a fire it breaks into small pieces, but on the continued application of heat the pieces again unite into a solid mass or cake. It burns readily with a yellow flame, but on account of its caking quality it is likely to clog the fire unless it is frequently stirred. The Newcastle beds mostly yield this form of coal.

Cherry Coal resembles in external appearance the pitch coal, and when exposed to heat it cracks and flies, but does not cake It is very brittle, and on this account much loss is occasioned in mining it. It burns with a clear yellow flame. This kind of coal occurs in the Glasgow beds.

Splint Coal is a variety found in connection with the last, and is remarkable for its hardness; for which reason it is sometimes called Hard Coal. It is also found at Glasgow.

Cannel Coal has little lustre, is very compact and smooth in its texture, and breaks with a large conchoidal fracture. It burns very readily, giving out a clear yellow flame without melting. In consequence it has been employed for the making of candles—hence its name. It is often employed for making inkstands, snuff-boxes, and other articles of use. At the Great Exhibition of 1851 several models of public buildings, monuments, &c. were exhibited, formed of Cannel Coal. The above coals are those most commonly burned. Their goodness for heating is tested by the quantity of water they evaporate. The following are the results of some recent experiments:—

	lb.	oz.
Common Scotch Bituminous Coal	5	14
Carr's West Hartley Main (Newcastle)	7	5
Merthyr Bituminous Coal,	8	0
Pure Welch Anthracite,	10	8½

From which it will be seen that the heating power of anthracite nearly doubles that of some bituminous coals.

Brown Coal, Wood Coal, Lignite, are names given to less perfect varieties of coal than the last. Specimens of these coals have a brownish-black colour, and burn with an empyreumatic odour. On placing sections of Lignite under the microscope, the structure of the wood of the plant forming it can be readily detected. This is not the case with the other kinds of coal, where, although the woody fibre can be frequently made out, it has evidently undergone considerable change. Professor Quekett, on this ground, proposes to confine the term coal to those fossil or mineral substances alone which are evidently made up of the woody tissue of plants. He maintained that the Torbane mineral was not coal, on the ground that it was not composed of the debris or remains of vegetable woody tissue. Although woody and vascular tissue can be seen in the Trobane mineral, Professor Quekett maintains that this has been accidentally introduced, and that no true vascular or spiral tissue is found in coal. The term *Brown Coal* is frequently applied to coal more recently deposited than that of the great coal-beds of the world, and this quite independent of its structure or any peculiarity in combustion. *Lignite* is also a term applied to the semi-carbonised forms of wood which are frequently found in deposits later than those of the coal deposits. Most of these varieties of coal contain a large quantity of water, and the quantity of matter given off at a moderate heat by distillation is at least equal to that of the carbon contained. It occurs in the tertiary deposits around all the shores of India.

"*Dysodil* is a yellow or grayish highly laminated substance, often found with lignite, and burning vividly, and spreading an odour of assafœtida."—(*Austed.*)

Jet is another variety of coal belonging to the bituminous series. It sometimes occurs in elongated reniform masses, and sometimes in the form of branches with a woody structure, It is soft and brittle, with a conchoidal fracture. Its specific gravity is but little greater than that of water. It is opaque, of a velvet-black colour, and has a brilliant and resinous lustre. It is found in Saxony, and also in the Prussian amber-mines in detached fragments. It is sometimes washed upon the shores of Great Britain, and has been found in Southern India. The finer sorts are used in the manufacture of ornaments and trinkets of various kinds. The coarser sorts are burned as fuel It gives out when burned a greenish flame and a strong bituminous smell, and leaves a yellowish ash. It contains about 37½ per cent of volatile matter.—*Eng. Cyc. Vol.* II, *p.* 10. In China, Coal is generally used for fuel in all those places which have been visited, and the supply might probably be greatly increased by introducing Europe machinery and modes of working it. The boats on the North river, below Nanhiung, lie near the mouth of a horizontal shaft worked into the mine, above which the cliffs are scraped down as the shaft advances. The ignorance of the Chinese of the best modes of draining and ventilating mines, must necessarily prevent working many of them beyond a certain depth and extent. The mountains of Shansi and Chihli supply large quantities of this valuable
